Ms. Lisa Felice
Executive Secretary
Michigan Public Service Commission
7109 West Saginaw Highway
Lansing, MI 48917

RE: In the matter of the Application of **DTE Gas Company** for approval of a Gas Cost Recovery Plan, 5-year Forecast and Monthly GCR Factor for the 12 months ending March 31, 2023
MPSC Case No: U-21064

Dear Ms. Felice:

Attached for electronic filing in the above referenced matter is DTE Gas Company's Application for Gas Cost Recovery Plan and Monthly GCR Factor and Evaluation of Its Five-Year Forecast, Direct Testimony and Exhibits of Witnesses, George H. Chapel, Eric P. Schiffer, Lucian Bratu, Timothy J. Krysinski, Andrea R. Hardy, and Kenneth A. Sosnick. Also attached is the Proof of Service.

Very truly yours,

Carlton D. Watson

CDW/erb

cc: Service List

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the Application of)
DTE GAS COMPANY for approval of a)
Gas Cost Recovery Plan, 5-year Forecast)
and Monthly GCR Factor for the 12 months)
ending March 31, 2023)

Case No. U-21064

**APPLICATION FOR APPROVAL OF DTE GAS COMPANY'S
GAS COST RECOVERY PLAN AND MONTHLY GCR FACTOR,
AND EVALUATION OF ITS FIVE-YEAR FORECAST**

DTE Gas Company ("DTE Gas") pursuant to 1939 PA 3, as amended, MCLA 460.6h *et seq.*, requests approval of its Gas Cost Recovery ("GCR") Plan and monthly GCR factor for a 12-month period from April 1, 2022 through March 31, 2023 ("GCR Plan Year"), and evaluation of its five-year Forecast as set forth in this Application. In support of this request, DTE Gas states the following:

1. DTE Gas is a subsidiary of DTE Energy Company, a Michigan corporation with its principal offices located at One Energy Plaza, Detroit, MI 48226. DTE Gas is a public utility subject to the jurisdiction of the Michigan Public Service Commission ("Commission" or "MPSC") and is engaged in the acquisition, storage, transportation, distribution, and sale of natural gas and other related services to approximately 1.3 million residential, commercial and industrial customers within the State of Michigan.

2. For the GCR Plan Year, DTE Gas proposes to implement a maximum base GCR factor of \$3.29 per thousand cubic feet ("Mcf") that can be increased by a contingency factor matrix based on increases in New York Mercantile Exchange ("NYMEX") gas commodity prices resulting in a new maximum GCR factor. The proposed maximum GCR factor, as adjusted, when necessary, by the NYMEX based contingency factor matrix includes costs to be paid to DTE Gas's

gas and pipeline suppliers. In addition, DTE Gas further proposes to implement for the GCR Plan Year a Supplier of Last Resort (“SOLR”) Reservation Charge in the amount of \$0.40 per Mcf that will be billed to GCR customers while the Reservation Charge billed to Gas Customer Choice (“GCC”) customers will be \$0.27 per Mcf, which reflects the 30% discount from the average rate as mandated by the Commission in Case No. U-17691.

3. The testimony and exhibits of Eric P. Schiffer, George H. Chapel, Timothy J. Krysinski, Lucian Bratu, Kenneth A. Sosnick and Andrea R. Hardy are attached to this Application and made a part hereof. The attached testimony and exhibits support the proposed 12-month GCR factor and constitute DTE Gas’s Gas Cost Recovery Plan for the requested 12-month GCR factor along with its 5-Year Forecast of Gas Requirements in accordance with Sections 6h (3) and (4) of 1939 PA 3, as amended.

4. This Application, including testimony and exhibits, will be promptly furnished to all intervenors in DTE Gas’s 2022-2023 GCR Plan, Case No. U-21064 (“Case No. U-21064”). It will also be promptly made available to any other persons seeking to intervene in this proceeding pursuant to Rule 410 of the Commission’s Rules of Practice and Procedure.

5. This Application, including testimony and exhibits, continues to support fundamental proposals including, but not limited to, DTE Gas’s fixed price purchase program and DTE Gas’s Reservation Charge.

6. Jurisdiction in this matter is pursuant to 1939 PA 3, as amended, MCL 460.6h *et seq.*; as well as 1909 PA 300, as amended; MCL 460.2 *et seq.*; 1919 PA 419, as amended; 1969 PA 306, as amended; MCL 24.200 *et seq.*; and the Commission’s Rules of Practice and Procedure, 1979 Michigan Administrative Code, R 460.17101 *et seq.*

WHEREFORE, DTE Gas respectfully prays that the Commission immediately commence a gas supply and cost review pursuant to Sections 6h (5), (6) and (7) of 1939 PA 3, as amended, establish dates for a hearing on DTE Gas's Application, supporting testimony, and exhibits as soon as scheduling permits in order to facilitate the issuance of a final Commission order that:

- i. Approves a maximum base gas cost recovery factor of \$3.29 per Mcf that can be adjusted to a new maximum GCR rate by the monthly NYMEX-based contingency factor matrix, to be reflected in DTE Gas's monthly gas customer billings beginning April 1, 2022, and continuing through March 31, 2023, and further approves a SOLR Reservation Charge of an additional \$0.40 per Mcf that is billed to GCR customers while the Reservation Charge billed to GCC customers will be \$0.27 per Mcf;
- ii. Finds that DTE Gas's 5-Year (April 2022-March 2027) Forecast of Gas Requirements, Supplies and Costs, and Gas Supply Plan does not include any cost items that the Commission would be unlikely to permit DTE Gas to recover in the future;
- iii. Grants such other and further relief as it may find appropriate.

Respectfully submitted,

DTE GAS COMPANY

QUALIFICATIONS

AND

DIRECT TESTIMONY

OF

GEORGE H. CHAPEL

DTE GAS COMPANY
QUALIFICATIONS AND DIRECT TESTIMONY OF GEORGE H. CHAPEL

Line
No.

1 **Q1. What is your name, business address and by whom are you employed?**

2 A1. My name is George H. Chapel. My business address is DTE Energy Gas (“DTE Gas”
3 or “the Company”), One Energy Plaza, Detroit, Michigan 48226. I am employed by
4 DTE Gas as Manager, Market Forecasting.

5

6 **Q2. On whose behalf are you testifying?**

7 A2. I am testifying on behalf of DTE Gas Company.

8

9 **Q3. What is your educational background?**

10 A3. In December 1985, I earned a Bachelor of Science degree from Central Michigan
11 University with a major in mathematics.

12

13 **Q4. What work experience do you have?**

14 A4. In April 1988, I was hired by Michigan Gas Company (“MiGas”) as a Rates and Gas
15 Supply Analyst where I performed various duties of increasing responsibility arising
16 out of the regulation of MiGas as a public utility. In 1993, the assets of MiGas were
17 rolled in with those of affiliate Southeastern Michigan Gas Company and Battle
18 Creek Gas Company. These companies were combined to form what is known today
19 as SEMCO Energy Gas Company (“SEMCO”). My duties with SEMCO included
20 demand forecasting, supply planning, supply purchasing, nominating, and pipeline
21 capacity management. I have attended numerous industry conferences focusing on
22 natural gas demand forecasting, sharing knowledge and expertise with a nationwide
23 range of industry peers.

24

Line
No.

1 In May 1998, I was hired by Michigan Consolidated Gas Company (MichCon, later
2 DTE Gas) as a Gas Supply Analyst. My duties with the Company in that capacity
3 included supply purchasing and market analysis. In October 2000, I was promoted
4 to Manager, Gas Supply. I assumed my current position on January 1, 2003.

5

6 **Q5. What are your current duties and responsibilities?**

7 A5. I am responsible for projecting DTE Gas' Gas Cost Recovery (GCR), Gas Customer
8 Choice (GCC), and Aggregate rate schedule customer growth/decline, natural gas
9 supply demand, and review and analysis of the natural gas market. These duties
10 support DTE Gas' regulatory, finance, and accounting functions.

11

12 **Q6. Have you been involved in any prior regulatory proceedings?**

13 A6. Yes. I sponsored testimony on behalf of SEMCO and its subsidiaries in a variety of
14 cases before the Commission. These cases include two general rate cases, two
15 Michigan Residential Conservation Surcharge cases, and several GCR Plan and
16 Reconciliation proceedings. I have also provided testimony in a large number of
17 regulatory proceedings for DTE Gas, including GCR Plan and Reconciliation
18 proceedings as well as DTE Gas' most recent general rate cases. My experience as a
19 GCR witness began with SEMCO in 1990 and has continued to the present day with
20 DTE Gas.

Line
No.

1 **Purpose of Testimony**

2 **Q7. What is the purpose of your testimony in this proceeding?**

3 A7. The purpose of my testimony is to present and describe the Company's GCR market
4 forecast for the five-year operational period 2022-2027. My testimony will address
5 DTE Gas's natural gas demand forecast over the next five years, April 2022 through
6 March 2027 ("the 5-Year Forecast Period"). My testimony will describe:

7 A) How the Company's GCR/GCC sales are projected to be 153 Bcf for the 2022-
8 2023 GCR Plan year and will decrease slightly over the course of the five-year
9 forecast period. It will also describe how the number of customers is expected to
10 increase over the five-year period due primarily to steadily increasing new
11 customer attachments anticipated over the five-year period.

12 B) The Company's rate schedule market forecast techniques. I will describe how
13 the Company's customer count forecast is projected using a build-up approach
14 that incorporates components that contribute to customer count increases and
15 decreases and how customer volumetric demand is projected using the
16 Company's three-step linear methodology.

17 C) The Company's GCC projection and why it is expected to remain unchanged
18 over the five-year period.

19 D) The Company's 2023 peak day load requirements, which are expected to change
20 from the volumes projected in last year's Plan case.

21 E) The Company's ongoing conservation assumptions with regard to its filed Energy
22 Waste Reduction (EWR) plan.

23

24 For reasons more fully described in my testimony below, the conclusions and
25 opinions I have reached regarding the above subjects support the reasonableness and

Line
No.

1 prudence of the decisions underlying DTE Gas's proposed GCR plan for the 12-
2 month period ending March 31, 2023.

3

4 **Q8. Are you sponsoring any exhibits in this proceeding?**

5 A8. Yes. I am sponsoring the following exhibits:

| 6 | <u>Exhibit</u> | <u>Description</u> |
|----|----------------|---|
| 7 | A-1 | Market Outlook – Weather Normalized Sales & Customers |
| 8 | A-2 | Market Forecast Analysis – Forecasted GCR Volumes |
| 9 | A-3 | Market Forecast Analysis - Forecasted GCR Number of Customers |
| 10 | A-4 | April 2022 – March 2027 Total Market Requirements |
| 11 | A-5 | Mean Peak Day Temperatures by District Peak Day Load by Area |
| 12 | A-6 | Historical Normalized Annual Sales (GCR & GCC) |

13

14 **Q9. Were these exhibits prepared by you or under your direction?**

15 A9. Yes, they were.

16

17 **MARKET OUTLOOK**

18 **Q10. What is DTE Gas's rate schedule and GCR sales forecast for the 2022 through**
19 **2027 planning period?**

20 A10. For the April 2022 - March 2023 operational plan year (OPY), I am forecasting
21 GCR/GCC sales volumes of approximately 153 Bcf for DTE Gas's rate schedule
22 sales customers (Exhibit A-1, page 1 of 2, line 13, column (a)). Rate schedule sales
23 customers include both GCR customers and GCC customers. Over the course of the
24 five-year forecast period, I am expecting annual volumes to generally decrease

Line
No.

1 slightly, with sales decreasing to approximately 150 Bcf for April 2026 – March
2 2027.

3

4 **Q11. Why are you projecting annual volumes to decrease slightly?**

5 A11. Though the Company expects that customer count will grow over the five-year
6 forecast period, I expect the ongoing efforts of the Company's EWR program to more
7 than offset the higher volumes normally associated with customer count growth. The
8 combination of higher customer count along with the Company's ongoing EWR
9 efforts are expected to result in a slight reduction to overall GCR/GCC natural gas
10 demand by the end of the five-year forecast period.

11

12 **Q12. What is your projection for average number of rate schedule customers from**
13 **2022 through 2027?**

14 A12. As reflected on Exhibit A-1, page 2 of 2, line 13, column (a), I am projecting
15 approximately 1.32 million rate schedule customers (mean average) during the 2022-
16 2023 OPY. This number is expected to increase to approximately 1.36 million
17 customers through 2026-2027 as shown in columns (b) through (e), line 13.

18

19 **Q13. Why is DTE Gas's customer count projected to increase over the course of the**
20 **five-year forecast period?**

21 A13. The Company's customer count continues to show growth. The Company continues
22 to observe a higher rate of requests for service and a lower rate of customer-requested
23 terminations of service, which could be reasonably interpreted as a sign that the
24 Company is still experiencing a period of customer growth.

25

Line
No.

1 **WEATHER NORMAL PERIODS**

2 **Q14. What is weather normalization and how is it used?**

3 A14. Weather normalization adjusts actual volumes from a past period to eliminate the
4 impact of non-normal weather on the data during that time-period. Weather-
5 normalized data is then used to make inferences about customer behavior trends.
6 Normal weather is also a key component in compiling volumetric forecasts.

7

8 **Q15. What weather-normalization technique does DTE Gas utilize to calculate**
9 **normal weather?**

10 A15. Consistent with the weather-normalization methodology included in prior
11 Commission-approved GCR Plan Cases, the Company uses a rolling 15-Year Normal
12 weather pattern to project its normal demand requirements in this GCR Plan.

13

14 **Q16. What 15-year period is DTE Gas using in this plan?**

15 A16. DTE Gas is calculating 15-year normal weather based upon actual weather from
16 calendar year 2006 to calendar year 2020.

17

18 **Q17. Why is DTE Gas proposing to utilize 15-year normal to project forecasted**
19 **demand requirements in this case?**

20 A17. Consistent with the Commission Order in Case No. U-15985 (general rate case), DTE
21 Gas utilizes a rolling 15-year weather period for its normal weather in all of its
22 regulatory filings.

23

24

25

Line
No.

1 **Q18. Why is the weather-normalization period important?**

2 A18. Weather is one of the primary determinants of natural gas demand. If the Company
3 can project Heating Degree Days (HDDs) more accurately, then it can more
4 accurately project demand on its system. Accurate projections lead to optimal
5 planning, which in turn reduces the gas costs DTE Gas will need to recover from its
6 customers.

7
8 **Q19. What is an HDD?**

9 A19. An HDD is a measure of how temperature relates to natural gas usage for heating
10 purposes; HDDs give an indication of a customer's likelihood of using their furnace
11 to heat their home or facility. Basically, the greater the number of HDDs, the greater
12 the heating demand. Mathematically, HDDs are defined as the greater of A) zero, or
13 B) $65 - \text{average daily temperature (in degrees Fahrenheit)}$.

14
15 For instance, if the daily high temperature is 30 degrees and the daily low temperature
16 is 20 degrees, then the daily average temperature is 25 degrees. The HDDs for that
17 day then, are: $65 - 25 = 40$ HDDs.

18
19 If, on the other hand, the daily high temperature is 90 degrees and the daily low
20 temperature is 70 degrees, then the daily average temperature is 80 degrees. The
21 HDDs for that day then, are 0, since $65 - 80$ results in a negative value.

22

23

Line
No.

1 **RESIDENTIAL RATE SCHEDULE SALES MARKET**

2 **Q20. How did you develop the forecast for the residential rate schedule sales market**
3 **including both GCR and GCC customers?**

4 A20. The projected residential GCR sales markets are shown on Exhibit A-2, pages 1
5 through 5. There are two key elements used in projecting volumes in the residential
6 sales market. The first element is the forecast of the number of customers, by month,
7 in the seven different market areas that DTE Gas serves. These seven different
8 service regions are: Detroit/Ann Arbor, Grand Rapids, Muskegon, Traverse City,
9 Alpena, Sault Ste. Marie, and Iron Mountain.

10

11 The second element is an analysis of the usage per customer per HDD at varying
12 temperatures. The Company uses a three-step linear factor model that determines the
13 monthly demand for all rate classes.

14

15 The combination of the two elements (customer count and three-step linear heat load
16 factor), along with normal HDDs by month for each respective market area yields the
17 monthly residential sales market forecast.

18

19 **Q21. How does the three-step linear methodology work?**

20 A21. The three-step linear equation consists of three components: a base load component
21 and two linear temperature-driven components. The base load component determines
22 how much gas a customer is expected to use every single day, regardless of the
23 weather. The remaining linear temperature-driven components determine how much
24 gas a customer is expected to use depending on how many HDDs are present on any

Line
No.

given day. The three-step linear equation is described mathematically with the following equation:

$$\text{Customer's Demand} = \text{BL} + ax_{\square} + bx_{55}$$

where BL = base load, x_{\square} = daily HDDs between 55 and 65 degrees Fahrenheit, and x_{55} = daily HDDs below 55 degrees Fahrenheit. Further, a and b represent usage coefficients unique to both a rate class and a demand region. The “a” coefficient is generally a lower value than the “b” coefficient because the “a” coefficient represents typical customer usage in aggregate at average temperatures between 55 and 65 degrees Fahrenheit; these are levels where some, but not all, of DTE Gas’s customers will turn on their furnace. This has the impact of dampening the demand calculation in the spring and fall months by weighting the lesser “a” usage coefficient more heavily during mild weather. Conversely, it has the impact of calculating higher heat load factors in the winter months by weighting the higher “b” usage coefficient more heavily during colder weather. The “b” coefficient represents typical customer usage at average temperatures below 55 degrees Fahrenheit, levels at which nearly all of DTE Gas’s active space-heating customers will turn on their furnace.

For the purposes of example, I have included a sample general graph that depicts this equation. It shows the daily consumption pattern of a typical Residential Space Heating customer. At relatively low HDDs (<10), on the left side of the graph, the slope of the graph is upward, but gradual. At higher levels of HDDs (>10), the slope of the graph gets steeper, indicating higher consumption per HDD the colder it gets.

6

7

8

9

10

11

12

13

Please note that the above graph is representative of the Detroit residential space-

14

heating gas customer class. Other rate classes will reflect similar demand curves.

15

16

Q22. How is the forecast of the number of customers, including both GCR and GCC, derived?

17

18

A22. A forecast of the number of customers by class, by month, is prepared using a recent three-year historical average growth/loss rate calculated for each of DTE Gas's seven demand regions. For this forecast, the historical three-year period was 36 months ended July 2021. The seven demand regions are: Detroit/Ann Arbor, Grand Rapids, Muskegon, Traverse City, Alpena, Sault Ste. Marie, and Iron Mountain.

19

20

21

22

23

24

Once this regional forecast is developed, incremental customer growth and losses are

25

projected. Forecasted customer change is developed through a combination of

Line
No.

1 projected attachments and the 12-month historical look-back of net non-attachment
2 customer change to the growth/loss rate. Projected attachments are provided by the
3 Company's Marketing Department and is their assessment of how many new
4 customers the Company expects to attach through marketing efforts in expanding
5 areas. The forecast also reflects marketing initiatives within the Company that are
6 expected to add approximately 9,500-10,000 customers annually over the 5-Year
7 Forecast Plan Period.

8

9 **Q23. What is the "net non-attachment customer change?"**

10 A23. The net non-attachment customer change is the monthly variance in customer total
11 from one month to the next less new attachments for that month. For example, if the
12 customer count for month M is 1,200,000, the customer count for succeeding month
13 M+1 is 1,210,000, and customer attachments for that month is 8,000, then the net
14 non-attachment customer change is calculated as:

15
$$1,210,000 - 1,200,000 - 8,000 = 2,000$$

16 The customer change in this group represents the net activity of an entire month's
17 worth of customers moving out of and into existing properties connected to the
18 Company's system. For instance, if Customer A moves out of 123 Main Street on
19 the 12th of a month and Customer B moves into 123 Main Street on the 15th of that
20 month, then the net change in customer count due to those activities is 0. On the
21 other hand, if Customer A moves out of 123 Main Street on the 12th of a month and
22 no one moves into 123 Main Street during that month, then the net change in
23 customer count due to that activity is -1.

Line
No.

1 **Q24. Are you forecasting growth in the number of customers from 2022 to 2027?**

2 A24. Yes. Company billing data over the past ten years has shown that customer count
3 continues to grow. Further, the Company is continuing to project new attachments
4 through its marketing efforts over the five-year forecast period. Going forward, DTE
5 Gas will continue to monitor these factors and adjust its long-term forecast as
6 necessary.

7

8 **COMMERCIAL & INDUSTRIAL MARKETS**

9 **Q25. How did you develop the forecast for commercial and small industrial markets**
10 **including both GCR and GCC customers?**

11 A25. The methodology used for forecasting volumes in the commercial and small
12 industrial GCR and GCC markets is essentially the same as that used for the
13 residential market. The process involves forecasting the number of customers for
14 each year and calculating the average base load and usage per HDD per customer.
15 As reflected on Exhibit A-1, page 1 of 2, line 10, I am projecting a slight decrease in
16 commercial and industrial GCR volumes from 27.6 Bcf to 26.7 Bcf for commercial
17 and industrial GCR sales customers from OPY 2022-2023 to OPY 2026-2027,
18 respectively.

19

20 **Q26. For which of the commercial and industrial classes do you use the three-step**
21 **linear forecast methodology?**

22 A26. All rate classes are forecast using the three-step linear methodology.

23

Line
No.

Q27. Does the implementation of the three-step linear methodology impact the way in which DTE Gas calculates its Warmer-than-Normal and Colder-than-Normal weather scenarios?

A27. Yes. The three-step linear approach captures the sensitivities around Warmer-than-Normal, and Colder-than-Normal scenarios. During a period of very cold weather, the “b” coefficient (see pages 8-9), which is generally greater than the “a” coefficient, has greater weight in the equation, generating increasingly higher heat load factors because the weather data includes colder temperatures. During a period of very warm weather, the “b” coefficient has less weight, and the equation will generate decreasingly lower heat load factors as the weather gets warmer. The net result is that the three-step method will produce lower consumption per customer per HDD during warmer weather (i.e. spring and fall months) and higher consumption per customer per HDD during colder weather (i.e. the deep winter months). This phenomenon produces an asymmetry in the application of Colder-than-Normal and Warmer-than-Normal demands.

GAS CUSTOMER CHOICE

Q28. What impact does the GCC program have on forecasted DTE Gas’ markets?

A28. The GCC program continues to have a significant impact on DTE Gas’s GCR markets. For 2022-2023 OPY, I have assumed that approximately 124,000 customers, or about 9% of DTE Gas’ total rate schedule customers, will be served by an alternate supplier through the GCC program (Exhibit A-1, page 2 of 2, line 12). Over the five-year forecast period, I am forecasting no change in the number of customers participating in the GCC program. Going forward, the Company will continue to monitor participation in the GCC program and adjust its sales projections accordingly.

Line
No.

1 **Q29. What are the forecasted GCC sales volumes?**

2 A29. Exhibit A-1, page 1 of 2, sets forth DTE Gas' forecasted GCC sales volumes by OPY.

3 The annual projected GCC sales volumes, identified on line 12, are: 21.9 Bcf for
4 OPY 2022-2023, dropping to 21.0 Bcf by OPY 2026-2027.

5

6 **FORECASTED GCR SALES VOLUMES**

7 **Q30. What are the forecasted GCR sales volumes and customers?**

8 A30. Exhibit A-2, pages 1 through 5, sets forth DTE Gas's forecasted GCR sales volumes
9 by month, and Exhibit A-3, pages 1 through 5, contains DTE Gas's forecasted
10 number of GCR customers by month. The annual projected GCR sales volumes,
11 identified on line 11 of each of the pages of Exhibit A-2 are laid out in Table 1 below:

12

Table 1

| OPY | Bcf |
|------------------|--------------|
| 2022-2023 | 131.1 |
| 2023-2024 | 131.5 |
| 2024-2025 | 130.3 |
| 2025-2026 | 129.8 |
| 2026-2027 | 129.3 |

13

14 The annual projected average GCR customer counts by OPY are laid out in Table 2
15 below:

Line
No.

1

Table 2

| OPY | GCR Customer Count |
|-----------|--------------------------|
| 2022-2023 | 1,193,971 |
| 2023-2024 | 1,204,994 |
| 2024-2025 | 1,215,969 |
| 2025-2026 | 1,226,758 |
| 2026-2027 | 1,237,106 |

2

3 **Q31. What is the basis for DTE Gas’s total annual GCR requirements?**

4 A31. The forecasted requirements are based on 15-year normal weather, which assumes a
5 change in daily temperature in accordance with the 15-year daily volatility (i.e.
6 “normal variable”); the distribution of daily HDDs assumes 15-year normal weather
7 for the 2022-2023 plan year, as well as for years 2 through 5 of the five-year plan.
8 Exhibit A-4, pages 1 through 3, identifies projected total requirements for OPYs 2022
9 – 2027, made up of Company use, lost gas, unbilled volume change and balance, and
10 the forecasted GCR sales market volumes previously described.

11

12 **DESIGN DAY DEMAND**

13 **Q32. What average temperatures does DTE Gas use to plan its design-day demand?**

14 A32. DTE Gas uses the coldest mean-average temperature it can expect during critical
15 periods in January, February and March. Exhibit A-5, page 1 of 2 identifies sixteen
16 key locations across DTE Gas’s service territory. The coldest mean-average
17 temperature (in degrees Fahrenheit) that DTE Gas can expect at each location during
18 three pivotal times during the winter is also identified on this exhibit. These pivotal

Line
No.

1 times occur at the ends of January, February, and March and represent the mean-
2 average temperatures that DTE Gas uses to plan its design-day demand.

3

4 **Q33. What is the 2023 design day load requirement associated with each of the three**
5 **critical-period mean-average temperatures?**

6 A33. DTE Gas plans to serve its peak-day requirements around critical end-of-month
7 demand. DTE Gas's design-day demand model examines the design weather at these
8 sixteen different locations and condenses them down to five primary demand
9 locations. Exhibit A-5, page 2 of 2 details the projected end-of-month peak demand
10 in January, February, and March 2023 at five primary demand locations (calculated
11 using statewide weather). These five locations are Detroit/Ann Arbor, Alpena, Grand
12 Rapids, the Upper Peninsula, and Traverse City.

13

14 **Q34. Have these design day load volumes changed as compared to DTE Gas's**
15 **previous GCR filing?**

16 A34. Yes. For the 2022 design-day projection, these loads have changed from prior years.
17 January 2023 design-day requirements have decreased by 162 MDth/day versus
18 January 2022. February 2023 design-day requirements have decreased versus
19 February 2022 by 128 MDth/day while March 2023 design-day requirements have
20 decreased by 132 MDth/day versus March 2022. The primary reason for these
21 changes is the annual update of DTE Gas's database of historical billing data in its
22 Load Program. There is also a slight decline in the expected system average heating
23 value which will result in slightly higher volumetric values. The annual update
24 reflects a combination of customer count and load changes in the Company's Detroit
25 area reflecting changes in peaker load; usage data for large end-use customers

Line
No.

(including peaker plants) was recently updated. Natural gas fired generators are modeled, by design day by month, using their most recent three years of activity.

Continued population growth in specific areas such as Kent County (major city: Grand Rapids), Washtenaw County (major city: Ann Arbor), and Grand Traverse County (major city: Traverse City) together with the population decrease in the Wayne County area (specifically in the city of Detroit) will continue to change the peak-day load. According to the US Census Bureau, from 2010 to 2020, the population of Kent County increased by 9.2% (approximately 55,000 persons), the population of Washtenaw County increased by 8.0% (approximately 27,000 persons), and the population of Grand Traverse County increased by 9.5% (approximately 8,300 persons). By contrast, the population in Wayne County decreased by 1.5% (approximately 27,000 persons). As I previously indicated, DTE Gas will continue to evaluate the population and customer changes so that it is positioned to respond to regional peak-day load demand changes.

DEMAND CHANGES

Q35. Has the Company experienced a change in normalized GCR and GCC sales in recent years?

A35. DTE Gas saw a relatively steep decline in normalized sales through 2009-2010. Into 2012, normalized usage characteristics amongst the Company's customer base appeared to stabilize, and then into 2016, normalized consumption appeared to be rebounding, until tapering off over the past couple of years. Please see the graph on Exhibit A-6. As shown on this exhibit, the steepest declines occurred in 2004-2005 and 2005-2006 (9-10 Bcf per year). Coincidentally, these two years saw increasingly

Line
No.

1 higher natural gas prices. Though still high from a longer-term historical perspective,
2 the 2006-2008 period generally saw a return to lower prices. The 2008-2009 period,
3 shown in column (f), once again showed a marked reduction in normalized
4 consumption, which was driven largely by the continued decline of the economy in
5 the state of Michigan and higher natural gas prices in general. From September 2009
6 through August 2012, normalized consumption stabilized to approximately 152-153
7 Bcf per year (about 127 Dth per customer). In 2012-2013 and 2013-2014, normalized
8 consumption rebounded up slightly to 155-156 Bcf each year. Beginning in 2017,
9 GCR/GCC demand increased steadily for the next several years, reaching 160 Bcf
10 annually (132 Dth per customer) by 2019.

11
12 The advent of the present CoVid-19 situation, however, has seen a marked dip in
13 normalized customer demand, with a drop to 154 Bcf normalized annual demand for
14 2019-2020 (127 Dth/customer) and then a further drop to 152 Bcf for 12 months
15 ended August 2021 (123 Dth/customer).

16

17 **Q36. What is the cumulative effect of the load changes from 2004 through 2021?**

18 A36. In general, DTE Gas has seen a long-term load reduction in GCR/GCC demand.

19

20 **Q37. Is the long-term load reduction permanent?**

21 A37. A portion of the long-term load reduction is permanent due to several factors.

22

23 **Q38. What factors contribute to the permanency of a portion of the longer-term load**
24 **reduction?**

Line
No.

1 A38. First, there is a time-sensitive load reduction, which means that there continues to be
2 ongoing replacement of old equipment with newer and more efficient equipment such
3 as furnaces, water heaters, and appliances. Also, household energy efficiencies are
4 gained by the demolition of older, less well-insulated houses in addition to the
5 construction of new homes built with better building materials.

6

7 **Q39. What are some differences between permanent and non-permanent load**
8 **reduction strategies amongst DTE Gas's customers?**

9 A39. Potentially less permanent are load reductions that are reflective of higher natural gas
10 prices. The data suggests that customers will react to higher natural gas market prices
11 by reducing their natural gas consumption in a variety of ways, from adding
12 insulation and new windows to their existing homes (permanent), to dialing down
13 their thermostats and delaying furnace use in the fall and hastening furnace turn-offs
14 in the spring (not permanent). This phenomenon affects natural gas customers across
15 the United States.

16

17 **Q40. Did you make any adjustments to the demand forecast in response to the**
18 **economic environment presented by the current CoVid-19 situation?**

19 A40. I did not make any specific adjustments to any of the rate classes due to the current
20 CoVid-19 situation. To develop the usage factors, I regressed customer demand over
21 the 24-month ended July 2021 billing periods. This time frame already encompasses
22 much of the demand changes that our customers have made in response to CoVid-19
23 and, as such, I did not make any further adjustments to expected customer behavior.
24 The Company will continue to monitor customer behavior moving forward and will
25 make necessary adjustments to notable changes in customer behavior.

Line
No.

1 **Q41. What has the Company assumed for system-wide heating value for forecast**
2 **purposes in this case?**

3 A41. The Company assumes that the system-wide heating value for the entire forecast
4 period of this GCR Plan case is 1,052 Btu/cf.

5

6 **Q42. Why has the Company assumed 1,052 Btu/cf for the system-wide heating value**
7 **for this GCR Plan?**

8 A42. The system weighted-average heating value has seemed to stabilize in recent years.
9 The 12-month system average heating value from August 2020 to July 2021 is 1,052
10 Btu/cf; the Company has assumed this heating value of 1,052 Btu/cf for all forecast
11 years in this case.

12

13 **Q43. Did you make an adjustment to the usage factors pursuant to changes in heating**
14 **value for this GCR Plan?**

15 A43. Yes. The weighted average heating value for the 24-month regression period was
16 1,056.18 Btu/cf. The assumed heating value for the forecast period is 1,052 Btu/cf.
17 I therefore made an adjustment to the usage factors of an increase of 0.397% (or a
18 factor of 1.00397). I derived at this value by simply dividing 1,056.18 Btu/cf by
19 1,052 Btu/cf. (Note that a lower heating value is expected in the forecast period than
20 was observed in the historical regression period. A lower heating value, or “cooler”
21 gas, will result in higher volumetric consumption.)

22

23 **Q44. What are DTE Gas’ current assumptions concerning ongoing conservation**
24 **efforts from its rate schedule customers?**

Line
No.

1 A44. In this plan, DTE Gas has assumed that normalized customer consumptive behavior
2 will closely resemble that shown in the 24-month period ended July 2021 with a
3 further adjustment consistent with expected demand reductions from the EWR
4 program that DTE Gas has put in place in compliance with 2008 PA 295. In
5 discussions this summer with the Company's EWR team, the Company projected
6 annual demand reductions due to EWR to be 1% for 2021, and then up to 1.05% for
7 forecast years 2022 and beyond. These are the rates that the EWR team was
8 expecting to implement at the time this forecast was put together. I have included
9 these levels of projected savings in my demand forecast.

10

11 **Q45. Does this complete your direct testimony?**

12 A45. Yes, it does.

In the matter of the Application of)
DTE Gas Company for approval of a)
 Gas Cost Recovery Plan, 5-year Forecast)
 and Monthly GCR Factor for the 12 months)
 ending March 31, 2023)

QUALIFICATIONS

AND

DIRECT TESTIMONY

OF

ERIC P. SCHIFFER

DTE GAS COMPANY
QUALIFICATIONS AND DIRECT TESTIMONY OF ERIC P. SCHIFFER

Line
No.

1 **Q1. What is your name and business address?**

2 A1. My name is Eric P. Schiffer. My business address is One Energy Plaza, Detroit,
3 Michigan 48226.

4

5 **Q2. By whom are you employed and in what capacity?**

6 A2. I am employed by DTE Gas Company (DTE Gas or Company) as Principal
7 Marketing Specialist.

8

9 **Q3. What is your educational background?**

10 A3. I earned both my Bachelor of Arts Degree in Professional Accounting and my
11 Master of Business Administration degree from Michigan State University. I have
12 attended conferences related to Risk Management, the natural gas industry, the
13 LDC Gas Forum, revenue requirements calculation, and Value at Risk (VaR).

14

15 **Q4. What is your business experience?**

16 A4. I have been employed full time by DTE Gas (formerly Michigan Consolidated Gas
17 Company), DTE Energy or MCN Energy Group (parent of MichCon, acquired by
18 DTE in 2001) since 1993. From 1993 to 2001, I held various positions primarily
19 in the non-regulatory accounting groups responsible for Oil and Gas production as
20 well as pipeline and processing plant accounting. From 2001 to 2013, I held various
21 positions of increasing responsibility in Enterprise Risk Management, including
22 Risk Associate for DTE Energy Trading (gas), Sarbanes Oxley Control Center lead
23 for Trading and Risk Analyst (Enterprise Risk and DTE Gas). In 2013, I was
24 promoted to Principal Supervisor responsible for Gas Accounting – gross margin

Line
No.

1 and then in 2014 I accepted a position in the LLC Controllers – Decision Support
2 Consolidation. In 2018, I accepted my current position, Principal Marketing
3 Specialist. I have participated on the Gas Buyers’ Panel at the LDC Gas Forums
4 since 2019.

5

6 **Q5. What are your responsibilities as a Principal Marketing Specialist?**

7 A5. As a Principal Marketing Specialist, I am responsible for the purchase of natural
8 gas and interstate transportation capacity to deliver the supply to the DTE Gas
9 system to serve GCR customers. I am also responsible for the analysis, planning
10 and forecasting of DTE Gas natural gas supply and transportation volumes, prices
11 and costs, and development and administration of the fixed price program and
12 represent the Company on the Natural Gas Sustainability Collaborative (NGSC).

13

14 **Q6. Have you previously testified or submitted testimony in any Michigan Public**
15 **Service Commission (MPSC or Commission) proceeding?**

16 A6. Yes, I testified in U-20210 GCR 2018-2019 Reconciliation case, U-20235 GCR
17 2019-2020 Plan case, U-20236 GCR 2019-2020 Reconciliation case, U-20543
18 GCR 2020-2021 Plan case, U-20544 GCR 2020-2021 Reconciliation case and U-
19 20816 GCR 2021-2022 Plan Case. I also adopted testimony in MPSC Case No.
20 U-20076.

21

22

23

24

25

Line
No.

1 **Purpose of Testimony**

2 **Q7. What is the purpose of your testimony in this proceeding?**

3 A7. The purpose of my testimony in this proceeding is to present DTE Gas's natural
4 gas supply plan ("Plan") for the Plan Period extending from April 1, 2022 through
5 March 31, 2027 ("Plan Period"). My testimony will cover the following subjects
6 and demonstrates that DTE Gas's proposed gas supply plan for the plan year and
7 the five-year Plan Period is reasonable and prudent:

8 1) **Supply Pricing Mix** - DTE Gas's pricing strategy is a mixture of both fixed
9 price supply where the price is known months in advance of delivery and index price
10 supply where the price is uncertain until delivery begins. Specifically, my testimony
11 will discuss how DTE Gas will mitigate price uncertainty utilizing the Volume Cost
12 Averaging methodology (VCA or VCA Method) of purchasing fixed price supply,
13 which was first approved by the MPSC in the Company's 2010-2011 GCR Plan, Case
14 No. U-16146, and contained in every subsequent Commission-approved GCR Plan
15 (Case Nos. U-16482, U-16921, U-17131, U-17332, U-17691, U-17941, U-18152, U-
16 18412, U-20235) through the Company's 2020-2021 GCR Plan, Case No. U-20543.

17 2) **Price Forecast** – The price forecast is based on the average settled prices
18 of the first five trading days of December 2021 because this is the most recent data
19 available at the time this filing was prepared. This approach is consistent with past
20 practice.

21 3) **Gas Supply Purchasing** - How the appropriate supply requirements are
22 determined for the ensuing month in monthly gas supply meetings after considering
23 the supply currently under contract and subsequently contracting for supply needs
24 from different geographic production regions and market zones based on operational
25 requirements first, followed by the lowest cost supply basin second, while

Line
No.

1 acknowledging such factors as weather, natural gas market fundamentals, national
2 inventory levels, geographical pricing, and system requirements.

3 4) **Transportation Portfolio Changes** – Since its last GCR Plan Case filing,
4 the Company renewed ANR Northern Zone Contract #122248 for 21 MDth/d,
5 Viking Gas Transmission Contract # FT-A (AF0081) for 21 MDth/d, NEXUS Gas
6 Transmission Contract # 860003/00002 for 75 MDth/d alternate receipt point at
7 Clarington for 37,500 dth/d and did not exercise ROFR rights on ANR Pipeline
8 Contract # 122247 for 15 MDth/d.

9 5) **400 MDth/d transportation – The rationale why it is prudent to have 400**
10 **MDth/d of firm transportation to provide safe, clean, reliable and reasonably**
11 **priced gas supply to its customers.**

12 6) **NEXUS Contract.** In response to the Commission's Orders in U-20210 and
13 U-20243, the Company is providing additional supporting evidence for the NEXUS
14 contract (including the TEAL amendment) including an updated independent
15 analysis of the benefits of the capacity contract.

16 7) **Projected Total Gas Supply Costs** - How DTE Gas's total supply
17 requirements for the 2022-23 GCR Plan Period are forecasted at approximately 134
18 Bcf at a total cost around \$468 million, including approximately \$60 million in total
19 transportation costs and \$250 thousand for the Gas Supply physical call option.

20 8) **Projected Supply Costs for Last in First Out (LIFO) Valuation of Gas**
21 **in Storage** - The projected NYMEX, volumes and costs are associated with the
22 January 2022 through March 2022 period for LIFO valuation of gas in storage, which
23 is utilized by Company Witness Hardy.

24 9) **Gas Supply Strategy for April 2023 and Beyond** – How DTE Gas's gas
25 supply strategy for April 2023 and beyond is essentially consistent with the strategy

Line
No.

1 used for the April 2022-March 2023 period including a projection of gas purchases
2 and transportation costs.

3 10) **Impact of DTE Gas net zero commitment on Gas Supply Strategy -**
4 How DTE Gas's commitment to reach a net zero carbon future impacts the gas supply
5 strategy for April 2022 and beyond.

