May 14, 2025

Ms. Lisa Felice
Executive Secretary
Michigan Public Service Commission
7109 West Saginaw Highway
Post Office Box 30221
Lansing, MI 48909

Re: MPSC Case No. U-21806 – In the matter of the application of Consumers Energy Company for authority to increase its rates for the distribution of natural gas and for other relief.

Dear Ms. Felice:

Enclosed for electronic filing in the above-captioned case, please find the **Redacted Rebuttal Testimony and Exhibits of Consumers Energy Company's Witnesses**. This is a paperless filing and is therefore being filed only in PDF. Also included are an updated Company Exhibit List, Table of Disputed Issues, and a Proof of Service showing electronic service upon the parties.

Confidential materials of Company witnesses Stacy H. Baker, Neal P. Dreisig, Quentin A. Guinn, and James P. Pnacek are being filed under seal with the Michigan Public Service Commission.

Sincerely,

Digitally signed by Anne M. Uitvlugt
Date: 2025.05.14 14:23:30 -04'00'

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REDACTED

REBUTTAL TESTIMONY

OF

STACY H. BAKER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Stacy H. Baker, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Stacy H. Baker who provided direct testimony in this proceeding on behalf of Consumers Energy Company ("Consumers Energy" or the "Company")?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to the testimony and exhibits submitted by the Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff"), Attorney General witness Sebastian Coppola, and Citizens Utility Board of Michigan ("CUB") witness Joshua W. Denzler in this case concerning the Information Technology ("IT") Department's Operations and Maintenance ("O&M") expenses and capital expenditures. Specifically, I will respond to:

- Staff witness Emma Zichi's proposed adjustments to IT Investments O&M and capital expenditures to correct errors discovered through audit and discovery;
- Staff witness Zichi's proposed adjustments to IT capital expenditures for Asset Refresh Program ("ARP")-Field Device Asset Management ("FDAM") and ARP-Workstation Asset Management ("WAM");
- Staff witness Zichi's proposed recommendations for the SAP S/4HANA Implementation project; and
- Staff witness Brittney Klocke's proposed adjustments to IT capital expenditures and IT Investments O&M expenses for the Product Family Enhancements-Customer-Capital and Click to Chat projects.

I will also respond to Attorney General witness Coppola's proposed adjustments to IT capital expenditures and IT Investments O&M expenses.

I will also respond to CUB witness Denzler's proposed adjustments to IT capital expenditures and IT Investments O&M expenses.

Q. Are you sponsoring any exhibits with your rebuttal testimony?

A. Yes.

Exhibit A-109 (SHB-12)	Audit Response No. U21806-SA-CE-409;
Exhibit A-110 (SHB-13)	Discovery Response No. U21806-AG-CE-0615;
Exhibit A-111 (SHB-14)	Discovery Response No. U21806-AG-CE-0616-Revised;
Exhibit A-112 (SHB-15)	Audit Response No. U21806-SA-CE-176;
Exhibit A-113 (SHB-16)	Discovery Response Nos. U21806-CUB-CE-0121 through 0126 and U21806-AG-CE-0613, 0614, and 0847; and
Exhibit A-158 (SHB-17)	Discovery Response No. U21806-AG-CE-0852, Attachment 2.

Q. Were these exhibits prepared by you or under your supervision?

A. Yes.

MPSC STAFF

Q. What project is Staff witness Zichi proposing adjustments for in this case?

A. On page 3, line 8, through page 4, line 3, of her direct testimony, Staff witness Zichi is proposing an adjustment for the Application Currency-Corporate-Capital project.

Q. What amount is Staff witness Zichi proposing to adjust for the Application Currency-Corporate-Capital project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 1, she is proposing an adjustment of $15,010 for the projected bridge period, $18,013 for the projected test year of capital expenditures, and $1,991 for the projected test year O&M for the Application Currency-Corporate-Capital project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the Application Currency-Corporate-Capital project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Discovery request U21806-ST-CE-0004 CONF (Exhibit S-19.2, page 2) that the 2025 and 2026 capital hardware/storage upgrade costs in each year were overstated by $15,010 for the bridge year, $18,013 for the projected test year, and $1,991 for the projected test year O&M. As a result, the capital expenditures for the projected bridge period and projected test year should be adjusted by $15,010 and $18,013, respectively, and $1,991 for test year O&M.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 4, lines 4 through 17, of her direct testimony, Staff witness Zichi is proposing an adjustment for the HR Support Pack and Business Software Inc Upgrade 2025 project.

Q. What amount is Staff witness Zichi proposing to adjust for the HR Support Pack and Business Software Inc Upgrade 2025 project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 2, she is proposing an adjustment of $20,119 for the projected test year O&M for the HR Support Pack and Business Software Inc Upgrade 2025 project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the HR Support Pack and Business Software Inc Upgrade 2025 project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21806-SA-CE-049-Revised (Exhibit S-19.1, pages 3 and 4) that the O&M costs were overstated by $20,119 for the projected test year O&M. As a result, the expenses for the test year O&M should be adjusted by $20,119.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 4, line 18, through page 5, line 9, of her direct testimony, Staff witness Zichi is proposing an adjustment for the HR Support Pack and Business Software Inc Upgrade 2026 project.

Q. What amount is Staff witness Zichi proposing to adjust for the HR Support Pack and Business Software Inc Upgrade 2026 project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 3, she is proposing an adjustment of $40,454 for the projected test year O&M for the HR Support Pack and Business Software Inc Upgrade 2026 project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the HR Support Pack and Business Software Inc Upgrade 2026 project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21806-SA-CE-049-Revised (Exhibit S-19.1, pages 3 and 4) that the O&M costs were overstated by $40,454 for the projected test year O&M. As a result, the expenses for the test year O&M should be adjusted by $40,454.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 5, line 16, through page 6, line 12, of her direct testimony, Staff witness Zichi is proposing an adjustment for the Application Currency-Electric & Gas Shared-Capital project.

Q. What amount is Staff witness Zichi proposing to adjust for the Application Currency-Electric & Gas Shared-Capital project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 9, she is proposing an adjustment of $19,146 for the projected bridge period, $22,975 for the projected test year of capital

expenditures, and $7,962 for the projected test year O&M for the Application Currency-Electric & Gas Shared-Capital project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the Application Currency-Electric & Gas Shared-Capital project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21490-ST-CE-0003 CONF (Exhibit S-19.2, page 1) that the 2025 and 2026 capital hardware/storage upgrade costs in each year were overstated by $19,146 for the bridge year, $22,975 for the projected test year, and $7,962 for the projected test year O&M. As a result, the capital expenditures for the projected bridge period and projected test year should be adjusted by $19,146 and $22,975, respectively, and $7,962 for test year O&M.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 6, line 13, through page 7, line 1, of her direct testimony, Staff witness Zichi is proposing an adjustment for the Standard Work Plan project.

Q. What amount is Staff witness Zichi proposing to adjust for the Standard Work Plan project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 10, she is proposing an adjustment of $70,665 for the projected test year O&M for Standard Work Plan project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the Standard Work Plan project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21806-SA-CE-075 (Exhibit S-19.1, page 5 and 6) that the O&M costs were overstated by $70,665 due to ongoing support costs being inadvertently

added for the projected test year O&M. As a result, the expenses for the test year O&M should be adjusted by $70,665.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 7, lines 2 through 19, of her direct testimony, Staff witness Zichi is proposing an adjustment for the Next Generation electronic Shift Operations Management System (eSOMS) Replacement project.

Q. What amount is Staff witness Zichi proposing to adjust for the Next Generation electronic Shift Operations Management System (eSOMS) Replacement project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 11, she is proposing an adjustment of $125,746 for the projected test year capital expenditures, and $8,243 for the projected test year O&M for the Next Generation electronic Shift Operations Management System (eSOMS) Replacement project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the Next Generation electronic Shift Operations Management System (eSOMS) Replacement project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21806-SA-CE-076 (Exhibit S-19.1, page 7) that the projected gas allocation capital and O&M should be reduced by $125,746 for the projected test year, and $8,243 for the projected test year O&M. As a result, the capital expenditures for the projected test year should be adjusted by $125,746 and $8,243 for test year O&M.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 8, lines 4 through 17, of her direct testimony, Staff witness Zichi is proposing an adjustment for the ARP-Collaboration project.

Q. What amount is Staff witness Zichi proposing to adjust for the ARP-Collaboration project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 13, she is proposing an adjustment of $6,015 for the projected bridge period, and $7,219 for the projected test year capital expenditures for the ARP-Collaboration project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the ARP-Collaboration project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21806-SA-CE-178 (Exhibit S-19.1, page 8 and 9) that the 2025 and 2026 capital hardware/storage upgrade costs in each year were overstated by $6,015 for the bridge year and $7,219 for the projected test year. As a result, the capital expenditures for the projected bridge period and projected test year should be adjusted by $6,015 and $7,219, respectively.

Q. What additional project is Staff witness Zichi proposing adjustments for in this case?

A. On page 13, lines 9 through 21, of her direct testimony, Staff witness Zichi is proposing an adjustment for the ARP-Physical Security project.

Q. What amount is Staff witness Zichi proposing to adjust for the ARP-Physical Security project?

A. Based on Staff witness Zichi's Exhibit S-19.0, line 17, she is proposing an adjustment of $72,640 for the projected bridge period, $108,960 for the projected test year of capital expenditures for the ARP-Physical Security project.

Q. Do you agree with Staff witness Zichi's proposed adjustment to the ARP-Physical Security project?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Staff Audit request U21806-SA-CE-018-Revised (Exhibit S-19.1, page 1 and 2) that the 2025 and 2026 capital hardware/storage upgrade costs in each year were overstated by $72,640 for the bridge year and $108,960 for the projected test year. As a result, the capital expenditures for the projected bridge period and projected test year should be adjusted by $72,640 and $108,960, respectively.

Q. What adjustments is Staff witness Zichi proposing for the ARP-FDAM project in this case?

A. On page 8, line 18, through page 9, line 4, of her direct testimony, Staff witness Zichi is proposing full disallowance of the new field device purchases of $831,046 for the 10-month bridge period ending 10/31/2025 and $999,543 for the projected test year ending 10/31/2026 as a part of the ARP-FDAM project.

Q. What is Staff witness Zichi's rationale for proposing full disallowance of the new field device purchases for the ARP-FDAM project?

A. On page 9, line 5, through page 10, line 19, of her direct testimony, Staff witness Zichi provides the rationale that the Company has not provided clear evidence to support the expenditures for new purchases for the ARP-FDAM project and there are conflicting rationales in the Company's testimony and audit responses regarding how the costs were projected.

Q. Did the Company provide the method for projecting the new field device purchases costs and clarify in audit how the costs were projected?

A. Yes. The Company provided in the audit response at Exhibit S-19.1, page 12 (U21806-SA-CE-325), that the Company projected the Total Company new purchases of $997,255 and $1 million for 2025 and 2026, which the basis was historical spend. The Company provided the historical actuals to validate the reasonableness of the projected 2025 and 2026 new purchase costs for ARP-FDAM, which historically had been included in ARP-WAM. Additionally, Exhibit S-19.1, page 12, references audit response Exhibit S-19.1, page 11 (U21806-SA-CE-288), that indicates that further investigation revealed that the Company did not use People and Culture hiring estimates to project new purchases for 2025 and 2026. Furthermore, Exhibit S-19.1, page 11, provides support that the four-year historical average for new purchases for 2020 – 2023 for ARP-FDAM and ARP-WAM exceeds what is being requested in this case for ARP-FDAM and ARP-WAM new purchases for 2025 and 2026.

Q. What is the impact of co-workers not having a field device to perform work in service of customers?

A. The absence of field devices for co-workers can significantly impact their ability to perform work effectively. Without field devices, co-workers face productivity losses due to the need to access information through less efficient means, such as using paper-based resources. This can lead to delays in work initiation and completion. The lack of access to electronic safety manuals and resources can increase safety risks. Workers may not have the most up-to-date safety information readily available, which is crucial for maintaining a safe working environment. Field devices facilitate better communication, especially

during emergencies or unexpected events. Without them, there is a risk of losing business continuity and effective communication, which can hinder timely responses to customer needs. Field devices provide access to online training and Company resources, which are essential for continuous learning and skill development. Without these devices, workers may miss out on training, leading to a gap in knowledge and skills. Sharing devices among employees can pose cybersecurity risks. Field devices help mitigate these risks by providing individual access to necessary resources, reducing the need for device sharing. Overall, the lack of field devices can lead to decreased efficiency, increased safety risks, and hindered communication, all of which negatively impact the service provided to customers.