6

7 **Q8. Are you sponsoring any exhibits in this proceeding?**

8 A8. Yes. I am sponsoring the following exhibits:

| 9 | <u>Exhibit</u> | <u>Description</u> |
|----|----------------|--|
| 10 | A-7 | Fixed Price Purchase Guidelines |
| 11 | A-8 | Projected NYMEX, Basis, and Supply Basin Prices |
| 12 | A-9 | Summary of Transport Contracts |
| 13 | A-10 | Projected Purchase Volumes and Cost (Excluding Transportation |
| 14 | | Costs) |
| 15 | A-11 | Projected Transportation Utilization, Reservation Costs, and Usage |
| 16 | | Costs |
| 17 | A-12 | Projected Total Delivered Cost Including Transportation Cost |
| 18 | A-25 | Historical Backcast of NYMEX Prices |
| 19 | A-27 | Fixed Price Program Analysis -- Purchase Percentages |
| 20 | A-28 | Affiliate Transactions with DTE Energy Trading |
| 21 | A-29 | NYMEX Monthly Settlement History |
| 22 | A-30 | Pipeline 2022 Expiring Capacity Summary |
| 23 | A-34 | TEAL 1 Year Amendment Option |

24

25 **Q9. Were these exhibits prepared by you or under your direction?**

Line
No.

1 A9. Yes, they were.

2

3 **Supply Pricing Mix**

4 **Q10. How is DTE Gas proposing to price its supply during the 2022-2023 GCR Plan**
5 **Period?**

6 A10. DTE Gas's supply will be priced utilizing a mixture of both fixed price supply
7 where the price is known months in advance of delivery and index price supply
8 where the price is uncertain until delivery begins.

9

10 **Q11. What fixed price method is DTE Gas proposing to operate under during the**
11 **2022-23 GCR Plan Period?**

12 A11. DTE Gas will continue to purchase fixed price supply under the Volume Cost
13 Average (VCA) Method, which is the same fixed price method that was first
14 approved expressly by the Commission on September 28, 2010 in the Company's
15 2010-2011 GCR Plan, Case No. U-16146, thereby replacing the quartile indices
16 method (QIM). This very same VCA method has been contained in every
17 subsequent Commission-approved GCR Plan (Case Nos. U-16482, U-16921, U-
18 17131, U-17332, U-17691, U-17941, U-18152, U-18412, and U-20543), through
19 the Company's pending 2021-22 GCR Plan Case No. U-20816. The specific
20 guidelines of the VCA Method are detailed in Exhibit A-7.

21

22 **Q12. What is the purpose of the VCA Method?**

23 A12. The VCA Method is a methodology used to create price certainty for natural gas
24 volumes that will be delivered at a future date. VCA provides upward price
25 protection, downward price participation, a year-over-year smoothing effect on the

Line
No.

1 GCR factor, and most importantly, it is a simple and effective way to manage price
2 fluctuations and dampen natural gas price uncertainty and volatility for GCR
3 Customers under a variety of actual and potential market and operating conditions.
4

5 **Q13. How does the VCA Method operate?**

6 A13. In general, DTE Gas will fix the price of its future supply requirements over a two-
7 year period prior to the start of delivery during the GCR Period. For the 2022-23
8 GCR year, DTE Gas bought 75% of the projected requirements ratably between
9 January 2020 and December 2021 (approximately 3% each month). This program
10 results in the price of 75% of DTE Gas's supply requirements being known prior
11 to the start of the GCR Period.
12

13 **Q14. Did DTE Gas conduct an annual review of the VCA Method?**

14 A14. Yes. DTE Gas reviewed the fixed price program (FPP) objectives, the current 75%
15 level of fixed price coverage, and updated the quantitative analysis based on current
16 market conditions. These reviews and analyses were necessary to corroborate the
17 Company's opinion that the VCA Method continues to form the foundation of a
18 reasonable and prudent FPP. Specifically, DTE Gas updated the NYMEX back test
19 through March 2021, which provides a 20-year historical view of how the VCA
20 Method would have performed based on the current purchase pattern with historical
21 prices. In addition, DTE Gas updated the Random Price Analysis, which is a
22 forward-looking analysis of the VCA Method's performance in 5,000 different
23 price scenarios. The Random Price Analysis update was necessary to determine
24 that the original conclusions resulting from the analysis have not changed based on
25 current market conditions. The NYMEX back test, Random Price Analysis

Line
No.

1 updates, and related conclusions are described in greater detail below as are the
2 FPP's objectives. This annual review and analyses support the continued use of the
3 VCA Method. DTE Gas also performed two additional analyses, an analysis of the
4 fixed price program consisting of the Future NYMEX Projection and a 95%
5 Confidence Interval of possible future prices, and an analysis of the historical
6 NYMEX natural gas price frequency distribution.

7

8 **Q15. What are the objectives of a reasonable and prudent FPP?**

9 A15. The objectives of a reasonable and prudent FPP include:

- 10 1) mitigating the impact of market price fluctuations and price uncertainty, also
11 known as price volatility or price risk, to provide GCR factor stability;
12 2) allowing participation in downward price movements;
13 3) protecting customers against upward price movements;
14 4) utilizing a prescriptive methodology that limits speculation; and
15 5) ensuring simplicity by utilizing a methodology that is not overly complex.

16

17 **Q16. Does the VCA Method still meet all the objectives of a reasonable and prudent**
18 **FPP?**

19 A16. Yes. The VCA Method continues to meet all the objectives for a reasonable and
20 prudent program for purchasing fixed price gas. VCA allows continual market
21 participation over an extended period, up to two years in advance of the GCR Period
22 start date. The methodology is consistent with the philosophy that one should not
23 try to beat or time the market, but instead regularly participate in the market over
24 an extended period, which is a reasonable and prudent method for mitigating price
25 fluctuations or volatility. VCA provides upward price protection, downward price

Line
No.

1 participation, GCR factor stability, and most importantly it is a simple and effective
2 way to manage price uncertainty and dampen price fluctuations.

3

4 **Q17. How does VCA protect the customer against upward price movements and**
5 **allow for downward price participation?**

6 A17. In the event of a temporary price spike in any given month, only approximately 3%
7 of supply would be exposed to that price spike. Fast forward in time and assume
8 that the temporary price spike does not abate, but instead becomes a fundamental
9 upward price level shift. Under such circumstances, the purchase made during the
10 initial price increase under VCA will be favorable in the new, higher price
11 environment. In the event prices abate in subsequent months, then the customer
12 will participate in the downside price movements with the execution of fixed price
13 purchases during that abatement period. VCA spreads risk evenly over time and
14 volumes in contrast to alternative approaches that may be speculative in nature and
15 subject customers to additional price risks that are inherent with speculative trading.

16

17 **Q18. How would VCA provide benefits to the customers in the event prices do not**
18 **abate but continue in a perpetual fundamental upward price shift?**

19 A18. If the market is in a long-term upward price shift, then VCA would fix prices during
20 the upward march of market prices, thereby contributing to a lower weighted
21 average cost relative to the higher market prices at the time of the final delivery
22 date.

23

24 **Q19. How does VCA eliminate price speculation?**

Line
No.

1 A19. VCA eliminates price speculation because the volumetric amount of the purchases
2 is fixed each month regardless of price. Therefore, the purchases are time
3 dependent as opposed to price dependent. VCA also provides protection from price
4 risk and uncertainty through equal volume purchases executed monthly over a
5 defined period well in advance of the delivery month. The purchase price in any
6 given month could be an outlier that is an extreme high or low relative to historical
7 prices. However, any individual monthly price will have a limited impact on the
8 volume weighted price of gas.

9

10 **Q20. Does the VCA provide GCR factor stability?**

11 A20. Yes. The VCA Method mitigates price uncertainty, price risk, price variability, and
12 volatility, thereby creating greater GCR factor stability.

13

14 **Q21. How will the VCA Method perform in a stable price environment?**

15 A21. In a stable price environment, the VCA will yield gas costs that are similar to not
16 purchasing forward at all. This is because VCA is a time-dependent technique and
17 if VCA purchase prices fixed in advance of the delivery date remain relatively
18 stable until the actual delivery date, then VCA will yield similar gas costs to
19 purchasing at Index. Index purchasing is a passive strategy that does not involve
20 any form of advanced purchasing that locks in price certainty for future deliveries,
21 which exposes all purchase requirements to market price fluctuations until the time
22 of delivery.

23

24 **Q22. Would the Company continue to purchase forward transactions during a**
25 **stable price environment in which the VCA will yield gas costs that are similar**
26 **to not purchasing forward at all?**

Line
No.

1 A22. Yes, because a stable price environment is only visible in hindsight. It is not until
2 the trading for a month has elapsed that one can know what the monthly settlement
3 price will be. The Webster's New International Dictionary, Second Edition, defines
4 "stable" as meaning "Firmly established; not easily moved, shaken or overthrown;
5 solid; fixed; steadfast."¹ See Exhibit A-29, NYMEX Monthly Settlement History,
6 for a history of NYMEX monthly settlement data. As shown in Exhibit A-29, the
7 NYMEX settlement price has varied between a high of \$6.202 in November 2021
8 and a low of \$1.495 in July 2020. These settlements are 16 months apart, which is
9 only nine months shorter than the 24-month term utilized by DTE Gas's Volume
10 Cost Averaging (VCA) program. During this 16-month period, the highest
11 settlement price is over four times or 415% greater than the lowest settlement price.
12 This type of large price swing is not a characteristic of the above definition of a
13 "stable" market.

14

15 **Q23. Is there any way to predict that a "stable" market will occur in the future?**

16 A23. No. One cannot know with any certainty how much the price of natural gas will
17 change or fluctuate from month to month. It is only upon looking back over a
18 period of time that one can ascertain that pricing did not change and can deem that
19 period of time as "stable" in hindsight. Lacking the ability to foresee the future,
20 the most reliable method to secure pricing stability is by acquiring gas supply under
21 fixed prices. That is the function of the VCA program. It is to create a "stable"
22 price environment for the GCR customers regardless of the actual vagaries of the
23 marketplace.

24

¹ Webster's New International Dictionary 2449 (2d ed. 1934)

Line
No.

1 **Q24. What is the Random Price Analysis?**

2 A24. The Random Price Analysis, originally presented in DTE Gas's Commission-
3 approved 2012-2013 GCR Plan Case No. U-16921, is a method for analyzing the
4 range of possible random outcomes from a particular purchasing method. The
5 Analysis is used to compare the VCA (at different fixed price percentages) with an
6 all-index method. Utilizing the price curve as of the 1st five trading days in
7 December and current volatility (11%), I ran 5,000 random scenarios to identify the
8 range of gas costs an average consumer would experience under each method.

9
10 **Q25. What updates did you make to the Random Price Analysis?**

11 A25. The Random Price Analysis has been updated for this GCR Plan Case to reflect
12 minor changes in DTE Gas's purchase profile, current market prices, and associated
13 market price volatility.

14
15 **Q26. Did your update change the results of the Random Price Analysis?**

16 A26. No. The conclusions and findings of the analysis, that were originally presented in
17 Case No. U-16921, have not changed. Specifically, the Random Price Analysis
18 confirms that the level of price risk or uncertainty that is borne by customers is
19 dependent upon the level of fixed price coverage. More specifically, decreasing
20 the level of fixed price coverage produces an increasingly wider range of potential
21 price outcomes, or higher level of price uncertainty, which is synonymous with
22 increased price volatility or price risk. This can be seen on Table 1, at line 5, where
23 95% of the time, the Index Method produces price outcomes between \$0.93 and
24 \$7.93. However, 95% of the time, the 75% VCA Method, represented on line 1,
25 produces price outcomes in a smaller, more compact range between \$1.40 and

Line
No.

1 \$6.53. Stated differently, 95% of the time, the Index Method produces residential
2 gas costs that are 29% to 152% of the average cost. In contrast, the 75% VCA
3 Method produces a more condensed and compact range of possible cost outcomes
4 that are 44% to 207% of the average cost.

Table 1 – Random Price Analysis

| Line | Fixed Price Method | Low Price (25th percentile) | | Average Price | | High Price (97.5th percentile) | | Rising Prices | | Falling Prices | |

(1) Based on average residential consumption of 95 Dth per year for the forecast year of 2021

6

7 **Q27. What is the NYMEX back test?**

8 A27. The NYMEX back test was originally presented in DTE Gas's 2012-2013 GCR
9 Plan Case No. U-16921. The NYMEX is an industry wide benchmark price of
10 natural gas at the Henry Hub receipt point in Louisiana. The NYMEX back test
11 assumes a purchase profile similar to DTE Gas's current purchase profile for all
12 years to maintain consistency over the 18-year period. The intent of the analysis is
13 to show the cost and benefit of the VCA Method as compared to settled NYMEX
14 prices over an extended historical period. The analysis used NYMEX prices to
15 represent gas costs because of the availability of historical data and because it is an
16 industry recognized benchmark of natural gas prices that correlate to DTE Gas's
17 purchase costs.

18
19 **Q28. Did DTE Gas update the NYMEX back test for the most recent GCR Period**
20 **ending March 2021?**

Line
No.

1 A28. Yes. DTE Gas updated the back test of historical NYMEX prices to include the
2 most recent April 2020 through March 2021 GCR Period. This NYMEX back test
3 update is designated as Exhibit A-25.

4
5 **Q29. What were the results of the NYMEX back test update in terms of residential**
6 **gas costs?**

7 A29. As shown in Exhibit A-25, at line 21, over the 20-year historical period, a typical
8 residential customer would have paid \$432 annually on average under the VCA
9 Method and \$400 annually on average under the Index Method. In other words,
10 over the 20-year period customers would have paid \$32 more annually or
11 approximately \$2.62 more per month on average under the VCA Method than
12 compared to the Index Method. However, gas price fluctuations, or price
13 uncertainty, which is synonymous with price volatility, over the 20-year period was
14 only 13% under the VCA Method, which was significantly less than the Index
15 Method volatility of 29%, as described more fully below.

16
17 **Q30. What does a reduction in volatility mean for the GCR customer?**

18 A30. As shown in Exhibit A-25, at line 21, volatility under the VCA Method means that
19 for any given year, 95% of the time the customers' gas costs would be within a
20 range of 26% higher or 26% lower than the average cost based on the past 20 years.
21 By contrast, volatility under the Index Method means that, for any given year, 95%
22 of the time the customers' gas costs would be within a range of 58% higher or 58%
23 lower than the average cost based on the past 20 years. Consequently, the VCA
24 Method significantly reduces the risk of extreme price run ups and provides greater

Line
No.

1 price certainty for the GCR customers, therefore providing greater assurance of
2 price affordability.

3

4 **Q31. What conclusions did you reach based on the NYMEX back test?**

5 A31. The \$32 annual cost difference between the VCA Method and the Index Method
6 that occurred over the historical 20 years used in the back test is approximately 7%
7 of the customers' gas cost (and an even lower percentage on a total bill basis), which
8 is a reasonable cost to pay to lower the gas price volatility from 29% under the
9 Index Method to 13% under the VCA Method as explained above.

10

11 **Q32. In addition to these two analyses, did DTE Gas perform any additional review**
12 **of the VCA Fixed Price Purchase Program?**

13 A32. Yes. DTE Gas prepared the analysis presented in Graph 1, Fixed Price Program
14 Analysis -- Future NYMEX Projection -- 95% Confidence Interval and the
15 Frequency Distribution of Historical NYMEX prices analysis. These analyses were
16 created in response to the April 23, 2015 Commission Order U-17332, which states
17 at page 5 that:

18 The Commission reiterates that, going forward, the burden continues to
19 be on DTE Gas to manage risk and to facilitate the affordability of the
20 natural gas sold to GCR customers. The Commission is not looking for
21 proof that a specific percentage of purchases were locked-in, but wants
22 to ensure that, over time and under a variety of actual and potential
23 market and operating conditions, the benefits of price stability to the
24 GCR customers outweigh any additional cost associated with the
25 procurement strategy. Accordingly, the Commission expects DTE Gas
26 to address the risk mitigation costs and benefits under different
27 conditions...

28 These analyses are intended to show that the benefits of price stability to the GCR
29 customers outweigh any additional cost associated with the VCA procurement

Line
No.

1 strategy. These analyses represent this cost vs. benefit by comparing and
2 quantifying the upside risk of higher prices against the downside opportunity of
3 lower prices in future natural gas prices.

4

5 **Q33. What data is contained in the price probability model?**

6 A33. Graph 1 is based on the methodology from the “EIA Past Henry Hub Price and 95%
7 NYMEX Confidence Interval” analyses performed by the United States
8 Department of Energy’s Energy Information Administration (EIA) in each monthly
9 publication of its Short-Term Energy Outlook (STEO). The upper and lower dotted
10 lines that create the cone-shaped projection are the Upper Confidence Level (UCL)
11 and Lower Confidence Level (LCL) projected five years into the future for
12 NYMEX natural gas futures prices. The 95% confidence level represents the 95%
13 probability that the final market price for a particular futures contract will fall
14 somewhere within the lower and upper range of prices. Note that the lower range
15 of prices has the same probability of occurrence as the upper range.

Line
No.

1

Graph 1

2

3

Q34. What do the remaining lines on Graph 1 represent?

4

A34. The blue line in the middle of the Graph that displays a series of peaks and valleys as it goes into future months represents the NYMEX natural gas futures prices for the next five years derived from the forward curve as of the first five trading days in December 2021. The purple jagged line on the left side of the Graph is the actual monthly NYMEX settlement price from January 2019 through December 2021. This shows a range of recent prices that have been as high as \$6.20/Dth in November 2021 and as low as \$1.50/Dth in July 2020. By displaying the market projections in this manner, the observer can easily review purchases from the perspective of the data that was known at the time that the purchase decisions were made. This removes the coloring of hindsight from the equation and allows for an understanding of the rationale that shows that the benefits of the VCA outweigh any additional costs.

15

Line
No.

1

2 **Q35. How would you quantify the value of the upside risk and the downside**
 3 **opportunity in future natural gas pricing where the future prices are**
 4 **uncertain?**

5 A35. Graph 1 is based upon the methodology used in the EIA STEO for quantifying price
 6 uncertainty. This graph covers the time range from December 2018 through March
 7 2027. This graph shows projections at a 95% confidence interval at the Henry Hub
 8 for Natural Gas Prices going forward for the next six years as projected by the
 9 NYMEX prices as of first trading days in December 2021. The average of the
 10 Upper Confidence Level (UCL) of natural gas pricing is \$1.88/Dth above the
 11 average NYMEX, and the average of the Lower Confidence Level (LCL) is
 12 \$1.31/Dth below the average NYMEX. This tells us that there is an equal chance
 13 of the price rising by \$1.88 as there is of the price declining by \$1.31. Thus,
 14 although the probability is equal of prices going up or down, the 95% confidence
 15 interval range of a price increase is 32% greater than the range of a price decrease
 16 ($44\% = (\$1.88 - \$0.1.31) / (\$1.31)$). This graphically displays (as summarized in
 17 Table 2 below) the fact that the potential cost (risk) exposure of a price increase is
 18 greater than the potential cost savings (opportunity) from a price decrease.

19

20

Price Outlook for Jan 2021 through Mar 2026:

Table 2

| NYMEX Price (Col 1) | UCL Avg Price (Col 2) | LCL Avg Price (Col 3) | UCL Range (Col 4) | LCL Range (Col 5) | Range Ratio UCL/LCL (Col 6) |
|---------------------------|-----------------------------|-----------------------------|-------------------------|-------------------------|-----------------------------------|
| \$3.32 | \$5.20 | \$2.01 | \$1.88 | \$1.31 | 144% |

21

Line
No.

1 **Q36. Have you also observed this upside risk and the downside opportunity in**
2 **historical natural gas pricing?**

3 A36. Yes, I reviewed the historical NYMEX settled prices from June 1990 to December
4 2021 to prove the upward bias of pricing. Graph 2 is a frequency distribution graph
5 of the historical NYMEX settlement prices from June 1990 to December 2021. The
6 X axis on the graph shows the range of settlement prices from lowest to highest in
7 \$1.10 increments, or bins, during that time period, and the Y axis shows the number
8 of occurrences that the NYMEX settled within the price range for each increment.

Graph 2

10 **Q37. Is there a historical bias toward the upside risk versus downside opportunity?**

11 A37. Yes, history has shown that 50% of the time prices ran up as much as \$10.91 from
12 the median price but only dropped from the median price by as much as \$1.94. The
13 average price above the median was \$4.47 (\$1.48 above median) and the average
14 price below the median was \$2.20 (\$0.79 below median), which shows on average
15 that price run ups were 1.9 times greater than price drops ($\$1.48 / \$0.79 = 1.88$).

Line
No.

1 Thus, compared to the median price, higher prices occurred an equal amount of the
2 time as lower prices, but the cost impact was 1.9 times greater for the higher prices
3 than the lower prices. The fixed price program helps protect the customer from this
4 upside risk of higher gas prices, which historically have 1.9 times greater cost
5 impact than lower prices relative to the median.

6

7 **Q38. How does Graph 2 and Table 2 demonstrate that the benefits of price stability**
8 **to the GCR customers outweigh any additional cost associated with the fixed**
9 **price procurement strategy?**

10 A38. The benefits are twofold: one benefit is the price certainty obtained with a fixed
11 price, and the other benefit is the protection from the potential of higher prices. By
12 implementing the VCA, the Company has locked in 75% of the gas costs prior to
13 the gas year. Assuming normal weather, approximately 2/3 of the costs will be
14 similar from the prior year, thus there will not be huge swings in customer bills. As
15 for the potential of higher prices, the cost of a fixed price program is the impact of
16 higher prices to the customer while the benefit is the potential for lower prices when
17 prices fall. When you look at the asymmetry of rising versus falling prices and
18 where gas prices have been historically a monthly \$2.625 cost clearly outweighs
19 the benefits.

20

21 **Q39. What are the “current and forecasted market conditions and fundamental**
22 **economic and physical considerations that affect gas supply and prices” (see**
23 **MPSC Order dated April 15, 2014 in Case No. U-17131)?**

Line
No.

1 A39. As described in my testimony above, the forecasted market conditions contain risk
2 and uncertainty. The STEO released by the EIA in October of 2021² shows, at page
3 2, that September Henry Hub spot prices averaged \$5.16 up \$1.09/MMBtu from
4 August when it averaged \$4.07/MMBtu and up almost \$2.00 for the first half of
5 2021. The reason for the high prices is storage levels below the five-year average.
6 In addition, inventory builds during the summer were below the five-year average
7 and then in September there have been sharp increases in international prices.
8 Below is a chart of the U.S. natural gas front-month futures prices and storage
9 deviation from the five-year average.

Source: Graph by EIA, based on data from CME Group, as compiled by Bloomberg L.P.

10

11 **Q40. Why is the VCA method reasonable and prudent for DTE Gas's customers?**

12 A40. In general, natural gas is not a discretionary purchase that can be avoided based on
13 price or some other factor. DTE Gas's customers need to purchase and consume
14 natural gas throughout the year for such basic needs as warmth in their homes and
15 businesses. The greatest unknown to the customer is not necessarily how much
16 natural gas they will consume but more importantly at what price they will purchase

² <https://www.eia.gov/outlooks/steo/archives/oct21.pdf>

Line
No.

1 natural gas to supply their inherent need for natural gas. DTE Gas's customers
2 should not be unduly subject to risk taking or speculating on what the price of
3 natural gas will be in the future. The greater risk to DTE Gas's customers is rising
4 prices because most customers, especially residential customers and small
5 businesses, are generally believed to have a fixed amount of non-discretionary
6 income to spend on a natural gas utility bill. These customers would ultimately be
7 more financially burdened with higher bills (if gas prices rise over time) as opposed
8 to steady or somewhat lower bills (if gas prices decline over time).

9

10 **Q41. How does the VCA Program mitigate this rising price risk for the customers?**

11 A41. Without some method of managing price uncertainty, DTE Gas's customers could
12 be exposed to prices that could rise without constraint and be exposed to unlimited
13 price risk. While the Random Price Analysis and the 95% Confidence Interval
14 analyses contained in the Graphs and Tables above show the probability of a range
15 of prices into the future, they only represent a snapshot in time reflected by the price
16 volatility of the current market. However, the volatility of gas prices has and can
17 swing widely, rapidly, and unpredictably without any prior notice or forewarning.
18 Thus, to mitigate the potentially unlimited price risk and uncertainty, which could
19 adversely impact customers' budgets, DTE Gas has implemented the VCA method
20 wherein the price of natural gas is fixed for a portion of their supply many months
21 prior to delivery, thereby creating price certainty or price protection.

22

23 **Q42. Why is 75% a reasonable and prudent level of fixed price coverage?**

24 A42. The optimal level of fixed price protection that DTE Gas can provide customers
25 and still have operational flexibility to adjust for lower purchase requirements

Line
No.

1 associated with GCC migration, warmer than normal weather, or conservation
2 resulting from ongoing energy-efficiency initiatives is 75%. Stated differently,
3 customers currently shoulder 25% of the price risk during the delivery period,
4 which is an acceptable and reasonable level of price risk or uncertainty based on
5 operational constraints and the customers' inherent risk-adverse nature. As the
6 level of fixed-price coverage is reduced from the 75% level, there is an equal and
7 offsetting increase in the level of price risk or uncertainty. Under the 75% VCA
8 Method, if prices rise over time, customers are rewarded through protection from
9 the rising prices. However, if prices fall over time, customers risk paying more
10 than they would have under a fixed-price-coverage ratio less than 75%. The greater
11 risk to DTE Gas's customers is the risk of rising prices because they typically have
12 a fixed amount of non-discretionary income to spend on a natural gas utility bill,
13 and customers would ultimately be more financially burdened with higher bills as
14 opposed to steady or somewhat lower bills. Using the 75% ratio strikes the
15 appropriate balance between protecting customers against rising prices and
16 allowing them to participate in any price decrease. Using a lower ratio exposes
17 customers to too much risk of price increases. Therefore, using the VCA method
18 with a 75% fixed price coverage ratio is a reasonable and prudent approach to
19 protecting customers from price risk.

20

21 **Q43. How does the VCA Method perform relative to the Index Method in different**
22 **price environments in terms of gas costs?**

23 A43. In a rising price environment, in which prices consistently increase as time
24 progresses, the VCA Method will produce lower gas costs than the Index method.
25 In a falling price environment, in which prices consistently decrease as time

Line
No.

1 progresses, the VCA Method will produce higher gas costs than the Index method.
2 It is important to remember that no one can accurately predict the future natural gas
3 price environment, and the greater risk to DTE Gas's customers comes from a
4 drastically rising price environment as opposed to a drastically falling price
5 environment. It is equally important to bear in mind that one of the goals of the
6 VCA Method is to mitigate the risk of price spikes and to provide a stable price to
7 DTE Gas's customers, and that the VCA Method was not designed or intended to
8 compete with or "beat" the Index-based natural gas market. Although gas costs in
9 a falling price environment may be lower with a fixed price coverage that is less
10 than 75%, there is an equal and offsetting risk of higher gas costs in a rising price
11 environment. The VCA Method protects against the financial burden of higher gas
12 costs to the customer; which is of primary concern because the natural gas utility
13 bill, insofar as it provides home heating during the frigid cold winters of the
14 Michigan climate, is a non-discretionary expense, and many customers may not be
15 able to afford the added cost without undue hardship.

16

17 **Q44. How much gas has DTE Gas purchased under the VCA FPP for delivery in**
18 **the April 2022 - March 2023 GCR Period?**

19 A44. Currently, DTE Gas has purchased 75% of the April 2022 through March 2023
20 requirements and has therefore achieved the 75% fixed-price-coverage ratio by
21 December 31, 2021, as specified in the Commission-approved FPP. Purchased
22 volumes under the VCA are shown on Exhibit A-10, page 1, line 1.

23

24 **Q45. Is DTE Gas proposing any changes to the VCA FPP that was originally**
25 **approved by the Commission in Case No. U-16146 and subsequently approved**

Line
No.

1 as part of every GCR Plan in Case Nos. U-16482, U-16921, U-17131, U-17332,
2 U-17691, U-17941, U-18152, U-18412, U-20235, and U-20543?

3 A45. No.

4

5 **Q46. Why is the Company not proposing any changes to the VCA FPP?**

6 A46. The Company's analysis of the VCA Method contained in this filing supports the
7 continuation of the FPP and the benefits derived therefrom.

8

9 **Q47. When will DTE Gas lock in fixed-price purchases each month?**

10 A47. The timing of each intra-month purchase is based on factors such as willing
11 counterparties, creditworthiness, market liquidity, and other best-available market
12 intelligence at the time of purchase. Utilization of these factors will ensure that
13 intra-month purchases are executed in a reasonable and prudent manner. The
14 Company will follow the guidelines described in Exhibit A-7 section 6.

15

16 **Q48. How does DTE Gas plan to price its remaining supply requirements that are**
17 **not fixed purchases?**

18 A48. All gas that is not locked in at fixed prices will be priced utilizing market-based
19 settled-index prices or at the NYMEX settlement price plus a fixed premium or
20 minus a fixed discount based on the geographic purchase point, which is also
21 known as fixed basis.

22

23 **Q49. What is a market-based settled-index price?**

24 A49. Market-based settled-index prices are determined by independent publishing
25 companies that survey market participants a week before the delivery month as to

Line
No.

1 the value of gas to be delivered during the month. The market-based settled-index
2 prices are published industry wide.

3

4 **Q50. What is the NYMEX settlement price?**

5 A50. NYMEX is the world's largest physical-commodity futures exchange and is the
6 industry-wide recognized price reference point for commodities including natural
7 gas. NYMEX provides the North American market's collective assessment of the
8 expected future values for natural gas. NYMEX trades reveal the value in dollars
9 per Dth that the market places on gas delivered to the Henry Hub trading point,
10 located in Louisiana, for each future delivery month. The NYMEX settlement
11 price is determined on the last day that market participants can enter into
12 transactions before the delivery month.

13

14 **Q51. Why are either the market-based settled-index price or the NYMEX**
15 **settlement price, plus a fixed premium or minus a fixed discount, the best**
16 **methods for pricing remaining gas supplies that are not fixed purchases?**

17 A51. These are the best methodologies to secure spot market pricing because they
18 represent the most recent value the market places on gas immediately prior to the
19 month of delivery.

20

21 **Price Forecast**

22 **Q52. What methodology did DTE Gas use to forecast gas prices for this GCR Plan**
23 **Case?**

24 A52. The five-year price forecast, which is a long-term price projection for the market,
25 is found on Exhibit A-8. Line 1 contains the average settlement price for the first
26 five trading days of December 2021 for the NYMEX Henry Hub natural gas futures

Line
No.

1 contract for each respective delivery period. The remaining lines show the
2 forecasted basis price differentials and resulting prices for the indicated purchase
3 locations. All prices are stated in dollars per Dth. Throughout this testimony, I
4 assume a simple average heating value of 1.052 Dth per Mcf. This heating value
5 assumption is more fully addressed in the testimony of Witness Chapel.

6

7 **Q53. Why did DTE Gas use the average settlement price for the first five trading**
8 **days of December 2021 to forecast market prices?**

9 A53. The average of the settlement prices on the first five trading days of December 2021
10 is the most recent natural gas traded prices at the time the Plan was finalized for
11 filing in this Plan Case.

12

13 **Q54. How did DTE Gas forecast the price of gas at geographic locations other than**
14 **at Henry Hub?**

15 A54. The price of gas at different geographic locations is measured through basis-price
16 differentials. Basis-price differentials represent the difference in price for gas
17 delivered at the indicated geographic location and the price for gas delivered at
18 Henry Hub as traded on the NYMEX. Basis prices may be expressed as either a
19 positive / premium (a price that is higher than Henry Hub) or a negative / discount
20 (a price that is lower than Henry Hub) depending on the geographic location. The
21 basis differential for DTE Gas's receipt points reflects prices both higher and lower
22 than Henry Hub.

23

Line
No.

1 **Q55. What source is DTE Gas using for forecasted basis prices?**

2 A55. DTE Gas is utilizing natural gas industry publications to forecast basis prices as
3 well as other available market intelligence.

4
5 **Q56. How are projected gas prices at different geographic supply points used in
6 your gas supply forecast?**

7 A56. These prices are used to calculate the cost of forecasted volumes that have not been
8 fixed.

9
10 **Q57. Are there any other purchases that DTE Gas has included in the Plan??**

11 A57. Yes. Contracted Indexed Price deals are purchases that DTE Gas has included in
12 the Plan. 50,000 Mcf per month of forecasted volumes that are purchased from
13 DTE Gas Gathering (MGAT) at the Platt's Gas Daily Price Guide first-of-the-
14 month DTE Gas city-gate published index price. However, the actual volumes may
15 be more or less than 50,000 Mcf per month. This volume is shown on Exhibit A-
16 10, page 1, line 3, with the corresponding price projection on line 11 of the same
17 exhibit.

18
19 **Q58. Does DTE Gas plan to purchase gas from any other affiliates during this Plan?**

20 A58. Yes, DTE Gas has included 22.6 Bcf of fixed priced purchases from DTE Energy
21 Trading at an average price of \$2.72. The transactions are detailed in Exhibit A-28
22 Affiliate Transactions with DTE Energy Trading. These volumes were purchased
23 as part of the VCA program and followed the procedures outlined in Exhibit A-7.

24
25 **Q59. Where can additional information related to the above transactions be found?**

Line
No.

1 A59. Intervenors on record have access to the bid warehouse where detailed deal
2 information is archived by deal number.³
3

4 **Gas Supply Purchasing**

5 **Q60. What process does DTE Gas use to acquire its monthly gas supply?**

6 A60. DTE Gas maintains an active list of more than 30 creditworthy suppliers with
7 production in areas that connect to the Company's contracted interstate
8 transportation capacity. Due to the continuous price volatility in the natural gas
9 industry, DTE Gas does not issue formal RFPs (Requests for Proposal) for its
10 supply requirements.
11

12 For its supply needs, the Company generally solicits three or more verbal offer
13 prices from its list of creditworthy suppliers from the supply area that is required.
14 DTE Gas will attempt to complete transactions with the supplier who provides the
15 lowest price offer, but the Company also considers supplier diversity, supplier
16 performance history, ability to deliver to alternate receipt points, and
17 creditworthiness existing at the time of purchase in order to ensure a balanced and
18 prudent gas supply plan.
19

20 **Q61. What factors does DTE Gas consider when making decisions about purchasing**
21 **its supply?**

22 A61. DTE Gas considers an array of factors in monthly meetings or more often if
23 necessary when making its supply decisions. These factors include, but are not

3

<https://dteenergy.sharepoint.com/sites/DiscoveryPortal/BidSheets/Bid%20Sheets%20Library/Forms/AllItems.aspx>

Line
No.

1 limited to: weather forecasts, system requirements and operational capabilities, the
2 forward NYMEX price curve, regional market basis prices, national storage levels
3 as reported by the EIA, DTE Gas-owned storage levels, and industry periodicals
4 and reports such as Gas Daily and the EIA Short Term Energy Outlook.

5

6 **Q62. How does DTE Gas respond to gas purchases impacted by pipeline outages,**
7 **maintenance or other Force Majeure events?**

8 A62. The Company negotiates either a change in location (with the appropriate change
9 in cost) or delivery period based on supplier capabilities and the Company's
10 requirements.

11

12 **Q63. What level of interstate firm transport capacity does DTE Gas rely on to meet**
13 **its market requirements?**

14 A63. DTE Gas maintains a portfolio of 400 MDth/day of firm transportation contracts
15 for the winter operating season and 330 MDth/day for the summer storage injection
16 season to meet supply requirements for normal weather, colder than normal
17 weather, design day, and supplier of last resort.

18

19 **Q64. What are the Company's total reservation charges for firm pipeline**
20 **transportation capacity for the 2022-2023 GCR year?**

21 A64. The Company's reservation charges for firm pipeline capacity for the 2022-2023
22 GCR year are approximately \$59 million, as shown on Exhibit A-11, column (14),
23 line 31. Witness Hardy uses these costs as the basis for the supplier of last resort
24 (SOLR) reservation charge.

25

Line
No.

1 **Q65. How will capacity-release revenues that DTE Gas receives be treated with**
2 **respect to the proposed SOLR reservation charge?**

3 A65. Any capacity-release revenues that DTE Gas receives will be credited back to
4 customers, both GCR and GCC, in the same load-proportionate manner as the
5 transportation-reservation costs were allocated.
6

7 **Q66. What level of capacity-release revenues is DTE Gas estimating in this GCR**
8 **Plan Case to include in the SOLR reservation charge?**

9 A66. Due to the highly unpredictable nature of capacity-release revenues, DTE Gas is
10 not predicting any capacity-release revenue to include in the SOLR reservation
11 charge. DTE Gas does not expect capacity-release revenues to materially impact
12 the SOLR reservation charge and any over/under recoveries that may occur will
13 nevertheless be addressed in the GCR Reconciliation.
14

15 **Q67. What are the total reservation charges for pipeline capacity that the Company**
16 **intends to recover through the SOLR reservation charge for the 2022-2023**
17 **GCR year?**

18 A67. The total amount of reservation charges to be recovered for pipeline capacity is
19 approximately \$59 million, as shown on Exhibit A-11, line 31, column (14).
20

21 **Q68. Are there any other costs associated with the gas purchase portfolio?**

22 A68. Yes, as described by Witness Bratu, DTE Gas obtained a Gas Supply Physical Call
23 Option. The cost of the option, which is \$250 thousand as shown on Exhibit A-11,
24 line 30, columns (11 and 12) and the rationale and parameters for acquiring the
25 option, are more thoroughly described in Witness Bratu's testimony.
26

Line
No.

1 **TRANSPORTATION PORTFOLIO CHANGES**

2 **Q69. What pipeline capacity have you assumed in the GCR Plan Case for the period**
3 **April 2022 through March 2023?**

4 A69. Exhibit A-9 shows all interstate transport currently under contract and the related
5 receipt points, capacities, and terms. Exhibit A-11 separates transportation costs
6 by reservation and commodity charges. Exhibit A-11 also displays the total
7 available capacity and forecasted monthly load utilization associated with each
8 pipe.

9
10 **Q70. What changes has DTE Gas made to its interstate pipeline capacity since its**
11 **2020-2021 GCR Plan Filing?**

12 A70. a) **ANR Northern Zone Contract #122248 for 21 MDth/d.** This capacity
13 transports gas from the ANR Marshfield interconnect with Viking Gas
14 Transmission to the DTE Gas system at Menominee throughout the GCR year.
15 DTE Gas renewed this capacity for a five-year term through March 31, 2027 to
16 coincide with the renewal of the corresponding capacity held on Viking Gas
17 Transmission.

18 b) **Viking Gas Transmission Contract # FT-A (AF0081) for 21 MDth/d.** This
19 capacity transports gas from the Viking Gas Transmission interconnect with
20 TransCanada Pipeline at Emerson. DTE Gas renewed this capacity for a five-year
21 term through March 31, 2027 to coincide with the renewal of the corresponding
22 capacity held on ANR Pipeline.

23 c) **NEXUS Gas Transmission Contract # 860003/00002 for 75 MDth/d.**
24 Extended the alternate receipt point at Clarington for 37,500 dth/d through October
25 31, 2024.

Line
No.

1 d) **ANR Pipeline Contract # 122247 for 15 MDth/d.** DTE Gas did not exercise
2 its right of first refusal (ROFR) rights and will allow this contract to expire on
3 March 31, 2022.

4

5 **Q71. Why did DTE Gas renew ANR Contract #122248 for 21 MDth/d?**

6 A71. This capacity transports gas from the ANR Marshfield interconnect with Viking
7 Gas Transmission to the DTE Gas system at Menominee citygate and was
8 scheduled to expire on March 31, 2022. DTE Gas renewed this capacity for a term
9 of five years through March 31, 2027 to coincide with the renewal of the
10 corresponding capacity held on Viking Gas Transmission. This capacity was
11 renewed because this 21 MDth/d requirement is necessary to service this isolated
12 area of the DTE Gas system in the Upper Peninsula of Michigan.

13 Competitive bids were not solicited for this capacity due to the isolated nature of
14 the service. This is the only transportation route capable of serving this specific
15 portion of the DTE Gas system. ANR was asked if there was any available capacity
16 from the Chicago Hub or on ANR SW field zone to service the Menominee area
17 starting on 4/1/2022, and ANR stated that there was no capacity available. DTE
18 Gas attempted to negotiate a discounted reservation rate with ANR, but DTE Gas
19 was told that ANR would not be willing to offer any discounts on this leg of
20 transportation.

21

22 **Q72. Why did DTE Gas renew Viking Gas Transmission Contract # FT-A (AF0081)**
23 **for 21 MDth/d?**

24 A72. This capacity transports gas from the Emerson interconnect with TransCanada
25 Pipeline to the Marshfield interconnect with ANR Pipeline and was scheduled to

Line
No.

1 expire on March 31, 2022. DTE Gas renewed this capacity for a term of five years
2 through March 31, 2027 to coincide with the renewal of the corresponding capacity
3 held on ANR Pipeline. This capacity was renewed because this 21 MDth/d volume
4 is necessary to feed into ANR Contract # 122248 to provide service to the isolated
5 Menominee area of the DTE Gas system in the Upper Peninsula of Michigan.
6 Additionally, a five-year term was elected because Viking has term-differentiated
7 rates and the lowest cost reservation rate is for a five-year term vs maximum tariff
8 rates for terms less than five years.