Q. If Staff witness Zichi's proposed disallowance for the ARP-FDAM project is nonetheless adopted, has the Company identified any necessary adjustments to the disallowance?

A. Yes. The Company has identified necessary adjustments for the ARP-FDAM project. The projected gas allocation capital expenditures for this project are $261,198 for the 10-month bridge period ending 10/31/2025 and $314,156 for the projected test year ending 10/31/2026, as provided in Exhibit A-22 (SHB-7), page 4, column (h), lines 4 through 6, for the test year. The capital expenditure amounts that Staff witness Zichi references in Exhibit A-22 (SHB-7), page 4, columns e and g, in her direct testimony on page 9, line 2, are the Total Company amounts and not the gas allocation. Therefore, if the Commission were to disallow this project based on Staff witness Zichi's position, which it should not, the gas projected capital expenditure disallowance of $261,198 for the 10-month bridge

period ending 10/31/2025 and $314,156 for the projected test year ending 10/31/2026, would be the correct disallowance amount.

Q. What adjustments is Staff witness Zichi proposing for the ARP-WAM project in this case?

A. On page 10, line 20, through page 11, line 7, of her direct testimony, Staff witness Zichi is proposing full disallowance of the new workstation purchases of $831,077 for the 10-month bridge period ending 10/31/2025 and $997,292 for the projected test year ending 10/31/2026 as a part of the ARP-WAM project.

Q. What is Staff witness Zichi's rationale for proposing full disallowance of the new workstation purchases for the ARP-WAM project?

A. On page 11, line 8, through page 13, line 4, of her direct testimony Staff witness Zichi provides the rationale that the Company has not provided clear evidence to support the expenditures for new purchase for the ARP-WAM project and there are conflicting rationales in the Company's testimony and audit responses regarding how the costs were projected.

Q. Did the Company provide the method for projecting the new workstation purchases costs and clarify in audit response how the costs were projected?

A. Yes. The Company provided in audit response Exhibit S-19.1, page 11 (U21806-SA-CE-288), that the Company projected the Total Company new purchases of $1 million for 2025 and 2026, which the basis was historical spend. The Company provided historical actuals to validate the reasonableness of the projected 2025 and 2026 new purchase costs for ARP-WAM, which historically had been included in ARP-FDAM. Additionally, the Company indicated that further investigation revealed that the Company did not use People and

Culture hiring estimates to project new purchases for 2025 and 2026. Furthermore, Exhibit S-19.1, page 11, provides support that the four-year historical average for new purchases for 2020 – 2023 for ARP-WAM and ARP-FDAM exceeds what is being requested in this case for ARP-WAM and ARP-FDAM new purchases for 2025 and 2026.

Q. What is the impact of co-workers not having a workstation to perform work in service of customers?

A. The absence of a workstation for co-workers can significantly impact their ability to perform work effectively. Without access to a workstation, co-workers face productivity losses due to the need to access systems to perform their work. This can lead to delays in work initiation and completion. Additionally, the inability to access electronic processes and systems significantly impacts their ability to perform work effectively, such as performing essential diagnostics, monitoring, and planning of critical systems. Workers may not have the most up-to-date safety and compliance information readily available, which is crucial for maintaining a safe working environment and regulatory compliance. Workstations facilitate better communication, especially during emergencies or unexpected events. Without them, there is a risk of losing business continuity and effective communication, which can hinder timely responses to customer needs. Workstations provide access to online training and Company resources, which are essential for continuous learning and skill development. Without these workstations, workers may miss out on training, leading to a gap in knowledge and skills. Sharing devices among employees can pose cybersecurity risks. Workstations help mitigate these risks by providing individual access to necessary resources, reducing the need for device sharing. Overall, the lack of workstations can lead to decreased efficiency, increased safety and

compliance risks, and hindered communication, all of which negatively impacts the service provided to customers.

Q. If Staff witness Zichi's proposed disallowance for the ARP-WAM project is nonetheless adopted, has the Company identified any necessary adjustments to the disallowance?

A. Yes. The Company has identified necessary adjustments for the ARP-WAM project. The projected gas allocation capital expenditures for this project are $261,197 for the 10-month bridge period ending 10/31/2025 and $314,300 for the projected test year ending 10/31/2026, as provided in Exhibit A-22 (SHB-7), page 12, column (h), lines 8 through 18, for the test year. The capital expenditure amounts that Staff witness Zichi used in the adjustment calculations are the Total Company amounts and not the gas allocation. Therefore, if the Commission were to disallow this project based on Staff witness Zichi's position, which it should not, the gas projected capital expenditure disallowance of $261,197 for the 10-month bridge period ending 10/31/2025 and $314,300 for the projected test year ending 10/31/2026, would be the correct disallowance amount.

Q. Did Staff provide any recommendations regarding the SAP S/4HANA Implementation project?

A. Yes. On page 14, lines 6 through 18, of her direct testimony, Staff witness Zichi proposed two recommendations regarding the SAP S/4HANA Implementation project.

First, Staff is recommending the Commission direct the Company to meet with Staff quarterly to provide progress of the SAP S/4HANA Implementation project, including any advancements and/or setbacks in project implementation, budget adherence,

changes to project scope, timeline, expenses, and any problems the Company has experienced or anticipates experiencing with any operations or customer interactions.

Second, Staff is recommending the Company include in future rate case filings until implementation is complete, any over and under recovery of each projected expense for the project compared to the 80% base (Rough Order of Magnitude ("ROM") Adjusted Amount).

Q. Does the Company agree with Staff witness Zichi's recommendations regarding the SAP S/4HANA Implementation project?

A. Yes. The Company agrees with Staff witness Zichi's recommendations regarding the SAP S/4HANA Implementation project as described above.

Q. What projects is Staff witness Klocke proposing adjustments for in this case?

A. As stated on page 5, lines 15 through 19, of her direct testimony, Staff witness Klocke is proposing adjustments for the Click to Chat project and Product Family Enhancements-Customer-Capital projects that includes Web Chat AI, Self-Service Mobile Application, and Low Moderate Income ("LMI") Customer Support enhancements. Company witness Jessica R. Byrom and I will address each proposed adjustment.

Q. What amount is Staff witness Klocke proposing to disallow for the Click to Chat project?

A. On page 5, line 30, through page 6, line 2, of her direct testimony, Staff witness Klocke is proposing full disallowance of the capital expenditures requested in this case for the Click to Chat project of $48,641, with $45,683 in the historical year ended December 31, 2023 and $2,958 in the bridge year ended December 31, 2024.

Q. Do you agree with Staff witness Klocke's proposal of full disallowance of the Click to Chat project?

A. No. The Company does not agree with Staff witness Klocke's proposal of full disallowance of the Click to Chat project. First, this project was included in the gas rate Case No. U-21308 and in electric rate Case No. U-21389, and no parties recommended disallowance of the project in those cases. Thus, the projections approved in those cases included approval of Click to Chat project costs. In the Commission's March 21, 2025 Order in Case No. U-21585, pages 183 through 186, the Commission approved the Click to Chat project 2023 historical year costs on the basis that although the Click to Chat function does not save money, it contributes to the provision of utility service. This same rationale should apply to the bridge period costs. Company witness Byrom's rebuttal testimony further addresses this project's value.

Q. What amount is Staff witness Klocke proposing to disallow for the Product Family Enhancements-Customer-Capital project related to the Web Chat AI, Customer Self-Service Mobile Application, and LMI Customer Support enhancements?

A. On page 8, lines 6 through 13, of her direct testimony, Staff witness Klocke is proposing full disallowance of the capital expenditures requested in this case for the Web Chat AI, Customer Self-Service Mobile Application, and LMI Customer Support enhancements that are part of Product Family Enhancements-Customer-Capital project of $1,905,494 ($61,562 for 2023, $274,116 for 2024, $699,355 10 months ending 10/31/2025, and $870,461 for the projected test year) in capital expenditures and $21,439 IT Investments O&M expense for the projected test year.

Enhancements	Capital				O&M
	Historical 12 Mos Ended 12/31/2023	12 Mos Ending 12/31/2024	10 Mos Ending 10/31/2025	Projected Test Year 12 Mos Ending 10/31/2026	Projected Test Year
Web Chat AI	$0	$0	$0	$180,565	$14,929
Customer Self-Service Mobile Application	$61,562	$274,116	$498,727	$649,770	$6,510
LMI Customer Support	$0	$0	$200,628	$40,126	$0

Q. What adjustment is Staff witness Klocke proposing for the Web Chat AI enhancements that is part of the Product Family Enhancements-Customer-Capital project?

A. On page 8, lines 14 through 20, of her direct testimony, Staff witness Klocke is proposing an adjustment of $180,565 in capital expenditures and $14,929 in IT Investments O&M expense for the projected test year for the Web Chat AI enhancements that is part of the Product Family Enhancements-Customer-Capital project.

Q. Do you agree with Staff witness Klocke's proposal of full disallowance of the Web Chat AI enhancements that is part of the Product Family Enhancements-Customer-Capital project?

A. No. The Company does not agree with Staff witness Klocke's proposal of full disallowance of the Web Chat AI enhancements that is part of the Product Family Enhancements-Customer-Capital project. Company witness Byrom's rebuttal testimony further addresses this project's value.

Q. What adjustment is Staff witness Klocke proposing for the Customer Self-Service Mobile Application enhancements that is part of the Product Family Enhancements-Customer-Capital project?

A. On page 11, lines 6 through 18, of her direct testimony, Staff witness Klocke is proposing an adjustment of $61,562 for historical year 2023, $274,116 for 2024, $498,727 for the 10 months ending 10/31/2025 ($598,472/12 *10), and $649,770 ($598,472/12*2 + $550,025) for the projected test year in capital expenditures and $14,929 in IT Investments O&M expense for the projected test year for the Customer Self-Service Mobile Application enhancements that are part of the Product Family Enhancements-Customer-Capital project.

Q. Do you agree with Staff witness Klocke's proposal of full disallowance of the Customer Self-Service Mobile Application enhancements that is part of the Product Family Enhancements-Customer-Capital project?

A. No. The Company does not agree with Staff witness Klocke's proposal of full disallowance of the Customer Self-Service Mobile Application enhancements that are part of the Product Family Enhancements-Customer-Capital project. Company witness Byrom's rebuttal testimony further addresses this project's value.

Q. What adjustment is Staff witness Klocke proposing for the LMI enhancements that are part of the Product Family Enhancements-Customer-Capital project?

A. On page 14, lines 2 through 5, of her direct testimony, Staff witness Klocke is proposing an adjustment of $200,628 for the 10 months ending 10/31/2025, and $40,126 for the projected test year in capital expenditures for the projected test year for the LMI Customer Support enhancements that are part of the Product Family Enhancements-Customer-Capital project.

Q. Do you agree with Staff witness Klocke's proposal of full disallowance of the LMI enhancements that is part of the Product Family Enhancements-Customer-Capital project?

A. No. The Company does not agree with Staff witness Klocke's proposal of full disallowance of the LMI enhancements that are part of the Product Family Enhancements-Customer-Capital project. Company witness Byrom's rebuttal testimony further addresses this project's value.

Q. What is the current status of the Company's website redesign project Staff witness Klocke discusses in her direct testimony related to Web Chat AI, Customer Self-Service Mobile Application, and LMI Customer Support enhancements that are part of Product Family Enhancements-Customer-Capital project?

A. As discussed in Staff Audit Response U21806-SA-CE-409 (Exhibit A-109 (SHB-12), the Company has put the website redesign on hold due to extended support of the current on-premises Sitecore web content management system and the Company's SAP S/4HANA planned implementation.