9

10 **Q73. Why did DTE Gas renew the amended Clarington receipt point on NEXUS**
11 **Gas Transmission Contract # 860003/00002 for 37,500 Dth/d?**

12 A73. The Company renewed the amended receipt point allowing for receipt of 37,500
13 dth/d of natural gas at the Clarington point because it provided a projected savings
14 of \$5.8 million dollars versus receiving the entire 75,000 dth/d of natural gas at
15 Kensington for the two years November 2022 - October 2024 as shown in Exhibit
16 A-34 on line 50.

17

18 **Q74. Why did the DTE Gas elect not to exercise its ROFR rights on ANR Pipeline**
19 **Contract # 122247 for 15 MDth/d?**

20 A74. The Company elected not to exercise its ROFR rights on this contract because it
21 plans to contract for capacity on the Panhandle pipeline beginning in April 2022.
22 The analysis shown in Exhibit A-30 shows GCR customers projected to save \$1.7
23 million annually over the three-year deal. In addition, gas flowing on the Panhandle
24 pipeline comes from the Appalachian region which shifts approximately 4% of the
25 portfolio from the Mid-Continent and provides lower supply emissions.

Line
No.

1 Energy Transfer has communicated the projected costs associated with this
2 contract; however, it cannot initiate the contract offer until January 3, 2022. It
3 anticipates submitting the request on that date for its standard internal review and
4 approval process. The companies will then execute a contract after that is
5 completed. Exhibits A 10-12 assume the execution of the contract at rates that were
6 used in Exhibit A-30.

7

8 **Q75. What changes does DTE Gas plan to make to its interstate pipeline contracts**
9 **during the 2022-2023 GCR Plan year?**

10 A75. As stated in the previous question, the Company plans to execute a three-year
11 contract for capacity on the Panhandle Pipeline. In addition, the Company has
12 50,000 Dth/d of transportation on ANR Pipeline(Southwest fieldzone); 20,000
13 Dth/d (winter), 10,000 Dth/d (summer) of Vector capacity expiring on 10/31/2022;
14 and 60,000 Dth/d (winter) of ANR (REX Shelbyville) capacity expiring on March
15 31, 2023 that it will be evaluating whether to renew or replace these contracts in
16 order to continue to provide safe, diverse and reliable natural gas to its customers.

17

18 **Q76. Is there regional diversity in the Company's current transportation portfolio?**

19 A76. Yes, Table 4 shows the regional diversity and percentage of firm interstate-
20 transportation contracts from each of the Company's supply sources for the GCR
21 Plan Year.⁴

22

23

24

25

⁴ 15 MDth/d of ANR SW is expected to be replaced by capacity on the Panhandle pipeline beginning April 1, 2022 decreasing the Mid-Continent percentage to 32% and increasing the Appalachia percentage to 38%

Line
No.

| Total All Pipelines | | 100.0% | 100.0% | 100.0% |

2 **Q77. Why is regional diversity of supply important to DTE Gas and its customers?**

3 A77. DTE Gas's customers benefit from regional diversity of supply with increased
4 supply reliability and mitigated price risk. Security of supply and increased options
5 for supply sources are the primary reasons DTE Gas holds regionally diverse
6 interstate transportation capacity. Supply basin diversity helps the Company
7 mitigate adverse effects of major disruptions in the general natural gas industry
8 supply chain. If supply becomes constrained in a particular basin, then a diverse
9 supply portfolio helps in insulating DTE Gas and its customers from the risk of
10 potential supply disruptions in that area. If we experience a colder than normal
11 winter and need to compete with other utilities for additional supply, having varied
12 sources of that supply increases the chances that the Company will be able to
13 purchase less expensive gas than if the Company could only purchase from one

Line
No.

1 location. This is accomplished through the Company's strategy of holding firm
2 pipeline capacity.

3

4 **400 MDth/d transportation**

5 **Q78. How much *Firm* transportation does the Company contract for?**

6 A78. The Company contracts for 400 MDth/d of winter capacity and 330 MDth/d of
7 summer capacity.

8

9 **Q79. Why is there a difference between summer and winter capacity?**

10 A79. The difference is that the Company has determined that 400 MDth/d of Firm
11 transportation is required for Design Day requirements. Design Day requirements
12 are described more fully in Witness Bratu's testimony.

13

14 **Q80. In Q78, the word "*FIRM*" is italicized, is there a reason?**

15 A80. Yes, the Company requires FIRM transportation versus interruptible service. All
16 pipeline tariffs have a protocol for cutting volumes (which means curtailing the
17 supply) based on the type of contracts. Supply can be cut for various reasons
18 ranging from planned construction outages or an emergency, having a FIRM
19 transportation contract means that DTE Gas will be in the last group to be cut and
20 therefore least likely to experience loss of supply.

21

22 **Q81. Are there other options that are equally as reliable and provide the same
23 certainty as maintaining firm transportation capacity?**

24 A81. No, purchasing gas on the spot market, buying interruptible contracts, purchasing
25 interstate transport capacity release, do not provide the same level of certainty.

Line
No.

1 Simply put, these other avenues of securing supply are interruptible, and by
2 definition cannot fulfill the required need for primary firm service. DTE Gas holds
3 primary firm interstate transportation capacity as an integral part, but not the entire
4 part, of its supply portfolio to ensure firm, secure, and reliable flowing supply to its
5 system, as well as ensuring the high level of availability of such supply as may be
6 needed as SOLR. There is no certainty that the other avenues would be available
7 when supply is needed, and there is a significant increase in supply risk with a
8 supply portfolio that does not maintain at a minimum the quantity of primary firm
9 interstate transport capacity that DTE Gas has historically maintained and proposes
10 to maintain into the future, which the Commission has reviewed and approved in
11 its previous GCR Plan cases. While there may be validity to the argument that these
12 other avenues of supply could be less costly than holding firm pipeline capacity, such
13 lower costs come at the expense of a lower level of reliability of service and potentially
14 higher supply risk., which is direct conflict with the recommendations of the Statewide
15 Energy Assessment (SEA) which advocates for more reliability.

16

17 **Q82. What is the operational benefit of 400/d??**

18 A82. The answer is different depending on whether it is on a design day or under normal
19 operating procedures. On a design day, if the service territory is experiencing (or
20 expected to experience) the extreme weather and low storage volumes where the
21 Company believes it will need to provide Design Day volumes, it would purchase
22 all 400 MDth/d of gas to flow through all the pipelines, resulting in all of the
23 capacity being fully utilized thus providing reliability as recommended by the SEA.
24 However, if Design Day criteria are not met, then the advantage of having the
25 diverse supply options that the current portfolio provides, the Gas Supply team can

Line
No.

1 review which pipeline supplies safe, reliable natural gas at a reasonable and prudent
2 price. In addition, if one of the basins experience issues, the Company can pivot
3 and acquire gas from a different basin thus providing redundancy in order to support
4 our customer's needs.

5

6 **Q83. Is it prudent for the Company to purchase all remaining requirements at**
7 **MichCon Citygate?**

8 A83. No. There are two issues with purchasing Citygate gas: interruptible transportation
9 and gas withdrawn from storage.

10

11 **Q84. Why is buying interruptible transportation not a safe and reliable option?**

12 A84. The issue with interruptible transportation is that it is just that interruptible. As I
13 mentioned before pipeline tariffs prioritize which contracts get cut first when there
14 are supply curtailments. Interruptible contracts will be curtailed prior to Firm
15 transportation contracts. If the Company purchases citygate gas from a third party,
16 the Company cannot be sure that the gas has firm transportation from the supply
17 area to citygate. By buying firm transportation and purchasing the gas at the supply
18 zone, the Company ensures that its customers are the last ones that will have their
19 supply cut if there is an outage.

20

21 **Q85. Is it likely that interruptible contracts will always get cut?**

22 A85. No, it is not, however the Company does not want to take on that risk. DTE Gas is
23 responsible for providing customers with safe, reliable natural gas at a reasonable
24 and prudent cost. Customers expect that when they turn their furnaces on, that the
25 furnace will have gas supply. By buying firm transportation and purchasing the gas

Line
No.

1 at the supply zone, the Company ensures that its customers are the last ones that
2 will have their supply cut if there is an outage.

3

4 **Q86. What is the issue with citygate and storage?**

5 A86. Citygate purchases can be made via transportation (firm or interruptible) or from a
6 marketer's storage account with one of the storage fields attached to the DTE Gas
7 system. (Marketers cannot magically create natural gas and put it onto the system).
8 The 400MDth/d requirement that system operations require for Design Day
9 operations is new flowing supply. Gas that is in storage is deemed to be gas already
10 in the DTE system as it came to the system in a prior period (even the prior day).
11 As it is not incremental gas to the system it does not provide support to ensure safe,
12 reliable supply to GCR customers on a Design Day.

13

14 **Q87. Are there other issues with CityGate purchases?**

15 A87. Yes, on an all-out region design day where weather is impacting Chicago, Dawn,
16 the Northeast and other parts of the North America gas market having Firm
17 transportation back to supply basins allows the Company to have more
18 opportunities to purchase supply. The Company could purchase natural gas at the
19 receipt points in the supply basins or along the path to the DTE Gas system
20 wherever it makes most economic sense. As seen during winter storm Uri a
21 significant portion of the country had extreme high prices. Fortunately for DTE
22 Gas the MichCon citygate did not experience this volatility, however as weather
23 becomes more extreme the Company wants to be prepared for events that have not
24 occurred before.

25

Line
No.

1 **Q88. Is there a benefit to having additional pipelines provide supply to Michigan?**

2 A88. Yes, anytime incremental supply to the region it will provide additional reliability
3 and redundancy. In addition, due to the laws of supply and demand, incremental
4 supply (without incremental demand) will decrease prices in the region. The
5 Company has experienced this as NEXUS, Rover and REX have brought supply to
6 the region driving MichCon basis lower.

7

8 **Q89. Are there any other benefits to having Firm transportation back to supply**
9 **basins?**

10 A89. Yes, by having access to multiple basins the Company can utilize methane and
11 other greenhouse gas emissions in the area and purchase lower emitting natural gas
12 to help with its net zero initiative. This would be utilized on warmer than normal
13 or normal weather, while still having the benefits to support customer needs during
14 colder than normal or even Design Day requirements.

15

16 **NEXUS Contract**

17 **Q90. When did DTE Gas first introduce NEXUS to the MPSC?**

18 A90. DTE Gas first introduced the NEXUS pipeline project in Case U-17691, DTE Gas's
19 2015-2016 GCR Plan case. During that case, the Company utilized analysis
20 provided by ICF Resources (report dated December 2014 and updated December
21 2015).

22

23 **Q91. Why did DTE Gas select NEXUS transport capacity to secure gas supply from**
24 **the Utica and Marcellus production region?**

Line
No.

1 A91. DTE Gas selected NEXUS because it provided the lowest delivered cost of gas on
2 a greenfield pipeline from the Utica and Marcellus regions. DTE Gas agreed to be
3 an anchor shipper on NEXUS and helped provide the support needed for NEXUS
4 to get FERC approval to proceed with the new greenfield project.

5

6 **Q92. Has the Commission approved the NEXUS contract previously?**

7 A92. Yes. In U-20235 the Commission approved the NEXUS contract.

8

9 **Q93. If the Commission approved the contract, why is the Company still including**
10 **NEXUS in this case?**

11 A93. Reading further in the U-20543 Order the Commission stated, “On a going forward
12 basis, the Commission will expect to see evidence that the company has taken steps
13 to minimize the cost of gas including efforts to renegotiate contracts...” This was
14 a similar theme from the Commission’s December 9, 2020 in U-20203 (DTE
15 Electric’s PSCR reconciliation case for the twelve months ending December 31,
16 2018). The Company along with DTE Electric began reevaluating the changes in
17 the natural gas market since the initial introduction of the NEXUS pipeline based
18 on the comments in the PSCR case (which were also quoted in the U-20543 Order).

19

20 **Q94. When did DTE Gas begin this analysis?**

21 A94. This analysis began in the 1st quarter of 2021 after DTE Electric received the Order
22 in U-20203 as the Company awaited the pending Order in U-20543 (issued April
23 8, 2021) to proactively be responsive to the Commissions guidance Order U-20203,
24 that likely would be incorporated in the U-20543 Order. DTE Gas did this
25 proactively as the PFD in U-20543 commented on some of the concerns the

Line
No.

1 Commission brought up in the U-20203 Order (while also understanding that the
2 two companies have different utilization, purchasing requirements and
3 procurement strategies).

4
5 **Q95. Is the natural gas market the same in 2021 as it was during the time of the**
6 **original reports?**

7 A95. No, back in 2014/2015 the ICF report projected gas prices to be between \$5-10/Dth
8 over the life of the NEXUS contract. In 2021, forward prices have reduced to \$2 –
9 6/Dth over the life of the NEXUS contract.

10

11 **Q96. How have NYMEX prices changed between 2014/2015 and the present?**

12 A96. The April 2015 to March 2016 NYMEX price presented in U-17691 Exhibit A-8
13 was between \$3.50 - 4.00 (page 1), the 5th-year of the 5-year forecast in that case
14 (April 2019 to March 2020) was between \$4.15 - 4.60 (page 5), and looking at the
15 forecasts at the time, it was anticipated that natural gas prices would continue to
16 rise. Contrast that with the NYMEX price outlook the Company filed in Case U-
17 20816 Exhibit A-8, DTE Gas's 2021 - 2022 GCR case, in which the prices are more
18 tightly bound in a \$2.50 - \$3.00 (page 1) range and the long-term outlook does not
19 forecast prices to increase as dramatically.

20

21 **Q97. What factors are driving this price decrease?**

22 A97. During the past seven years, we have seen both improvements in technology as well
23 as significant additional reserves that have dampened the outlook on the rise of
24 natural gas prices. Due to this dynamic market shift, DTE Gas has contracted with

Line
No.

1 FTI Consulting in order to refresh the analysis that ICF produced in order to get an
2 updated look at the benefits of the NEXUS agreement.

3
4 **Q98. Are there any long-term projections showing this shift in market prices and**
5 **production?**

6 A98. Yes. The EIA annually publishes a long-term forecast for natural gas prices and in
7 2014⁵ the projections were showing higher prices versus 2021.⁶ As can be seen in
8 the tables below, back in 2014 when DTEG was initially looking at NEXUS, gas
9 prices were expected to steadily rise. In comparison, when you review the 2021
10 table, gas prices and the related projections have flattened out.

11
12 Conversely when you review the following two tables from the same two reports you
13 see that the projected production of natural gas has significantly increased (key is the
14 y axis scale).

⁵ [https://www.eia.gov/outlooks/archive/aeo14/pdf/0383\(2014\).pdf](https://www.eia.gov/outlooks/archive/aeo14/pdf/0383(2014).pdf)

⁶ https://www.eia.gov/outlooks/aeo/pdf/AEO_Narrative_2021.pdf

Line
No.

1

2

3 Also, the EIA shows that U.S. proved reserves has increased over 26% from almost
4 369 Tcf to over 465 Tcf from year end 2014 to year end 2019.^{7,8}

Dry Natural Gas Proved Reserves

eia Source: U.S. Energy Information Administration

⁷ https://www.eia.gov/dnav/ng/NG_ENR_DRY_A_EPG0_R11_BCF_A.htm

⁸ From 2014 to 2015 US proved reserves decreased from 369 Tcf to 308 Tcf

Line
No.

1 The combination of increased reserves and production has put downward pressure on
2 natural gas prices.

3

4 The changes to the industry came after the analysis that ICF completed in 2014, as in
5 Exhibit A - 26 Technology and Efficiency Gains Create A New Normal For U.S
6 describes that beginning in mid-2013 and for three years Texas's oil production was
7 dormant and then increased by 50% from 4.2 bcf/d to approximately 6.5 bcf/d in one
8 year (2017 to 2018).

9

10 **Q99. Are technological improvements causing the production numbers to increase?**

11 A99. Yes, the article in Exhibit A-26 attributes the technological improvements to two
12 main drivers for this production increase. The first is that producers have cut down
13 the time to drill, frac and complete each well from 25-30 days down to 10-12 days.
14 This almost doubles the output of each active rig.

15

16 Secondly, productivity gains per well have dramatically improved. Drilling,
17 fracking, and completion technologies have advanced to provide the industry with
18 more powerful rigs that can drill longer laterals. In addition, the advancements in
19 analysis tools for identifying gas underneath the ground have allowed producers to
20 drill into the formation's more prolific areas or "sweet spot" more accurately. On
21 the fracking side, improvements in the fluids used have resulted in better fracking
22 of the rocks, which allows for more gas and liquids to be recovered.

23

Line
No.

1 **Q100. Is this technological improvement isolated to Texas?**

2 A100. No, the improvements and efficiencies are not isolated to Texas and the benefits
3 shown in Texas are also seen across the entire industry.
4

5 **Q101. How is the Company addressing the concerns expressed by the Commission**
6 **that the Company has not provided new data or updated the 2014 analysis on**
7 **NEXUS and its impact on the Michigan natural gas market?**

8 A101. During the first quarter 2021, the Company engaged FTI Consulting (FTI) to review
9 the market dynamics and evaluate the benefits of the NEXUS pipeline. The scope
10 of work was to develop historical simulations of the Upper Midwest gas markets
11 since NEXUS went into service and then review the model in a simulation where
12 NEXUS was not built, thus providing an “ex post” analysis of the Michigan gas
13 market.
14

15 **Q102. Has DTE Gas provided this analysis before?**

16 A102. No. DTE Gas has the ability to look forward and analyze the environment based
17 on current infrastructure and utilizing forward curves to value pipelines. The
18 Company does not have the resources or expertise to do the complex what-if
19 modelling of the natural gas marketplace that takes into account new projects that
20 impact supply and demand levels or similarly to provide a robust analysis of how
21 the market would be impacted had actual projects not been constructed and placed
22 into service. Similar to 2014, DTE Gas looks to experts in the industry to
23 supplement its team when it needs these types of analyses done.
24

25 **Q103. Why is this analysis relevant now?**

Line
No.

1 A103. Based upon the information available and analysis completed at the time, the
2 NEXUS agreement was appropriate to execute when the Company first entered into
3 it. And while the statute indicates the threshold to establish prudence is based on the
4 decisions made based on the information that the Company knew or should have
5 known at the time; in this instance it is appropriate to consider ongoing effects of
6 those decisions. The author of the article in Exhibit A-26 stated, "The reality, of
7 course, is that it is one of the most high-tech industries on the face of the earth, led
8 by engineers, geologists and other scientists who advance efficiencies and improve
9 technologies each and every day." He was talking about the focus on the
10 technology side of the knowledge base in the industry, but I think it can be
11 expanded to be a reminder to us that the Company and the others in the marketplace
12 are continuing to improve all aspects of the knowledge base and that even though
13 approval is based on information available at the time of the decision, it is
14 appropriate to refresh analysis from time to time to review how the marketplace has
15 evolved.

16

17 **Q104. Did the refreshed results that FTI provided show benefits to DTE Gas**
18 **customers?**

19 A104. Yes. The updated report showed that MichCon Citygate prices are down on
20 average of \$0.08 over the life of the contract due to the NEXUS pipeline being
21 built. The analysis estimates that DTE Gas customers will save approximately \$199
22 million between 2022 and 2038 and that all consumers in the state of Michigan will
23 save roughly \$1 billion due to the NEXUS pipeline being built.

24

25 **Q105. What is driving the savings for DTE Gas and the residents of Michigan?**

Line
No.

1 A105. FTI modeled the North American gas markets and evaluated a scenario wherein
2 NEXUS was not built. By doing so, it was able to estimate the amount of savings
3 DTE Gas customers and all consumers would receive by comparing the costs in a
4 status quo environment as well as the “No NEXUS” case. These savings are
5 discussed in more detail in Witness Sosnick’s testimony.

6

7 **Q106. Are there any specific examples of price savings attributable to NEXUS?**

8 A106. Yes. As discussed in previous cases, the MichCon city-gate index has historically
9 traded at a premium to the NYMEX with a higher premium in the winter than the
10 summer. As the Appalachian gas has increased supply to the region, the MichCon
11 index has continued to decline, and essentially flipped from premium to a discount
12 to the NYMEX index. In 2015 – 2017 the premium was essentially erased as the
13 Rockies Express brought additional Appalachian gas west into Ohio which then
14 interconnected with other pipelines to bring new gas to Michigan. Following up in
15 2018 when Rover and NEXUS were put in service with direct access to Michigan,
16 MichCon basis turned negative.

17

18 **Q107. Since NEXUS went in service has the basis ever been a premium?**

19 A107. Yes, there was an outlier in November 2018. This was the first full month NEXUS
20 was in service. There also was an outlier where the basis discount reached (\$0.50).
21 It is better to look at the average basis premium / discount by season to evaluate
22 whether the basis is trading at a premium or discount as to smooth out individual
23 month aberrations.

24

25 **Q108. Do individual months (or days) ever provide insight to the benefits of NEXUS?**

Line
No.

1 A108. Yes, In February 2021, when the country experienced extreme cold temperatures,
2 which led to freeze-offs as well as record setting pricing. Cash prices in Oklahoma
3 hit \$999, Northern, Demarc peaked around \$230 and NIPSCO topped \$200.
4 However, the high for MichCon city gate was under \$8.00. This clearly shows
5 another example of the benefits of having multiple sources of natural gas from
6 different regions of the country coming into the state. The Company said one of
7 the benefits of a new greenfield pipeline was to provide additional supply reliability
8 and this is a good example of it.

9

10 **Q109. The Commission expressed in its Order in U-20543 that it would like the DTE**
11 **Gas to attempt to renegotiate existing contracts when expected contract**
12 **benefits do not materialize. Has DTE Gas complied with the Commission's**
13 **request?**

14 A109. Yes, the Company complied with the Commission's request because it has
15 reviewed the contract and determined that the expected contract benefits have
16 materialized. The Commission did request the Company to renegotiate, but another
17 key part of the Order reads, "As such, additional information regarding the market
18 outlook at Kensington would be helpful in informing the Commission's review of
19 the ongoing reasonableness over the full life of the NEXUS contract and its
20 amendment." I believe these two requests go hand in hand. In order to determine
21 if the Company would receive benefits from the contract the Company engaged an
22 independent consultant, FTI Consulting Inc. (FTI), to provide guidance on the value
23 of NEXUS. This was the first step that DTE Gas utilized to determine if the benefits
24 of the NEXUS contract would continue to materialize. While there have been some
25 delays that have affected liquidity and pricing at Kensington, overall, the NEXUS

Line
No.

1 contract has achieved substantial benefits to DTE Gas customers. The Company
2 has not concluded that it will not ultimately receive the expected benefits of the
3 contract as originally anticipated in 2014.

4
5 In addition, contracts between counterparties (even affiliates⁹) are negotiated and
6 executed at a point in time based on facts known by the parties at that point in time.
7 There is always some inherent risk in any long-term contract that market or other
8 changes may occur that may change expected outcomes. Because this risk is
9 inherent in all long-term contracts, and all sophisticated parties accept this inherent
10 risk, long-term contracts are not typically renegotiated when circumstances change
11 unless there has been a breach of contract.

12

13 **Q110. Does the fact that the two entities were affiliates give DTE Gas leverage to**
14 **renegotiate the contract?**

15 A110. No. First, the former DTE affiliate only owns 50% of NEXUS, so even if it was
16 possible, the DTE affiliate does not have a majority stake in NEXUS. More
17 troubling is the idea that because of the affiliation between the companies, NEXUS
18 should be expected to treat DTE Gas differently from its other customers. If
19 NEXUS were to do so, it would constitute a violation of both the MPSC's Code of
20 Conduct and FERC's Standards of Conduct – which state that affiliates are not
21 allowed to offer to provide unduly discriminatory service (service discrimination
22 of any kind). This concept of providing another affiliate a benefit that is not
23 available to all other companies in the marketplace is a clear example of what these

⁹ At the time the contracts were executed, DTE Gas and NEXUS were affiliates. On July 1, 2021 DTMidstream (which owns 50% of NEXUS) was spun off from DTE Energy and effective that date, DTE Gas and NEXUS are no longer affiliates.

Line
No.

1 prohibitions are trying to prevent. In addition, as of July 1, 2021 DT Midstream
2 (along with the NEXUS assets) was spun-off from DTE and therefore the two
3 companies are no longer affiliates.

4
5 **Q111. Has there been an appropriate time to renegotiate the NEXUS contract?**

6 A111. Yes, during the Precedent Agreement phase there were updates to the contract due
7 to construction and regulatory delays. The Company felt that the access to the
8 additional low-cost supply that NEXUS would provide was adequate consideration
9 for the amendment changes, especially considering the main reason for the delays
10 was the lack of quorum at FERC which was outside of NEXUS's control. In
11 addition, when DTE Gas wanted to modify the receipt point and acquired the ability
12 to receive gas at Clarington versus Kensington. These negotiations were universal
13 in that all shippers had the same ability to make these changes and NEXUS did not
14 provide DTE Gas with any special treatment or benefit.

15

16 **Q112. Has NEXUS filed its cost and revenue study (CRS) to the FERC?**

17 A112. Yes, on October 13, 2021 NEXUS filed its CRS.

18

19 **Q113. What were the costs and revenues in that study?**

20 A113. "As set forth in detail in the Cost and Revenue Study, NEXUS' actual annual
21 transportation service revenue was \$306,549,093 for the twelve months ending
22 June 30, 2021 against a cost of service for the same period of \$522,872,562. This
23 is primarily due to the fact that no NEXUS shippers have contracts at the recourse
24 rate (i.e., all shippers pay either negotiated or discounted rates). Thus, NEXUS is
25 significantly under-recovering its cost of service."

Line
No.

1 **Q114. What kind of contract does DTE Gas have with NEXUS?**

2 A114. DTE Gas has a negotiated rate contract with NEXUS.

3

4 **Q115. Due to the negotiated rate contract, what is the impact to DTE Gas if NEXUS**
5 **does try and file for higher rates?**

6 A115. DTE Gas's negotiated rate would not change. Similar to the situation when the
7 Company elected to have a fixed price contract versus a capital project tracker the
8 rate DTE Gas will pay will not change until the contract expires.

9

10 **Q116. Did the Commission's Order in U-20235 discuss the TEAL amendment?**

11 A116. Yes, on page 6 of that Order the Commission states, "These costs will be examined
12 in each reconciliation, where the utility will need to provide adequate support for
13 the reasonableness and prudence of the amounts associated with the NEXUS
14 Agreement and Amendment."

15

16 **Q117. Has the Company provided evidence of the benefits of the Agreement and**
17 **Amendment?**

18 A117. Yes. The Company provided evidence in U-20236 where the Commission felt that
19 NEXUS was a reasonable and prudent decision. In U-20236 the Company provided
20 exhibits showing the projected savings of \$4.3 million during the term of the
21 amendment when the Company executed the agreement as well as actual savings
22 of \$6.0 million (November 2018 – December 2020), and as I mentioned earlier the
23 Company renewed the TEAL amendment for two years with projected savings of
24 \$5.8 million between November 1, 2022 and October 31, 2024.

25

Line
No.

1 **Q118. Are there any other benefits related to NEXUS?**

2 A118. The benefit to GCR customers is also enhanced by lower distribution rates due to
3 the higher rate NEXUS is paying DTE Gas above the cost DTE Gas pays NEXUS
4 for Kensington to Ypsilanti transportation. On an annual basis, NEXUS pays DTE
5 Gas \$32.1 million in transportation. See Witness Decker's testimony in DTE Gas's
6 General Rate Case, U-20642 at HJD-42 Line 8. The lease agreement revenue
7 benefits all DTE Gas customers, including GCR customers.

8

9 In addition, NEXUS supplies have benefited all gas utilities in the state and thereby
10 all customers in the state, as well as electric utilities with gas fired generation.

11

12 **PROJECTED TOTAL GAS SUPPLY COSTS**

13 **Q119. What are DTE Gas's projected total gas purchase quantities and costs for the**
14 **April 2022 through March 2023 period?**

15 A119. DTE Gas's projected total gas purchase quantities and costs are summarized in
16 Exhibit A-10. This exhibit reflects projected total purchases and subtotals for these
17 categories: contracted fixed price, contracted indexed price, and supply not under
18 contract. The totals of these subdivisions are added together to arrive at the total
19 expected gas purchase quantity of approximately 143 MMDth (page 1, line 4,
20 column (14) and a total expected gas purchase cost around \$408 million (page 1,
21 line 12, column (14) for the April 2022 through March 2023 period. These costs
22 and volumes are prior to pipeline fuel retention, prior to conversion from Dth
23 (energy quantity) to Mcf (volumetric quantity), and do not include pipeline
24 transportation costs.

25

Line
No.

1 **Q120. What are DTE Gas's projected total transportation costs for the April 2022**
2 **through March 2023 GCR Plan Period?**

3 A120. DTE Gas's projected total transportation costs are summarized in Exhibit A-11.
4 This exhibit reflects projected transportation reservation and commodity costs by
5 month. The total expected transportation cost is approximately \$60 million
6 (Exhibit A-11, page 1, line 43, column (14)) for the period April 2022 through
7 March 2023.

8

9 **Q121. What are DTE Gas's projected total supply costs and total delivered supply**
10 **volumes for the period April 2022 through March 2023?**

11 A121. Projected total supply costs are presented on Exhibit A-12 and reflect the sum of
12 the projected gas purchases and transport costs. DTE Gas's projected total supply
13 cost for the period April 2022 through March 2023 is approximately \$468.2 million
14 (Exhibit A-12, page 1, line 3, column (14)). The total delivered supply volumes are
15 presented on Exhibit A-10. DTE Gas's total delivered supply volume for the period
16 April 2022 through March 2023 is approximately 134 Bcf, Exhibit A-10, (page 1,
17 line 8, column (14)). This total delivered supply volume is the quantity delivered
18 into DTE Gas's system after interstate pipeline fuel is removed and after conversion
19 from Dth (energy quantity) to Mcf (volumetric quantity) at a heating value of 1.052
20 Dth/Mcf.

21

22 **PROJECTED SUPPLY COSTS FOR LIFO VALUATION OF GAS IN STORAGE**

23 **Q122. What projections have you developed regarding DTE Gas's gas supply**
24 **volumes and costs for the period January 2022 through March 2023?**

25 A122. Table 5 shows the projected NYMEX, volumes and costs for the period January
26 2022 through March 2023. Furthermore, and consistent with the methods used

Line
No.

throughout the GCR Plan, appropriate basis, fuel, transportation charges, and heating value adjustments were applied. The NYMEX prices below were used to calculate the purchase price for all volumes not already contracted at fixed prices pursuant to the FPP.

Table 5

| Item | Jan-22 | Feb-22 | Mar-22 |
|----------------------|----------|----------|----------|
| NYMEX | \$3.962 | \$3.911 | \$3.778 |
| Delivered Vol (MMcf) | 9,860 | 7,604 | 11,776 |
| Total Cost (\$000) | \$32,066 | \$26,229 | \$38,822 |

GAS SUPPLY STRATEGY FOR APRIL 2023 AND BEYOND

Q123. How does DTE Gas plan to purchase its required gas supply for April 2023 and beyond?

A123. DTE Gas's proposed natural gas supply acquisition strategy for April 2023 and beyond is essentially the same as that used for the April 2022 - March 2023 period. Specifically, DTE Gas's supply will be priced utilizing a mixture of fixed-price supply and market-based indexed price supply.

Q124. Does DTE Gas plan to execute any fixed price supply contracts during the Plan Period for gas to be delivered in April 2023 and beyond?

A124. Yes. Consistent with the Commission approved VCA methodology in the Company's 2010-2011 GCR Plan Case No. U-16146, and contained in every subsequent Commission-approved GCR Plan (Case Nos. U-16482, U-16921, U-17131, U-17332, U-17691, U-17941, U-18152, U-18412, U-20235, U-20543) through the Company's pending 2021-2022 GCR Plan Case No. U-20816, as

Line
No.

1 detailed in Exhibit A-7, DTE Gas will continue to make fixed price purchases each
2 month during the April 2022-March 2023 Period for approximately 3% of the total
3 gas supply requirements to be delivered during the April 2023-March 2025 GCR
4 Period. The table on Exhibit A-27 "Fixed Price Program Analysis – Purchase
5 Percentages" summarizes the monthly and cumulative total fixed price purchases
6 to occur by GCR delivery period.
7

8 **Q125. Is DTE Gas reviewing any transportation portfolio changes during the Plan**
9 **Period related to future GCR periods, specifically April 2023 and beyond?**

10 A125. As mentioned earlier the Company has 60,000 Dth/d (winter) of ANR (REX
11 Shelbyville) capacity expiring on March 31, 2023 that it will be evaluating whether
12 to renew or replace this contract in order to continue to provide safe, diverse and
13 reliable natural gas to its customers.
14

15 **Q126. Does DTE Gas plan to change its transport capacity for April 2023 and beyond**
16 **due to customers switching between GCR and GCC?**

17 A126. No. DTE Gas does not plan to change its transport capacity if customers switch
18 between GCR and GCC. DTE Gas intends to maintain a GCR/GCC portfolio of
19 interstate transportation and city-gate supply that is sufficient to serve total GCR
20 and GCC markets. This is necessary from a security of supply standpoint as DTE
21 Gas is the SOLR for all customers, both GCR and GCC.
22

23 **Q127. What projection of gas purchase and transportation costs have you made for**
24 **the period April 2023 through March 2027?**

25 A127. Projected gas purchase costs for the period April 2023 through March 2027 are
26 calculated on pages 2 through 5 of Exhibit A-10. Projected transportation costs for

Line
No.

1 that same period are calculated on pages 2 through 5 of Exhibit A-11 and the
2 projected total supply costs (the sum of purchase and transport costs) are calculated
3 on Exhibit A-12.

4

5 **IMPACT OF DTE GAS NET ZERO COMMITMENT ON GAS SUPPLY**

6 **STRATEGY**

7 **Q128. What is DTE Gas's position on greenhouse gases?**

8 A128. As mentioned in DTE Gas's previous GCR case, Case U-20816, the Company
9 issued a press release on June 24, 2020 that stated it was committed to reduce
10 greenhouse gas emissions to net zero by 2050 for DTE Gas and by 2050 the
11 Company will help reduce our customers' greenhouse emissions 35% from 2005.

12

13 **Q129. What part of the Company's operations does this commitment impact?**

14 A129. This commitment impacts all operations from procurement through gas delivery.

15

16 **Q130. Will this commitment impact GCR customers?**

17 A130. For DTE Gas to achieve this important milestone, we will need the cooperation of
18 gas suppliers. In the short term, there will not be an impact to GCR customers. In
19 the longer term, the Company will include measures to reduce methane emissions
20 in our evaluation of supply, in addition to the current supplier evaluations based on
21 basin, counterparty creditworthiness, supplier reliability, operational requirements
22 and cost.

23

24 **Q131. What has the Gas Supply team done since the announcement?**

Line
No.

1 A131. In 2021, the team was involved in a number of activities in order to understand
2 where the industry is today and where it looks like it will go. The Company met
3 with a number of its industry peers to ascertain their position on Responsibly
4 Sourced Gas (RSG). We also met with a number of our suppliers and other industry
5 participants to gather information on RSG, the various certifications for RSG and
6 product offerings that include RSG.

7

8 **Q132. What is RSG?**

9 A132. RSG is a natural gas product which has undergone third party certification and
10 regular monitoring to verify it has been produced in a way that meets the highest
11 standards of responsibility with respect to air, water, land and community. In
12 addition, a critical component of RSG for DTE will be focusing on RGS being a
13 lower methane intensity natural gas product in comparison with other supply
14 alternatives

15

16 **Q133. What information did you gather from industry peers?**

17 A133. There was a wide range of both familiarity and planning in this emerging space.
18 Some industry peers have not contemplated a net zero strategy, some were in the
19 infancy of contemplating the impact of more environmentally friendly emissions
20 (i.e. reduced methane emissions, and RSG) and others had already procured
21 contracts committing to RSG in their portfolio.

22

23 **Q134. Were there any commonalities found amongst industry peers as it relates to**
24 **the integration of RSG into the portfolio?**

Line
No.

1 A134. The recurring theme that was identified through the conversations is that most of
2 the utilities believe that certification (and third-party auditing) was required. The
3 other utilities typically did not want to speculate on which certification to choose
4 as this is the beginning stages of the market, but felt that as the market matured
5 and developed some certifications may become more common than others.

6

7 **Q135. Does DTE Gas believe certification is a necessity for procuring RSG?**

8 A135. Yes, The Company agrees that certification and auditing would be required for it
9 to purchase RSG.

10

11 **Q136. How mature is the industry as it relates to the certification of RSG?**

12 A136. The company concluded that though there is work being done in this space, the
13 industry is still developing.

14

15 **Q137. Is there currently uniformity in the certification process?**

16 A137. In our research we identified five certifications and one registry. The table below
17 describes the various certifications and which organization is promoting it. The
18 performance attributes are an important differential. Certifications range on
19 focusing only on Methane Intensity and others ae including other Environmental,
20 Social and (Corporate) Governance (ESG) attributes.

21

22

Line
No.

| Certification | Est. | Organization | Performance Attributes |
|--|--------------|---|--|
| <i>EO100™</i> | 2012 | <i>Equitable Origin's 100 (EO100™) Standard for Responsible Energy Development</i> verifies production site emissions and multiple ESG measures including working conditions | Operators quantify and disclose emissions performance. Requires independent 3rd party audits and recertification every 3 years • <i>Not methane specific but working towards this with MiQ</i> |
| <i>ISO 14001:2015</i> | 2015 | <i>International Organization for Standardization (ISO)</i> is an NGO based in Switzerland. The standard requires an environmental management system to manage environmental impacts, meet regulatory compliance requirements and assess risk | Includes internal and ISO audits of adherence to globally recognized environmental management standards. Does not require specific technology or emissions quantification to achieve certification • <i>Not methane specific / no 3rd party audits</i> |
| <i>IES TrustWell™</i> | 2016 | Joint project of <i>Project Canary</i> , which continuously monitors on-site methane emissions & <i>International Environmental Standards (FKA Independent Energy Standards)</i> | Producers self-report risks to water, air, land and community. Includes independent verification of methane intensity using continuous methane monitoring technology • <i>Does not have 3rd party audits</i> |
| <i>MiQ Standard</i> | 2021 (pilot) | Partnership between Rocky Mountain Institute (RMI) and SYSTEMiQ that plans to certify gas through quantitative evaluation and monitoring | Requires quantitative evaluation of methane intensity, monitoring technology deployment, and independent 3rd party audits |
| <i>Platts MPC</i> | 2021 | <i>Platts</i> recently proposed a <i>Methane Performance Certificate</i> based on Methane Intensity calculated under the NGSI protocol | Assigns letter grades A-F to producers based on metered data & Methane Intensity. The maximum threshold for certification is under review. • <i>Working with Xpansiv (below) to track NG through entire supply chain</i> |
| <i>GTI Veritas</i> | TBD | Gas Technology Institute (GTI) recently launched an effort to create a differentiated gas measurement and verification initiative | Methane intensity by supply chain segment |
| <i>Xpansiv (Registry, not a certification)</i> | 2019 | Xpansiv CBL Holding Group (XCHG) is a partnership between Xpansiv data refinery & | Enables producers to issue certificates with an auditable chain back to the source |

Line
No.

1 **Q138. Has DTE Gas solidified the parameters and certification process it will adopt?**

2 A138. The company is closely monitoring, evaluating and analyzing the different
3 certification options that are available and others that have been proposed that are
4 on the horizon. The Company has not committed to a specific certification process
5 and will continue to analyze its option to determine the most prudent methodology
6 in this space.

7

8 **Q139. What industry groups or collaboratives is DTE Gas involved in?**

9 A139. The Company is involved in the Natural Gas Supply Collaborative, Downstream
10 Natural Gas Initiative, Next Generation Gas Coalition, One Future Coalition and
11 the Gas Technology Institute's Veritas Initiative (via the One Future membership).

12

13 **Q140. What is the (NGSC)?**

14 A140. The NGSC is a voluntary collaborative of natural gas purchasers throughout North
15 America that are promoting safe and responsible practices for natural gas supply.
16 DTE is actively participating in the collaborative and I am a representative for the
17 Company on this collaborative.

18

19 **Q141. What is the Natural Gas Sustainability Initiative (NGSI)?**

20 A141. While methane emissions intensity is a recognized means of measurement for
21 methane emissions output in natural gas, the method of calculating and reporting
22 intensity is not consistent across the natural gas industry. This lack of consistency
23 is an obstacle to managing, tracking and providing transparency for the reduction
24 of methane emissions, including measurement and tracking of our emission
25 reduction goals. To address these inconsistencies in methane reporting, the NGSI
26 was launched by the Edison Electric Institute (EEI) and American Gas Association

Line
No.

1 (AGA) in 2018. The NGSI has developed a voluntary, industry-wide approach for
2 companies to calculate methane emissions intensity by segment—the Methane
3 Emissions Intensity Protocol (Protocol). DTE Energy was one of a small group of
4 companies who participated in a pilot program sponsored by AGA and EEI to test
5 the Protocol in June of 2020. Having completed the pilot, DTE is among the first
6 to publicly report its methane emissions intensity results using the NGSI Protocol.
7 Another goal of the NGSI protocol is to be all-inclusive of methane emissions. The
8 protocol includes methods for calculating methane intensity for each of the
9 following five segments of the natural gas value chain - production, gathering &
10 boosting, processing, transmission & storage, and distribution. Many of the current
11 reporting programs that are currently in place do not include emissions from
12 sources upstream and downstream of a company's operations.