The previous timing for the website redesign was developed with the expectation that the Company would need to migrate to the cloud/Software-as-a-Service ("SaaS") version of the Sitecore system based on Sitecore's published product support lifecycle at that time. This would have been a major reason to initiate the website redesign. Since then, Sitecore has extended mainstream support for the on-premises version 10.4 to December 31, 2027, giving the Company more flexibility in its migration schedule.

In addition, the Company's implementation of the SAP S/4HANA system will be a major undertaking, which will significantly impact the design of integration between the

Company's website and SAP. The Company plans to complete the S/4HANA implementation before starting the website redesign.

It is important to note that improvements to the Company's website design, content, navigation, accessibility, and features are not static or stopped until the website redesign project is undertaken. The Company is regularly prioritizing and executing updates to web pages, content, and flows based on customer needs and challenges. An example of this is for the LMI Customer Support Enhancement. On page 15 of her direct testimony regarding LMI, Staff witness Klocke says, "Staff strongly feels that the Company updating their website to make information such as this standard would be a much better use of money." In fact, much of the investment in this enhancement is being achieved through updates to website design, content, features, and navigation, without the full re-architecture associated with the eventual website redesign project.

Q. Do you agree that the Company's website redesign would negate the need to make investments in Customer Self-Service Mobile Application and Web Chat AI?

A. No. The Website Redesign would not negate the need to make investments in the Customer Self-Service Mobile Application, Web Chat AI, or any other channels preferred by customers for specific needs, as discussed in Company witness Byrom's rebuttal testimony.

Q. Are there any adjustments needed to the proposed adjustments for the Product Family Enhancements-Customer-Capital provided in Staff Exhibit S-19.0, line 6, for IT Investments O&M expense for the projected test year?

A. Yes. Based on the amounts provided in Staff witness Klocke's direct testimony, on page 8, lines 17 through 18, for the Web Chat AI enhancement of $14,929 in IT Investments O&M expense for the projected test year and on page 11, lines 13 through 14, for the Self-Service

Mobile Application enhancements of $6,510 in IT Investments O&M expense for the projected test year, the total IT Investments O&M expense on Staff Exhibit S-19.0, line 6 should be $21,439.

ATTORNEY GENERAL

Q. What projected capital expenditures and O&M expense adjustments is Attorney General witness Coppola proposing for the Tracking and Traceability project identified on pages 85 through 87 of his direct testimony?

A. Attorney General witness Coppola is proposing on page 87, lines 4 through 6, of his direct testimony to remove $2,218,000 for the projected bridge period for the 10 months ending October 2025, and $5,295,000 for the projected test year of the Company's capital expenditures and $509,000 of the Company's projected test year Investments O&M expense for the Tracking and Traceability project.

Q. What is the first argument Attorney General witness Coppola describes for adjustments to the Tracking and Traceability project?

A. The first argument Attorney General witness Coppola describes on page 86 of his direct testimony for removing amounts for the Tracking and Traceability project, is his claim that, based on the Company's cost benefit analysis, it appears that the Company is not expecting any significant cost savings from the new system.

Q. Does the Company agree that the Tracking and Traceability project must provide significant cost savings in order to be viable?

A. No. The project is required to meet Pipeline and Hazardous Materials Safety Administration ("PHSMSA") proposed regulatory requirements (PHSMSA-2014-0098), also known as the Plastic Pipe rule, as described in Company witness Lincoln D.

Warriner's direct testimony on pages 76 and 77. Company witness Warriner's rebuttal testimony further addresses this project's value.

Q. What is the second argument Attorney General witness Coppola describes for removing amounts for the Tracking and Traceability project?

A. The second argument Attorney General witness Coppola describes on page 86, line 18, through page 87, line 3, of his direct testimony for removing amounts for the Tracking and Traceability project is that the project is currently in the Origination Phase or Investment Planning stage.

Q. Does the Company agree the Tracking and Traceability project should be disallowed because it is in the Investment Planning phase?

A. No. This project should not be disallowed on the basis that it is in the Investment Planning phase. Investment Planning is the phase a project remains in while it is waiting for funding and does not indicate that it is incomplete or lacking information. An IT business case was completed and approved for this project prior to consideration for inclusion in the Company rate case, following the Company's business case process. Even though the business case is complete and approved, projects remain in this Investment Planning Phase and are not released for further planning and implementation activities until funding is approved through rate case and budget disposition. Therefore, significant requirements are complete, and the project should be included and approved as the Company fully plans to spend the projected expenditures based on the project timeline in this case.

Q. What projected capital expenditures adjustments is Attorney General witness Coppola proposing for the SAP S/4HANA Implementation project identified on page 90 of his direct testimony?

A. Attorney General witness Coppola is proposing on page 90, lines 7 through 9, of his direct testimony proposed to remove [redacted] for the 10 months ending October 2025 and [redacted] for the projected test year of the Company's capital expenditures for the SAP S/4HANA Implementation project.

Q. What is Attorney General witness Coppola proposing for SAP S/4HANA Implementation project O&M costs identified on page 90 of his direct testimony?

A. Attorney General witness Coppola is proposing on page 90, lines 9 through 11, that the Commission reject the Company's proposal to defer [redacted] O&M costs into a regulatory asset.

Q. What is the argument Attorney General witness Coppola describes for capital expenditures adjustments and rejecting the proposal for deferral of O&M costs to a regulatory asset for the SAP S/4HANA Implementation project?

A. The first argument Attorney General witness Coppola describes on page 89, line 16, through page 90, line 4, of his direct testimony for removing capital amounts and rejecting deferral of O&M costs for the SAP S/4HANA Implementation project is his claim that the current Enterprise Resource Planning ("ERP") system still functions well and meets the operating needs, and that it appears that the option exists for the Company to continue to operate the system into 2030 and potentially past the date with system support by SAP.

Q. Does the Company agree that the option exists to continue to operate the current system into 2030 and potentially past the date with system support by SAP?

A. No. The project will take approximately three years to complete and extended support for the Company's current SAP version is only available until 2030, as discussed in my direct testimony, on page 108, lines 10 through 17. There is also an increased risk of cyberattacks if the SAP S/4HANA project is not executed, because SAP has stated that after maintenance ends, standard patches will no longer be available, as discussed on page 108, line 18, through page 109, line 10, of my direct testimony.

Q. What is the second argument Attorney General witness Coppola describes for capital expenditure adjustments and rejecting the proposal for deferral of O&M costs to a regulatory asset for the SAP S/4HANA Implementation project?

A. The second argument Attorney General witness Coppola describes on page 86, line 18, through page 87, line 3, of his direct testimony for removing capital amounts and rejecting deferral of O&M costs for the SAP S/4HANA Implementation project is his contention that the project is premature.

Q. Does the Company agree the SAP S/4HANA Implementation project capital expenditures should be disallowed and proposal for deferral of O&M costs be rejected because it is premature and in the Investment Planning phase?

A. No. This project's capital expenditures should not be disallowed and proposal for deferral of O&M costs rejected on the basis that it is in the Investment Planning phase. Investment Planning is the phase a project remains in while it is waiting for funding and does not indicate that it is premature or incomplete or lacking information. Although the Company plans to issue a request for proposal in May 2025 for implementation partners, the

Company leveraged a third party that specializes in preparing for S/4HANA upgrades to develop the cost estimates for the business case, as stated in my direct testimony on page 109, lines 11 through 15. The IT business case was completed and approved for this project prior to consideration for inclusion in the Company rate case, following the same strict business case process. Even though the business case is complete and approved, projects remain in this Investment Planning Phase and are not released for further planning and implementation activities until funding is approved through rate case and budget disposition. Therefore, significant requirements are complete, and the project should be included and approved as the Company fully plans to spend the projected expenditures based on the project timeline in this case.

Q. What is the argument Attorney General witness Coppola describes for removing the O&M amounts for the SAP S/4HANA Implementation project?

A. Similar to the capital expenditures, the argument Attorney General witness Coppola describes on page 180, lines 3 through 6, of his direct testimony for removing amounts for the SAP S/4HANA Implementation project is his contention that the project is premature.

Q. Did Attorney General witness Coppola make any additional recommendations related to the SAP S/4HANA Implementation project?

A. Yes. Attorney General witness Coppola, on page 180, lines 7 through 10, made two recommendations. First, that the Commission not approve a regulatory asset to record the deferred IT Investments O&M expense for this project. Second, that the Commission not approve a 15-year amortization for the cloud implementation costs. Refer to Company witness Heidi J. Myers' rebuttal testimony for further information on these requests.

Q. Does the Company agree the SAP S/4HANA Implementation project should be disallowed because it is premature?

A. No, for the same reasons discussed above.

Q. What is Attorney General witness Coppola's proposed adjustment to IT Investments O&M expense related to cloud computing?

A. On page 108, line 2 through 4, and page 180, line 12, through page 181, line 2, Attorney General witness Coppola indicates that the Company made an error in calculating the amortization expense for cloud computing fees and costs that have been deferred and that the difference of $5,478,000 should be removed from the expense forecasted by the Company for the projected test year.

Q. Do you agree that the Company made an error in calculating the amortization expense for cloud computing fees?

A. No. The Company did not make an error in calculating the amortization expense for cloud computing fees. In response to Discovery request No. U21806-AG-CE-0852, Attachment 2 (Exhibit A-158 (SHB-17)), the Company provided an updated Exhibit A-18 (SHB-2) excluding some non-cloud computing pre-payments and expenses that were included inadvertently in that exhibit. The update to Exhibit A-18 (SHB-2) did not result in an error in the calculation of the amortization expense for cloud computing fees and costs included in the case for either IT Investments O&M or IT Operations O&M. Attorney General witness Coppola's conclusion is inaccurate and unvalidated. The Company provides a detailed list of projects in Exhibit A-20 (SHB-5) that supports the IT Investments O&M amounts in Exhibit A-19 (SHB-3), and the detailed exhibit does not include any line items for the amortization expense for cloud computing fees and costs. In addition, the original

Exhibit A-18 (SHB-2) was not used to project the amortization expense in IT Operations O&M expense; therefore, an update to Exhibit A-18 (SHB-2) would not result in a change to IT Operations O&M expense either. The Commission should not approve the removal of $5,478,000 from IT Investments O&M expense.

Q. What is Attorney General witness Coppola's proposal regarding reducing the Company's working capital for the deferred costs for the SAP S/4HANA Implementation project and Prepaid Cloud Computing?

A. On page 106, line 5, through page 107, line 4, and page 107, lines 5 through 18, Attorney General witness Coppola is proposing to reduce the Company's working capital adjustment for the deferred costs for the SAP S/4HANA Implementation project by $1.7 million and the Prepaid Cloud Computing by $1.0 million.

Q. Do you agree with Attorney General witness Coppola's proposed adjustment to working capital for the SAP S/4HANA Implementation project and Prepaid Cloud Computing costs?

A. Yes. The Company agrees with the basis of the proposed adjustment as explained in its response to Attorney General Discovery request U21806-AG-CE-0628 CONF (Exhibit AG-37, page 1) that the SAP S/4HANA Cloud Implementation Costs were inadvertently provided as Total Company rather than the gas allocation. Also, the Company agrees with the basis of the proposed adjustment as explained in its response to Attorney General Discovery request U21806-AG-CE-0852 (Exhibit AG-38, page 4) that the cloud computing prepaid balances inadvertently included some non-cloud computing pre-payments and expense.

Q. Do you agree with Attorney General witness Coppola's proposal, at page 91, of his direct testimony, to reduce capital expenditures for the 10 months ending October 2025 to $423,000, and for the projected test year to $519,000 for the ARP-OT Support Gas project?

A. No. Attorney General witness Coppola is basing the projections on a three-year historical average plus an adjustment for forecasted inflation. This does not consider that the cost projected for each year for the ARP-OT Support Gas project is for specific hardware that requires replacement based on timing of when it was installed and risk if it were not replaced in the five-year refresh cycle. As described in the response to Discovery request U21806-AG-CE-0615 (Exhibit A-110 (SHB-13)), the increase in the projected test year costs are due to the need to refresh assets implemented as a part of the Pipeline Supervisory Control and Data Acquisition ("SCADA") project. Maintaining a reliable control system is critical for ensuring continuous and safe gas flow.