13

14 **Q142. When was the NGSI protocol finalized and released?**

15 A142. The NGSI Protocol was publicly announced by the EEI and AGA in February 2021
16 with updates in July 2021. The Protocol provides a uniform and standardized
17 method for reporting and benchmarking methane emissions across the entire
18 industry, from well-head to burner tip.

19

20 **Q143. Who is expected to participate and utilize the protocol?**

21 A143. The intent is to encourage upstream producers, processors and transporters in
22 addition to EEI/AGA members to report their methane intensity using the NGSI
23 protocol. It may be too early to determine if this is happening, but NGSC will be
24 looking at the utilization of the NGSI protocol by the natural gas industry in 2022.

Line
No.

1 DTE Gas will encourage its suppliers that are not members to also utilize the
2 protocol as well.

3

4 **Q144. What information will be gathered by utilizing the NGSi protocol?**

5 A144. The primary information that the NGSi protocol is gathering is methane intensity.
6 NGSi breaks down the natural gas industry into five segments for reporting of
7 methane emissions: Production, Gathering & Boosting, Processing, Transmission
8 & Storage, and Distribution. The protocol recommends disclosure of total methane
9 emissions, natural gas throughput and a unitless measure of methane emissions
10 intensity (emissions/throughput).

11

12 **Q145. Will DTE Gas use the data that is provided in the NGSi protocol to make gas**
13 **procurement decisions?**

14 A145. No. The Company will not use the NGSi protocol as a decision-making tool during
15 this Plan Year. DTE Gas did ask its suppliers to voluntarily participate and submit
16 the requested information.

17

18 **Q146. Is it mandatory for companies to report based on the protocol?**

19 A146. No, the NGSi cannot require companies to report under the new protocol, however,
20 much of the information is similar to data filed with the EPA. The Company has
21 sent letters to suppliers encouraging participation through voluntarily reporting.

22

23 **Q147. What is the next step in the process for achieving this goal within the scope of**
24 **GCR supply purchases?**

Line
No.

1 A147. As mentioned earlier, the Company plans to identify which attributes are important
2 to DTE Gas and its customers. To help identify supply availability as well as gather
3 information, the Company is anticipating issuing a request for information (RFI) in
4 the first half of 2022. The expectation is that the RFI will be open ended as to
5 specific certification for RSG (but will have certification and audit requirements).
6 As the Company writes the RFI it will determine the appropriate tenor for the
7 request (monthly, seasonal or annual volumes).

8

9 **Q148. Will the Company execute purchase(s) based on the RFI?**

10 A148. Potentially. The primary goal of the RFI is to get information. DTE Gas feels the
11 best way to get this information is to ensure its suppliers understand that the
12 Company may execute transactions if it feels that there is appropriate value.

13

14 **Q149. Is there a benefit to issuing an RFI with the intention of execution versus the**
15 **intention only to glean information?**

16 A149. DTE Gas is concerned that if it issues an RFI without an indication that it may
17 execute the response will not be as meaningful.

18

19 **Q150. How much of the portfolio would you anticipate the Company executing from**
20 **the RFI?**

21 A150. I cannot foresee a situation where the Company would purchase a material amount
22 of the requirements. This would be the first foray of purchasing RSG for GCR
23 customers so I would anticipate it being no more than 1 – 1.5% of the total
24 requirements.

25

Line
No.

1 **Q151. Why are you anticipating such a low percentage of the portfolio to be RSG in**
2 **the 2021-2022 GCR year?**

3 A151. I would anticipate minimal purchases because as I stated earlier the primary goal
4 of the RFI is to get a further understanding of where the industry is in supplying
5 RSG.

6
7 **Q152. If the Company anticipates the volumes will be minimal, why not just issue**
8 **exclusively an RFI versus including something with the possibility of**
9 **execution?**

10 A152. The Company is concerned that without the opportunity to execute there would be
11 fewer responses.

12

13 **Q153. Are there any other reasons the Company would not execute a greater**
14 **percentage of the portfolio if the RFI provided favorable response?**

15 A153. Yes, a common theme discussed by other utilities in other jurisdictions was that the
16 reasonable and prudent standard for recovery includes latitude related to
17 creditworthiness, diversity and reliable supply, however there are various
18 interpretations as to whether this standard covers costs associated with
19 environmental activity. The Company would like the Commission to offer
20 guidance on whether Public Act 304's reasonable and prudent standard includes
21 recovery of premiums for environmental benefits. If the Company does execute
22 transactions from the RFI, it will identify any premiums associated with RSG in
23 order to disclose in reconciliation so that the Commission will easily be able to
24 understand the cost of the supply (which has historically been recovered in the GCR
25 reconciliation) and any premiums (if applicable) for RSG in order to provide

Line
No.

1 guidance on recovery. The Company believes that as the industry has evolved
2 premiums paid for RSG attributes are reasonable and prudent similar to other
3 environmental costs (CO2 scrubbers at a power plant) which are recoverable.

4

5 **Q154. Does the company intend on implementing a RSG purchase strategy in the**
6 **current plan year?**

7 A154. No, the company is still in the exploration, analysis and development stages of
8 developing a robust RSG purchase strategy. The company will potentially use the
9 procurement of gas based on a RFI with RSG parameters to get a better
10 understanding of the maturity of the industry. The insight gathered during the RFI
11 process will aid in the development of a comprehensive RSG purchasing strategy.

12

13 **Q155. Do you anticipate completing the journey to net zero during the 5-year Plan**
14 **Period?**

15 A155. Developing a cleaner portfolio is a high priority to the Enterprise. The Company
16 will continue the standardized process of updating the Staff and Commission of its
17 plans and intent through case filings. Any proposed changes will be identified and
18 filed for review in accordance with the established regulatory process. At this time,
19 no specific plan has been developed for the five-year period, and if one is developed
20 it will be filed in the case for the corresponding Plan year. This is a long-term goal
21 that we anticipate working on between now and 2050. There will be changes and
22 updates along the way. The goal during the current Plan Period is to understand
23 the certifications that are currently available, what attributes are being certified and
24 developing a plan to include RSG in the portfolio.

25

Line
No.

1 **Q156. In summary, what is the impact of the net zero goal for this GCR filing?**

2 A156. In summary, the Company is planning a phased approach where during the current
3 GCR year, it will reach out to suppliers and understand the current landscape of
4 methane emissions. Then during the balance of the 5-year GCR Plan Period, it will
5 work with its suppliers to help develop ways to begin to reduce and mitigate the
6 carbon emissions from the Company's supply portfolio.

7

8 **Q157. Does this complete your direct testimony?**

9 A157. Yes, it does.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the Application of)
DTE Gas Company for approval of a)
 Gas Cost Recovery Plan, 5-year Forecast)
 and Monthly GCR Factor for the 12 months)
 ending March 31, 2023)
 _____)

Case No. U-21064

EXHIBITS

OF

ERIC P. SCHIFFER

1) Proposed Methodology Description

- a) Volume Cost Averaging (VCA) - A timing technique of buying an equal volume of natural gas, on a regular schedule, at a fixed price.
- b) DTE Gas will commence purchases equal to 75% of the total GCR Period supply requirements spread equally over a 24-month period (i.e. the VCA Purchase Period) starting on January 1st which precedes the GCR Period by 27 months.
- c) The purchases shall be complete by December 31st directly preceding the GCR Period.
- d) Please see below for an example of the timeline associated with the April 1, 2021 through March 31, 2022 GCR Period.

VCA Purchases Start - January 1, 2019

37.5% of Purchases Complete - December 31, 2019

75% of Purchases Complete - December 31, 2020

2) Fixed Purchase Coverage Ratio

- a) DTE Gas will achieve a fixed purchase coverage ratio of 75% of total GCR Period requirements on December 31st directly preceding the GCR Period.

3) VCA Purchase Limitations

- a) The monthly VCA purchase shall not exceed 1/24 of 75% or ~ 3% of the total GCR Period purchase requirements (except as it relates to 3.b).
- b) In the event forecasted GCR Period purchase requirements increase or decrease during the 24 month VCA Purchase Period, DTE Gas will either increase or decrease the VCA purchase volume equally over the remaining scheduled purchases so that the 75% fixed purchase requirement is met by December 31st directly preceding the GCR Period.

4) GCR Period Monthly Receipt Volumes

- a) The monthly receipt volumes purchased for the GCR Period may vary due to varying monthly purchase requirements which is defined as volume shaping described more fully in paragraph 8) below.

5) GCR Period Purchase Requirements

- a) GCR Period purchase requirements utilized to determine VCA purchases may be updated without limitation, to reflect the best available real time information at the time of purchase.

6) VCA Purchase Timing

- a) DTE Gas may make multiple purchases or one single purchase at any time during the calendar month or thirty-one days following the monthly sign-off meeting at its own discretion, not to exceed the VCA purchase limitations described in paragraph 3).
- b) Any purchase made within the calendar month or thirty-one days following the monthly sign-off meeting is in compliance with the fixed price guidelines and cannot be deemed unreasonable and imprudent solely on the basis that the purchase price was not the lowest price within the anticipated timeframe.

7) Purchase Price

- a) The purchase price will be representative of physical fixed price supply at the specified receipt point purchase location, which will be inclusive of any market based premium or discount (i.e. physical basis) associated with the specific geographic purchase location.

8) Volume Shaping

- a) DTE Gas will attempt to shape purchases consistent with the seasonal profile in place at the time of purchase.

- b) Volume shaping may require DTE Gas to purchase varying receipt volumes for each month within the GCR Period in scope.
- c) For example, if summer purchase requirements are greater than winter purchase requirements, DTE Gas will purchase proportionately more volumes in the summer than in the winter for each of the VCA purchases.

9) Force Majeure

- a) DTE Gas may suspend the fixed price program for an indefinite period of time in the event of a Force Majeure.

10) VCA Transition Period (Assuming a January 1, 2011 Commission Order)

- a) April 2011 – March 2012 GCR Period
 - i) DTE Gas will commence purchasing equal monthly balance of period volumes concurrent with a Commission Order and will continue each month through October 2011 to achieve a 75% fixed coverage ratio of winter only flowing supply by October 31, 2011. (Refer to Supplement 1 for illustrative purposes)
 - ii) Paragraphs 4) through 9) above apply to the April 2011 – March 2012 GCR Period.
- b) April 2012 – March 2013 GCR Period
 - i) DTE Gas will commence purchasing equal monthly volumes concurrent with a Commission Order and will continue each month through March 2012 to achieve a 75% fixed coverage ratio of total GCR Period requirements by March 31, 2012. (Refer to Supplement 1 for illustrative purposes)
 - ii) Paragraphs 4) through 9) above apply to the April 2012 – March 2013 GCR Period.
- c) In the event a Commission Order or Settlement Agreement is reached earlier than January 1, 2011, DTE Gas would commence purchases immediately which would extend the duration of the purchase period in order to achieve the targets described in paragraphs 10) a) i) and 10) b) i).

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the Application of)
DTE Gas Company for approval of a)
 Gas Cost Recovery Plan, 5-year Forecast)
 and Monthly GCR Factor for the 12 months)
 ending March 31, 2023)
)

Case No. U-21064

QUALIFICATIONS

AND

DIRECT TESTIMONY

OF

LUCIAN BRATU

DTE GAS COMPANY
QUALIFICATIONS AND DIRECT TESTIMONY OF LUCIAN BRATU

Line
No.

1 **Q1. What is your name and business address?**

2 A1. My name is Lucian Bratu. My business address is One Energy Plaza, Detroit,
3 Michigan 48226.

4

5 **Q2. By whom are you employed and in what capacity?**

6 A2. I am employed by DTE Gas Company (DTE Gas or Company) as a Senior Gas
7 Supply & Planning Analyst in Gas Supply and Planning.

8

9 **Q3. What is your educational background?**

10 A3. I earned a Bachelor of Electromechanical Engineering Degree from Polytechnic
11 University of Bucharest and a Master's Degree in Business Administration from
12 University of Windsor.

13

14 **Q4. Do you hold any professional designations?**

15 A4. I earned a Professional Engineer certification from Professional Engineers Ontario
16 (PEO), the licensing and regulation body for professional engineers in Ontario,
17 Canada.

18

19 **Q5. Have you had other applicable training?**

20 A5. I have completed The Oxford Princeton Programme's "Overview of the North
21 American Natural Gas Industry" and "North American Natural Gas Transportation
22 and Storage" training.

23

24

25

Line
No.

1 **Q6. What is your relevant business experience?**

2 A6. After an engineering career in the automotive industry, in 2009 I was hired full time
3 by Union Gas Limited, one of the two major natural gas distribution companies in
4 Ontario, Canada at that time where I held positions of increased responsibility in
5 Finance, Operations and Business Development. I was hired by DTE Energy in
6 August 2015 as a full time Senior Strategist in the Emergency Preparedness &
7 Response department of DTE Electric Company (DTE Electric) where I implemented
8 engineering solutions and process changes to reduce power outage duration and
9 restoration costs. In August 2017, I accepted a position in the Vegetation
10 Management department where I designed and implemented an herbicide treatment
11 program to control the vegetation in the right-of-way more effectively and at a
12 reduced cost. In July 2018, I accepted a position with DTE Gas as a Senior Gas
13 Supply & Planning Analyst in the Gas Supply and Planning Department.

14

15 **Q7. What are your responsibilities as a Senior Gas Supply and Planning Analyst in**
16 **Gas Supply and Planning?**

17 A7. I am responsible for the planning of natural gas supplies necessary to reliably meet
18 the requirements of DTE Gas's customers.

19

20 **Q8. Have you previously testified or submitted testimony in any regulatory**
21 **proceedings?**

22 A8. Yes. I have sponsored testimony before the MPSC in Case Nos. U-20210, U-20235
23 U-20236, U-20543 and U-20544. I also adopted testimony in MPSC Case No. U-
24 20076.

25

26

Line
No.

1 **Purpose of Testimony**

2 **Q9. What is the purpose of your testimony in this proceeding?**

3 A9. In my testimony, I will describe DTE Gas's operational plan for the 5-year period
4 April 1, 2022 through March 31, 2027 and I will detail the operational plan year April
5 1, 2022 to March 31, 2023. My testimony will support DTE Gas's operational
6 planning decisions as being reasonable and prudent and will cover the following
7 topics:

- 8 1. **Normal Weather Operating Plan** – How the planned supply purchase
9 requirements are developed for normal weather.
- 10 2. **Storage Plan** – Total storage field cyclable capacity of 135.1 Bcf has remained
11 unchanged.
- 12 3. **GCR/GCC Storage Allocation** – The allocation of 71.9 Bcf of cyclable storage
13 capacity to Gas Cost Recovery (GCR) and Gas Customer Choice (GCC) customers
14 has remained unchanged.
- 15 4. **GCC Plan** – DTE Gas administers the GCC program in accordance with DTE
16 Gas's GCC tariff.
- 17 5. **Design Day and Minimum Storage Balances** – How DTE Gas plans to meet
18 projected peak day requirements.
- 19 6. **Colder than Normal Protection** – How the planned supply purchase requirements
20 are adjusted for colder than normal (CTN) weather and that CTN exposure has
21 increased from last year's GCR Plan case by 3.2 Bcf, from 24.2 Bcf to 27.4 Bcf.
- 22 7. **Warmer than Normal Weather Operating Plan** - How the planned supply
23 purchase requirements are adjusted for warmer than normal weather.

Line
No.

1 8. **Other Operational Changes** - During the GCR year, factors influencing DTE
2 Gas's operations are continually changing. Refinements to the plan will be based
3 on current and projected market and operational conditions.

4 9. **Future Outlook** - There are no indications at this time that the operating plan for
5 April 2023 through March 2027 will have any significant changes from the April
6 2022 through March 2023 operating plan.

7

8 **Q10. Are you sponsoring any exhibits in this proceeding?**

9 A10. Yes. I am supporting the following exhibits:

| 10 | <u>Exhibit</u> | <u>Description</u> |
|----|----------------|--|
| 11 | A-13 | Normal Weather Source and Disposition |
| 12 | A-14 | Storage Capacity and Utilization |
| 13 | A-15 | Peak Day Supply Mix |
| 14 | A-16 | Colder-Than-Normal Storage Balances |
| 15 | A-17 | Colder-Than-Normal Weather Source and Disposition (CTN) |
| 16 | A-18 | Warmer-Than-Normal Weather Source and Disposition (WTN) |
| 17 | A-33 | Reliability Improvement – Temporary Alternatives for Belle River |
| 18 | | Dehydration Unit Failure |

19 **Q11. Were these exhibits prepared by you or under your direction?**

20 A11. Yes, they were.

21

22 **OPERATIONAL PLANNING**

23 **Q12. What data was used to develop the operating plan?**

24 A12. DTE Gas develops its operating plan from four primary sources. These sources are:

25 1) market requirements as supported by Company Witness Mr. Chapel

Line
No.

1 2) peak winter day flowing supply

2 3) minimum winter storage balances developed in conjunction with peak day
3 operations

4 4) CTN exposures

5 I provide support for the last three sources of data in my testimony.

6

7 **Q13. Are there factors other than the four discussed above that are important to the**
8 **development of DTE Gas's operating plan and supply purchasing pattern?**

9 A13. Yes. In addition to reliably meeting customers' requirements, protecting for peak
10 day operations, and CTN exposures, other factors that influence the supply
11 purchasing pattern include the GCC supply delivery pattern, achieving target storage
12 balances at the end of the injection season and at the end of the withdrawal season,
13 storage operations, WTN exposures, and the operational constraints of DTE Gas's
14 system.

15

16 **NORMAL WEATHER OPERATING PLAN**

17 **Q14. What is the monthly supply volume that DTE Gas plans to purchase under**
18 **normal weather conditions?**

19 A14. The monthly supply volume that DTE Gas plans to purchase under normal weather
20 conditions is identified on Exhibit A-13. This exhibit illustrates DTE Gas's normal
21 weather operating plan based on the normal weather market requirements projected
22 by Company Witness Chapel. As described by Company Witness Chapel, in his
23 testimony at page GHC-6, DTE Gas utilizes a 15-year normal weather pattern to
24 project customers' requirements. He also describes how DTE Gas assumes normal
25 weather to be expected and it's use of 15-year normal heating degree-days (HDDs)

Line
No.

1 for the operating plan April 2022 through March 2027, at page GHC-6 of his direct
2 testimony. Heating degree-day (HDD) is a measurement meant to quantify the
3 demand of energy needed to heat a building and is calculated as the number of
4 degrees that the average daily temperature is lower than the 65° F.

5
6 **Q15. Does DTE Gas expect that its actual monthly supply purchases will match those**
7 **contained in Exhibit A-13?**

8 A15. No, it does not. There are numerous factors that can influence monthly supply
9 purchases and cause it to deviate from the plan. It is highly unlikely that DTE Gas
10 will experience normal weather evenly throughout the year for the entire period
11 considered in the plan illustrated in Exhibit A-13. Weather patterns tend to occur
12 unevenly such that even if actual weather experienced was on average normal on an
13 annual basis, the actual storage balances and monthly purchases would differ from
14 those contained in DTE Gas's normal weather plan based on when during the year
15 the weather deviates from normal. Therefore, on at least a monthly basis during the
16 operating year, DTE Gas refines its planned supply volumes based on actual and
17 projected market requirements, operational conditions including weather variations,
18 actual storage balances, GCC migration, customer count, and changes in customer
19 usage such as conservation. DTE Gas also updates its planned purchases during the
20 plan year due to routine updated projections of lost gas, company use, gas in kind,
21 and GCC enrollment levels. In addition, the Company updates the market forecast
22 at least once during the plan year based on updated customer count and usage factors
23 assumptions.

Line
No.

1 **STORAGE PLAN**

2 **Q16. Where does DTE Gas secure its gas storage service?**

3 A16. DTE Gas uses its own facilities for gas storage. DTE Gas owns and operates four
4 gas storage fields in Michigan. The fields are located in different parts of the state
5 and each storage field has unique operating characteristics. The Six Lakes (Taggart)
6 field is located in central Michigan and is operated in a base load manner. The other
7 three fields, Belle River, Columbus, and West Columbus are located on the eastside
8 of the state in St. Clair County. Belle River and West Columbus are peaking fields,
9 while Columbus is considered a base load field.

10

11 **Q17. What is the difference between a base load storage field and a peaking storage**
12 **field?**

13 A17. The primary difference is the time required to inject or withdraw the full working
14 volumes from the storage field. A base load field typically requires the entire summer
15 injection season to refill and the entire winter withdrawal season to fully remove gas
16 from storage. By contrast, peak storage fields equipped with the necessary
17 compression and facilities, are capable of withdrawing gas at a much faster rate to
18 meet peak demands than base load fields. The time to fill and empty peak storage
19 fields is considerably shorter, with the actual timing dependent upon the
20 characteristics of each field.

21

22 **Q18. What is the capacity of DTE Gas's storage fields?**

23 A18. DTE Gas's current aggregate cyclable working storage capacity is 135.1 Bcf, and has
24 remained unchanged (Exhibit A-14, line 14, column (d)). Exhibit A-14 depicts DTE

Line
No.

1 Gas's cyclable working storage capacity and its utilization of total capacity by
2 customer group.

3

4 **Q19. Are there any factors that could affect this cyclable storage capacity of 135.1**
5 **Bcf?**

6 A19. Yes. DTE Gas may actually inject or withdraw more or less than the 135.1 Bcf of
7 current aggregate cyclable working storage gas. The maximum capacity may
8 actually be higher or lower depending on numerous operating conditions and design
9 assumptions. The maximum of this operating range may be constrained by system
10 operating conditions, storage field performance and reservoir characteristics. For
11 example, operating a base load field at the high end of its operating range could result
12 in gas migration to the outer limits of the reservoir increasing the likelihood that a
13 portion of the previously injected storage gas from that field may not be recoverable.
14 In addition, during periods of warmer than normal weather, withdrawals from the
15 base load storage field may be reduced. These withdrawals will be difficult to make
16 up at a later time due to such constraints as available compression and maximum
17 operating pressures. Other factors that affect the cycling capability of the storage
18 fields include performance of DTE Gas's transmission systems, compressor stations,
19 actual weather patterns, the duration of cold/warm weather, actual temperatures,
20 supply deliveries, loads experienced, and the particular injection and withdrawal
21 patterns of each storage field. System constraints and uneven weather patterns impact
22 storage operations and must be taken into consideration in planning for the safe and
23 efficient operation of the system.

24

Line
No.

1 **Q20. How do storage operations affect the supply plan?**

2 A20. Storage allows DTE Gas to buy steady daily volumes of gas supply. Changes in daily
3 market volumes are balanced by storage withdrawals or injections. Storage
4 withdrawals are most pronounced during the winter heating season when market
5 requirements exceed supply. By contrast, injections are predominant during the
6 summer when market requirements are low. Storage operations are especially critical
7 during the deep winter months to protect for peak day operations and CTN exposures.
8 DTE Gas designed its supply plan to meet the required minimum storage inventory
9 balances to ensure specific storage withdrawal rates necessary to meet peak day
10 sendout in combination with flowing supplies. Storage holds a portion of the CTN
11 protection volumes and must be managed on both a seasonal and daily basis. Another
12 critical time for storage operations occurs during WTN conditions at the end of the
13 injection season (October) and at the beginning of the winter withdrawal season in
14 November, when storage fields are near maximum capacity. Facility enhancement
15 projects or other system constraints such as storage field pressures, available
16 compression capacity, available storage field injection or withdrawal capability, and
17 unforeseen pipeline integrity compliance could also affect the supply plan.

18

19 **GCR/GCC STORAGE ALLOCATION**

20 **Q21. Does DTE Gas target a specific storage balance for GCR and GCC customers**
21 **at the end of the storage injection season?**

22 A21. Yes. DTE Gas plans for a specific storage balance on October 31 of each year, which
23 is the end of the injection season. The targeted storage level, in addition to winter
24 flowing supply, allows DTE Gas to meet normal winter market requirements and

Line
No.

1 maintain planned minimum storage balances. The targeted storage balance includes
2 the colder-than-normal protection (CTNP) gas held in storage.

3

4 **Q22. What is the targeted storage balance for GCR and GCC customers by**
5 **October 31, 2022?**

6 A22. Total working gas in storage by October 31 for both GCR and GCC customers is
7 planned at 70.1 Bcf regardless of the mix between GCR and GCC. See Exhibit A-
8 13, page 6 of 10, line 7, column (f).

9

10 **Q23. Has the targeted storage balance for GCR and GCC customers on October 31,**
11 **2022 changed since the 2021-2022 Plan Case?**

12 A23. No, the target storage balance on October 31 for GCR and GCC combined is 70.1
13 Bcf, unchanged from the 2022-2023 Plan Case.

14

15 **Q24. How much cyclable storage capacity does DTE Gas propose to allocate for use**
16 **by GCR and GCC customers in 2022-2023?**

17 A24. For 2022-2023, DTE Gas proposes to continue to allocate 71.9 Bcf of cyclable
18 storage capacity to GCR/GCC customers (Exhibit A-14, line 16, column (d)). The
19 details of DTE Gas's storage utilization are outlined in Exhibit A-14, lines 9-16. As
20 detailed in this Exhibit, the 71.9 Bcf of storage capacity for 2022-2023 is comprised
21 of 66.9 Bcf for both Normal and CTN working gas utilization (line 10), and 5 Bcf of
22 WTN/contingency space (line 11), totaling 71.9 Bcf (line 16).

23

Line
No.

1 **Q25. Does this 71.9 Bcf storage allocation for 2022-2023 GCR Plan Year represent a**
2 **change from the amount that DTE Gas allocated to GCR/GCC customers for**
3 **the 2021-2022 GCR Plan Year?**

4 A25. No. For the 2021-2022 GCR Plan Year, DTE Gas implemented a GCR/GCC cyclable
5 storage allocation volume of 71.9 Bcf. This is also the same 71.9 Bcf of cyclable
6 storage allocation that DTE Gas implemented for the prior 2020-2021 GCR Plan
7 Year. Additionally, this is the same 71.9 Bcf of cyclable storage allocation ordered
8 by the Commission on December 20, 2012, in the DTE Gas Rate Case Settlement in
9 Case No. U-16999.

10

11 **GCC PLAN**

12 **Q26. What are the specific supply parameters for the GCC program?**

13 A26. Each month, based on a supplier's enrollment of customers, DTE Gas will provide
14 each supplier with a daily flow volume that identifies the daily delivery requirement
15 normally using the 1/365th +/- 10% of total normal weather annual GCC customer
16 usage. Deliveries to the customer continue to be DTE Gas's responsibility.
17 Operationally, DTE Gas will operate and deliver gas to the GCC customers as if they
18 were DTE Gas sales customers.

19

20 **Q27. How does DTE Gas manage its supply strategy in conjunction with the GCC**
21 **program?**

22 A27. The annual GCC volume reflected in the Plan is approximately 21.8 Bcf (Exhibit A-
23 13, page 1 of 10, line 13, column (g)), which represents 124,088 customers. Because
24 DTE Gas's GCC tariff identifies it as the supplier of last resort (SOLR), DTE Gas
25 faces uncertainty in the event of a supplier defaulting or a customer returning to sales

Line
No.

1 service. DTE Gas continually monitors the number of customers and their associated
2 flow requirement moving between the GCC program and GCR sales. DTE Gas
3 adjusts its final monthly purchases to reflect the volumes remaining under GCR sales.
4 This approach allows DTE Gas to maintain sufficient daily winter flowing supply to
5 meet the needs of its customers and a sufficient daily summer flowing supply to meet
6 the volume requirements to fill storage sufficiently to meet operational plans.

7

8 **DESIGN DAY AND MINIMUM STORAGE BALANCES**

9 **Q28. What assumptions does System Planning use when modeling Design Day**
10 **operations for DTE Gas system?**

11 A28. For operating conditions, system requirements on a Design Day assume that
12 minimum storage balances, statewide coldest record temperatures, maximum
13 midstream withdrawal rates, and high EUT withdrawal rates will occur
14 simultaneously. Supply from a single storage field on the DTE Gas system can
15 account for up to 35% of total system demand on a Design Day. Gas that is withdrawn
16 from storage must flow through processing equipment to remove excess sediment
17 and moisture so that it complies with pipeline quality standards, meaning that the gas
18 is of the quality that it can be delivered to and utilized by our customers. In the current
19 Design Day plan, processing equipment at critical storage fields are forecasted to be
20 operating at their maximum capacity. Redundant units do not exist for these facilities
21 at all storage fields.

22

23

24

Line
No.

1 **Q29. Are there contingencies in place to address operational challenges on a Design**
2 **Day?**

3 A29. DTE Gas periodically assesses the risks to the system and have contingencies in place
4 to address operational challenges on a Design Day even as there is no imminent risk
5 to the system. The following contingencies are included in the Design Day plan:

6 **a. Coverage through redundant lines**

7 Coverage through redundant lines help alleviate transport constraints that may
8 occur when moving gas from one point to another on the transmission system.

9 The primary transmission system experiences the highest throughput and is
10 therefore the most critical part of the transmission system. It provides access to
11 most of the large pipeline interconnects, storage, and production facilities on DTE
12 Gas's system. It directly feeds the distribution systems supplying Southeast
13 Michigan market areas and secondary transmission systems, which serve greater
14 Michigan regions.

15 The DTE Gas primary transmission system transports gas to up to 70% of the
16 total DTE Gas market. Almost every transport path within this system is
17 comprised of redundant lines. Redundant lines serve as a duplicate feed to critical
18 areas of the system and run in parallel to one another. If service is lost from one
19 of these lines, gas can be rerouted through the alternate line.

20 **b. Reserve Compression**

21 Compression assets in critical locations are held in reserve to protect for unit
22 outages.

23 **c. Coverage for temperature variance**

24 Design Day temperatures are derived by identifying the lowest daily mean
25 temperatures experienced in the last sixty years in each of the sixteen separate

Line
No.

1 regions throughout DTE Gas's service territory. The temperatures are applied
2 coincidentally for added conservatism in the Design Day load calculation.
3 Coincidental application means that we presume that the coldest temperature in
4 each of the sixteen regions occurs on the same day. Temperatures are updated
5 every time a new record is set, and the Company reviews inputs annually.

6 **d. Storage Deliverability**

7 In the event of storage equipment failure, DTE Gas would maximize other storage
8 fields to their full capabilities. Stations could be reconfigured so that unprocessed
9 storage gas could blend with processed gas from other fields to achieve the lowest
10 moisture level possible under those conditions.

11

12 **Q30. What flowing supplies will DTE Gas need to meet projected peak-day**
13 **requirements?**

14 A30. Total end-of-month peak-day requirements are identified on line 26 of Exhibit A-15.
15 These requirements are provided by Company Witness Chapel (Exhibit A-5, page 2
16 of 2, line 6). For the 2022-2023 Plan Year, DTE Gas plans to hold 380 MMcf/d (400
17 MDth/day capacity assuming 1.052 MMBtu/Mcf heating value) of firm
18 transportation contracts for the winter operating season to meet requirements for
19 normal weather, colder than normal weather, design day, and SOLR. DTE Gas
20 projects it will flow approximately 334 MMcf/d of GCR supply for January through
21 March 2023, Exhibit A-15, line 2, to satisfy the projected normal winter
22 requirements. Consequently, the amount of GCR flowing gas supply necessary to
23 meet a design day will be approximately 413 MMcf/d. This volume is approximately
24 79 MMcf/d above the normal GCR flowing supplies, which may be purchased using
25 a combination of:

Line
No.

- 1 1) 66 MMcf/d of DTE Gas's remaining recallable firm transportation either on the
2 first of month or spot day market, and
3 2) Citygate purchases, depending on the availability of gas in storage at the time.
4 The remainder of the gas supply to serve January through March peak days will
5 come from DTE Gas's storage.

6

7 **Q31. Will DTE Gas utilize storage to satisfy peak day requirements?**

8 A31. Yes. Approximately 66% of DTE Gas's supply on a January 2023 peak day will be
9 provided from storage. Deliveries out of storage include deliveries to GCR, GCC,
10 EUT, including Exelon. This percentage does not include deliveries for midstream
11 services.

12

13 **Q32. What are DTE Gas's planned colder-than-normal storage balances?**

14 A32. The amount of DTE Gas's planned total storage balances for the CTN weather
15 exposure is identified in Exhibit A-17. The minimum total balance as shown in
16 Exhibit A-16, line 5, for January, February and March, is the planned quantity to
17 meet the peak day deliveries.

18

19 **Q33. Are DTE Gas's planned colder-than-normal storage balances inclusive of third-**
20 **party gas in storage?**

21 A33. Yes. Lines 2 and 3 of Exhibit A-16 represent estimated third-party storage balances
22 at the end of January, February and March in 2023. During the operating year, the
23 mix of the planned end-of-month volumes of DTE Gas and third-party customers'
24 gas is constantly adjusted in response to weather and third-party activity. DTE Gas
25 may be able to rely on additional third-party gas in inventory above what is included

Line
No.

1 in Exhibit A-16, lines 2 through 4, and reduce winter purchases while maintaining
2 peak-day minimum-storage balances necessary for storage deliverability. In any
3 event, DTE Gas will maintain the peak-day minimum-storage balances for the 2022-
4 2023 GCR plan year to provide the necessary peak-day withdrawal requirements
5 from storage.

6
7 **Q34. Are there other factors that DTE Gas considers when planning how to meet**
8 **projected peak-day requirements?**

9 A34. Yes. Besides analyzing the deliverability requirements and determining the pipeline
10 supply and storage deliveries necessary to meet projected peak-day requirements,
11 DTE Gas also develops contingency plans to address potential operations challenges,
12 including failure of different key components of DTE Gas's system.

13
14 **Q35. Following extreme weather events, has DTE Gas adopted measures to improve**
15 **its system reliability, mitigate adverse conditions and lower the risk of gas**
16 **shortages?**

17 A35. Yes. For instance, after the Polar Vortex winter of 2013-2014, DTE Gas adopted a
18 number of short term and long-term measures to address potential supply shortage
19 and mitigate the risk of curtailments should a similar weather event occur.

20 The interim solutions were:

- 21 1. A 4.8 Bcf parking service was purchased in the 2014-2015 GCR year in
22 MPSC Case No. U-17332-R to secure the necessary winter deliverability
23 requirements for GCR and GCC customers.

Line
No.

1 2. A 2.1 Bcf parking service was purchased in the 2015-2016 GCR Plan,
2 MPSC Case No. U-17691, to secure the necessary winter deliverability
3 requirements for GCR and GCC customers.

4 To permanently improve system performance and reliability in the long term, DTE
5 Gas:

6 1. Made capital improvements to the Columbus group storage fields and
7 surface facilities. The Company drilled three new horizontal wells in the
8 Columbus storage field, added a liquid extraction unit, improved liquid
9 handling of existing filter /separator, and added a dehydration unit at the
10 Columbus Compressor Station to enhance storage deliverability. The
11 Commission approved these improvements in its December 2016 order
12 in MPSC Case No. U-17999.

13 2. Enhanced the Belle River storage facility including a combination of
14 additional compression and additional retained non-cyclable base gas. The
15 Company constructed two new turbine driven compressor units and injected
16 1.9 Bcf of base gas at the Belle River storage field, as ordered in MPSC Case
17 No. U-17999.

18

19 **Q36. Was there a reliability assessment of DTE Gas's system performed following the**
20 **released by the MPSC (Michigan Public Services Commission) of its Statewide**
21 **Energy Assessment (SEA) report in September 2019?**

22 A36. Yes. In the months following the SEA release DTE Gas performed an assessment
23 and created a plan to improve DTE Gas's system reliability.

24

Line
No.

1 **Q37. Did DTE Gas extend its collaboration with other Michigan utilities to increase**
2 **the reliability of natural gas services to customers state-wide, as recommended**
3 **by the Statewide Energy Assessment (SEA) report?**

4 A37. Yes. DTE Gas and Consumers Energy entered into a Memorandum Of
5 Understanding (MOU) to provide each other mutual assistance in case of emergency.

6

7 **Q38. Were there any findings of DTE Gas's reliability assessment that impact**
8 **future GCR Plans?**

9 A38. Yes, a possible failure of the dehydration unit at Belle River storage field was
10 identified as the potentially critical event that would impact DTE Gas' ability to serve
11 its customers.

12

13 **Q39. Is GCR/GCC mitigating the entire potential exposure that would result from a**
14 **failure of the dehydration unit at Belle River storage field?**

15 A39. No. The GCR/GCC customer group was allocated its share of the deliverability
16 exposure that was directly attributable to a possible failure of the dehydration
17 equipment at Belle River storage field based on its respective share of design day
18 storage withdrawal requirements each month.

19

20 **Q40. What is the evaluated GCR/GCC deliverability exposure attributable to a**
21 **possible failure of the dehydration equipment at Belle River storage field?**

22 A40. The evaluated GCR/GCC deliverability exposure attributable to a possible failure of
23 the dehydration equipment at Belle River storage field is 318 MMcf/d for January
24 2023 and 306 MMcf/d for February 2023.

25

Line
No.

1 **Q41. How will the deliverability exposures described above be mitigated for winter**
2 **2022-23?**

3 A41. Storage deliverability is an integral part of DTE Gas' supply portfolio.
4 The deliverability exposures for winter 2022-23 described above might be mitigated
5 with a Gas Supply Physical Call Option for 250,000 Dth/d, or 237.6 MMcf/d for any
6 10 days in January 2023 and February 2023.

7

8 **Q42. Is the Gas Supply Physical Call Option contract new for the 2022-2023 gas year?**

9 A42. No. The Gas Supply Physical Call Option was purchased in September 2020 for a
10 two year term covering 2020-2021 and 2021-2022 gas years with the possibility to
11 extend it for another year if both parties mutually agree.

12

13 **Q43. Why is the mitigated volume lower than the deliverability exposure for January**
14 **and February?**

15 A43. In the event that a failure with the dehydration unit at Belle River occurred, the Gas
16 Supply Physical Call Option could mitigate at least 75% of the supply loss by the
17 outage. The remaining 25% could be procured on the spot market. DTE Gas believes
18 this is a prudent approach to ensure system reliability in the event of a failure of the
19 dehydration unit at Belle River storage field.

20

21 **Q44. What strategic alternatives were evaluated to improve system reliability?**

22 A44. Five fundamental strategic alternatives were identified to improve system reliability
23 by mitigating the GCR/GCC deliverability exposure described above. A team of
24 representatives from Regulatory, Legal, Controllers Office, System Planning,

Line
No.

1 Marketing and Gas Supply worked together to identify and analyze these alternatives.

2 The alternatives were as follows:

3 a) Purchasing just-in-time gas when needed

4 b) Increasing base gas inventory thus enhancing storage fields deliverability

5 c) Purchasing gas in November - January to increase storage balances over the
6 winter thus enhancing storage fields deliverability

7 d) Buying a deliverability service through third party parking of gas in the DTE Gas
8 storage fields thus enhancing storage fields deliverability

9 e) Buying a Gas Supply Physical Call Option service that would be utilized when
10 and as needed to replace storage withdrawal shortfall volumes

11 All fundamental strategic alternatives and its various iterations are identified in
12 Exhibit A-33.

13

14 **Q45. Please describe the strategic alternative of just-in-time gas purchases as**
15 **mentioned above.**

16 A45. The strategic alternative of purchasing gas just-in-time is a reactive solution that
17 consists of purchasing the GCR/GCC volume of gas needed to ensure that natural gas
18 service to GCR/GCC customers is maintained if the dehydration unit fails. The
19 GCR/GCC gas will be purchased on the daily market only when the natural gas
20 service disruption is imminent and only for the volume needed at that time. The
21 maximum volume of GCR/GCC gas purchased just-in-time if Peak Day weather
22 would occur during the winter is approximately 0.2 Bcf per day. This strategic
23 alternative was rejected because it has the highest risk as the required volume might
24 not be available when needed.

25

Line
No.

1 **Q46. Please describe the strategic alternative of increasing base gas inventory as**
2 **mentioned above.**

3 A46. The strategic alternative of increasing the base gas inventory consists of purchasing
4 9.4 Bcf of GCR/GCC non-cyclable working gas to increase the base gas inventory
5 which in turn would increase storage deliverability. The gas would be purchased
6 during the summer to hold in inventory through the entire gas year. This strategic
7 alternative was rejected because of the high costs associated with it and lack of
8 flexibility given the volume of gas needed.

9

10 **Q47. Please describe the strategic alternative of purchasing gas to hold in storage**
11 **until summer as mentioned above.**

12 A47. The strategic alternative of purchasing gas to hold in storage until summer consists
13 of GCR/GCC purchasing non-cyclable working gas to increase winter deliverability
14 and mitigate the January, February and March deliverability exposure. The gas would
15 be purchased during or prior to January and would be backed off gas purchases during
16 the summer for the following gas year. The GCR/GCC volume needed is between
17 7.3 Bcf and 9.4 Bcf depending on the timing of gas purchases. This strategic
18 alternative was rejected because of the high costs associated with it and lack of
19 flexibility given the volume of gas needed.

20

21 **Q48. Please describe the strategic alternative of buying a deliverability service**
22 **through third party parking of gas as mentioned above.**

23 A48. A park is a transaction that consists of DTE Gas paying a third party to park (i.e.
24 store) gas in our storage facility for a specified amount of time. A contract is
25 structured that defines how much gas is received, the price, when the gas will be

Line
No.

1 parked (i.e. stored) and when the third party can withdraw their gas from our storage
2 facility. Contract terms and conditions are defined between DTE Gas and the third
3 party that the gas is procured from. The parked volume needed is between 7.3 Bcf
4 and 9.4 Bcf depending on the timing when the gas will be delivered to DTE Gas to
5 be parked (i.e. stored). This strategic alternative was rejected because of the high
6 costs associated with it and lack of flexibility given the volume of gas needed.

7

8 **Q49. Please describe the strategic alternative of buying a Gas Supply Physical Call**
9 **Option service as mentioned above.**

10 A49. A Gas Supply Physical Call Option is a transaction that functions much like an
11 insurance policy: DTE Gas is paying a third party to “stand-by” and be ready to
12 deliver up to a maximum daily quantity of gas to us at citygate when DTE Gas “calls
13 on it” (i.e. DTE Gas requires it), for a limited number of days. DTE Gas can call for
14 any quantity of gas up to the contracted maximum daily quantity on any given day
15 during the agreed upon months up to the maximum number of days contracted. A
16 nominal fixed fee is paid to the third party regardless of whether DTE Gas requests
17 gas delivery or not. If the call option is executed, DTE will typically pay the market
18 price plus a premium. This alternative was selected to improve system reliability
19 because of its cost effectiveness, high reliability and high flexibility.

20

21 **Q50. Which alternative did the company determine was the most reasonable and**
22 **prudent?**

23 A50. For the reasons described above, the Company determined that the Gas Supply
24 Physical Call Option was the most reasonable and prudent.

25

Line
No.

1 **Q51. What are the terms of the Gas Supply Physical Call Option?**

2 A51. DTE Gas purchased a Gas Supply Physical Call Option for 237.6 MMcf/d for any 10
3 days in January - February 2021, any 10 days in January - February 2022 and a
4 renewal clause for any 10 days in January - February 2023. If DTE needs additional
5 supply, it can execute the option for any quantity of gas up to 237.6 MMcf/d to be
6 delivered by the supplier to DTE Gas during any 10 days of January and February
7 (does not have to be consecutive days). DTE Gas pays a fixed \$250,000 Demand Fee
8 each year as a nominal premium which is not impacted by whether the gas is called
9 for delivery or not. If the Gas Supply Physical Call Option is executed, DTE Gas will
10 pay the MichCon gas price on the delivery day and a premium between \$0.80 - \$2.00
11 per Dth, depending on the quantity of gas delivered.

12

13 **Q52. What costs associated with the Gas Supply Physical Call Option is DTE Gas**
14 **asking to recover in this case?**

15 A52. In this Plan filing, DTE Gas is asking to recover the Gas Supply Physical Call Option
16 costs associated with the January - February 2023 term. The cost associated with
17 years outside of the scope of this Plan are discussed in the filings relevant to those
18 time periods.

19

20 **Q53. Why did the Company believe it was reasonable and prudent to purchase a 237.6**
21 **MMcf/d Gas Supply Physical Call Option to improve its system reliability?**

22 A53. The purchase of 237.6 MMcf/d Gas Supply Physical Call Option can solve a
23 significant portion of the storage deliverability exposure allocated to GCR as
24 described above and it was the most flexible, cost effective and lower risk alternative.

25

Line
No.

1 **Q54. Is the 237.6 MMcf/d Gas Supply Physical Call Option a long-term solution?**

2 A54. No, the 237.6 MMcf/d Gas Supply Physical Call Option is a short-term interim
3 solution while long term solutions are being identified and analyzed.

4

5 **COLDER-THAN-NORMAL PROTECTION**

6 **Q55. What is a colder-than-normal protection (CTNP) volume?**

7 A55. CTNP is a calculated volume of gas that allows DTE Gas to maintain the minimum
8 storage balances identified in Exhibit A-16, line 5, should colder-than-normal
9 weather persist over a sustained period, or otherwise higher than forecasted sendout
10 occurs. The CTNP volume consists of storage gas and, if necessary, incremental
11 purchases.

12

13 **Q56. What is DTE Gas's planned maximum winter CTN exposure?**

14 A56. DTE Gas's planned maximum winter CTN exposure for the 2022-2023 GCR plan
15 year represents the incremental customer usage that may occur in the event DTE Gas
16 were to again experience the coldest winter in its history. DTE Gas calculates its
17 maximum winter CTN exposure using the actual monthly Heating Degree Days
18 (HDD) experienced in 2013-2014, which is the coldest November through March
19 winter period since 1951. These actual monthly HDDs from 2013-2014 were then
20 applied to the forecasting model, which is more fully described by Company Witness
21 Chapel, to calculate the winter markets if such weather were to occur now. The
22 maximum CTN exposure represents the difference between the planned normal
23 winter requirements and the maximum CTN requirements. The total colder-than-
24 normal exposure volume for all GCC and GCR customers is 27.4 Bcf. Based on
25 numerous prior Company proposals and Commission approvals, DTE Gas continues

Line
No.

1 to prepare a CTN plan based on the coldest historical period since 1951 to make
2 certain that the Company will be prepared and able to continue to provide reliable
3 gas supply for its customers should it experience a level of severe cold weather that
4 it has experienced in the past. DTE Gas considers all 70 years of weather history
5 (1951-2020) in designing its Plans to ensure that customers will be protected for all
6 possible weather extremes and weather patterns that have occurred.

7
8 **Q57. Has DTE Gas's maximum CTN exposure changed since the 2021-2022 Plan**
9 **Case?**

10 A57. Yes. The maximum winter CTN exposure has increased from last year's Plan case
11 by 3.2 Bcf, from 24.2 Bcf to 27.4 Bcf (Exhibit A-17, line 7, page 1 of 2, column (e)).

12
13 **Q58. How is the level of CTNP volume supplied?**

14 A58. For the winter of 2022-2023, DTE Gas plans to enter the winter season with 5 Bcf of gas
15 in storage for CTNP. In addition, DTE Gas plans to mitigate a portion of the risk of
16 the 27.4 Bcf CTN exposure with 3 Bcf of normal weather purchases in excess of
17 normal weather requirements (made ratably) from November 2022 to March 2023.
18 Furthermore, DTE Gas will monitor actual and projected CTN weather exposures
19 throughout the winter and will obtain additional CTNP supply via incremental winter
20 purchases if gas in storage is insufficient to meet the potential exposure and maintain
21 necessary minimum storage balances. A CTN plan for the 2022-2023 winter is shown
22 on Exhibit A-17.

Line
No.

1 **Q59. How will DTE Gas determine when to purchase incremental supply for CTN?**

2 A59. Timing of the incremental purchases, and whether these purchases will be first of
3 month (FOM) or daily spot purchases, will depend upon the severity of the winter
4 season, at what point in time the cold weather is actually experienced, supply
5 liquidity, and projected storage balances. DTE Gas plans to limit mid-month daily
6 spot purchases to the most operationally critical deep winter months of January
7 through March. In order to minimize price and supply reliability risk, DTE Gas plans
8 to purchase sufficient FOM quantities to limit daily spot purchases. If, after the
9 month has begun, DTE Gas assesses that FOM flowing supply levels are not adequate
10 to meet operational requirements based on actual and projected storage balances,
11 potential cold weather exposures and weather forecasts, then it will begin to layer in
12 day gas purchases. On a normal winter basis, DTE Gas plans to fill 334 MMcf/d of
13 its 380 MMcf/d of firm pipeline entitlement and release 46 MMcf/d of recallable
14 capacity that would be available for FOM or daily CTN gas purchases and/or peak-
15 day requirements.

16

17 **Q60. Does peak day and CTN planning end at March 31?**

18 A60. No. DTE Gas plans for an end-of-month peak day based on the coldest historical
19 temperatures from the 22nd of that month to the 7th of the following month. It is
20 possible for an end of March peak day temperature to occur through the end of the
21 first week in April when storage balances are at their minimums.

22

23

24

Line
No.

1 **Q61. Is it possible that DTE Gas will need to purchase incremental supply in April**
2 **for CTN and/or peak day protection?**

3 A61. Yes. Operating experience has shown that CTN winter weather could extend into a
4 CTN April. Storage withdrawals for GCR/GCC could continue into the month of
5 April, even under normal weather conditions. If GCR storage balances are projected
6 to be at or near minimums, then DTE Gas may need to purchase incremental supply
7 in April for CTN volumetric coverage and/or peak day protection in the same manner
8 as described above for the deep winter months.

9

10 **Q62. What is DTE Gas's plan if CTN, or otherwise higher than forecasted sendout,**
11 **should occur during the summer months (April – October)?**

12 A62. As the summer injection season progresses, if CTN weather or otherwise higher
13 sendout occurs, then DTE Gas plans to increase its remaining planned summer
14 purchases in order to achieve its planned normal end-of-injection-season storage
15 target by October 31. For each remaining summer month, DTE Gas plans to evenly
16 purchase its remaining planned summer purchases. However, if DTE Gas
17 experiences higher sendout in October, then the October 31 storage balance will
18 likely fall short of the normal weather target, thereby effectively consuming a portion
19 of the CTNP held in storage. If this were to occur, then DTE Gas plans to replenish
20 CTNP in November, with any remainder replaced in December, prior to entering the
21 deep winter months of January - March. These replacement purchases, as described
22 above, are subject to operational limitations, particularly scheduled compressor
23 maintenance, potential WTN weather exposures, and available storage field injection
24 capacity.

25

Line
No.

1 **WARMER-THAN-NORMAL WEATHER OPERATING PLAN**

2 **Q63. What is DTE Gas's plan if warmer-than-normal weather, or otherwise lower**
3 **than forecasted sendout, should occur during the summer months (April –**
4 **October)?**

5 A63. As the summer injection season progresses and warmer-than-normal conditions
6 occur, or otherwise lower than forecasted sendout occurs, DTE Gas plans to evenly
7 purchase the reduced remaining planned summer purchase requirements, subject to
8 operational limitations, to achieve its planned normal end-of-injection season
9 working-gas-storage target at October 31, 2022 of 70.1 Bcf. However, depending on
10 the timing of the reduced sendout and the associated reduction to supply, a volume
11 of gas associated with the September and primarily the October weather variation
12 could remain in storage. DTE Gas reserves 5 Bcf of storage space to accommodate
13 higher injections due to lower than expected sendout and other unpredictable system
14 imbalances in September, October and early November. If DTE Gas experiences
15 lower sendout than planned in October and expects to enter the winter operating
16 season with significantly more GCR and GCC gas in storage above the normal
17 weather injection season target, then November planned purchases may be reduced
18 to permit operational flexibility necessary for compression maintenance, maximum
19 daily flowing supply limitations, limitations on storage field injection capability,
20 continued warmer-than-normal exposure, and storage field maximum capacity
21 limitations.

22
23
24

Line
No.

1 **Q64. What is DTE Gas's plan if warmer-than-normal weather occurs during the**
2 **winter months (November – March)?**

3 A64. DTE Gas's WTN Plan is provided in Exhibit A-18. It is based on the maximum
4 WTN exposure from the 2011-2012 winter. As illustrated in Exhibit A-18, DTE Gas
5 may begin to reduce flowing supply, if, as the winter progresses, warmer-than-normal
6 weather continues, and storage balances continue to exceed Plan levels. Before any
7 reduction in purchases is implemented, the estimated cumulative WTN surplus is
8 reduced by 1 Bcf for margin of accuracy purposes. The WTN surplus is the excess
9 amount of gas in storage above normal planned target. It includes the net result of a
10 cumulative reduction in sendout resulting from WTN weather actually experienced
11 in prior months offset by the cumulative reduction, if any, of purchases already made
12 in prior months. A reduction in purchases would be at 50% of the cumulative WTN
13 surplus for December purchases, and at a reduced percentage for the deep winter
14 months of January through March, approximately in the range of 35-40% of the WTN
15 surplus.

16

17 **Q65. Are there limits to the WTN Plan supply reductions?**

18 A65. Yes, DTE Gas must limit the reduction in flowing supply determined by the above
19 factors to an amount that will result in sufficient flowing supply to meet contracted
20 supply and the requirements of customers located in isolated regions, such as
21 Michigan's Upper Peninsula, that can only be served by supply delivered from certain
22 pipelines.

23

24

25

Line
No.

1 **Q66. What will DTE Gas do if storage levels exceed plan levels on March 31?**

2 A66. If by March 31, gas remains in storage above the Plan level, then DTE Gas plans to
3 reduce its planned summer purchases in order to achieve its planned October 31 end-
4 of-injection-season storage target. DTE Gas plans to evenly purchase each month the
5 reduced summer purchase requirements, subject to operational limitations.

6

7 **OTHER OPERATIONAL CHANGES**

8 **Q67. How likely is it that DTE Gas's Operational Plan will change during the 2022-**
9 **2023 GCR Plan Year?**

10 A67. During a typical GCR year, factors influencing DTE Gas's operations are continually
11 changing. Such factors may include changes in weather, GCC migration, customer
12 usage, customer count, supply liquidity, changes in inventory levels, and changes in
13 operations. Therefore, before and during the 2022-2023 GCR Year, there is a
14 reasonable likelihood that DTE Gas will continue to refine its operational plan based
15 on current and projected market and operational conditions.

16

17 **FUTURE OUTLOOK**

18 **Q68. Does DTE Gas's Operational Plan for the operating years April 2023-March**
19 **2027 differ from the 2022-2023 Operating Plan?**

20 A68. At the time of the filing of the GCR Plan case for the 2022-2023 GCR Year, there
21 are no indications that the operating plan will have any significant changes over the
22 next five years. With regards to storage utilization, DTE Gas's GCR/GCC storage
23 allocation plan for the operating years April 2022-March 2027 does not differ from
24 the 2022-2023 GCR Plan Year. The Company is currently proposing to maintain a
25 GCR/GCC cyclable storage allocation of 71.9 Bcf for 2022-2023 and all subsequent

Line
No.

1 years of the 5-Year forecast period. However, at some point in the future, depending
2 on increases or decreases in requirements or other operational factors, DTE Gas may
3 decide to modify this storage allocation plan for the future operating years beginning
4 with the 2023-2024 GCR Plan year.

5

6 **Q69. Does this complete your direct testimony?**

7 A69. Yes, it does.

In the matter of the Application of)
DTE Gas Company for approval of a)
Gas Cost Recovery Plan, 5-year Forecast, and)
Monthly GCR Factor for the 12 months ending)
March 31, 2023)

QUALIFICATIONS

AND

DIRECT TESTIMONY

OF

TIMOTHY J. KRYSINSKI

DTE GAS COMPANY
QUALIFICATIONS AND DIRECT TESTIMONY OF TIMOTHY J. KRYSINSKI

Line
No.

1 **Q1. What is your name and address, and by whom you are employed?**

2 A1. My name is Timothy J. Krysinski. My business address is One Energy Plaza, Detroit,
3 Michigan 48226. I am employed by DTE Energy Corporate Services, LLC (DTE
4 Energy) as a Principal Project Manager in the Regulatory Affairs Gas Strategy group.

5

6 **Q2. What is your educational background?**

7 A2. I have a Bachelor's Degree in Accounting and a Master of Science Degree in Finance.
8 Both degrees were earned from Walsh College in Troy, Michigan.

9

10 **Q3. Do you hold any professional designations?**

11 A3. I am a Certified Public Accountant. My certification is from the Board of Examiners
12 of the University of Illinois.

13

14 **Q4. Have you had other regulatory training?**

15 A4. I have attended seminars on regulatory topics held by the American Gas Association
16 and the Edison Electric Institute. I also completed a two-day Regulatory and Rates
17 seminar given by Electric Utility Consultants, Inc. (EUCI) and a week-long
18 Advanced Regulatory Studies Program given by the Institute of Public Utilities.

19

20 **Q5. What is your work experience?**

21 A5. I joined DTE Energy in 2002 as part of the Controllers Budget, Forecast and
22 Reporting group where I was primarily responsible for internal management
23 reporting. Early in 2005, I accepted the position of Senior Project Analyst in the
24 Facilities, Design and Construction organization where I managed the capital
25 appropriation process in support of their asset preservation program. Late in 2005, I

Line
No.

1 transferred back into the Asset Management department in a Senior Business
2 Financial Analyst role. My initial focus was to assist with implementation of the first
3 wave of the enterprise business solution (EBS) migration. Subsequent
4 responsibilities included budget appropriations, capital project tracking, Sarbanes-
5 Oxley compliance testing, and depreciation work. In 2009, I transferred to a decision
6 support role for Distribution Operations where I provided financial support to the
7 regional managers responsible for Service Operations. In June 2013, I moved to the
8 Regulatory Accounting & Strategy group within the Controllers organization where
9 my responsibilities included researching regulatory accounting issues, drafting white
10 papers, and participating in case filings. In April 2015, I was asked to return to the
11 Asset Management department to assist with conversion activities associated with
12 the launch of the PowerPlan asset system. In July 2016, I transferred to the
13 Regulatory Affairs organization. I was promoted to Principal Project Manager in
14 May 2018. Prior to joining DTE Energy, I spent several years working at various
15 positions in the Accounting department and in the Customer Service organization at
16 TRW Occupant Safety Systems located in Washington, Michigan.

17

18 **Q6. What are your responsibilities in your current position?**

19 A6. My primary responsibilities are monitoring proceedings before the Federal Energy
20 Regulatory Commission (FERC) and the Canada Energy Regulator (CER) with the
21 purpose of participating in proceedings that could materially affect DTE Gas and its
22 customers. Participation can mean filing comments, or filing as an intervenor, and/or
23 active, ongoing participation in contested cases or settlement negotiations.
24 Additional responsibilities include managing cases before the Michigan Public
25 Service Commission (MPSC), providing witness testimony in DTE Gas's GCR

Line
No.

1 proceedings, providing regulatory support to witnesses in various proceedings before
2 the MPSC, and researching issues related to Federal and State regulatory matters.

3

4 **Q7. Have you previously testified before any regulatory body?**

5 A7. Yes, I sponsored testimony to the MPSC in Case Nos. U-17762; U-17763; U-17941-
6 R; U-18152; U-18412; U-20076; U-20210; U-20235; U-20236; U-20543; U-20544;
7 and U-20816. I also adopted testimony in MPSC Case No. U-17691-R.

8

Line
No.

1 **Purpose of Testimony**

2 **Q8. What is the purpose of your testimony in this proceeding?**

3 A8. My testimony provides an overview of specific Federal regulatory issues that affect
4 DTE Gas and activities conducted by DTE Gas to minimize costs incurred under its
5 interstate pipeline transportation agreements. I also sponsor certain gas
6 transportation cost assumptions that Witness Schiffer uses to develop the forecast of
7 gas costs from DTE Gas's pipeline transporters. Specifically, my testimony
8 addresses:

- 9 A) DTE Gas's Federal regulatory policies related to pipeline transporters;
10 B) The ongoing rate case proceeding of Panhandle Eastern Pipeline
11 Company (Panhandle);
12 C) The forecast rates for ANR Pipeline Company's (ANR) firm
13 transportation services, and the firm transportation rate forecast for DTE
14 Gas's other transportation suppliers. These other pipelines are Viking Gas
15 Transmission Company (Viking), Great Lakes Gas Transmission Limited
16 (Great Lakes), Panhandle, NEXUS Gas Transmission, LLC (NEXUS),
17 Vector Pipeline L.P. (Vector), and DTM Michigan Gathering Company
18 (DTM Gathering).

19

20 **Q9. Are you sponsoring any exhibits in this proceeding?**

21 A9. Yes. I am sponsoring the following exhibit:

| 22 <u>Exhibit</u> | <u>Description</u> |
|-------------------|--|
| 23 A-19 | Forecast ANR, Viking, Great Lakes, Panhandle, NEXUS, Vector, |
| 24 | and DTM Gathering Rates. |

25

Line
No.

1 **Q10. Was this exhibit prepared by you or under your direction?**

2 A10. Yes, it was.

3

4 **A) Federal Regulatory Policies**

5 **Q11. What are DTE Gas's Federal regulatory policies as they relate to its interstate**
6 **pipeline transporters?**

7 A11. It is DTE Gas's policy to monitor all rate-related applications filed at the FERC and
8 participate in proceedings that may impact DTE Gas's cost of gas transportation.
9 DTE Gas also monitors FERC rulemaking proceedings affecting pipeline regulation
10 and follows other FERC and CER activities that could ultimately affect DTE Gas's
11 pipeline transporters.

12

13 **B) Panhandle Section 5 and Section 4 proceedings**

14 **Q12. What action did FERC take in 2019 related to Panhandle Eastern Pipeline**
15 **Company?**

16 A12. On January 16, 2019, in Docket No. RP19-78-000, FERC initiated an investigation,
17 pursuant to Section 5 of the Natural Gas Act (NGA), to determine whether the rates
18 charged by Panhandle were just and reasonable and set the matter for hearing. Based
19 upon a review of Panhandle's Form No. 501-G filing and other information on file
20 with the Commission, FERC stated that Panhandle may be over-recovering its cost
21 of service, causing Panhandle's rates to be unjust and unreasonable.

22

23 **Q13. What subsequent actions were taken in Docket No. RP19-78-000, the Panhandle**
24 **Section 5 case?**

Line
No.

1 A13. On April 1, 2019 Panhandle filed a cost and revenue study which included actual
2 costs for the 12-month period ending November 30, 2018. The cost and revenue
3 study reflected an increase over Panhandle's currently existing rates. On May 20,
4 2019 FERC Trial Staff filed top sheets, which indicated that a significant decrease in
5 rates should take place. FERC Trial Staff also offered a black box settlement option,
6 which was greater than the top sheets – yet still was a decrease relative to current
7 rates. Panhandle then offered a counter-settlement on June 5, 2019. Their
8 counteroffer was higher than their original Section 5 as-filed amounts. When asked
9 how they could support an increase over and above their as-filed Section 5 rates,
10 Panhandle responded that they were now including a negative salvage depreciation
11 component in their cost of service. Settlement talks stalled at that point. Lastly, on
12 August 14, 2019 FERC Trial Staff filed their direct testimony in the Section 5 case.
13 Their testimony reflected a decrease to the cost of service (below the top sheet
14 amount and below their initial black box settlement offer). Table 1 below shows the
15 timing of these actions in RP19-78-000, and the related cost of service amounts.
16

| Table 1 | | | | |
|--|--|---|--|--|
| Cost of Service | | | | |
| Amounts | | | | |
| (\$000's) | | | | |
| 1-Apr-19 RP19-78-000 Panhandle As-Filed | 20-May-19 FERC Trial Staff Top Sheets | 20-May-19 Trial Staff Black Box Settlement Offer | 5-Jun-19 Panhandle Settlement Counter Offer | 14-Aug-19 FERC Trial Staff Direct Testimony |
| \$341,772 | \$255,755 | \$278,000 | \$363,547 | \$239,417 |

17

18 **Q14. What event occurred on August 30, 2019?**

Line
No.

1 A14. On August 30, 2019 Panhandle filed a Section 4 general rate case in Docket No.
2 RP19-1523-000. The Section 4 general rate case as-filed reflected a cost of service
3 amount of \$407.9 million. Panhandle stated that the principal factors supporting the
4 increased cost of service include:
5 (a) establishment of a negative salvage rate and a terminal decommissioning
6 expense;
7 (b) an increase in depreciation expense;
8 (c) an increase in taxes – other than income;
9 (d) an increase in return; and
10 (e) elimination of income taxes as a result of a change in corporate structure.

11

12 **Q15. What change in corporate structure was Panhandle referring to in item (e)**
13 **above?**

14 A15. Panhandle announced that they “restructured” their corporate entity ownership
15 structure effective July 1, 2019. Panhandle stated it is now an indirect subsidiary of
16 a master limited partnership, and therefore is no longer owned by an entity subject to
17 federal income tax.

18

19 **Q16. Has FERC responded to the Panhandle Section 4 filing?**

20 A16. Yes, FERC issued a Hearing and Suspension Order on September 30, 2019. The
21 Order accepted Panhandle’s tariff records and suspended the rates subject to refund
22 and subject to the outcome of a hearing and technical conference - making them
23 effective beginning March 1, 2020. The Order also denied Panhandle’s request to
24 terminate the Section 5 proceeding. Then on October 1, 2019, the Chief Judge issued

Line
No.

1 an Order stating that the Section 4 and the Section 5 proceedings be consolidated -
2 citing administrative efficiency as the main reason.

3

4 **Q17. What impact does this Section 4 filing have on the transportation contract rates**
5 **DTE Gas holds with Panhandle?**

6 A17. As of March 1, 2020, the as-filed rates of the Section 4 filing went into effect and
7 now DTE Gas is paying significantly higher rates for the same firm transportation
8 service. DTE Gas has experienced an approximately 59% increase in rates. These
9 rates are, however, subject to refund - if the rates that the FERC ultimately approves
10 as just and reasonable - are lower than the Section 4 as-filed rates.

11

12 **Q18. Has DTE Gas intervened in either the Section 5 or the Section 4 filings?**

13 A18. Yes, DTE Gas is an intervenor and an active participant in both filings.

14

15 **Q19. What specific actions has DTE Gas undertaken thus far?**

16 A19. In addition to filing as an intervenor in both RP19-78-000 and RP19-1523-000, DTE
17 Gas has collaborated with FERC Trial Staff, outside counsel, other Michigan-based
18 intervenors (including Consumers Energy Company, the Michigan Public Service
19 Commission Staff, and SEMCO Energy Gas Company), and other similarly-situated,
20 long-haul shippers. The collaboration remains centered around advocating for just
21 and reasonable rates for all shippers that have contract paths similar to DTE Gas.

22

23 **Q20. Has DTE Gas filed any motions in either of the Panhandle proceedings?**

24 A20. Yes, on September 20, 2019 DTE Gas along with the other Michigan Parties filed an
25 answer in opposition to Panhandle's motion to terminate the Section 5 proceeding.

Line
No.

1 Also, on October 30, 2019 the Michigan Parties filed a request for clarification or
2 rehearing. The Motion sought clarification with respect to an issue raised in
3 Paragraph 36 of the Hearing and Suspension Order, where the Commission denied
4 Panhandle's Motion to terminate the Panhandle Section 5 Case. Lastly, on April 30,
5 2020, DTE Gas and the Michigan Parties filed an Answer in Opposition to
6 Panhandle's (second) Motion to terminate the Section 5 Case. On June 18, 2020,
7 FERC issued their Order addressing the Michigan Parties Motions - the motions were
8 denied. Additionally, Panhandle's second motion to terminate the Section 5
9 proceeding was also denied.

10
11 **Q21. What is the current status of the Panhandle settlement talks?**

12 A21. DTE Gas and other interveners met with Panhandle (in Washington DC, and via
13 phone conference) in the context of settlement negotiations. The last settlement
14 conference was held via WebEx on April 23, 2020. At that conference, group
15 discussions among all the parties took place, along with separate discussions and
16 ALJ-lead breakout sessions designed to help the parties move toward settlement. In
17 the end, it was recognized that the interveners and Panhandle remained far apart on
18 key issues. On August 24, 2020 the settlement judge issued an order declaring an
19 impasse – which was followed by an order from the Chief Judge (on August 25)
20 terminating further settlement judge procedures. Litigation is not paused during
21 settlement negotiations - meaning the Section 4 and Section 5 litigated cases proceed
22 in parallel while the parties also pursue a possible settlement.

Line
No.

1 **Q22. What is the current status of the Panhandle trial proceeding?**

2 A22. Virtual cross examination was held from August 25 through September 16, 2020. On
3 September 18, 2020, Panhandle filed a motion to have the testimony of the FERC
4 Trial Staff ROE witness stricken from the record. Panhandle claimed the FERC
5 witness plagiarized his testimony by copying testimony from other FERC pipeline
6 cases and using as his own. On October 6, 2020 the ALJ issued an order denying
7 Panhandle's motion. The ALJ found that the ROE witness, "*applied consistently*
8 *interpreted Commission policies to the unique facts involved in this proceeding and*
9 *then drew his own independent conclusions based on his analytical experience.*"
10 Further, on October 13, 2020 Panhandle filed a Petition for Rehearing with the D.C.
11 Circuit Court of Appeals – asking for an appellate review of the June 18, 2020
12 Commission order that denied Panhandle's motion to terminate the Section 5 case.
13 Most recently, the ALJ filed her Initial Decision on March 26, 2021, and exceptions
14 followed by briefs opposing exceptions have been filed. Lastly, interveners (DTE
15 Gas included) filed letters in the docket requesting that the Commission issue an order
16 on the Initial Decision as soon as possible, and in any event no later than November
17 1, 2021, in order to ensure that ratepayers receive rate relief and access to refunds as
18 soon as possible. As of the writing of this testimony, the Commission has not yet
19 issued an order in these consolidated proceedings.

20

21 **C) Rate Forecast Summary for DTE Gas's Transportation Providers**

22 **Q23. What assumptions have you provided to Witness Schiffer regarding DTE Gas's**
23 **gas transportation rates from ANR during the forecast period?**

24 A23. I assume that the settlement rates from ANR's last rate case (Docket No. RP16-440-
25 000) will continue to apply to the maximum rate contracts that will be in effect at the

Line
No.

beginning of the plan period on April 1, 2022. I assume that ANR's settlement rates will remain effective for the duration of the five-year plan. I also assume that ANR's fuel retention percentages in Docket No. RP20-636-000, and subsequently approved by the Commission on March 24, 2020, will be in effect through the end of the plan period. Lastly, I assume that the Electric Power Compression Charge (EPC Charge) filed in Docket No. RP20-636-000 will be in effect through the end of the plan period. The rates and fuel charges related to the ANR transportation contracts are shown in Exhibit A-19, page 1 of 7.

Q24. What do you assume regarding the discounted rate firm transport contracts that DTE Gas holds on ANR?

A24. I assume that the fixed discount rate that applies will remain unchanged during the plan period. I included ANR's discounted transportation rates in Exhibit A-19, page 1 of 7.

Q25. What assumptions have you provided to Witness Schiffer with respect to Viking transportation costs billed to DTE Gas?

A25. I assume that Viking's term-differentiated rates as filed in the Viking unopposed settlement (in Docket No. RP19-1340-000) which was approved by the Commission on July 1, 2020 will remain in effect through the end of the plan period. Exhibit A-19, page 2 of 7 includes my forecast of Viking rates starting April 1, 2022.

Q26. What do you assume regarding Viking's fuel charges?

A26. I assume that Viking's fuel charges during the plan period will be the same as those included in Viking's most recent fuel filing with the FERC, which is found in Docket

Line
No.

1 RP22-4-000 (and was approved by the Commission on October 29, 2021) will remain
2 in effect through the plan period. Exhibit A-19, page 2 of 7, shows the projected
3 Viking rates starting April 1, 2022.

4

5 **Q27. What assumptions have you provided to Witness Schiffer regarding the**
6 **transport costs DTE Gas incurs on Great Lakes?**

7 A27. I assume that the rates that were filed in Docket RP19-409-000 (the limited Section
8 4 reduction filed on December 6, 2018, and subsequently approved by FERC on
9 January 31, 2019) will remain in effect for the duration of the plan period. Great
10 Lake's forecast rates and fuel retention percentages are provided in Exhibit A-19,
11 page 3 of 7.

12

13 **Q28. What assumptions have you provided to Witness Schiffer regarding**
14 **transportation fuel costs DTE Gas incurs on Great Lakes?**

15 A28. Great Lakes revises its fuel charges monthly, and the monthly fuel charges can vary
16 significantly due, in part, to the reconciliation of fuel over and under recoveries. So,
17 I assume that Great Lake's average fuel retention percentages for the 12 months
18 ending November 2021 will apply during the plan period. Great Lake's forecast rates
19 and fuel retention percentages are provided in Exhibit A-19, page 3 of 7.

20

21 **Q29. What assumptions have you provided to Witness Schiffer with respect to DTE**
22 **Gas transportation costs on Panhandle?**

23 A29. I assume that Panhandle's maximum tariff rates (as filed in their recent Section 4
24 general rate case in Docket No. RP19-1523-000) that went into effect on March 1,
25 2020 will remain in effect through the plan period.

Line
No.

1

2 **Q30. What assumptions do you provide with respect to Panhandle's fuel rates?**

3 A30. I project that Panhandle's fuel rates during the plan period will be the same as the
4 applicable fuel rate contained in Docket No. RP21-1181-000. This is Panhandle's
5 most recent fuel filing which was accepted by the FERC on October 29, 2021.
6 Panhandle's forecast transportation and fuel rates are contained in Exhibit A-19, page
7 4 of 7.

8

9 **Q31. What assumptions have you provided to Witness Schiffer with respect to DTE**
10 **Gas transportation costs on NEXUS?**

11 A31. I assume that the rates contained in the Negotiated Rate Agreement (NRA) dated July
12 12, 2021, which was filed with the FERC on September 1, 2021, and accepted by
13 FERC letter order on September 24, 2021 (Docket RP21-1091-000), will apply to the
14 plan period. The forecast showing NEXUS's transportation rates are contained in
15 Exhibit A-19, page 5 of 7.

16

17 **Q32. What assumptions do you provide with respect to NEXUS's fuel rates?**

18 A32. I assume that the Applicable Shrinkage Adjustment (ASA) percentages contained in
19 NEXUS's latest ASA filing in Docket No. RP21-549-000 (filed on February 26, 2021
20 and subsequently accepted by the Commission on March 15, 2021) will apply for the
21 plan period. The Applicable Shrinkage Adjustment percentages are shown on
22 Exhibit A-19, page 5 of 7.

23

24

Line
No.

1 **Q33. What assumptions have you provided to Witness Schiffer with respect to Vector**
2 **transportation costs?**

3 A33. I assume that the discounted rate in FT Contract No. FT1-MCG-5676 will be in effect
4 throughout the entire plan period.

5

6 **Q34. What assumptions do you provide with respect to Vector's fuel rates?**

7 A34. Vector revises its fuel rates and reconciles over and under recoveries on a monthly
8 basis. Therefore, I based Vector's fuel charge forecast on Vector's average fuel
9 retention percentages for the period between December 2020 and November 2021.
10 Vector's forecast transportation and fuel rates are presented in Exhibit A-19, page 6
11 of 7.

12

13 **Q35. What assumptions have you provided to Witness Schiffer with respect to DTE**
14 **Gas transportation costs on DTM Gathering?**

15 A35. I assume that the transportation agreement signed by DTE Gas and the associated
16 contract rate as listed on the rate page dated July 18, 2016 will remain in effect
17 throughout the plan period. The rate is presented on Exhibit A-19, page 7 of 7.

18

19 **Q36. Does this conclude your pre-filed testimony?**

20 A36. Yes, it does.

ANDREA R. HARDY

DTE GAS COMPANY
QUALIFICATIONS AND DIRECT TESTIMONY OF ANDREA R. HARDY

Line
No.

1 **Q1. What is your name, business address and by whom are you employed?**

2 A1. My name is Andrea R. Hardy. My business address is One Energy Plaza, Detroit,
3 Michigan 48226. I am employed by DTE Energy Corporate Services LLC (“DTE
4 Energy” or “DTE”) within Regulatory Affairs as a Principal Project Manager.

5

6 **Q2. On whose behalf are you testifying?**

7 A2. I am testifying on behalf of DTE Gas Company.

8

9 **Q3. What is your educational background?**

10 A3. I received a Bachelor of Science Degree in Chemical Engineering with a double
11 major in Economics from Northwestern University in 2011 and a Master of Business
12 Administration Degree from University of Chicago in 2015.

13

14 **Q4. What work experience do you have?**

15 A4. I have been employed full time by DTE since 2015. From 2015 to 2021, I performed
16 project financial modeling and provided strategic analysis as an Associate and Senior
17 Associate in DTE’s Power & Industrial group. I am currently a Principal Project
18 Manager in the Regulatory Affairs DTE Gas Strategy department. Prior to joining
19 DTE in 2015, I spent four years working as an engineer in the nuclear industry.

20

21 **Q5. What are your current responsibilities with DTE?**

22 A5. My current responsibilities include supporting DTE Gas’s GCR cases as well as other
23 project work largely focused on DTE Gas’s regulatory strategy and operations.

Line
No.

1 **Q6. Have you been involved in any prior regulatory proceedings?**

2 A6. No, I have not been involved in any prior regulatory proceedings.

3

4 **Purpose of Testimony**

5 **Q7. What is the purpose of your testimony in this proceeding?**

6 A7. My testimony addresses:

7 1) The calculation of DTE Gas's proposed April 2022 through March 2023 monthly
8 base GCR factor;

9 2) The contingency mechanism and its implementation;

10 3) The five-year forecasted cost of gas; and

11 4) The administration of DTE Gas's Supplier of Last Resort (SOLR) Reservation
12 Charge.

13

14 **Q8. Are you sponsoring any exhibits in this proceeding?**

15 A8. Yes. I am sponsoring the following exhibits:

| 16 | <u>Exhibit</u> | <u>Description</u> |
|----|----------------|--|
| 17 | A-20 | Derivation of April 2022 through March 2023 GCR Factor |
| 18 | A-21 | Forecasted Cost of Gas April 2022 – March 2027 |
| 19 | A-22 | Calculation of LIFO Rate and Storage Costs |
| 20 | A-23 | Proposed Monthly GCR Factor Ceiling Price Adjustment |
| 21 | | (Contingency) Mechanism Tariff Sheet |
| 22 | A-24 | Calculations and Derivation of Contingent Factor +\$1 and +\$2 |
| 23 | A-26 | Calculation of Reservation Charge Applied to GCC and GCR |
| 24 | | Customers |

25

Line
No.

1 **Q9. Were these exhibits prepared by you or under your direction?**

2 A9. Yes, they were.

3

4 **APRIL 2022 THROUGH MARCH 2023 MAXIMUM BASE GCR FACTOR**

5 **Q10. What is DTE Gas's proposed maximum base GCR factor (GCR factor) for April**
6 **2022 through March 2023?**

7 A10. DTE Gas proposes a maximum base GCR factor of \$3.29 per Mcf for the April 2022
8 through March 2023 operational year ("GCR Year" or "Year"). This maximum
9 factor can be adjusted monthly to reflect changes in DTE Gas's cost of gas resulting
10 from higher gas commodity market prices as discussed later in my testimony.

11

12 **Q11. How is the GCR factor of \$3.29 per Mcf calculated?**

13 A11. The GCR factor is calculated by dividing the Adjusted Cost of Gas Less Reservation
14 Charge Revenue incurred for the Year plus any estimated over or (under) recovery
15 from the prior GCR Period by the Year's Adjusted Sales Volumes. The detailed
16 calculations used to determine the GCR factor are included in Exhibit A-20. This
17 methodology has been used to calculate the GCR factor and all its components in
18 DTE Gas's previous GCR cases.

19

20 **Q12. What are Reservation Charge Revenues?**

21 A12. The Reservation Charge Revenue is collected to recover cost related to transportation
22 capacity reserved on interstate pipelines.

23

24 **Q13. Are the Reservation Charge revenues removed from the Adjusted Cost of Gas?**

Line
No.

1 A13. Yes, the Reservation Revenue is calculated on Exhibit A-20, lines 18-22, and totals
2 \$54 million, which is shown on line 22. The Reservation Charge revenue is
3 subtracted from the Adjusted Cost of Gas, shown on line 17, to produce the Adjusted
4 Cost of Gas Less Reservation Charge Revenue, which is \$402 million, shown on line
5 23.

6

7 **Q14. Why are Reservation Charge revenues removed from the Adjusted Cost of Gas?**

8 A14. The revenues received through the Reservation Charge are removed from the Adjusted
9 Cost of Gas because they are treated as an offset to the GCR Cost of Gas Sold. The
10 pipeline reservation costs remain a part of the GCR costs for GCR reconciliation
11 purposes. See the order in case U-17313 dated April 15, 2014.

12

13 **Q15. What are the components of the Adjusted Cost of Gas?**

14 A15. The Adjusted Cost of Gas includes: 1) the Total Booked Cost of Gas Sold and 2) the
15 March 2023 Unbilled Revenue Adjustment.

16

17 **Q16. What are the components of the Total Booked Cost of Gas Sold?**

18 A16. The Total Booked Cost of Gas Sold, calculated in Exhibit A-20, includes the cost of:
19 1) Purchased Gas; 2) Gas (To)/From Storage; 3) Company Use Gas; 4) Lost and
20 Unaccounted for Gas; and 5) Gas in Kind.

21

22 **Q17. How is the cost of gas injected into or withdrawn from storage calculated?**

23 A17. DTE Gas uses annual last in, first out (LIFO) accounting to calculate its cost of gas.
24 Each calendar year's LIFO rate is calculated by dividing the annual cost of purchased
25 gas by the total annual volume of purchased gas for that year. If, on a net basis, gas

Line
No.