Q. Do you agree with Attorney General witness Coppola's proposal, at page 92, of his direct testimony, to reduce capital expenditures for the projected test year by $747,000 for the ARP-Physical Security project?

A. No. Attorney General witness Coppola's proposal would result in running critical hardware to failure based on broad generalizations that the Company already has security cameras, gate and lock systems, and other security equipment in place. This does not consider that the costs projected for each year for the ARP-Physical Security project are for specific hardware that requires replacement based on timing of when it was installed and risk if it were not replaced based on the refresh cycle. In addition, this argument does not consider that this critical hardware is required to avoid physical security vulnerabilities

and to comply with state, federal, and Federal Energy Regulatory Commission ("FERC") requirements, as discussed in my direct testimony on pages 62 and 63, as well as the response to Discovery request U21806-AG-CE-0616-Revised (Exhibit A-111 (SHB-14)).

Q. Do you agree with Attorney General witness Coppola's proposal, at page 93 of his direct testimony, to reduce capital expenditures by $939,000 and O&M expense by $180,000 for the projected test year for the Forward Web Proxy Services project?

A. No. Attorney General witness Coppola's argument is that the project is not necessary at this time and not a priority that should be undertaken for the projected test year. Mr. Coppola indicates that the Company has been working with the vendor and acknowledged service improvement with some lingering issues. This does not consider that the Company no longer uses some of the functionality of the current product and that additional controls to mitigate risk had to be put in place in order to reduce impact and improve stability, as indicated in response to Discovery request U21806-AG-CE-0630 (Exhibit AG-31).

Q. Does the Company agree that the Forward Web Proxy Services project must provide significant cost savings in order to be viable?

A. No. The project is critical to filtering out unwanted or harmful content from the internet, protecting the Company's systems from cyberattacks. The project is also critical as the Company continues to leverage more SaaS solutions to provide consistent access and communication, while protecting the Company from cyber threats to avoid disruption to business operations. Refer to my direct testimony, page 115, line 36, through page 116, line 42, for further project value.

Q. Has the Company identified any necessary adjustments to Attorney General witness Coppola's proposed adjustments for the Forward Web Proxy Services project?

A. Yes. The Company has identified necessary adjustments for the Forward Web Proxy Services project. The projected test year gas allocation O&M expense for this project is $149,967 as stated on page 115, line 37, of my direct testimony. Therefore, if the Commission were to disallow this project based on Attorney General witness Coppola's position, which it should not, the projected test year gas allocation O&M expense of $149,967 would be the correct disallowance amount.

Q. What projected capital expenditures and O&M expense adjustments is Attorney General witness Coppola proposing for the OT Datacenter Migration project identified on pages 95 through 97 of his direct testimony?

A. Attorney General witness Coppola is proposing on page 95, lines 10 through 11, of his direct testimony to remove $1,441,000 for the projected test year of the Company's capital expenditures and $716,000 of the Company's projected test year Investments O&M expense for the OT Datacenter Migration project.

Q. What is the first argument Attorney General witness Coppola describes for adjustments to the OT Datacenter Migration project?

A. The first argument Attorney General witness Coppola describes on page 95, lines 12 through 17, of his direct testimony for removing amounts for the OT Datacenter Migration project is his claim that it is not clear why the Company could not resolve the water infiltration risk and the aging climate equipment at a lower cost than $11 million.

Q. Does the Company agree that the water infiltration risk and aging climate equipment are the only risks the Company is resolving with the OT Datacenter Migration project?

A. No. The project is planned to remove the risk of systems critical to the control of gas pipelines and the electric grid so they are no longer in close proximity to a railway system and the main water pipe for the building as described in my direct testimony on pages 100 and 101.

Q. What is the second argument Attorney General witness Coppola describes for removing amounts for the OT Datacenter Migration project?

A. The second argument Attorney General witness Coppola describes on page 95, lines 15 through 17, and page 97, lines 8 through 11, of his direct testimony for removing amounts for the OT Datacenter Migration project is that the project is currently in the Investment Planning stage.

Q. Does the Company agree the OT Datacenter Migration project should be disallowed because it is in the Investment Planning phase?

A. No. This project should not be disallowed on the basis that it is in the Investment Planning phase. Investment Planning is the phase a project remains in while it is waiting for funding and does not indicate that it is incomplete or lacking information. An IT business case was completed and approved for this project prior to consideration for inclusion in the Company's rate case, following the same strict business case process. Even though the business case is complete and approved, projects remain in this Investment Planning Phase and are not released for further planning and implementation activities until funding is approved through rate case and budget disposition. Therefore, significant requirements are

complete, and the project should be included and approved in this rate case as the Company fully plans to spend the projected expenditures based on the project timeline in this case.

Q. What projected capital expenditures and O&M expense adjustments is Attorney General witness Coppola proposing for the Physical Access Management and Alarm Response project identified on pages 95 through 97 of his direct testimony?

A. Attorney General witness Coppola is proposing on page 96, lines 10 through 12, of his direct testimony to remove $678,000 for the projected test year of the Company's capital expenditures and $102,000 of the Company's projected test year Investments O&M expense for the Physical Access Management and Alarm Response project.

Q. Does the Company agree that the Physical Access Management and Alarm Response project must provide significant cost savings in order to be viable?

A. No. Failing to move to new technology carries a growing risk of system failure which could result in unauthorized physical access and/or impact the Company's ability to efficiently function. Refer to my direct testimony, page 117, line 1, through page 118, line 28, for further project value.

Q. What is the second argument Attorney General witness Coppola describes for removing amounts for the Physical Access Management and Alarm Response project?

A. The second argument Attorney General witness Coppola describes on page 95, lines 15 through 17, and page 97, lines 8 through 11, of his direct testimony for removing amounts for the Physical Access Management and Alarm Response project is that the project is currently in the Investment Planning stage.

Q. Does the Company agree that the Physical Access Management and Alarm Response project should be disallowed because it is premature and in the Investment Planning phase?

A. No. This project should not be disallowed on the basis that it is in the Investment Planning phase. Investment Planning is the phase a project remains in while it is waiting for funding and does not indicate that it is premature or incomplete or lacking information. An IT business case was completed and approved for this project prior to consideration for inclusion in the Company rate case, following the same strict business case process. Even though the business case is complete and approved, projects remain in this Investment Planning Phase and are not released for further planning and implementation activities until funding is approved through rate case and budget disposition. Therefore, significant requirements are complete, and the project should be included and approved in this rate case.