1 is injected into storage in a calendar year, then an increment is created. The increment
2 is priced using that year's LIFO rate and a LIFO layer is created. If, on a net basis,
3 gas is withdrawn from storage in the calendar year, then there is a decrement. The
4 cost of storage gas withdrawn for a decrement is calculated using the most recent
5 LIFO layer or layers injected into storage. The calculation of LIFO rates and cost of
6 storage for January 2022 through March 2027 is included in detail in Exhibit A-22.

7

8 **Q18. What is the cost of 2022 storage in this GCR period?**

9 A18. A net decrement is forecasted for calendar year 2022. This decrement is priced at the
10 forecasted 2021 LIFO rates and is calculated on page 2 of Exhibit A-22. The cost of
11 storage gas for the calendar year is calculated on page 1, in lines 15 through 28. The
12 impact of storage gas for the period April through December 2022, a \$126 million
13 decrease in the cost of gas, is calculated by summing the cost of storage gas for those
14 months.

15

16 **Q19. What is the cost of storage gas for the January through March 2023 period?**

17 A19. The cost of storage gas used during the January through March 2023 period is based
18 on the projected \$3.53 per Mcf LIFO rate for 2023. In these three months, 35 Bcf is
19 withdrawn and included in the 2022/2023 GCR Year's cost of gas at a total cost of
20 \$125 million. The net impact of storage gas for the GCR Year is a \$2 million increase
21 to the cost of gas. See Exhibit A-22, column (b), Line 42.

22

23 **Q20. Have you included any provision for an over- or (under)recovery from the 2021–**
24 **2022 GCR period?**

Line
No.

1 A20. Yes. At the time of this filing, DTE Gas projects that it will incur an under-recovery
2 of \$27.4 million from the 2021– 2022 GCR period.

3

4 **Q21. What rate is used to calculate the cost of gas used by the Company, lost and**
5 **unaccounted for, and received in kind?**

6 A21. The jurisdictional rate¹ is used to calculate these costs. This rate, \$3.50 per Mcf,
7 calculated in Exhibit A-20, reflects the average cost of gas purchased for the Year.

8

9 **Q22. What is the Unbilled Revenue Adjustment?**

10 A22. The Unbilled Revenue Adjustment recognizes the revenue that will be accrued for
11 volumes that are delivered to GCR customers in March 2023 but are not billed until
12 April 2023 at the April 2023 GCR factor. This adjustment is calculated in lines 11
13 through 15 in Exhibit A-20.

14

15 **Q23. Why is it necessary to adjust the Total Booked Cost of Gas Sold by the Unbilled**
16 **Revenue Adjustment?**

17 A23. The Unbilled Revenue Adjustment is necessary because the volumes of gas that are
18 sold in March 2023 but not billed until April 2023 are still part of the 2022 – 2023
19 GCR Year. These revenues will be billed at the 2023 – 2024 GCR factor, so the value
20 of those revenues is subtracted from the Total Booked Cost of Gas Sold.

21

22 **Q24. How are the Adjusted Sales Volumes calculated on Exhibit A-20?**

23 A24. The Adjusted Sales Volumes are calculated by subtracting the March 2022 Unbilled
24 Volume Balance from the Year's Billed Sales Volumes. This adjustment for March

¹ Jurisdictional Rate is the Cost of Purchased Gas divided by the Volumes Purchased as defined in DTE Gas Tariff Section C7.1 (2).

Line
No.

1 2022 unbilled volumes recognizes that the revenues related to volumes delivered to
2 GCR customers in March 2022 but billed for in April 2022 will be included in the
3 2021 - 2022 GCR reconciliation.

4 **FORECASTED COST OF GAS**

5 **Q25. How did you calculate the forecasted cost of gas for the operational years April**
6 **2023 – March 2027 included in Exhibit A-21?**

7 A25. To calculate the forecasted cost of gas for the operational years April 2023-March
8 2027, I used the same methodology and sources I used to calculate Exhibit A-20.
9 This exhibit shows DTE Gas's forecasted cost of gas for the four remaining
10 operational years of this GCR plan case.

11

12 **CONTINGENCY MECHANISM**

13 **Q26. What is DTE Gas's contingency mechanism?**

14 A26. DTE Gas streamlined the process in case U-20543 for GCR Plan Year 2020-2021 to
15 use a matrix to determine the contingency factor each month based upon the
16 mechanism that was previously approved in case U-16146. The mechanism allows
17 DTE Gas to mitigate an under-recovery that would result from an increase in natural
18 gas commodity market prices above those used to determine the base factor in the
19 GCR Plan. Without a contingency mechanism, the incremental costs resulting from
20 such a price increase cannot be recovered during the current GCR year using the
21 maximum base GCR factor. Any under-recovery resulting from increases in market
22 prices would be rolled forward into the next year's GCR calculation, shifting costs
23 from one year to another. DTE Gas's contingency mechanism mitigates this cost
24 shifting by allowing the Maximum Allowable GCR factor to reflect increases in GCR

Line
No.

1 costs due to increasing market prices. The tariff sheet containing the contingency
2 Maximum Allowable GCR factor matrix is provided in Exhibit A-23.

3

4 **Q27. Has DTE Gas changed the methodology used to calculate its Maximum**
5 **Allowable GCR factor amounts?**

6 A27. Yes, we have updated the months that are used to determine the Maximum Allowable
7 GCR Factor. Previously, we used the full two calendar years that the GCR year spans.
8 Upon further review, an increase in gas costs during January, February, or March
9 preceding the current GCR year will cause a reduction in GCR costs. This happens
10 because an increase in gas costs during those months causes the LIFO rate of the first
11 calendar year to increase, but there is a net injection into storage for the April –
12 December period of the GCR year that falls in the first calendar year so an increase
13 in the LIFO rate reduces costs. With the exception of excluding these three months
14 from the calculation, the method of calculation remains the same. Rather than
15 requiring a series of mathematical calculations each month, we completed the
16 mathematical equations and populated the contingent factor matrix with the resulting
17 maximum GCR factors. DTE Gas uses the single-input methodology first approved
18 by the Commission in DTE Gas's 2010 - 2011 GCR Plan, Case No. U-16146, to
19 develop its incremental contingency GCR amounts. The Commission has approved
20 this methodology in each GCR Plan since that case. This method determines the
21 factor needed, based on current market prices, to recover increased costs from that
22 point in time forward. This method evaluates a single NYMEX strip to estimate the
23 impact of changes in market prices not only on the current Year's purchases but also
24 on the storage activity that is priced at LIFO. A Contingency Multiplier (Multiplier)
25 is used to establish the Maximum Allowable GCR factors necessary based on

Line
No.

changes in prices. The tariff sheet D-4.00 Monthly GCR Factor Ceiling Price Adjustment (Contingency) Mechanism was developed using the Multiplier.

Q28. How is the Multiplier calculated?

A28. First, the Company estimates gas costs for \$1.00 per Dth and \$2.00 per Dth NYMEX increases above Plan levels (provided by Company witness Schiffer). Using the same methodology shown in Exhibit A-20, I calculate two GCR factors based on these cost estimates. These calculations are performed in Exhibit A-24. The Company then compares the resultant GCR factors and uses them to calculate the impact of the NYMEX change on the GCR factor as shown in Table 1 below.

Table 1 Calculation of Fractional Multiplier

| NYMEX | Resulting GCR Factor per Mcf | Change per Mcf |
|--|------------------------------------|-------------------|
| Based on April 2022 – December 2023 NYMEX | \$3.29 | |
| +\$1.00 per Dth | \$3.60 | \$0.31 |
| +\$2.00 per Dth | \$3.96 | \$0.36 |
| Average GCR Change per \$1.00 NYMEX Change | | \$0.333 |
| Multiplier (\$0.333/\$1.00, rounded) | | 33% |

The Multiplier is then multiplied by \$0.10 to arrive at the contingent factor for a \$0.10 per Dth NYMEX increase, \$0.033 per Mcf. Finally, the Company adds an incremental \$0.033 per Mcf, rounded to the nearest penny, to the base GCR factor to establish the Maximum Allowable GCR factors on DTE Gas's tariff sheet D-4.00, included on Exhibit A-23.

Q29. Is DTE Gas proposing a Maximum Allowable GCR factor of \$6.29 per Mcf (\$3.29 per Mcf base GCR Factor + \$3.00 per Dth Maximum NYMEX change)?

A29. No, DTE Gas is proposing only to reflect those costs that will be incurred if market prices increase. Even if prices increased by \$3.00 per Dth, or more, DTE Gas's

Line
No.

1 resultant maximum contingent factor would be well below the base maximum GCR
2 factor plus \$3.00 per Dth, \$6.29 per Mcf. If prices increased \$3.00 per Dth above
3 plan levels, then DTE Gas's maximum contingent GCR factor will be \$4.28 per Mcf
4 shown on Exhibit A-24, page 2.

5

6 **Q30. How has the process for determining the monthly Maximum Allowable GCR**
7 **factor changed?**

8 A30. No, DTE Gas will use the same process approved in U-20543, which includes
9 calculating the factors to adjust for the impact that incremental increases in NYMEX
10 have on the cost of gas. This is then used to populate the Contingency Matrix,
11 allowing a simple comparison of the current NYMEX strip to the Matrix to determine
12 the appropriate Maximum Allowable GCR factor.

13

14 **Q31. Does the Contingency Mechanism still operate symmetrically?**

15 A31. Yes. The NYMEX strip will indicate the appropriate maximum GCR factor,
16 regardless whether that factor is greater than or less than the current GCR factor.

17

18 **Q32. Why are prices from months outside of the Plan period included in the NYMEX**
19 **averages calculated?**

20 A32. April through December 2023 are included because they are used to derive LIFO
21 rates. Because a large quantity of gas is withdrawn from storage in January - March
22 2023 at the 2023 LIFO rate, changes in NYMEX for April - December 2023 will
23 influence the cost of storage during the plan year and impact the GCR factor.

24

Line
No.

1 **Q33. Why are no adjustments to the market price purchases made for prices that will**
2 **be fixed during the year?**

3 A33. It is impossible to know the price of any volumes fixed during the GCR year. Valuing
4 the fixed volumes during the year at current market prices, is the best estimate of their
5 cost during the GCR year.

6

7 **Q34. How does DTE Gas plan to implement this factor?**

8 A34. Prior to each month (March for April, June for July and so on), DTE Gas will make
9 an informational filing with the MPSC, in this docket, calculating the current
10 NYMEX prices and the corresponding Maximum Allowable GCR factor.

11

12 **SUPPLIER OF LAST RESORT (SOLR)**

13 **Q35. What is the Supplier of Last Resort?**

14 A35. The Supplier of Last Resort supplies Gas Customer Choice (GCC) customers' gas
15 requirements should an alternative gas supplier fail to do so or if customers return to
16 GCR supply from Gas Customer Choice. DTE Gas agreed to fulfill this role for GCC
17 customers as a part of its voluntary GCC program. DTE Gas's responsibility for this
18 role is contained in Section F of its tariff, paragraph F1.19. This charge was first
19 approved by the Commission in its April 15, 2014 Order in Case No. U-17131 and
20 was approved in each subsequent GCR Plan case.

21

22 **Q36. Have you calculated the Reservation Charge?**

23 A36. Yes, Exhibit A-26 calculates the Reservation Charge on an unbilled basis. Lines 1-
24 7 adjust the Pipeline Reservation Cost to reflect the March 2023 unbilled revenue
25 that will be collected at the 2023-2024 rate. The unbilled balance was taken from

Line
No.

1 Exhibit A-4. Line 15 presents the total GCR and GCC March 2022 unbilled volume
2 balance and because any revenues associated with those volumes will be accrued into
3 the 2021-2022 GCR year, those volumes are excluded from the calculation of the
4 Reservation Charge. The adjusted Pipeline Reservation Cost, line 8, is divided by
5 the April 2022 - March 2023 Adjusted Sales Volume, line 16, to produce the April
6 2022 – March 2023 GCR Reservation Charge, line 24, of an average rate of \$0.40
7 per Mcf.

8

9 **Q37. Have you calculated the Reservation Charge (RC) to include the 30% discount**
10 **for GCC customers as directed by the Commission?**

11 A37. Yes, I have. As described above, Exhibit A-26, lines 1-17 calculated the Reservation
12 Charge in the manner the Company employed in prior cases. Lines 18-19 calculate
13 a GCC RC that reflects a discount of 30%, which is \$0.27 per Mcf. Lines 19-21
14 calculate the Reservation Charge revenue that will be received from GCC customers.

15

16 **Q38. Does the Reservation Charge remove the pipeline costs from the GCR process?**

17 A38. No, it does not. The revenue received through the Reservation Charge reduces the
18 GCR Cost of Gas Sold.

19

20 **Q39. Can the Reservation Charge be adjusted within the GCR year?**

21 A39. Yes, but it can only be reduced. There are two main reasons DTE Gas might lower
22 the Reservation Charge during the GCR year. While pipeline costs do not normally
23 vary from year to year, GCR and GCC usage does. Although DTE Gas could not
24 increase the rates if volumes were below projected levels, if volumes were higher
25 than anticipated and a large over-recovery were anticipated, then DTE Gas might

Line
No.

1 lower the rates. Likewise, if DTE Gas forecasts an over-recovery from the
2 Reservation Charge, then it may lower the actual charge billed from the maximum
3 allowable rate.

4

5 **Q40. Does this conclude your direct testimony?**

6 A40. Yes, it does.

STATE OF MICHIGAN

M.P.S.C. No. 1 – Gas
DTE Gas Company
(Revised Pursuant to Case No. U-21064)

Tenth Revised Sheet No. D-4.00
Cancels Ninth Revised Sheet No. D-4.00

D4. MONTHLY GCR FACTOR CEILING PRICE ADJUSTMENT (CONTINGENCY) MECHANISM

The Maximum Allowable GCR factors listed on Sheet No. D-3.00 may change on a monthly basis, for the remaining months of the April **2022** through March **2023** GCR Plan year, contingent upon the NYMEX futures prices. The Maximum Allowable GCR factor the base GCR factor of \$3.29 per Mcf.

Current NYMEX Strip: The simple average of the actual NYMEX monthly natural gas futures contract settlement prices, (\$/MMBtu) for April **2022** through December **2023** averaged over the first five trading days of the month prior to implementation. Closing prices may be used for months that are no longer trading on NYMEX.

By the fifteenth of each month, the Company shall file with the Michigan Public Service Commission an updated maximum allowable GCR factor. The filing shall include all supporting documents necessary to verify the Current NYMEX Strip including published NYMEX futures price sheets for the first five trading days of the month, such sheet being an authoritative source used by the gas industry. The filing shall be incorporated into the GCR Plan docket, Case No. **U-21064**, with notice provided to all intervenors.

KENNETH A. SOSNICK

DTE GAS COMPANY
QUALIFICATIONS AND DIRECT TESTIMONY OF KENNETH A SOSNICK

Line
No.

1 **Q1. Please state your name and business address.**

2 A1. My name is Kenneth Sosnick (he/him/his). My business address is 200 State Street,
3 Boston, Massachusetts 02109.

4

5 **Q2. On whose behalf are you testifying?**

6 A2. I am testifying on behalf of DTE Gas Company (Company or DTE Gas).

7

8 **Q3. By whom are you employed and in what capacity?**

9 A3. I am a Managing Director in the Power & Utilities practice at FTI Consulting, Inc.
10 (FTI).

11

12 **Q4. Please describe FTI and its Power & Utilities practice.**

13 A4. FTI is a worldwide consulting firm dedicated to helping organizations manage
14 change, mitigate risk, and resolve disputes. Our Power & Utilities practice brings
15 these services to firms in regulated and competitive energy industries. The services
16 we provide our utility clients include expert testimony, regulatory advice, support
17 for strategic decision-making, and advice regarding investments and capital
18 allocation. Our team is comprised of former utility executives, regulators,
19 investors, and financial analysts that combine for hundreds of years of experience
20 in the regulated energy space.

21

22 **Q5. Please summarize your educational background.**

23 A5. I hold a Bachelor of Science in Accounting from Indiana University of
24 Pennsylvania.

25

Line
No.

1 **Q6. Please describe your work experience.**

2 A6. I have been with FTI since February 2019. Previously, I consulted with Concentric
3 Energy Advisors, Inc. in Marlborough, MA, consulted with MRW & Associates in
4 Oakland, CA and was a subject matter expert and testifying witness in the Office
5 of Administrative Litigation at the Federal Energy Regulatory Commission
6 ("FERC").
7

8 **Q7. Have you previously sponsored testimony before utility commissions?**

9 A7. Yes. I have appeared as a testifying expert before utility regulators in New
10 Hampshire, North Carolina and before FERC. Additionally, I have been retained in
11 several instances to advise state regulators and their staff, including assignments on
12 behalf of utility regulators in California, District of Columbia, Maryland, and
13 Michigan.
14

15 **Q8. Have you previously testified before the Commission?**

16 A8. Yes. I adopted testimony on behalf of DTE Electric in Cases No U-20528 and U-
17 20826 and DTE Gas in U-20236 as well as filed rebuttal in U-20236. Prior to that,
18 I testified before the New Hampshire Public Utilities Commission, the District of
19 Columbia Public Service Commission, and the Federal Energy Regulatory
20 Commission. I have also been retained as an expert on natural gas and competitive
21 markets for civil disputes, administrative proceedings, and arbitrations.
22

23 **Purpose of Testimony**

24 **Q9. What is the purpose of your testimony in this proceeding?**

25 A9. The Company has asked me to estimate the impacts to DTE Gas customers
26 specifically, and customers in Michigan generally, from the development of the
27 NEXUS Gas Transmission pipeline (NEXUS). To do so, the team at FTI and I

Line
No.

1 developed long-run simulations of relevant gas markets, including the Upper
2 Midwest and supply regions, from whose results we estimated how NEXUS is
3 expected to affect the delivered cost of gas that will be paid by consumers in
4 Michigan. My analysis and results are described in detail in Exhibit A-32, FTI
5 Report “NEXUS Pipeline Impacts Analysis.” The purpose of my testimony is to
6 introduce and summarize that report.

7
8 **Q10. Are you sponsoring any exhibits in this proceeding?**

9 A10. I am sponsoring the following exhibit(s):

| <u>Exhibit</u> | <u>Description</u> |
|----------------|--|
| A-31 | K. A. Sosnick Curriculum Vitae |
| A-32 | FTI Report “NEXUS Pipeline Impacts Analysis” |

13
14 **Q11. Were these exhibits prepared by you or under your direction?**

15 A11. Yes.

16
17 **Q12. Can you please briefly summarize the primary conclusions you reached based**
18 **on your analysis?**

19 A12. Yes. My testimony describes an analysis I contributed to and oversaw that shows
20 that NEXUS will decrease natural gas prices in Michigan significantly. Decreases
21 in prices create savings for all the gas consumers in the state, including customers
22 of DTE Gas, DTE Electric, and customers of other utilities. Those savings are
23 greater than the costs of the contract that DTE Gas executed for long-term firm
24 transportation entitlements on NEXUS. My primary conclusion, therefore, is that
25 the Company’s execution of its contracts for NEXUS supply have been very

Line
No.

1 beneficial to its customers. Later in my testimony, I also describe additional
2 reliability and environmental benefits that create additional value for DTE Gas
3 customers and all Michigan consumers.

4
5 **Q13. How large are the projected savings?**

6 A13. For the period 2022 to 2038, the total savings to Michigan's gas customers is
7 approximately \$1 billion, which includes \$199 million in savings to customers of
8 DTE Gas. As I explain later in my testimony, the team at FTI and I also estimated
9 savings under an alternative scenario in which demand is assumed to increase and
10 the savings are even greater.

11

12 **Q14. How is the rest of your testimony organized?**

13 A14. *First*, I briefly describe the NEXUS system and the entitlements held by the
14 Company. *Second*, I explain the simulations I developed to forecast delivered
15 prices with and without NEXUS in service. *Third*, I explain how I used those
16 forecasts to estimate the savings to Michigan customers attributable to NEXUS and
17 summarize my results. *Fourth*, I explain some of the similarities and differences
18 among the analyses I conducted and those previously commissioned by DTE Gas.
19 *Fifth*, I identify additional benefits, other than cost savings, that NEXUS creates for
20 customers. Finally, *sixth*, I discuss my conclusions.

21

22

The NEXUS System

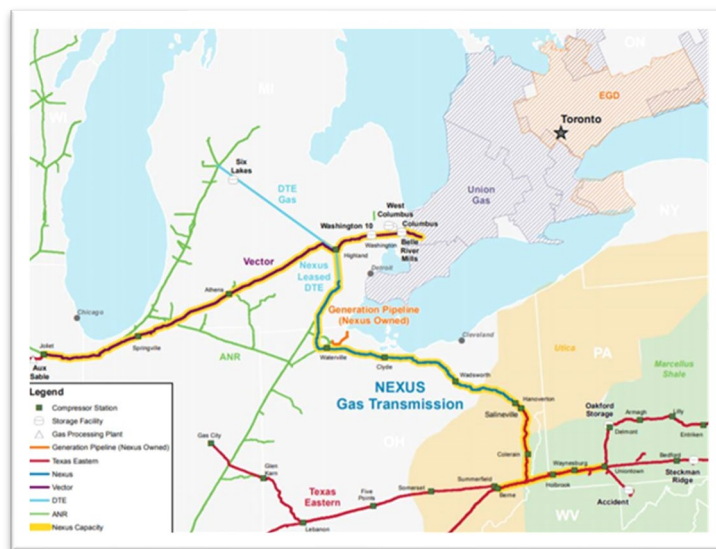

23 **Q15. Can you describe the NEXUS pipeline?**

24 A15. Yes. NEXUS is an approximately 250-mile natural gas transmission pipeline
25 designed to transport up to 1.4 billion cubic feet per day (Bcf/d) of natural gas from
26 receipt points in eastern Ohio to existing pipeline system interconnects in

Line
No.

southeastern Michigan. In Southeast Ohio, NEXUS can receive gas from gas suppliers operating in the Marcellus and Utica Shale plays and from interconnections with the Texas Eastern Transmission (TETCO) and Tennessee Gas Pipeline (TGP) systems. In Michigan, NEXUS provides deliverability to interconnects with the DTE Gas transmission system at its interconnect in Ypsilanti, Michigan, and to the Vector Pipeline (Vector).

Figure 1. NEXUS Map¹

Q16. What is the current status of NEXUS?

A16. It is operational. In October 2018, the system was placed into service allowing flows north from Kensington, Ohio into Michigan. Additional capacity to Clarington, Ohio, was developed as a separate, incremental project, the Texas Eastern Appalachian Lease (TEAL), which is a 950,000 dekatherm per day (Dth/d) pipeline from Clarington to Kensington. TEAL is also in service.

¹ Source: DTE Midstream

Line
No.

1 **Q17. What entitlements does DTE Gas hold on NEXUS?**

2 A17. DTE Gas holds a contract entitling it to receive gas at Kensington and deliver it to
3 Ypsilanti until 2033. The contract's Maximum Daily Quantity (MDQ) is currently
4 37,500 Dth/d and will increase to 75,000 Dth/d in 2022. Through 2022, the
5 Company can receive 37,500 Dth/d at Clarington². Additional detail regarding the
6 Company's entitlements is included in Exhibit A-32.

7
8 **Q18. What rates does DTE Gas pay under these agreements?**

9 A18. The transportation rates are \$0.695/Dth from Kensington to NEXUS-Ypsilanti and
10 \$0.15/Dth from Clarington to Kensington. There is an additional fuel charge that
11 is currently 1.26%.

12

13 **Simulation Analyses**

14 **Q19. Can you summarize this simulation analyses section of your testimony?**

15 A19. In this section, I describe simulation analyses that were developed whose primary
16 purpose was to forecast gas prices in Michigan, Ohio, and Ontario. Below, I
17 explain how a set of price forecasts was developed, which I refer to as the *Base*
18 *Case* and which reflects expected market conditions. Those results were then
19 compared to a separate set of forecasts, the *No NEXUS Case*, from which NEXUS
20 was removed but all other inputs were held constant. This comparison is intended
21 to estimate the impact NEXUS will have on delivered prices in and around
22 Michigan.

² Subsequent to the report being developed DTE Gas extended the term of the TEAL capacity through October 31, 2024. This has no impact on the results of the analysis as it was assumed that it would be renewed.

Line
No.

1 **Q20. What impact did you find?**

2 A20. Prices at the MichCon CityGate and Dawn (Ontario) were lower in the *Base Case*,
3 which indicates that NEXUS reduces prices in and around Michigan.

5 **Q21. Why does NEXUS reduce prices in and around Michigan?**

6 A21. Gas flowing on NEXUS includes production from shale gas deposits in Ohio,
7 Pennsylvania, and West Virginia, where gas is abundant and where prices are
8 among the lowest in North America. Historically, prices in and around Michigan
9 have been higher than in Appalachia, sometimes considerably so. Because of its
10 cost advantage, Appalachian gas flowing on NEXUS for delivery to Michigan
11 displaces more expensive supplies, reducing prices.

13 **Q22. Can you explain how you estimated the magnitude of the price reduction?**

14 A22. I and the team at FTI conducted simulations of the gas market using GPCM™, an
15 industry-standard software tool designed for that purpose. Specifically, two
16 simulations were developed. First, the *Base Case* is a “business as usual” outlook
17 insofar as it reflects current expectations regarding supply, demand, pipeline
18 infrastructure, and other factors, including NEXUS. The specific inputs utilized
19 are discussed in Exhibit A-32. A *No NEXUS Case* was then run, in which the
20 NEXUS pipeline is removed from the simulation, but all other inputs are held
21 constant. Comparing the prices from the *Base Case* to those from the *No NEXUS*
22 *Case* allowed the impact on prices attributable to NEXUS to be estimated. A
23 sensitivity analysis was also conducted to estimate the benefits of NEXUS under
24 higher demand conditions, which I describe later in my testimony.

25

Line
No.

1 **Q23. What is GPCM™?**

2 A23. GPCM™ allows for the simulation of the operation of the natural gas system at a
3 highly granular level including flows across pipelines, production by gas suppliers,
4 consumption by gas customers, the utilization of storage, and the other various
5 interactions between supply, demand, and infrastructure from which market prices
6 are set. It is the industry-standard application for this purpose and is in widespread
7 use among pipelines, utilities, regulators, and consultancies.

8

9 **Q24. Where does the data that serves as inputs to the simulations come from?**

10 A24. From a variety of sources. GPCM™ comes loaded with a range of operational and
11 economic data from the software vendor, which FTI updates on an ongoing basis.
12 Custom datasets developed by FTI that are included in the simulations include those
13 related to supply, demand, infrastructure projects, transportation costs, and other
14 variables.

15

16 **Q25. What time period did you simulate?**

17 A25. Simulations for ten years beginning in 2022 were run. Forecasts were then
18 extended through linear extrapolation through 2038, the year in which the
19 Company's entitlements end.

20

21 **Q26. Why did you take this approach instead of running 20-year simulations?**

22 A26. Long-term forecasts are often based on extrapolation of nearer-term forecasts, one
23 reason for which is that doing so reduces the need to speculate on discrete events
24 and their timing in the future. This issue applies most specifically to new gas
25 infrastructure, which is simultaneously important and difficult to predict. Although

Line
No.

1 I find it highly likely that new gas projects will be built in the mid-2030s and
 2 beyond, it cannot be yet known where they will be built, how large they will be, or
 3 when they will be commercialized. My approach of combining a shorter forecast
 4 with extrapolation for periods farther into the future attempts to balance the need to
 5 incorporate expected changes to the system into forecasts with the desire to avoid
 6 biasing results with speculative or arbitrary assumptions.

7

8 **Q27. Can you provide your *Base Case* price forecasts?**

9 A27. Average annual prices under the *Base Case* forecast for Dawn, Ontario (Dawn), the
 10 MichCon Citygates (MichCon), Clarington, and Kensington are shown below:

11 **Table 1. Average Annual *Base Case* Prices (\$/MMBtu)**

12

| | Dawn | MichCon | Clarington | Kensington |
|------|-------------|----------------|-------------------|-------------------|
| 2022 | \$2.65 | \$2.68 | \$2.19 | \$2.35 |
| 2023 | \$2.52 | \$2.56 | \$2.05 | \$2.22 |
| 2024 | \$2.50 | \$2.55 | \$2.05 | \$2.24 |
| 2025 | \$2.59 | \$2.63 | \$2.06 | \$2.27 |
| 2026 | \$2.62 | \$2.67 | \$2.05 | \$2.28 |
| 2027 | \$2.70 | \$2.73 | \$2.11 | \$2.33 |
| 2028 | \$2.79 | \$2.83 | \$2.19 | \$2.41 |
| 2029 | \$2.95 | \$2.99 | \$2.29 | \$2.52 |
| 2030 | \$3.04 | \$3.09 | \$2.37 | \$2.61 |
| 2031 | \$3.18 | \$3.22 | \$2.46 | \$2.72 |
| 2032 | \$3.29 | \$3.33 | \$2.54 | \$2.81 |
| 2033 | \$3.40 | \$3.44 | \$2.61 | \$2.90 |
| 2034 | \$3.52 | \$3.55 | \$2.69 | \$2.99 |
| 2035 | \$3.63 | \$3.67 | \$2.78 | \$3.08 |
| 2036 | \$3.76 | \$3.80 | \$2.86 | \$3.18 |
| 2037 | \$3.88 | \$3.92 | \$2.95 | \$3.28 |
| 2038 | \$4.01 | \$4.05 | \$3.04 | \$3.38 |

13

Line
No.

1 **Q28. Was the reasonableness of the *Base Case* validated?**

2 A28. Yes.

3

4 **Q29. How?**

5 A29. Among the ways the team at FTI validated the *Base Case* results was by comparing
6 the prices for key indices to prevailing forward gas prices and by comparing my
7 outlook of gas consumption by sector in Michigan to other available forecasts.

8

9 **Q30. Can you please explain?**

10 A30. Forward gas prices that settled on February 25, 2021 for a large number of pricing
11 indices in markets in and around Michigan were retrieved, including Dawn,
12 MichCon, Consumers Citygate (Consumers CG) and Chicago Citygate (Chicago
13 CG). The team at FTI and I also retrieved prices from the regions where NEXUS
14 sources its gas, including, Dominion South Point (Dominion South), receipts into
15 TETCO Market Zone 2 (TETCO M2), and the 200 leg of Zone 4 on the Tennessee
16 Gas Pipeline (TGP Z4 200L). By comparing the forward prices to the *Base Case*
17 forecasts, it was determined whether the two were in general agreement regarding
18 future price levels. Detailed comparisons of the *Base Case* price to the futures are
19 shown in Exhibit A-32.

20

21 **Q31. Did you validate the Kensington and Clarington prices in the same manner?**

22 A31. Yes. Kensington is priced based on the TGP Z4 200L price while Clarington gas
23 is priced based on the TETCO M2 price. Those prices were used to validate the
24 reasonableness of the forecast.

25

Line
No.

Q32. Can you explain the demand forecasts to which you compared the *Base Case* outlook?

A32. FTI compared the forecasts of gas consumption in the East North Central “ENC” region, the U.S. census region that includes Michigan, from the two most recent Annual Energy Outlooks (“AEO”), which are developed by the Energy Information Administration (“EIA”), to the demand forecasts I developed using GPCM™. Specifically, forecast growth rates for the Company’s demand were compared to the ENC forecast for gas consumption for generation and also the DTE Gas forecasts of consumption by customer type (e.g. residential, commercial, or industrial) to the corresponding forecasts in the AEOs. Results are shown below. In each instance, the comparison indicates that the outlooks were sufficiently consistent with each other that they validated the *Base Case* demand outlook. Additional detail about the comparison is provided in Exhibit A-32.

Table 2. Comparison of Base Case and AEO Consumption Forecasts

| Sector | Forecast | Area | Units | 2022 | 2038 | Growth rate |
|-------------|--------------|----------|------------|------|-------|-------------|
| Total | 2021 AEO | ENC | <i>Tcf</i> | 4.3 | 5.4 | 1.4% |
| | 2020 AEO | ENC | <i>Tcf</i> | 4.6 | 5.4 | 1.0% |
| | FTI | Michigan | <i>Bcf</i> | 980 | 1,167 | 1.1% |
| Residential | 2021 AEO | ENC | <i>Tcf</i> | 1.3 | 1.2 | -0.6% |
| | 2020 AEO | ENC | <i>Tcf</i> | 1.3 | 1.1 | -0.7% |
| | FTI forecast | Michigan | <i>Bcf</i> | 106 | 94 | -0.8% |
| Industrial | 2021 AEO | ENC | <i>Tcf</i> | 1.2 | 1.4 | 1.0% |
| | 2020 AEO | ENC | <i>Tcf</i> | 1.4 | 1.5 | 0.6% |
| | FTI | Michigan | <i>Bcf</i> | 73 | 90 | 1.3% |
| Commercial | 2021 AEO | ENC | <i>Tcf</i> | 0.7 | 0.8 | 0.4% |
| | 2020 AEO | ENC | <i>Tcf</i> | 0.8 | 0.8 | 0.0% |
| | FTI | Michigan | <i>Bcf</i> | 74 | 73 | -0.1% |
| Electric | 2021 AEO | ENC | <i>Tcf</i> | 1.1 | 2.0 | 3.8% |
| | 2020 AEO | ENC | <i>Tcf</i> | 1.2 | 2.0 | 3.1% |
| | FTI | Michigan | <i>Bcf</i> | 69 | 111 | 3.0% |

Line
No.

1 **Q33. What was your next step after validating the results of the *Base Case*?**

2 A33. I next ran the *No NEXUS Case* and calculated the difference in prices. The *No*
3 *NEXUS Case* has the same inputs as the *Base Case* with the one exception that
4 NEXUS is removed.
5

6 **Q34. Can you explain the difference in prices between the *Base Case* and the *No***
7 ***NEXUS Case*?**

8 A34. Prices in the areas where NEXUS delivers gas are lower in the *Base Case* than in
9 the *No NEXUS Case*. For example, the MichCon price is roughly \$0.08/MMBtu
10 (3%) lower, on average, in the *Base Case*, as shown in Table 3. The Dawn price is
11 also lower, but to a smaller extent. The change in prices for Dominion South is
12 also shown in Table 3. That price is, on average, lower in the *No NEXUS Case*, as
13 are the prices of other Appalachian indices, because NEXUS increases demand for
14 local production which, all else equal, puts upward pressure on prices. Additional
15 detail from the forecasts is provided in Exhibit A-32.
16

17 **Table 3. Summary of Price Impacts for MichCon, Dawn,**
18 **and Dominion South (\$/MMBtu)**
19

| | <i>Base Case</i> | <i>No NEXUS</i> | Price Change |
|----------------|------------------|-----------------|--------------|
| MichCon | \$3.16 | \$3.24 | \$0.08 |
| Dawn | \$3.12 | \$3.18 | \$0.06 |
| Dominion South | \$2.23 | \$2.19 | (\$0.04) |

20

21 **Calculation of Benefits**

22 **Q35. Can you summarize your calculations in this section of your testimony?**

23 A35. In this section of my testimony I explain the estimated total savings to customers
24 in Michigan that results from the price changes estimated from the price forecasts

Line
No.

1 I discuss above. The benefits quantified are the benefits to DTE Gas of being able
2 to purchase gas at either Kensington or Clarington, the additional savings that DTE
3 Gas will realize from the reduction in local prices caused by NEXUS, and the
4 savings from the same source that other consumers in Michigan will benefit from.
5 I then explain how I deducted the cost of holding NEXUS entitlements from these
6 savings to calculate a total benefit attributable to NEXUS of \$1 billion for the
7 period 2022-2038. Finally, I explain how the results of an alternative simulation
8 shows that benefits could be even higher than that if demand and/or prices increase
9 in the future.

10

11 **Q36. How does NEXUS create savings for the Company?**

12 A36. Gas cost reductions are achieved through two mechanisms. *First*, DTE Gas'
13 entitlement allows it to purchase gas at Kensington and Clarington instead of in
14 Michigan. Prices in Kensington and Clarington are typically lower, so this reduces
15 the purchase price. *Second*, if NEXUS did not exist, prices in Michigan would be
16 higher, as I discuss above, meaning that all of DTE Gas' purchases in Michigan
17 would be made at a higher price. To the extent that the Company's cost to hold its
18 NEXUS entitlement is less than the reduction in costs that NEXUS creates by these
19 two mechanisms, net savings are created.

20

21 **Q37. Have you calculated these savings?**

22 A37. Yes. Net savings each year are shown in Table 4.

Line
No.1
2**Table 4. DTE Gas Savings (\$millions)**

| | Energy Savings | Contract Costs | Net Savings |
|-------|----------------|----------------|-------------|
| 2022 | \$33.7 | (\$21.1) | \$12.6 |
| 2023 | \$31.2 | (\$21.1) | \$10.1 |
| 2024 | \$21.5 | (\$21.1) | \$0.3 |
| 2025 | \$23.2 | (\$21.1) | \$2.1 |
| 2026 | \$25.7 | (\$21.1) | \$4.6 |
| 2027 | \$27.3 | (\$21.1) | \$6.2 |
| 2028 | \$28.2 | (\$21.1) | \$7.0 |
| 2029 | \$29.4 | (\$21.1) | \$8.3 |
| 2030 | \$30.3 | (\$21.1) | \$9.3 |
| 2031 | \$34.4 | (\$21.1) | \$13.3 |
| 2032 | \$35.7 | (\$21.1) | \$14.5 |
| 2033 | \$37.0 | (\$21.1) | \$15.9 |
| 2034 | \$38.4 | (\$21.1) | \$17.3 |
| 2035 | \$39.8 | (\$21.1) | \$18.7 |
| 2036 | \$41.4 | (\$21.1) | \$20.2 |
| 2037 | \$42.9 | (\$21.1) | \$21.8 |
| 2038 | \$34.6 | (\$17.6) | \$17.0 |
| Total | \$554.5 | (\$355.1) | \$199.4 |

3

4

Over the period indicated, the NEXUS agreement creates \$199 million in savings for DTE Gas residential, commercial, and industrial customers.

5

6

7

Q38. Did you also find estimated savings arise for other customers in Michigan from NEXUS?

8

9

A38. Yes. The estimate of the savings for the non-DTE customers is based on the change in Michigan delivered prices. Because there is no one price index that captures all of the Michigan market, an average was used of the difference each month between the *Base Case* and the *No NEXUS Case prices* for Consumers CG, Dawn, Chicago CG, and Emerson. That differential, on average, was approximately \$0.06/MMBtu. For each month of the forecast, I calculated the savings by multiplying the average price change by the forecast of non-DTE consumption.

10

11

12

13

14

15

Line
No.

1 **Q39. Can you summarize your results?**

2 A39. The total estimated savings associated with NEXUS for all Michigan gas customers
3 for the period 2022-2038 are approximately \$1 billion.
4

5 **Table 5. Savings Estimate (\$millions)**
6

| | |
|--------------|---------|
| DTE Electric | \$11 |
| DTE Gas | \$199 |
| Non-DTE | \$808 |
| Total | \$1,018 |

7

8

Alternative Case

9 **Q40. Did FTI simulate any other scenarios?**

10 A40. Yes, a *High Demand Case* was developed in which a roughly 8% increase to
11 demand for the ENC states was applied, held all other factors constant with the
12 *Base Case*, and then the *High Demand Case* with and without NEXUS was
13 performed. Using the results of the compared prices, the benefits to Michigan
14 consumers were calculated in the same manner as I describe above.
15

16 **Q41. What were the results?**

17 A41. That savings attributable to NEXUS increased considerably even though the price
18 effect is relatively small. Prices at MichCon, for example, went up by an average
19 of about \$0.15/MMBtu during January and February but only by about
20 \$0.02/MMBtu overall, compared to the *Base Case*. Regardless, the change was
21 enough to significantly increase the savings calculated by comparing the *High*
22 *Demand Case* prices with and without NEXUS included in the simulation. The
23 overall benefits rose to over \$1.2 billion, an increase of roughly 24%.
24

25 **Q42. How would you characterize this finding?**

Line
No.

1 A42. It is important. It means that NEXUS provides a useful hedge that helps reduce
2 Michigan's exposure to long-term changes in prices. This result also suggests that
3 the investment in NEXUS creates benefits under fundamentally different market
4 conditions. As I explain above, my analysis indicates that NEXUS creates
5 significant benefits for gas consumers in Michigan in the current, low price
6 environment. That the investment performs even better when prices increase means
7 that there are unlikely to be any changes to market pricing paradigms that would
8 push the investment "out of the money." Finally, this finding suggests that even
9 modest increases in gas prices could lead to significant extra benefits.

10

11

Comparison to the November 2015 Report

12 **Q43. How do your findings and conclusions compare with the 2015 ICF Study that**
13 **you previously referenced?**

14 A43. The findings and conclusions of this FTI study are generally consistent with those
15 described in the 2015 ICF Study. My analyses show that NEXUS creates savings
16 for DTE Gas customers, which is the same result described in the November 2015
17 Report.

18

19 **Q44. Your estimates of benefits are lower than those shown in the November 2015**
20 **Report; do you have any explanation as to why that is?**

21 A44. While I did not prepare the November 2015 Report, I have reviewed it and have
22 identified some important differences. Among the most obvious of these is that
23 market prices were considerably higher at the time that report was developed than
24 they are now. Table 6 shows average annual MichCon prices since 2014, during
25 which time they have declined significantly. For example, in 2020, prices were, on

Line
No.

1 average, 34% lower than they had been in 2015 and 67% lower than they were in
2 2014.

3 **Table 6. Average Annual MichCon Prices (\$/MMBtu)**
4

| | |
|------|--------|
| 2014 | \$5.72 |
| 2015 | \$2.83 |
| 2016 | \$2.49 |
| 2017 | \$2.93 |
| 2018 | \$3.00 |
| 2019 | \$2.36 |
| 2020 | \$1.87 |

5
6 Expectations regarding future prices were also considerably different at the time
7 the November 2015 Report was written. Figure 2 compares the forward curve
8 prices for the Henry Hub, an important benchmark of North American gas prices,
9 that settled on the New York Mercantile Exchange (NYMEX) in March 2015 to
10 settlements for the same product from March 2021. The former reflects an
11 expectation that prices would follow a strong upward trajectory, quickly rising
12 above \$3/MMBtu and continuing to climb from there. The 2021 curve, on the other
13 hand, indicates an expectation of prices that actually decline moderately over time.
14

Line
No.1
2**Figure 2. Henry Hub Forward Curves (\$/MMBtu)**3
4**Q45. Why does this matter?**

A45. Because, all else equal, gas infrastructure tends to be most valuable when prices are highest. This tendency is confirmed by my findings from the *High Demand Case*.

8

Q46. Are there indications of consistency between the NEXUS benefits estimate from the November 2015 Report and your NEXUS benefits estimate?

A46. Yes, there are. When evaluated on a percentage basis, the estimate of the price reduction in this study is not dissimilar to the one shown in the November 2015 Report. Over the forecast period, the forecasts indicates that average MichCon prices are reduced by NEXUS by approximately 2.5%, from \$3.24/MMBtu to \$3.16/MMBtu. The November 2015 Report indicated that prices would be lower by \$0.21/MMBtu because of NEXUS, which is larger than FTI's projected change, but which indicates only a 3.6% change in the average MichCon price.

Line
No.**Table 7. Price Change Comparison (\$/MMBtu)**

| | FTI | ICF |
|----------|---------------|---------------|
| Base | \$3.16 | \$5.87 |
| No NEXUS | <u>\$3.24</u> | <u>\$6.08</u> |
| Change | <u>\$0.08</u> | <u>\$0.21</u> |
| % change | 2.5% | 3.6% |

Q47. What conclusions have you reached about the November 2015 Report?

A47. It is unreasonable to require perfect accuracy in hindsight in order for a forecast to be acceptably precise. Instead, it is necessary to understand the context in which a forecast was made and analyze the degree to which it aligns with available information and prevailing market expectations at the time it was made. In the case of the November 2015 Report, the higher forecast of market prices reflected broader sentiments held by the industry that are reflected in the NYMEX curves shown in Figure 2 and elsewhere. Since there seems to be a positive correlation between overall price levels and magnitude of the benefits that NEXUS generates, higher estimates of those benefits are also logical. I have not identified any basis by which to conclude that the analysis described in the November 2015 Report was unreasonable nor that the Company was unreasonable in relying on its findings when it made its decision to execute contracts on NEXUS. Moreover, the key conclusion from those two studies remains the same: NEXUS creates savings that are greater than its costs.

Other benefits**Q48. Has NEXUS reduced gas prices in Michigan since it has been in service?**

A48. Yes, it has.

Line
No.

1 **Q49. What is your basis for the assertion that NEXUS has reduced gas prices in**
2 **Michigan since it has been in service?**

3 A49. The observation that the market conditions which create the expected reductions
4 during the forecast have also been emergent since NEXUS came online. Most
5 important among these is the fact that gas prices in Appalachia are lower than they
6 are in Michigan and also lower than in many of the other basins from which gas
7 flows to the Upper Midwest. The flows of inexpensive gas into Michigan from
8 NEXUS have necessarily displaced deliveries of more expensive supplies, which
9 has reduced prices in Michigan in the sense that they would be higher had NEXUS
10 never been built.

11

12 **Q50. Can you say how large these price reductions have been?**

13 A50. If all else were equal, I would expect the magnitude of the price reduction to be
14 generally similar to that observed during the forecast period. That being said, the
15 period since NEXUS was commercialized is a short one during which some
16 extraordinary events have occurred. Most notably, the COVID-19 pandemic
17 brought changes to markets that included significant reductions in gas demand.
18 Notwithstanding the impacts of the pandemic, NEXUS flowed significant volumes
19 of competitively priced gas, without which prices in Michigan certainly would have
20 been higher during this period.

21

22 **Q51. Other than reducing gas costs, does NEXUS provide any other benefits for**
23 **Michigan gas consumers?**

24 A51. Yes, NEXUS provides a number of other benefits, one of the most important of
25 which is better fuel security. There are only a relatively small handful of interstate

Line
No.

1 pipelines that serve Michigan and, of those, many of the largest and most important
2 were designed to source gas in the same region and follow a similar path to the
3 market. PEPL, the ANR Pipeline, and Northern Natural Gas Company (NNG) are
4 among Michigan's most important sources of energy and each were designed to
5 source gas in and around Texas for transportation to the Upper Midwest. This
6 means that disruptions in certain producing areas or transmission corridors could
7 have outsized effects. NEXUS creates a short, direct path from Appalachia to
8 Michigan, which creates an important degree of diversity and reduces the likelihood
9 that an event currently difficult to foresee could threaten reliability in Michigan.
10 Additionally, gas pipelines can suffer from mechanical failures which are
11 infrequent, but which have the potential to be very impactful since Michigan's
12 capacity to bring gas into the market is spread among a relatively small number of
13 pipelines, each of which has a correspondingly large share of the total delivery
14 capability. As a result, a single mechanical failure can have widespread effects. A
15 new pipeline that is largely unconnected to other systems creates operational
16 redundancies that improve the chances Michigan could avoid critical supply
17 disruptions even when pipeline emergencies occur.

18

19 **Q52. Are there other benefits that should also be considered?**

20 A52. Yes, additional benefits from NEXUS include enhanced competitiveness for
21 Michigan's electric generation fleet. Lower gas prices reduce costs for gas-fired
22 generators in Michigan whether they hold NEXUS entitlements or not. This means
23 that, all else equal, the Company's generators and other gas-fired generators in
24 Michigan will be called upon to run more often in wholesale markets, and, when
25 they do run, their margins will be greater. NEXUS also creates environmental

Line
No.

benefits in the sense that economic supplies of natural gas are a necessary precondition for the deployment of new and efficient gas-fired generation, which, in turn, allows for the displacement of coal-fired generation in Michigan and, potentially, elsewhere, while also providing an important tool for managing the intermittency of renewable generators being added to the system in increasing amounts.

Q53. Does NEXUS also improve reliability?

A53. Yes. Michigan's reliability is necessarily enhanced from having another pipeline in service since the likelihood of an impactful outage from a failure on a single system is lower. Additionally, NEXUS enhances the diversity of Michigan's gas supplies, which creates economic benefits since NEXUS sources gas in Appalachia, where prices are low, but also reliability benefits since the effects of a supply disruption specific to one region would be potentially mitigated.

Q54. Has the Commission recognized the importance of reliability benefits from new pipeline projects in the past?

A54. Yes. The Commission recently approved SEMCO Energy Company's (SEMCO's) Marquette Connector Pipeline, which was motivated, in part, by SEMCO's desire to increase the diversity of its supplies and not become unduly reliant on any one system. The Commission cited the factors for its approval, including the project's ability to "increase the reliability of natural gas service to many of SEMCO's customers [and] provide much-needed redundancy in the event of a pipeline rupture."³ NEXUS provides these same benefits.

³ Order Approving Settlement Agreement, Filing number U-18202-0061.

Line
No.

Conclusions

1

2 **Q55. Can you summarize your primary conclusions?**

3 A55. My primary conclusion is that the NEXUS pipeline brings many benefits for DTE
4 Gas and the state of Michigan, and the benefits Michigan's gas consumers will
5 realize far outweigh its costs. I expect savings totaling \$199 million for DTE Gas
6 customers and \$1 billion for all Michigan consumers over the period 2022-2038.
7 Additionally, my modeling shows that savings could be considerably higher under
8 certain conditions.

9

10 **Q56. Does this conclude your testimony?**

11 A56. Yes.

Education

B.S., Accounting, Indiana
University of Pennsylvania

Mr. Sosnick has over 18 years of experience with electric utility, natural gas pipeline and crude/product pipeline industry matters before the Federal Energy Regulatory Commission ("FERC"), state regulators, as well civil litigation proceedings and management consulting engagements.

Prior to joining FTI, Mr. Sosnick spent over 8 years as a consultant extensively engaged in the natural gas, crude/product and electricity markets. His work has included analysis of onshore and offshore natural gas pipeline and crude/product pipeline cost of service rates, levelized rates, market-based rates, discounted and negotiated rates, incremental vs. rolled-in project costs, Certificate Proceedings, allocation of corporate overhead costs, master-limited partnership income taxes, throughput/system rate design quantities, fuel recovery mechanisms, NGA Section 5 rate complaints, Return on Equity calculations under the DCF/Risk Premium/CAPM/Expected Earnings methods, depreciation rate and negative salvage rate calculations, Asset Retirement Obligations, FERC Form 1 and 2 filing requirements as well as being proficient in the application of FERC's Uniform System of Accounts.

Mr. Sosnick has prepared expert testimony and provided expert advisory services for clients in proceedings at FERC, state commissions as well as expert reports assessing and quantifying damages in civil litigation, conducted strategic analysis for a large energy company considering alternatives for its existing pipeline and storage portfolio, written a whitepaper on the impacts of the Tax Cuts and Jobs Act on FERC regulated assets as well as a whitepaper on the impacts of FERC Orders in SFPP, LP Docket No. IS08-390 related to Master Limited Partnerships and other pass-through entities income tax allowance. In addition, he conducted confidential buy-side valuations and assessments of regulated electric and natural gas utilities in the U.S.

Mr. Sosnick spent 10 years at FERC in which he spent two years as an auditor in the Office of Enforcement, and eight years as an expert witness and one of the lead technical staff negotiators on major electric utility proceedings, interstate natural gas pipeline and crude/product pipeline in the Office of Administrative Litigation. Mr. Sosnick's insights were incorporated into the revision of the FERC Form 2 in Docket No. RM07-9-000, which lead to the FERC-initiated Section 5 natural gas pipeline proceedings.

Mr. Sosnick currently teaches multiple courses in coordination with EUCL, and previously taught at the New Mexico State University Center for Public Utilities Practical and Regulatory Training for the Natural Gas Interstate Pipeline Industry specifically addressing FERC requirements for determining "Just and Reasonable" rates.

PROFESSIONAL EXPERIENCE

- *FTI Consulting*, Managing Director, Boston, MA, 2019 – Present
- *Concentric Energy Advisors*, Senior Project Manager, Marlborough MA, 2015 – 2019
- *MRW & Associates, LLC, Energy Consultants*, Senior Project Manager, Oakland, CA, 2013 – 2015
- *Federal Energy Regulatory Commission*, Energy Industry Analyst, Office of Administrative Litigation, Washington, D.C., 2005 – 2013
- *Federal Energy Regulatory Commission*, Auditor, Office of Enforcement, Washington, D.C., 2003 – 2005

SELECTED PROJECTS

Cost of Service

Mr. Sosnick assists clients, state regulatory agencies, and other experts developing and refining cost of service models regarding rate base calculations, appropriate levels of operations and maintenance expenses, appropriate levels of directly assigned or allocated affiliated or parent company overhead costs, the application of cost allocation procedures in the allocation of costs between jurisdictional activities, between non-jurisdictional and jurisdictional activities or amongst separate jurisdictional systems.

Natural Gas Experience

- Paiute Pipeline Company, Docket Nos. RP05-163-000 and RP09-406-000
- El Paso Natural Gas Company, Docket No. RP06-369-000
- Transcontinental Pipeline Company, Docket Nos. RP06-569-000 and RP12-993-000
- Black Marlin Pipeline Company, Docket No. RP07-39-000
- Sea Robin Pipeline Company (Section 4 Rate Case & Hurricane Surcharge), Docket Nos. RP07-513-000 and RP09-995-000
- Portland Natural Gas Transmission System, Inc., Docket No. RP08-306-000: Filed testimony on behalf of FERC Trial Staff on Cost-of-Service Issues
- UTOS, Docket No. RP10-1393
- Florida Gas Transmission Company, LLC, Docket No. RP10-21-000: Filed testimony on behalf of FERC Trial Staff on Cost-of-Service Issues
- Northern Natural Gas Company, Docket No. RP10-148-000: Filed testimony on behalf of FERC Trial Staff on Cost-of-Service Issues under Section 5 of the NGA
- Kinder Morgan Interstate Gas Transmission, Docket No. RP11-1494-000
- Tuscarora Gas Transmission Company, Docket No. RP11-1823-000: Filed testimony on behalf of FERC Trial Staff
- Tennessee Gas Pipeline Company, Docket No. RP11-1566-000
- Trailblazer Pipeline Company, Docket No. RP11-2168-000
- Stingray Pipeline Company, Docket No. RP11-1957-000
- Northern Natural, Docket No. RP11-1781-000

- Saltville Gas Storage, Docket No. RP14-251-000
- Sea Robin Pipeline Company, Docket No. RP14-247-000
- Williston Basin Pipeline Company, Docket No. RP14-118-000
- HIOS Pipeline Company, Docket No. RP14-218-000
- Mojave Pipeline Company, Docket No. RP14-1275-000
- Saltville Gas Storage, Docket No. RP14-251-000
- Florida Gas Transmission, Docket No. RP15-101-000
- Alliance Pipeline Company, Docket No. RP15-1022-000
- Gulf South Pipeline Company, Docket No. RP15-65-000: Filed testimony on the behalf of Atmos Energy Corporation on Cost-of-Service Issues

Natural Gas Experience-Continued

- Columbia Gas Pipeline, Docket No. RP16-314-000
- KO Transmission Company, Docket No. RP16-1097-000: Filed testimony on behalf of KO Transmission and served as the Rate Case Filing/Settlement Coordinator
- ANR Pipeline Company, Docket No. RP16-440-000
- Columbia Gas Transmission, Docket No. RP16-302-000
- ECA/Greylock Pipeline, Docket No. CP16-35-000: Initial rates for intrastate pipeline becoming a FERC regulated interstate pipeline
- Natural Gas Pipeline Company of America, Docket No. RP17-303-000
- Great Lakes Gas Transmission, Docket No. RP17-598-000
- Eastern Shore Pipeline Company, Docket No. RP17-363-000
- Mississippi River Transmission, Docket No. RP18-923-000; Filed testimony on the behalf of Spire Missouri, Inc. on Cost of Service, Cost Allocation, Affiliate Issues
- Empire Pipeline Company, Docket No. RP18-940-000
- Transcontinental Gas Pipeline, Docket No. RP18-1126-000
- Texas Eastern Transmission Company, Docket No. RP19-343-000
- Saltville Gas Storage, Docket No. RP18-1115-000
- East Tennessee Natural Gas Company, Docket Nos. RP19-63-000 and RP19-64-000; RP20-980-000
- Northern Natural Gas Company, Docket Nos. RP19-59-000 and RP19-1353-000; Filed testimony on the behalf of CenterPoint Energy, Inc. on Cost of Service, Cost Allocation, Affiliate Issues
- Panhandle Eastern Pipeline Company, Docket No. RP19-78-000
- National Fuel Gas Supply, Docket No. RP19-1426-000
- Kinetica Deepwater Express, Docket Nos. RP19-53-000 and RP19-1634-000
- Dominion Energy Cove Point, Docket No. RP20-467-000; Filed testimony on the behalf of the FPS Customer Group on Cost of Service, Cost Allocation and Rate Design
- Transcontinental Gas Pipeline, Docket Nos. RP20-614-000 and RP20-618-000; Filed testimony on behalf of Transco's Zone 4/5 Shipper Group relating to Transco's Cash-out Mechanism
- Bridge-Line-LIGG Section 311 Filing, Docket No. PR20-48-000
- Columbia Gas Transmission, Docket No. RP20-1060-000
- Florida Gas transmission, Docket No. RP21-441-000
- Energy North, Docket No. DG 20-105; Liberty Utilities (EnergyNorth Natural Gas) Corp. d/b/a Liberty Utilities
- Midwestern Gas Transmission Company, Docket No. RP21-525-000
- Southern Star Central Gas Pipeline, Inc., Docket. No. RP21-778-000
- Developed Section 7 Initial Rates for facilities to support LNG exporting for a confidential client.
- Confidential Client, FERC Form 501-G Filing Assistance

Electric Experience

- AEP, Docket No. ER05-751-000: Reviewed costs for AEP's Voltage Control from Generation Source Service on behalf of FERC Trial Staff
- Michigan Electric Transmission Company, Docket Nos. ER06-56-000 and ER06-56-002: Filed testimony on behalf of FERC Trial Staff and participated in the development of initial Formula Rates

Electric Experience-Continued

- Duke Energy Vermillion, LLC, Docket No. ER05-123-000: Reviewed the cost-of-service study for Duke Vermillion's Reactive Power Voltage Control from Generation Source Service on behalf of FERC Trial Staff
- GenOn Power Midwest, LP (Now NRG), Docket No. ER12-1901-000: Led FERC team that reviewed the cost-of-service study underlying the Reliability Must Run (RMR) contract as well as ensuring FERC precedent was followed in the determining the RMR rate for the GenOn generating facilities.
- SDG&E, Docket No. ER05-853-000: Reviewed the cost of service and balancing authority to ensure compliance with FERC precedent as well as ensuring that SDG&E and CASIO agreed with the commitments in the filing.
- Southern California Edison Company, Docket No. ER05-763-000: Reviewed the cost of service and balancing authority to ensure compliance with FERC precedent as well as ensuring that SCE and CASIO agreed with the commitments in the filing.
- Berkshire Power Company, LLC, Docket No. ER05-1179-000: Reviewed the cost-of-service study underlying the RMR contract as well as ensuring FERC precedent was followed in the determining the RMR rate for the Berkshire generating facility.
- Milford Power Company, LLC, Docket No. ER05-163-000: Reviewed the cost-of-service study underlying the RMR contract as well as ensuring FERC precedent was followed in the determining the RMR rate for the Milford generating facility.
- City of Anaheim, Docket No. ER11-3594-000: Led FERC Trial Staff review of the inputs of the Anaheim cost of service filing for accuracy as well as being in accordance with FERC precedent.
- City of Banning, Docket No. ER11-3962-000: Led FERC Trial Staff review of the inputs of the Anaheim cost of service filing for accuracy as well as being in accordance with FERC precedent.
- Delmarva Power and Light Company, Docket No. ER18-903-000: Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs.
- Potomac Electric Power Company, Docket No. ER18-905-000: Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs.
- Baltimore Gas & Electric Company, Docket No. ER17-528-000; Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs.
- Nebraska Public Power District, Docket No. EL18-194-000; Filed an Affidavit supporting NPPD's complaint against Tri-State Generation and Transmission Association, Inc. and SPP's 2018 ATRR filing for Tri-State.
- Confidential Client; Review of multiple entities RTO/ISO Formula Rates to ensure compliance with current FERC precedent.
- Delmarva Power and Light Company, Potomac Electric Power Company, Baltimore Gas & Electric Company, Docket No. ER19-5-000; Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs.
- Tri-State Generation and Transmission Association, Inc. Docket Nos. ER20-686-000, ER20-688-001, ER20-726-000 and EL20-25-000, Tri-State Initial FERC Rates, Terms and Tariff

Liquids Experience

- SFPP L.P., Docket No. OR03-5-000: Filed testimony on behalf of FERC Trial Staff addressing directly assigned or allocated affiliated or parent company overhead costs, the application of cost allocation procedures in the allocation of costs between jurisdictional activities, between non-jurisdictional and jurisdictional activities or amongst separate jurisdictional systems.
- SFPP L.P., Docket No. OR03-5-001: Filed testimony on behalf of FERC Trial Staff addressing the appropriate income tax allowance after the Exxon Circuit Court review as well as the levels of

- Confidential Client, FERC Form 501-G Filing Assistance
- Developed Section 7 Initial Rates for facilities to support LNG exporting for a confidential client
- Pacific Gas & Electric, Docket No. A.13-12-012: Participated in PG&E's 2015 Gas Accord, reviewing cost allocation and tariff issues related to Core Transport Aggregators

Electric Experience

- Pacific Gas & Electric, Docket No. ER05-116: Reviewed the rate design for wholesale distribution service to ensure compliance with FERC precedent as well as ensuring that PG&E and Western agreed with the commitments in the filing
- Michigan Electric Transmission Company, Docket Nos. ER06-56-000 and ER06-56-002: Filed testimony on behalf of FERC Trial Staff and participated in the development of initial Formula Rates
- City of Anaheim, Docket No. ER11-3594: Led FERC Trial Staff review of the inputs of the Anaheim gross load calculation filing for accuracy as well as being in accordance with FERC precedent
- City of Banning, Docket No. ER11-3962-000: Led FERC Trial Staff review of the inputs of the Anaheim gross load calculation filing for accuracy as well as being in accordance with FERC precedent
- Entergy Arkansas, Inc., Entergy Gulf States, Inc., Entergy Louisiana, Inc., Entergy Mississippi, Inc., and Entergy New Orleans, Inc. (collectively, the "Entergy Operating Companies"), Docket Nos. ER95-112-012, ER95-112-013, ER96-586-007, and ER96-586-008: Reviewed the inputs of the Entergy filing for accuracy as well as being in accordance with FERC formula rate precedent
- Oklahoma Gas and Electric Company, Docket No. ER08-281-000: Led FERC Trial Staff review of the filing for accuracy as well as being in accordance with FERC formula rate precedent

Electric Experience-Continued

- Midwest Independent Transmission System Operator, Inc., Docket No. ER12-715-003: Filed testimony on behalf of FERC Trial Staff addressing the appropriate Exit Fees to be paid by DEO/DEK and ATSI leaving MISO and joining PJM
- Nebraska Public Power District, Docket No. EL18-194-000; Filed an Affidavit supporting NPPD's complaint against Tri-State Generation and Transmission Association, Inc. and SPP's 2018 ATRR filing for Tri-State.
- Confidential Client: Review of multiple entities RTO/ISO Formula Rates to ensure compliance with current FERC precedent
- Delmarva Power and Light Company, Potomac Electric Power Company, Baltimore Gas & Electric Company, Docket No. ER19-5-000; Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs.
- Tri-State Generation and Transmission Association, Inc. Docket Nos. ER20-686-000, ER20-688-001, ER20-726-000 and EL20-25-000, Tri-State Initial FERC Rates, Terms and Tariff

Regulatory Policy and Strategic Analysis.

Utilizing his background in accounting, regulatory affairs, and the nuances of the energy sector Mr. Sosnick has helped clients ensure they are charging or paying appropriate rates, under terms and conditions that are just, reasonable and not unduly discriminatory or preferential. In addition, Mr. Sosnick helps clients develop safe, reliable and efficient energy infrastructure that serves the public interest.

Natural Gas Experience

- Strategic analysis for a large energy company considering alternatives for its existing pipeline and storage portfolio
- PG&E, Docket No. A.13-06-011: Participated in their Interstate Pipeline Capacity proceeding, for Core Transport Aggregators
- Confidential buy-side valuation and assessment of a regulated combination electric and natural gas utility in the U.S.
- Prepared expert report assessing and quantifying damages in litigation regarding the revenue sharing provisions of an Asset Management Agreement
- Strategic analysis of FERC's Form 501-G Final Order for a FERC regulated asset

Electric Experience

- Assisted in the formation of the Small Utility Distribution Company tariff language and operating agreement formed by the California Independent System Operator
- Developed GAAP to FERC accounting mapping for a new electric transmission provider
- Wisconsin Public Service Corporation, Led FERC Trial Staff review of the Wind-Up plan, costs, amortization and customers affected by the underlying the sale of the Kewaunee Nuclear Power Plant owned by Wisconsin Public Service Corp. Additionally, he ensured FERC precedent was followed in the determining the accounting for the costs included in the final settlement Written a whitepaper on the impacts of the Tax Cuts and Jobs Act on FERC regulated assets
- Assessed impacts of FERC Formula Rate challenge for a Transmission Owner in SPP
- Delmarva Power and Light Company, Docket No. ER18-903-000: Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs
- Potomac Electric Power Company, Docket No. ER18-905-000: Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs
- Baltimore Gas & Electric Company, Docket No. ER17-528-000; Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs

Electric Experience-Continued

- Nebraska Public Power District, Docket No. EI18-194-000; Filed an Affidavit supporting NPPD's complaint against Tri-State Generation and Transmission Association, Inc. and SPP's 2018 ATRR filing for Tri-State.
- Confidential Client; Review of multiple entities RTO/ISO Formula Rates to ensure compliance with current FERC precedent
- Delmarva Power and Light Company, Potomac Electric Power Company, Baltimore Gas & Electric Company, Docket No. ER19-5-000; Reviewed the FERC Formula Rate proposal for pass-through of tax savings of the TCJA as well as historical FAS 109 related costs.
- Tri-State Generation and Transmission Association, Inc. Docket Nos. ER20-686-000, ER20-688-001, ER20-726-000 and EL20-25-000, Tri-State Initial FERC Rates, Terms and Tariff

Liquids Experience

- Liquids Shippers Group, Airlines for America and the National Propane Gas Association, Docket No. RM15-19-000: Filed an affidavit in the Petition for a Rulemaking
- Colonial Pipeline Company, Docket No. OR16-17-000: Filed an Affidavit regarding Colonial Pipeline's Pro-Rationing Policy
- SFPP, L.P., Opinion No. 511 & 511A: Examined Corporate Overhead Allocation methodologies of. for its compliance with Federal Energy Regulatory Commission policy
- Constructed a whitepaper on the impacts of FERC Orders in SFPP, LP Docket No. IS08-390 related to Master Limited Partnership and other pass-through entities income tax allowance

Tariffs

- Analyzed Open Access Transmission Tariff formula rates to verify conformity to FERC's Uniform System of Accounts and the structure of their formula had FERC's approval
- Participated in the review and refunding of Southern Company's RTO Development Costs that were collected erroneously through their Open Access Transmission Tariff, Unit Power Sales Agreements, and Transmission Service Agreements
- Confidential Client; Review of a SPP Member's ATRR to provide an opinion on the appropriateness of the inclusion of certain costs
- Confidential Client; Review of multiple entities RTO/ISO Formula Rates to ensure compliance with current FERC precedent
- Served the role of advisor to clients to internal FERC Trial Staff on settlements on FERC wholesale electric, liquid pipeline and natural gas pipelines Tariff matters

Negotiations

- Coordinated Pre-filing Settlement negotiations on behalf of a firm storage customer in a state rate proceeding in the western US
- Facilitated the settlement of the refund amounts associated with the sale and related costs of the portion of the Kewaunee Nuclear Power Plant owned by Wisconsin Public Service Corp.
- California Independent System Operator Corporation, ER05-150: Reviewed the Utility Distribution Company Operating Agreement to ensure compliance with FERC precedent and coordinated with all parties to confirm understanding of commitments being filed
- PG&E, ER05-130: Reviewed the CASIO requirements and Western Interconnection Agreement as well as the FERC precedent to assist TPUD and PG&E to reach a settlement resolving the interconnection issue
- KO Transmission Company, Docket No. RP16-1097-000: Filed testimony on behalf of KO Transmission and served as the Rate Case Filing/Settlement Coordinator

Negotiations-Continued

- Served the role of lead FERC Trial Staff Technical Witness on settlements on FERC wholesale electric, liquid pipeline and natural gas pipelines related to cost of service and cost allocation and rate design

Presentations

- Panelist—EBA Energizer—FERC Pass-Through Taxation and Income Tax Allowance Recovery Policy Discussion
- Panelist EBA-Section 5 Perspectives, January 2018
- FC Intelligence-Natural Gas Impact, Transportation Options and Regulatory Oversight, May 2016
- Western States Association of Tax Administrators, four presentations between 2015 to 2017
- Panelist, “Will Fracking Change the Gas Pipeline Flows in Ways that Affect Rate Design and Cost Allocation?” EBA Mid-Year Meeting, November 2014

Courses Taught

- FERC Natural Gas 101, FERC Natural Gas Pipeline Cost of Service, Cost Allocation and rate Design, FERC Natural Gas Pipeline Rate Case Process—Presenter--EUCI, Inc., 2013 to present

NEXUS Pipeline Impacts Analysis

PREPARED FOR

EXPERTS WITH **IMPACT**TM

INTRODUCTION

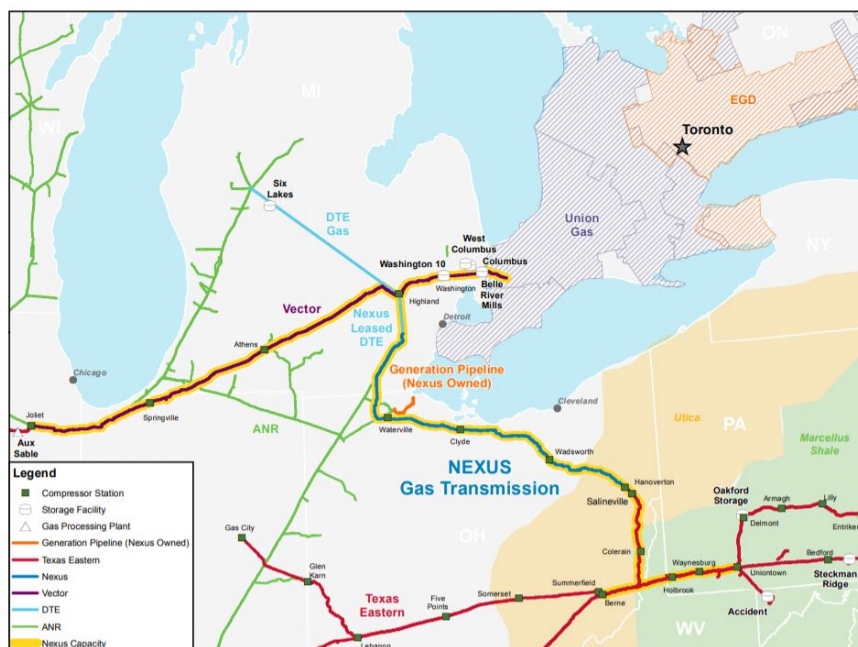

The Power & Utilities practice at FTI Consulting Inc. ("FTI") has been engaged by DTE Gas and DTE Electric (collectively, the "DTE Utilities" or the "Companies") to analyze the impacts of the Nexus Gas Transmission pipeline ("NEXUS") on natural gas prices in Michigan and the savings in gas costs that accrue to customers in that state as a result. To do so, a team of experts from FTI developed simulations of the North American gas markets to forecast market prices in Michigan and elsewhere for the period 2022 to 2038 (the "Forecast Period"), whose end coincides with the termination of the longest-dated entitlements held on NEXUS by the DTE Utilities. Analysis of those prices indicates that NEXUS will create total savings of approximately \$1 billion to customers over that time.

This report describes the methods and results FTI used to estimate savings attributable to NEXUS, additional analyses that indicate that savings could be higher if market prices increase in the future, and also additional benefits from NEXUS other than gas cost savings that accrue to customers from the pipeline's commercialization.

The NEXUS System

NEXUS is a roughly 250-mile pipeline that provides access for consumers in Ohio, Michigan, and Ontario to abundant and economical shale gas supplies. The system receives gas from Marcellus Shale and Utica Shale production areas for delivery to customers in the Upper Midwest via connections with the DTE Gas Transmission System and the Vector Pipeline. NEXUS also enhances shippers' ability to utilize gas storage, including the facilities located at Dawn, Ontario. Initially, the Kensington gas processing plant in Ohio ("Kensington") was envisioned as the southern terminus of the project. Later, it was determined to expand further south via the Texas East Appalachia Lease ("TEAL") project, which included capacity to a new interconnect with the Texas Eastern ("TETCO") system in Clarington, Ohio ("Clarington"). The entire system, including TEAL, began shipping gas in October 2018. NEXUS can transport up to 1.4 Billion Cubic Feet per Day ("Bcf/d") of gas.

Figure 1. NEXUS System¹

Both of the DTE Utilities hold entitlements on NEXUS. DTE Electric has an entitlement for 30,000 Dth/d to receive gas at Kensington and move it to the interconnect with the DTE Gas System in Ypsilanti, Michigan. In 2022, the size of its entitlement increases to 75,000 Dth/d, the timing of which is designed to coincide with commercialization of the Blue Water Energy Center (“BWEC”), a combined cycle generation facility currently under construction. The DTE Electric contract also allows it to receive 15,000 Dth/d of that capacity at either Clarington or Kensington until 2022. DTE Electric’s capacity contract expires in 2038.

DTE Gas has an entitlement for 75,000 Dth/d that expires in 2033. Under its agreement, DTE Gas can receive up to half of its receipts at Clarington through 2022, after which point its contract calls for all receipts to be made at Kensington; however, FTI is aware of ongoing discussions between DTE Gas and NEXUS to further amend its agreement to extend the period during which it can receive gas at Clarington. For this reason, FTI has assumed that DTE Gas will receive half its entitlement at Clarington and half at Kensington for the entirety of the Forecast Period. This assumption is consistent with recent filings DTE Gas has made before the Commission.

Table 1 shows how the DTE Utilities’ NEXUS entitlements change over time. Note that the periods reflect the time periods covered in this analysis; both the DTE Electric and DTE Gas contracts began prior to January 2022.

¹ Source: DTE Midstream

Table 1. NEXUS Entitlements by Time Period (Dth/d)

| Start | End | Quantity | Receipt Point |
|----------------------------|--------------|----------|-----------------------|
| <u>DTE Electric</u> | | | |
| January 2022 | May 2022 | 15,000 | Kensington/Clarington |
| | | 15,000 | Kensington |
| June 2022 | October 2022 | 15,000 | Kensington/Clarington |
| | | 60,000 | Kensington |
| November 2022 | May 2037 | 75,000 | Kensington |
| June 2037 | October 2038 | 30,000 | Kensington |
| <u>DTE Gas</u> | | | |
| January 2022 | October 2022 | 37,500 | Kensington/Clarington |
| | | 37,500 | Kensington |
| November 2022 | October 2033 | 75,000 | Kensington |

Both DTE Electric and DTE Gas pay a negotiated reservation rate of \$0.695/Dth for service from Kensington to NEXUS-Ypsilanti. Both also pay a negotiated reservation rate of \$0.15/Dth for receipts at Clarington. Each of the DTE Utilities' agreements also includes a fuel charge, which is currently approximately 1.3%.

Summary of Conclusions

An important motivation for this study is the desire to update previous analyses of the value of NEXUS in the context of current and upcoming proceedings before the Michigan Public Service Commission. Previously, the DTE Utilities have relied on a report dated November 2015 (the "November 2015 Report") to help explain the benefits that NEXUS creates for Michigan ratepayers. That study is now several years old and gas markets have undergone significant changes since it was developed. To capture the effect of these changes and to develop an updated estimate of the savings that NEXUS provides, FTI conducted long-run simulations using a customized version of GPCM, the industry-standard platform for the analysis of natural gas markets in North America.² The results of those simulations and related analyses support the following conclusions:

- NEXUS reduces the DTE Utilities cost of gas purchases by approximately \$867 million between 2022 and 2038. Over that time, they will pay roughly \$657 million for their contracts on NEXUS, meaning that their net savings is approximately \$210 million.
- Other gas consumers in Michigan also benefit from NEXUS because it reduces prices in Michigan. Those savings will total approximately \$808 million 2022-2038. Therefore, the total savings to customers in the state is approximately \$1 billion.
- These amounts are in addition to the savings that consumers in Michigan have already realized since NEXUS has been placed into service.

² <https://rbac.com/>

- If gas prices increase, savings attributable to NEXUS will likely be greater, perhaps by a significant amount.
- In addition to reducing gas costs, NEXUS creates other benefits, including diversity of fuel supply, the value of which FTI has not attempted to quantify but that are nonetheless important.

The remainder of this report is organized as follows. *First*, the simulation analyses that FTI conducted are described in detail. *Second*, the calculations of benefits to customers based on the simulation results are explained and summarized. *Third*, an alternative scenario that demonstrates that NEXUS benefits increase in a higher demand, higher price market is presented. *Fourth*, other benefits that are significant but that are not quantified in this study are identified. Finally, *fifth*, key conclusions and findings are summarized.

MARKET ANALYSIS

FTI's analytical approach is centered on the development of detailed simulations of the gas markets in Michigan, Appalachia, and surrounding areas that provide a realistic outlook for production, consumption, and the utilization of pipeline infrastructure. The simulation that includes NEXUS, referred to as the *Base Case*, is intended to represent a "business as usual" outlook, against which the results of alternative scenarios can be analyzed. The process by which FTI validated the reasonableness of the *Base Case* is described later in this section.

Once the *Base Case* was finalized, a *No Nexus Case* was run, in which NEXUS was removed from the simulation while all other inputs were held constant. Delivered prices in and around Michigan are higher in the *No Nexus Case*. Since the removal of NEXUS is the only change, the difference in the prices between the two cases is the estimate of NEXUS' impact on the current market and becomes the basis for the calculations of benefits.³

All the simulations were conducted on a monthly basis for ten years, from January 2022 to December 2031. FTI then extrapolated results from that ten-year forecast through 2038.

Modeling Overview

FTI developed the simulations described in this document using a customized version of GPCM that the Power & Utilities team has developed and maintains for that purpose. GPCM is the leading tool to simulate gas markets and is in widespread use by pipeline companies, banks, investors, and regulators, including the Federal Energy Regulatory Commission ("FERC"), and others.⁴ The software includes a network model based on equilibrium economics whose inputs and assumptions are developed regarding gas producers' ability to supply gas at various price levels, consumers' willingness to buy gas at various price levels, and costs from transporting and/or storing gas using existing and planned infrastructure, the cost of which is defined by published rates as well as observational data that relates costs and discounting to system utilization levels. In other words, as in the real world, suppliers will produce more

³ In other words, the prices in the *No NEXUS Case* indicate what prices would be had NEXUS never been constructed.

⁴ Additional detail regarding GPCM is included as Appendix 1. GPCM Description.

when prices are high and less when prices are low, consumers are assumed to also be responsive to price to some degree, and infrastructure owners can be expected to discount the cost of transportation or storage compared to maximum tariff rates when demand for their services is low and less when it is high. These dynamics are captured in supply and demand curves for gas as well as for transportation and storage whose parameters, including price, production, and consumption levels as well as elasticities, are based on empirical data collected in the market, as are the characteristics of pipeline and storage facilities on the system (capacity, connections, etc.). Simulation solutions are generated based on convergence to a set of conditions at which the amount of gas produced by suppliers is equal to the amount of gas consumed by customers i.e. the intersection of supply and demand curves or clearing prices. Because physical constraints impose finite limitations on the flow of gas across the system, prices will be lower in locations where there is abundant, inexpensive supplies of gas compared to demand and higher in areas in which demand is higher and the availability of gas production, transportation, or both is limited.

Customers are modeled individually based on their expected consumption patterns; for example, DTE Gas and DTE Electric are each represented as individual entities in GPCM, with customer-specific demand assumptions that are based on both historic and forecast data, system interconnections based on the real-world configuration of the DTE Gas Transportation System and the other gas infrastructure in and around the Companies' service territory (and the entire North American pipeline system), and other relevant data. Suppliers are modeled with similar levels of granularity, as are pipelines and storage facilities. For example, the configuration of NEXUS in the model includes the three zones NEXUS uses for ratemaking; connections with other pipelines, customers, and suppliers based on the system's actual configuration; and other data captured in regulatory filings and public databases. In total, the GPCM database used for this study includes more than 150 gas supply areas; nearly 500 consumers, including utilities, industrials, Liquefied Natural Gas ("LNG") export facilities, and others; almost 300 pipelines, each of which are modeled at similar levels of granularity as is NEXUS; and roughly 450 gas storage facilities. With each simulation, the model reports production, consumption, flows across each segment of infrastructure, and pricing for most publicly available indices, among other data.

Base Case Simulations

For the *Base Case*, FTI modeled supply and demand outlooks based on publicly available data and internal analyses. Assumptions regarding the development of new pipeline infrastructure also rely on current information. Of particular note for this analysis are projects designed to provide takeaway capacity from the Marcellus and Utica shales. With the completion of NEXUS and the commercialization of the Energy Transfer Partners Rover project ("ET Rover"), there are no large projects designed to provide Appalachian gas a new east-to-west path to new markets.

The outlook accounts for the cancellation of some high-profile projects that would have also added new delivery out of the region, including the Constitution pipeline and the Atlantic Coast Pipeline, both of which were abandoned by their developers in 2020 (although Constitution had been bogged down by a

number of permitting challenges for some time).^{5,6} FTI has also made the decision to not include the Mountain Valley Pipeline even though it has received its required approvals from the FERC, based on that project's recent, persistent delays. Thus, the number of projects providing new delivery out of the mid-Atlantic region expected to be developed in the next several years is relatively small. Table 2 lists planned and recent system expansions of relevance to the Marcellus and Utica areas that are included in the *Base Case*, along with their capacities and in-service dates ("ISDs"). Both NEXUS and TEAL are intentionally excluded from Table 2.

Table 2. Base Case Pipeline Projects (MMcf/d)

| Project | ISD | Capacity |
|------------------------------|------|----------|
| Columbia Gulf Xpress | 2018 | 860 |
| Mountaineer Xpress | 2018 | 2,700 |
| Columbia WB Xpress | 2018 | 1,300 |
| Atlantic Sunrise | 2018 | 1,700 |
| ET Rover | 2018 | 3,250 |
| Columbia Leach Xpress | 2018 | 1,530 |
| Eastern Sore 2017 Expansion | 2018 | 61 |
| Birdsboro (DTE) | 2019 | 79 |
| Adelphia Gateway | 2021 | 350 |
| Appalachia to Market (TETCO) | 2021 | 18 |
| PennEast | 2021 | 1,000 |
| Transco Leidy South | 2021 | 582 |
| Vector BWEC Pipeline | 2022 | 180 |

Aside from the BWEC Pipeline project on Vector, which is a lateral project to support DTE Electric's new generation facility, there are no pipeline expansions planned in Michigan nor have there been any large projects recently completed. The most recent pipeline project in the region is SEMCO Energy Gas Company's Marquette Connector, a new lateral connection from its distribution system to Great Lakes Gas Transmission ("GLGT"), which went into service in 2019.⁷

Once FTI ran the forecast using these assumptions, one way in which the *Base Case* simulation was validated was by comparing the resulting price forecasts to available forwards. Specifically, FTI compiled forward curves from February 25, 2021, which are reported by OTC Global Holdings, L.P. and accessed through S&P Global Market Intelligence ("S&P"), which it compared to the *Base Case* forecast. Below, monthly forecasts for Dominion South Point ("Dominion South"), Texas Eastern Market Zone 2 ("TETCO M2"), and the Tennessee Gas Pipeline Zone 4, 200 Leg ("TGP Z4-200L").

Figure 2. Base Case Forecast vs. Forward Pricing: Dominion South

Figure 3. Base Case Forecast vs. Forward Pricing: TETCO M2

Figure 4. Base Case Forecast vs. Forward Pricing: TGP Z4-200L

FTI also calibrated the *Base Case* simulation based on expected prices at Kensington and Clarington. To do so, FTI synthesized forward prices for each location based on pricing relationships to other indices, TGP Z4 200L and TETCO M2, respectively.

Figure 5. Base Case Forecast vs. Forward Pricing: Kensington

Figure 6. Base Case Forecast vs. Forward Pricing: Clarington

FTI also compared pricing points in the areas where NEXUS delivers, including MichCon, Dawn, and the Consumers Energy Citygate (“Consumers”).

Figure 7. Base Case Forecast vs. Forward Pricing: MichCon

Figure 8. Base Case Forecast vs. Forward Pricing: Dawn

Figure 9. Base Case Forecast vs. Forward Pricing: Consumers

The Base Case forecast was also validated by comparing the demand outlook with recent versions of the Annual Energy Outlook (“AEO”), which is published each year by the Energy Information Agency (“EIA”). The AEO includes a series of forecasts that reflect EIA’s current projections for energy prices, production, consumption, and other outcomes, differentiated by geographic area, under various scenarios. FTI compared the Base Case demand forecast for Michigan to “Reference Case” demand forecast from each of the last two AEOs, which were published in 2020 (“AEO2020”) and 2021 (“AEO2021”). The AEO forecasts are for the East North Central (“ENC”) region, the U.S. census region that includes Michigan, Illinois, Indiana, Ohio, and Wisconsin. Therefore, the Base Case forecast is not directly compared to the ENC outlook but, rather, annual rates of growth in annual gas consumption are compared for each of DTE’s Residential, Commercial, and Industrial customers and DTE Electric were compared to the corresponding forecasts for ENC consumption from the AEOs. Results are shown in Table 3 below.

Table 3. Base Case and AEO Demand Forecast Comparison

| Sector | Forecast | Area | Units | 2022 | 2033 | 2038 | Growth Rate (2022-2038) |
|-------------|-----------|----------|-------|-------|---------|---------|----------------------------|
| Total | 2021 AEO | ENC | Tcf | 4.3 | 5.0 | 5.4 | 1.4% |
| | 2020 AEO | ENC | Tcf | 4.6 | 4.9 | 5.4 | 1.0% |
| | Base Case | Michigan | Bcf | 979.7 | 1,096.8 | 1,166.7 | 1.1% |
| Residential | 2021 AEO | ENC | Tcf | 1.3 | 1.2 | 1.2 | -0.6% |
| | 2020 AEO | ENC | Tcf | 1.3 | 1.2 | 1.1 | -0.7% |
| | Base Case | Michigan | Bcf | 106.3 | 99.7 | 93.9 | -0.8% |
| Industrial | 2021 AEO | ENC | Tcf | 1.2 | 1.3 | 1.4 | 1.0% |
| | 2020 AEO | ENC | Tcf | 1.4 | 1.4 | 1.5 | 0.6% |
| | Base Case | Michigan | Bcf | 73.4 | 85.1 | 89.5 | 1.3% |
| Commercial | 2021 AEO | ENC | Tcf | 0.7 | 0.8 | 0.8 | 0.4% |
| | 2020 AEO | ENC | Tcf | 0.8 | 0.8 | 0.8 | 0.0% |
| | Base Case | Michigan | Bcf | 74.1 | 73.8 | 72.9 | -0.1% |
| Electric | 2021 AEO | ENC | Tcf | 1.1 | 1.7 | 2.0 | 3.8% |
| | 2020 AEO | ENC | Tcf | 1.2 | 1.5 | 2.0 | 3.1% |
| | Base Case | Michigan | Bcf | 69.0 | 93.1 | 111.4 | 3.0% |

These data show general consistency between the *Base Case* and the AEO forecasts for each customer segment. All three forecasts indicate moderate growth in total consumption is expected through 2038, driven by strong growth in gas consumption for electric generation and offset by declines in residential growth. The *Base Case* forecasts for Industrial and Commercial demand also align reasonably well with the AEO projections. Note that Table 3 also includes data for 2030, showing the general agreement among the forecasts in the middle of the Forecast Period as well.

Average annual prices from the *Base Case* for selected points are shown in Table 4.

Table 4. Base Case Annual Prices (\$/MMBtu)

| | Dawn | MichCon | Clarington | Kensington |
|------|-------------|----------------|-------------------|-------------------|
| 2022 | \$2.65 | \$2.68 | \$2.19 | \$2.35 |
| 2023 | \$2.52 | \$2.56 | \$2.05 | \$2.22 |
| 2024 | \$2.50 | \$2.55 | \$2.05 | \$2.24 |
| 2025 | \$2.59 | \$2.63 | \$2.06 | \$2.27 |
| 2026 | \$2.62 | \$2.67 | \$2.05 | \$2.28 |
| 2027 | \$2.70 | \$2.73 | \$2.11 | \$2.33 |
| 2028 | \$2.79 | \$2.83 | \$2.19 | \$2.41 |
| 2029 | \$2.95 | \$2.99 | \$2.29 | \$2.52 |
| 2030 | \$3.04 | \$3.09 | \$2.37 | \$2.61 |
| 2031 | \$3.18 | \$3.22 | \$2.46 | \$2.72 |
| 2032 | \$3.29 | \$3.33 | \$2.54 | \$2.81 |
| 2033 | \$3.40 | \$3.44 | \$2.61 | \$2.90 |
| 2034 | \$3.52 | \$3.55 | \$2.69 | \$2.99 |
| 2035 | \$3.63 | \$3.67 | \$2.78 | \$3.08 |
| 2036 | \$3.76 | \$3.80 | \$2.86 | \$3.18 |
| 2037 | \$3.88 | \$3.92 | \$2.95 | \$3.28 |
| 2038 | \$4.01 | \$4.05 | \$3.04 | \$3.38 |

The Upper Midwest prices, MichCon and Dawn, increase at a higher rate than do the other prices shown, indicating that even though prices will remain low compared to historical levels, regional delivery constraints will continue to create price separation to other areas.

Also noteworthy is the evolving relationship between the MichCon and Dawn prices. Historically, Dawn gas has been priced at a premium to gas at MichCon; however, the *Base Case* forecast indicates an inversion of that relationship. This outlook represents a continuation of recent trends between those prices, whereby the spread has decreased consistently and, recently, reversed. Figure 10 shows the average annual spread between Dawn and MichCon since 2010.⁸

⁸ Data for 2021 are a year-to-date average through March 23.

Figure 10. Average Annual Spread from Dawn to MichCon⁹

No Nexus Simulations

In the *No Nexus* case, flows on NEXUS are eliminated while all other factors are held constant. From Michigan's perspective, the result is that access to the lowest priced sources of gas (the Marcellus and Utica shales) is reduced and the market is compelled to import gas from other sources that are either farther away such as the Haynesville Shale, located mostly in Texas and Louisiana, or the Niobara Shale, which is in the Rockies, or from local production from the Antrim Shale, which is nearby but more expensive.

One result of the supply shift is an increase in local prices. Figure 11 shows the average annual change in the MichCon price in the *No NEXUS* case compared to the *Base Case*. On average, the differential is roughly \$0.08/MMBtu.

⁹ FTI analysis using data from S&P.

Figure 11. Change in Annual MichCon Prices

Figure 12 shows a similar comparison for Dawn, where the spread between the *No NEXUS Case* and the *Base Case* is lower, averaging roughly \$0.06/MMBtu over the forecast period. Prices at Dawn are less sensitive to the impact from NEXUS because it is farther away from NEXUS receipts and because Dawn is subject to other market influences that may be more pronounced on the Canadian side of the border, including, for example, flows on the TransCanada Pipeline Line (“TCPL”) system.

Figure 12. Change in Annual Dawn Prices

In some locations, the opposite price response occurs, and prices are higher in the *Base Case*. This is the case in some supply areas, where NEXUS increases demand. For example, Table 5 shows that prices at Dominion South and TGP Z4 200L each increased as a result of NEXUS being placed into service.

Table 5. Average Change (2022-2038) in Selected Prices (\$/MMBtu)

| | Base Case | No NEXUS | Price Change | % Change vs. Base |
|----------------|-----------|----------|--------------|-------------------|
| MichCon | \$3.16 | \$3.24 | \$0.08 | 2.5% |
| Dawn | \$3.12 | \$3.18 | \$0.06 | 2.0% |
| Dominion South | \$2.23 | \$2.19 | (\$0.04) | -1.7% |
| TGP Z4 200L | \$2.41 | \$2.38 | (\$0.03) | -1.3% |

Comparison to Results Reported in the November 2015 Report

These results differ meaningfully from those described in the November 2015 Report. In that study, NEXUS was found to cause a larger difference in delivered prices, which, in turn, created more savings. One reason for the difference – likely the most significant – is the fact that gas prices were higher around the time the November 2015 Report was developed than they are now. For example, the average MichCon prices for 2014 and 2015 were \$5.72/MMBtu and \$2.83/MMBtu, respectively. By 2020, the average price at MichCon had fallen below \$2/MMBtu. Average annual prices since 2014 are shown below.

Figure 13. Average Annual MichCon Prices, 2014-2020¹⁰

Expectations for future prices were also considerably higher in 2015 than they are at present. Figure 14 shows the New York Mercantile Exchange (“NYMEX”) forward curves for the Henry Hub, historically the benchmark index for North American gas, that settled on March 15, 2015 and on March 12, 2021. The curve from 2015 is considerably higher and indicates that the cost of gas is expected to increase at a rapid pace into the future. For example, the 2021 settlements indicate that the Henry Hub price in 2027, the last year included in both curves, is expected to average \$2.58/MMBtu while the 2015 settlements indicate \$4.45/MMBtu, more than 75% higher.

¹⁰ Analysis by FTI using data from S&P.

Figure 14. NYMEX Henry Hub Futures, 2015 vs. 2021

One implication of the current, lower price environment is that price changes attributable to new infrastructure are likely to be smaller.

Another, closely related reason for the difference in the outlooks presented in the two studies may be the unexpected response to Appalachian gas producers to low prices. Production levels from suppliers in the Marcellus and Utica regions over the last several years have surprised many industry observers, who believed that low prices would cause producers to curtail their output. Instead, production has generally remained strong and although some declines have been observed since the beginning of 2020, they may be attributable to impacts from the COVID-19 pandemic.

Finally, the disposition of supply into Michigan, both historically and in terms of the long-term outlook, has clearly changed. The November 2015 Report indicates that, absent NEXUS, only about a third of the gas brought to Michigan would be from Appalachia, with gas from sources in the west representing the state's largest sources of supply.¹¹ At the time, that outlook was generally supported by more competitive pricing for gas from the Western Canadian Sedimentary Basin ("WCSB"), from which a significant amount of gas for the Upper Midwest is sourced and delivered via TCPL, the Northern Border system and smaller systems that connect with TCPL, including Alliance and GLGT. More recently, supplies from WCSB have become less competitive compared to shale gas from the mid-Atlantic and also compared to supplies from other areas whose favorable economics have supported recent growth, such

¹¹ p. 22.

as the Haynesville or Niobara formations or the Permian Basin. It may be the case, then, that when the November 2015 Report was presented to the Commission that NEXUS would be expected to provide a path to Michigan that would allow for the displacement of gas that was considerably more expensive than Michigan's current supplies. Some of the non-Appalachian supplies that Michigan can access, including, for the example, Haynesville gas, may be more expensive than Marcellus and Utica gas, but the difference may be smaller than it was when the November 2015 Report was developed. As a result, the expected impact from NEXUS could be somewhat less than had been expected at that time.

These important differences notwithstanding, the findings described in this document and those described in the November 2015 Report share important consistencies. In particular, the November 2015 Report found that NEXUS was expected to decrease the MichCon price by roughly 3.6%, on average, over its forecast period, a result that generally similar the forecast of a 2.5% reduction that FTI has found in this study. Table 6 shows a comparison.

Table 6. Comparison of Results to November 2015 Report, Average MichCon Prices (\$/MMBtu)

| | FTI Study | November 2015 Report |
|----------|---------------|----------------------|
| Base | \$3.16 | \$5.87 |
| No NEXUS | <u>\$3.24</u> | <u>\$6.08</u> |
| Change | <u>\$0.08</u> | <u>\$0.21</u> |
| % change | 2.5% | 3.6% |

While some of the forecasts described in the November 2015 Report are now inconsistent with current expectations, it is not appropriate to evaluate their accuracy based entirely on hindsight and without context. Market conditions when that study was developed, particularly with regard to the considerably higher spot and forward gas prices, clearly align with a higher price outlook which, in turn, results in higher benefits. Now, with market prices lower, the benefits attributable to NEXUS are decreased. These differences notwithstanding, similarities between the two studies, particularly the expected percentage reductions in delivered prices and the simple fact that both forecasts found NEXUS to provide significant impacts that create ratepayer savings, may serve to validate both studies while also demonstrating that NEXUS delivers benefits under a wide range of market conditions.

CALCULATION OF NEXUS BENEFITS

Benefits attributable to NEXUS accrue in different ways for different customers, depending on whether they hold entitlements on NEXUS, on other systems, or both, among other factors. This section discusses the derivation of the benefits attributable to each of DTE Electric, DTE Gas, and other customers in Michigan from the results of the simulation analyses.

As contract holders, savings for DTE Electric and DTE Gas emerge from their ability to source gas upstream on NEXUS instead of in or closer to Michigan and also from the fact that other purchases are made at reduced prices. The following example illustrates the mechanics of how savings are realized.

The *Base Case* forecast for November 2028 is \$2.93/Dth for MichCon and \$2.41/Dth for Kensington.¹² The *No NEXUS Case* forecast for the same month is \$3.03/Dth for MichCon. That same month, DTE Electric's consumption is expected to be approximately 6.6 million Dth, of which about 2.3 million Dth can be bought at Kensington under Company's NEXUS entitlement. DTE Electric's cost of that gas is therefore \$0.62/Dth lower than what it would otherwise have to pay since those purchases would be made at the *No NEXUS* MichCon price had NEXUS had not been built. The cost of gas for the month is further reduced by comparing the MichCon price from the *Base Case* of \$2.93/Dth to the MichCon price from the *No NEXUS Case* of \$3.03/Dth, resulting in cost savings of about \$0.10/Dth for the 4.4 million Dth of expected spot volumes, or \$445,000. The fuel charge on NEXUS volumes for the month is 1.26%, a cost of approximately \$70,000. For the month, the total savings are greater than the cost of the NEXUS entitlement and fuel costs, and delivered costs are reduced by approximately \$213,000.

Table 7. November 2028 Savings Calculation Example

| | | | |
|-----------------------------------|-----------|-------------------|-------------------------------|
| Demand | Dth | 6,613,337 | <i>a</i> |
| Entitlement | Dth | 2,250,000 | <i>b</i> |
| Reservation rate | \$/Dth | <u>(\$0.695)</u> | <i>c</i> |
| Contract cost | \$ | (\$1,563,750) | $d=b*c$ |
| MichCon Price (<i>No NEXUS</i>) | \$/Dth | \$3.03 | <i>e</i> |
| Kensington Price | \$/Dth | <u>\$2.41</u> | <i>f</i> |
| Savings | \$/Dth | <u>\$0.62</u> | $g=e-f$ |
| Savings | \$ | \$1,400,486 | $h=g*b$ |
| Non-contracted Volumes | Dth | 4,363,337 | <i>i</i> |
| MichCon Price (<i>No NEXUS</i>) | \$/Dth | \$3.03 | <i>e</i> |
| MichCon Price | \$/Dth | <u>\$2.93</u> | <i>j</i> |
| Savings | \$/Dth | <u>\$0.10</u> | $k=e-j$ |
| Savings | \$ | \$444,529 | $l=i*k$ |
| Contract Rate | % | 1.26% | <i>m</i> |
| Fuel Cost | \$ | <u>(\$68,371)</u> | $n = b*f*m$ |
| Savings | \$ | \$212,893 | $o=d+h+l+n$ |

By repeating this calculation for this month forecast period, FTI determined that for the period 2022-2038, the gas price savings to DTE Electric is approximately \$312 million. After accounting for NEXUS entitlement costs of \$302 million, the analysis demonstrates that total savings for DTE Electric customers is approximately \$11 million. Annual results are shown below:

¹² 1 Dth = 1MMBtu

Table 8. DTE Electric Net Savings by Year (\$,millions)

| | Benefits | Contract Costs | Net |
|------|----------|----------------|---------|
| 2022 | \$12.4 | (\$16.5) | (\$4.2) |
| 2023 | \$14.3 | (\$19.0) | (\$4.8) |
| 2024 | \$12.0 | (\$19.1) | (\$7.1) |
| 2025 | \$14.1 | (\$19.0) | (\$5.0) |
| 2026 | \$15.7 | (\$19.0) | (\$3.3) |
| 2027 | \$16.1 | (\$19.0) | (\$2.9) |
| 2028 | \$16.7 | (\$19.1) | (\$2.4) |
| 2029 | \$18.3 | (\$19.0) | (\$0.7) |
| 2030 | \$18.8 | (\$19.0) | (\$0.3) |
| 2031 | \$20.7 | (\$19.0) | \$1.7 |
| 2032 | \$21.9 | (\$19.1) | \$2.8 |
| 2033 | \$22.7 | (\$19.0) | \$3.7 |
| 2034 | \$23.7 | (\$19.0) | \$4.6 |
| 2035 | \$24.6 | (\$19.0) | \$5.6 |
| 2036 | \$25.7 | (\$19.1) | \$6.6 |
| 2037 | \$20.7 | (\$12.4) | \$8.3 |
| 2038 | \$14.0 | (\$6.3) | \$7.7 |

The same general approach was followed to estimate benefits for DTE Gas, except that additional steps had to be taken to account for its transportation portfolio by identifying the relevant market index for delivery points associated with each contract. For example, DTE Gas holds a contract with GLGT that specifies delivery points at or near the Emerson meter station near the U.S.-Canada border, where gas is typically valued based on the Emerson, Viking GL (“Emerson”) index. Therefore, for the gas that DTE Gas will flow using that contract, the benefit of NEXUS is based on the difference in the Emerson prices in the *Base Case* and *No NEXUS Case*. Table 9 shows the DTE Gas transportation portfolio and the pricing index selected to analyze the benefits for gas flowed under each contract.¹³

¹³ DTE Gas holds additional contracts on the ANR system that are intentionally excluded because their cost is recovered via distribution rates.

Table 9. DTE Gas Transportation Portfolio (Dth/d)

| Pipeline | Qty | Index |
|--------------------------------------|------------|------------------|
| NEXUS - Kensington | 37,500 | Kensington |
| NEXUS - Clarington | 37,500 | Clarington |
| GLGT | 30,390 | Emerson |
| Viking/ANR | 21,000 | Emerson |
| Vector | 20,000 | Chicago CG |
| Panhandle | 65,000 | Panhandle, TX-OK |
| ANR Alliance | 50,000 | Chicago CG |
| ANR SW | 79,000 | ANR, OK |
| ANR Mainline 3 ("ML3") ¹⁴ | 60,000 | REX Z3 |

As detailed in the GCR filing, all of these contracts except the one on GLGT expire by 2033. FTI has made the simplifying assumption that each will be renewed at the same terms for the duration of the forecast period. This includes the NEXUS contract, which is assumed to continue to be effective through October 2038 (the end date of the DTE Electric contract). Over that period, the total benefit to DTE Gas is approximately \$555 million with net savings of \$199 million. Annual totals are shown below.

Table 10. DTE Gas Net Savings by Year (\$,millions)

| | Benefits | Contract Costs | Net |
|------|-----------------|-----------------------|------------|
| 2022 | \$33.7 | (\$21.1) | \$12.6 |
| 2023 | \$31.2 | (\$21.1) | \$10.1 |
| 2024 | \$21.5 | (\$21.1) | \$0.3 |
| 2025 | \$23.2 | (\$21.1) | \$2.1 |
| 2026 | \$25.7 | (\$21.1) | \$4.6 |
| 2027 | \$27.3 | (\$21.1) | \$6.2 |
| 2028 | \$28.2 | (\$21.1) | \$7.0 |
| 2029 | \$29.4 | (\$21.1) | \$8.3 |
| 2030 | \$30.3 | (\$21.1) | \$9.3 |
| 2031 | \$34.4 | (\$21.1) | \$13.3 |
| 2032 | \$35.7 | (\$21.1) | \$14.5 |
| 2033 | \$37.0 | (\$21.1) | \$15.9 |
| 2034 | \$38.4 | (\$21.1) | \$17.3 |
| 2035 | \$39.8 | (\$21.1) | \$18.7 |
| 2036 | \$41.4 | (\$21.1) | \$20.2 |
| 2037 | \$42.9 | (\$21.1) | \$21.8 |
| 2038 | \$34.6 | (\$17.6) | \$17.0 |

¹⁴ The contract for capacity on ANR ML3 each winter, from November through March, only.

In addition to the DTE Utilities, other customers who buy gas in Michigan because their delivered costs are lower than they would be without NEXUS because of the downward pressure the incremental supplies into the market put on clearing prices. This benefits the consumers who buy spot gas priced at a Michigan index and also customers who hedge since using transportation contracts, since over time, reductions in Michigan gas prices should translate to reductions in the cost of pipeline transportation into the region of roughly the same magnitude.

To calculate these benefits, FTI first developed a non-DTE consumption forecast by subtracting the DTE Utilities' consumption from the statewide forecast. The resulting outlook, differentiated between DTE and non-DTE consumption, is shown below.

Figure 15. Consumption Outlook by Type

Savings for the non-DTE customers are created by the change in spot prices attributable to NEXUS. FTI used the average of differentials between the *Base Case* and the *No NEXUS Case* for each of Consumers CG, Dawn, Chicago CG, and Emerson. For month, the average reduction in those prices was multiplied by the forecast of non-DTE consumption shown in Figure 15. The results indicate that savings to non-DTE gas customers is expected to total approximately \$808 million.

Table 11. Non-DTE Savings by Year (\$,millions)

| | Savings |
|------|---------|
| 2022 | \$55.1 |
| 2023 | \$48.2 |
| 2024 | \$27.6 |
| 2025 | \$31.0 |
| 2026 | \$34.5 |
| 2027 | \$37.0 |
| 2028 | \$37.5 |
| 2029 | \$39.7 |
| 2030 | \$41.5 |
| 2031 | \$49.3 |
| 2032 | \$51.8 |
| 2033 | \$53.8 |
| 2034 | \$55.8 |
| 2035 | \$58.0 |
| 2036 | \$60.2 |
| 2037 | \$62.4 |
| 2038 | \$64.8 |

The non-DTE savings are large because they are not offset by any contract costs and because there are so many non-DTE customers. Therefore, on a unit basis, the change in delivered costs these customers realize is small, but because they comprise two-thirds of the entire state, those small savings are multiplied across large amounts of consumption.

Combined across all three customers types, the total benefit attributable to NEXUS over the forecast period is approximately \$1 billion.

Table 12. Total Benefits by Year (\$, millions)

| | DTE Electric | DTE Gas | Non-DTE | Total |
|-------|--------------|---------------|---------------|---------------|
| 2022 | (\$4.2) | \$12.6 | \$55.1 | \$63.6 |
| 2023 | (\$4.8) | \$10.1 | \$48.2 | \$53.5 |
| 2024 | (\$7.1) | \$0.3 | \$27.6 | \$20.9 |
| 2025 | (\$5.0) | \$2.1 | \$31.0 | \$28.2 |
| 2026 | (\$3.3) | \$4.6 | \$34.5 | \$35.8 |
| 2027 | (\$2.9) | \$6.2 | \$37.0 | \$40.4 |
| 2028 | (\$2.4) | \$7.0 | \$37.5 | \$42.1 |
| 2029 | (\$0.7) | \$8.3 | \$39.7 | \$47.3 |
| 2030 | (\$0.3) | \$9.3 | \$41.5 | \$50.5 |
| 2031 | \$1.7 | \$13.3 | \$49.3 | \$64.3 |
| 2032 | \$2.8 | \$14.5 | \$51.8 | \$69.1 |
| 2033 | \$3.7 | \$15.9 | \$53.8 | \$73.4 |
| 2034 | \$4.6 | \$17.3 | \$55.8 | \$77.8 |
| 2035 | \$5.6 | \$18.7 | \$58.0 | \$82.3 |
| 2036 | \$6.6 | \$20.2 | \$60.2 | \$87.0 |
| 2037 | \$8.3 | \$21.8 | \$62.4 | \$92.6 |
| 2038 | <u>\$7.7</u> | <u>\$17.0</u> | <u>\$64.8</u> | <u>\$89.5</u> |
| Total | \$10.5 | \$199.4 | \$808.3 | \$1,018.2 |

HIGH DEMAND SCENARIO

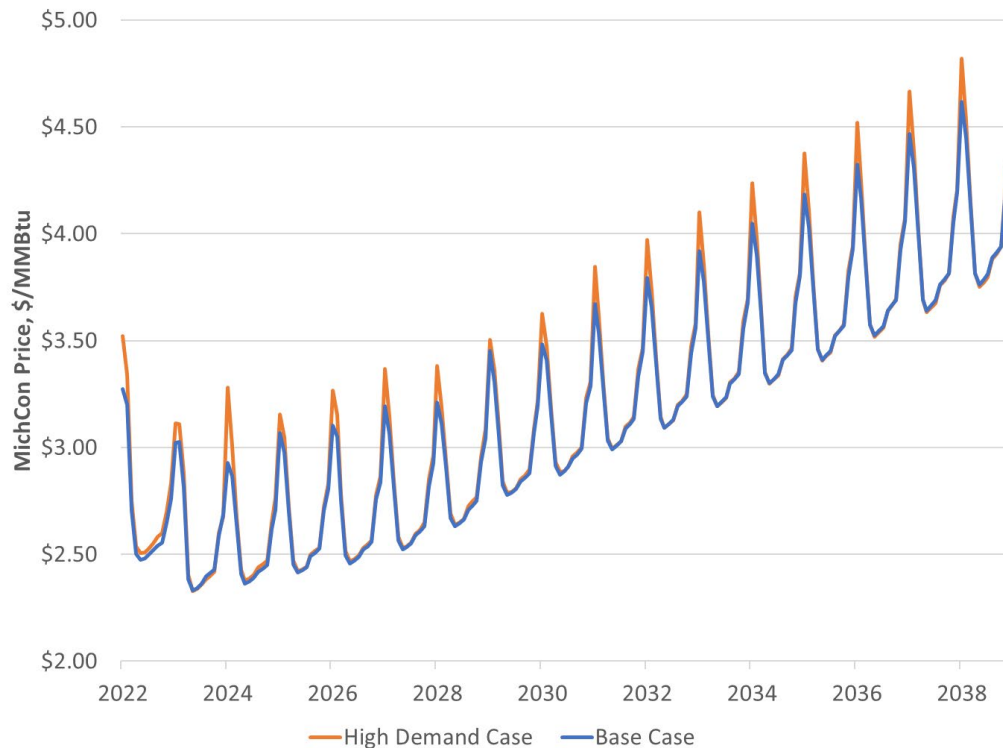

FTI also developed a high demand scenario in which gas demand was increased for the five ENC states based on an analysis of historic Heating Degree Day (“HDD”) data. The simulations were executed using this higher demand outlook with and without NEXUS using the same general approach applied to the *Base Case* and the *No NEXUS Case*.

The DTE Utilities provided FTI with weighted average HDD information for the past fifteen years, 2006-2020. Over that period there were an average of 6,490 HDDs per year in DTE’s service territory. To develop the adder, FTI identified the five years in that set with the highest HDDs (which are, in order from highest to lowest, 2014, 2007, 2013, 2009, and 2019). Among those five years, HDDs were 8% higher than the overall average. The *High Demand Case* was therefore created by increasing demand in all sectors and in all months throughout the year in the ENC states by that amount while holding all other inputs constant.¹⁵

Figure 16 shows the MichCon outlook for the *High Demand Case* compared to the *Base Case*. There is a noticeable increase during the coldest winter months, when gas demand and prices are generally highest, with little or no increase during the non-peak months.

¹⁵ The inputs held constant are from the *Base Case*. In other words, this iteration of the *High Demand Case* includes NEXUS.

Figure 16. MichCon Price Forecast Comparison

For the period 2022 through 2038, the average increase in the *High Demand Case* over the *Base Case* for January and February is \$0.15/MMBtu while the average for the remaining months is \$0.02/MMBtu.

Despite the relatively small change in market prices, there is a significant increase in the benefits to Michigan ratepayers attributable to NEXUS under this alternative demand outlook. FTI calculated the benefits in the same manner as described above for the *Base Case*. Doing so involved running the *High Demand Case*, configuring a separate simulation in which NEXUS was excluded but all other variables were held constant, and comparing the results in the same manner as is described above. The result was a sizeable increase in benefits attributable to NEXUS; the value of NEXUS to customers in Michigan increases by about 20% when the higher demand assumption is utilized.

Table 13. Comparison of NEXUS Benefits Under High Demand Case (\$, millions)

| | Base Demand | High Demand |
|----------------|-------------|-------------|
| Total Benefits | \$1,018 | \$1,264 |

This finding is significant because it suggests that not only does NEXUS provide a useful hedge against price increases in the future but that the investment in NEXUS may have a very attractive upside. The *Base Case* results indicate that NEXUS creates significant savings when prices are low. If it is the case that prices are more likely to increase than decrease for some or all of the forecast period – a reasonable

proposition given that gas prices are currently near historic lows – then the NEXUS investment may confer considerable additional value and that potential outcome is offset by very little risk.

OTHER BENEFITS

In addition to the gas cost reductions calculated under each scenario analyzed in this report, NEXUS provides other important benefits to Michigan ratepayers that are either primarily qualitative or whose calculation is beyond the scope of these analysis. These benefits include, but are not limited to the following:

- **Electric Generation Benefits.** Lower gas prices reduce costs for gas-fired generators in Michigan whether they hold NEXUS entitlements or not. This means, all else equal, that DTE's generators will be called upon to run more often by MISO, and, when they do run, their margins will be greater.
- **Reliability.** The addition of an entirely new path to supply sources reduces the likelihood of a major shortfall that could impact the reliability of the gas or electric systems in the event of an outage or other contingency event on one of the pipelines that serves Michigan.
- **Environmental Benefits.** Secure, economic supplies of natural gas are a necessary precondition for the deployment of new and efficient gas-fired generation, which, in turn, allows for the displacement of coal-fired generation in Michigan and, potentially, elsewhere and also provides an important tool for managing the intermittency of renewable generators being added to the system in increasing amounts.

CONCLUSIONS

The primary conclusion of this study is that NEXUS will create significant savings for Michigan gas consumers. For the period 2022-2038, FTI expects those savings to exceed \$1 billion. If market prices increase in the future, those savings could be even greater.

APPENDIX 1. GPCM DESCRIPTION

GPCM[®] Product Description and Introduction

1.0 Purpose

GPCM[®] is RBAC's GPCM Natural Gas Market Forecasting System[™]. Originally known as the Gas Pipeline Competition Model, GPCM is a combination software-database system, whose purpose is to enable its users to build models for analysis of natural gas economics, including the sectors of production, transportation, storage, marketing, and sales to distributors and other large customers. GPCM is the latest in a series of systems and models built by Dr. Robert E. Brooks from the mid-1970s through the present. Making use of the latest PC hardware and software technology as well as advanced computational algorithms, it enables analysts to do more at their desktop than has ever been possible in the past using mainframe computers with earlier, similar software tools.

2.0 Model Structure

Mathematically, GPCM is a network model. It can be diagrammed as a set of "nodes" and "arcs". Nodes represent production regions, pipeline zones and interconnects, storage facilities, delivery points, and customers or customer groups. The connections between these nodes are called "arcs". They represent transactions and flows. Some of these are supplier deliveries to pipelines, transportation across zones and from one zone to another, transfers of gas by one pipeline to another, delivery of gas into storage, storage of gas from one period to another, withdrawal of gas from storage, and pipeline deliveries of gas to customers.

In general an arc has four input attributes and two output attributes. The inputs are cost (which may depend on transaction volume), a minimum, a maximum, and a loss factor (representing fuel use and miscellaneous losses). The outputs are the amount of the transaction (the flow) and the economic rent associated with the flow. The latter is defined mathematically as the economic value of a unit increase (decrease) in the upper (lower) bound. It generally applies to pipeline transportation and storage capacity and represents the marginal value of increased capacity.

The economic value of a solution to this problem is identified in economic theory to be the sum of producer and consumer surplus. These concepts are defined for price sensitive supplies and demands. We assume that each supply source and each customer has a well-defined supply or demand curve. The forms for these curves can be quite general. GPCM only requires the quantity to decrease with increasing price for demand curves and to increase with increasing price for supply curves.

The objective function for this "equilibrium" solution has been shown by Nobel Prize winning economist Paul Samuelson to consist of three terms: the integral of the demand price function over demand minus the integral of the supply price function over supply and minus the sum of the transportation and storage costs. By dividing the applicable range of possible prices into a number of small steps, we can approximate the integrals in the objective function by linear terms of the form $p \cdot \Delta q$, where Δq is the additional demand (or supply) resulting from the small price change. Because of the form of the supply and demand functions and the objective function, each of these terms will be brought into the solution in an economically sensible order to produce an economically efficient, market-clearing solution. That is, the cheaper supplies will be used before more expensive ones and the customers willing to pay more will be served before those willing to pay less. Thus we are able to use a "linear

GPCM® Product Description and Introduction

programming" approach to solve a highly non-linear, complex model of market clearing behavior in the natural gas industry.

3.0 Transportation and Storage Tariff Structure

In general, each transportation and storage transaction cost is parameterized by five values: a unit demand charge, unit firm commodity charge, unit interruptible commodity charge, a "full discount quantity" (FDQ) and a "zero discount quantity" (ZDQ). The cost model for such transactions assumes that, for a price, some amount of the capacity could be reserved for certain customers. The cost of such capacity reservations will be the unit demand charge times the capacity reserved plus the unit firm commodity charge times the amount actually used. The cost for interruptible service (interruptible commodity charge) will be lower on average than the total cost for firm service, but higher than the firm commodity charge. The model says that if demand for the capacity is higher than the ZDQ, the pipeline will be able to charge the full interruptible rate for transportation. If not then it will have to discount. The amount of the discount in this model is maximal when demand falls to FDQ or lower: then the price of transportation is equal to the firm commodity charge. The discount declines linearly as demand increases from the FDQ up to the ZDQ. For all demand greater than or equal to ZDQ, the price is the full interruptible commodity charge, i.e. no discounting is required.

Storage transactions work the same way. There are three storage transactions: injection, storage, and withdrawal. Injection and withdrawal have the structure just defined. Storage has a simpler structure: a constant unit cost per period, which may be zero. The user may model a situation where gas is transported to a storage location on one rate schedule, injected and withdrawn under another, and delivered to another location under a third. The user may also model a "bundled" structure involving movement from one location to the storage location and then downstream to yet a third, all under the same rate structure.

Marketers are modeled as a single undifferentiated sector in GPCM. This sector is assumed to mediate all transactions in the model. It is the sector which makes the market by linking gas supply to gas demand through the pipeline and storage system.

The bulk of the economic rent due to capacity restrictions is generally distributed to the marketing sector. The assumption is basically that the marketers are able to buy at market conditions, sell at market conditions, and acquire transportation at prices fixed in the short term. Therefore, short term economic rents will not be acquired by the pipeline sector and will go to the marketing sector. Suppliers and customers owning Firm Transportation earn the remainder of these rents. Their rents may be earned by reselling their capacity to others or by using the F/T themselves.

4.0 User Interface

The user interface is the principal analysis tool contained in the GPCM system. It consists of a set of queries, macros, modules, forms, and reports contained in a Microsoft Access file. The user interacts with this interface through Access "Forms". Forms contain data from the database and controls such as button for causing actions to be done. The data displayed in forms is stored in database tables in a separate Access file. These tables are "attached" to the user interface so that they can be viewed and modified by the analyst.

GPCM® Product Description and Introduction

5.0 Database

The database file consists of a number of data tables for input and output. The data inputs are primarily of three types: tables representing the basic entities of the model (suppliers, supply regions, customers, demand regions, pipeline zones, storage facilities), tables relating these entities representing the structural linkages in the model (the arcs), and the quantitative data representing supplies, demands, tariffs, capacities, fuel use, etc. The GPCM user typically populates the database via Windows clipboard copy-paste operations from Excel or other spreadsheets. Alternatively, the user can utilize GPCM's built-in data import routines.

6.0 RBAC Network Optimizer

RBAC Network Optimizer is a specialized linear programming algorithm designed specifically to solve network models such as that used in GPCM™. In benchmarking tests on a large variety of such problems, it has proven to be world class in speed and functionality. RBAC Network Optimizer has been extended to handle the linearized approximations of non-linear supply, demand, and transportation cost functions required for the solution of the GPCM model.

7.0 Outputs

GPCM contains powerful and flexible tabular and graphical output capabilities. In addition the entire solution can be exported to an Excel spreadsheet for further analysis and reporting.

Following is a list of the pre-packaged screen and hardcopy reports available in GPCM:

- Results Summary / Detail
- Pipeline Usage Summary
- Supplier Deliveries Detail / Summary
- Customer Receipts Detail / Summary
- Supplier Revenue Report
- Customer Cost Report
- Transport Results Detail
- Transport Zone Prices
- Transport Zone Basis
- Interconnect Basis
- Transport Revenue
- Storage Revenue
- Transport Zone Utilization
- Transport Link Utilization
- Storage Utilization
- Storage Balance

Report 9 allows the user to find the basis (market price spread) between any two pipeline zones identified in the model in any period of the scenario. The report has a graphical capability which allows the user to produce a time series plot of the basis forecast over the forecast horizon of the case.

The Results Summary Report is an aggregate report of the gas and dollar flows among the various sectors of the gas industry. It shows the forecast aggregate average supply price, average unit return to the marketing sector, average transportation and storage cost per unit delivered, and average cost to customers represented in the model. There is also a graphical

GPCM® Product Description and Introduction

routine which allows the user to produce histograms comparing any of the elements of the case summary report for various cases.

Finally, GPCM has a general purpose graphing capability the analyst can use to plot time series of inputs and / or outputs either one at a time or overlayed against each other. For example, the analyst could plot the time series of market clearing prices in two different regions in the same scenario or in multiple scenarios in order to get a visual perspective on their relative values.