Q. Does the Company oppose Attorney General witness Coppola's recommendation on page 97, line 14, through page 98, line 4, of his direct testimony, that the Commission disallow $5,668,000 in capital expenditures for 2024 based on actual information?

A. The Company will not oppose the reduction of $5,668,000 in capital for 2024 based on actual capital expenditures.

CITIZENS UTILITY BOARD

Q. What observations does CUB witness Denzler provide for the Gas SCADA Software Solution project?

A. On page 8, line 6, through page 10, line 13, CUB witness Denzler discusses changes that were made to the planned project and costs, and argues that the issues in planning of this project are evidence of a deficient estimation and planning process.

Q. How do you respond to CUB witness Denzler's observations related to estimation and planning for the Gas SCADA Software Solution project based on changes from the project's initial ROM estimate?

A. As discussed on page 33, line 12, through page 34, line 8, of my direct testimony, the Company performs the preliminary project stage activities that are essential to ensure the Company makes prudent investments in technology that benefit customers. In addition, as discussed on page 45, line 10, through page 46, line 3, IT's investment forecasts evolve over time. Factors may arise during project execution that results in funding being lower or higher than initially estimated. In the PMBOK (Project Management Body of Knowledge), ROM estimates have cost estimate bounds of -25% to +75%; this means that a ROM estimated project could end up costing between 25% less to 75% more than the initial estimate.

Q. What other concerns does CUB witness Denzler indicate for the Gas SCADA Software Solution project?

A. On page 10, line 14, through page 11, line 18, CUB witness Denzler argues that the merits and necessity of the project are not sufficiently justified.

Q. Do you agree with CUB witness Denzler's concerns regarding the merits of the Gas SCADA Software Solution project?

A. No. First, the Company's concerns with the current system are not based primarily on "hypothetical" future risks. As discussed on page 50, lines 11 through 22, of my direct testimony, the original Gas SCADA system implemented in 2000 was based on the gas system requirements at that time. The current system has capability gaps and requires custom interim fixes and integrations which adds complexity and cost to the current solution. The Gas SCADA system is critical in controlling and monitoring the Company's gas system. While Mr. Denzler argues that there is limited evidence to suggest that the current system is defective, it would be expected that defects are limited for such a critical system. If the system is unstable or not functioning, it would impact the Company's ability to operate and monitor real-time system conditions, maintain safe operations, and comply with regulatory requirements.

Additionally, the Company provided detailed explanation of incremental costs in my direct testimony, on page 54, line 1, through page 55, line 11, and the responses to Discovery requests provided in Exhibit A-113 (SHB-16).

Q. What amount does CUB witness Denzler recommend the Commission disallow for the Gas SCADA Software solution project?

A. On page 12, lines 1 through 7, of his direct testimony, CUB witness Denzler recommends that the Commission hold the total allowed capital at $11,491,200 as previously approved in Case No. U-21490. This would be a disallowance of $6,524,840.

Q. Do you agree with CUB witness Denzler's recommendation to the Commission to hold the total allowed capital at $11,491,200 as previously approved in Case No. U-21490?

A. No. Not allowing recovery of the costs required to complete this project, as previously discussed, would have a significant impact on the Company's ability to operate and monitor real-time system conditions, maintain safe operations, and comply with regulatory requirements. It is also important to note that Attorney General witness Coppola's proposed disallowance of $5,558,000 related to 2024 actuals, which the Company is not opposing as previously discussed, already includes a reduction of $4,623,400 in 2024 Gas SCADA Software Solution costs from an originally projected $8,027,542 to an actual amount of $3,404,142.

Q. What concerns does CUB witness Denzler have with the methodology the Company utilizes to apply a 20% reduction on its projects with ROM estimates?

A. On page 12, line 15, through page 13, line 3, of CUB witness Denzler's direct testimony, he indicates a concern that the Company has routinely underspent its ROM estimates by much more than 20%.

Q. How do you respond to CUB witness Denzler's concern?

A. Business objectives and priorities and customer needs and expectations can evolve. This may require IT projects to be reprioritized and may require the Company to shift capital funding between projects, which could account for spending changes on ROM projects. Reducing capital expenditures for an incremental 20% could negatively impact other planned and approved projects.

Q. What recommendation does CUB witness Denzler provide for the ROM projections?

A. On page 13, lines 4 through 10, of CUB witness Denzler's direct testimony, he recommends the Commission disallow a total of 40% of the ROM projections for 2025 and 2026. This is an incremental 20% over the Company's 20% ROM Adjustment for projects identified with the ROM estimate type. He indicates this level results in an incremental disallowance of $8.21 million (20% of $41.04 million) in 2025 capital spend and an incremental disallowance of $11.59 million (20% of $57.46 million) in 2026 capital spend.

Q. Do you agree with CUB witness Denzler's proposal to disallow an incremental 20% over the Company's 20% ROM Adjustment for the specified projects based on ROM estimate classification?

A. No. An incremental 20% reduction in capital for the specified projects imposes a shortfall in the projected funding required to deliver the scope and expected outcomes of those projects. The Company's IT & Security projects plan and execute on a budget. These budgets are based on the analysis resulting from the ROM estimate. This shortfall in recovery may require the Company to shift capital funding between projects and could negatively impact other planned and approved projects.

Q. If CUB witness Denzler's proposed disallowance for an incremental 20% over the Company's 20% ROM Adjustment for the specified projects based on ROM estimate classification is nonetheless adopted, has the Company identified any necessary adjustments to the disallowance?

A. Yes. The Company has identified necessary adjustments for the proposed disallowance for an incremental 20% over the Company's 20% ROM Adjustment for the specified projects based on ROM estimate classification. Based on Exhibit A-20 (SHB-5), the

projected gas allocation capital expenditures for the 2025 spend year (column a) with a ROM estimate classification (column k) is $13,569,004 (column l) and the projected gas allocation capital expenditures for the 2026 spend year (column a) with a ROM estimate classification (column k) is $40,545,837 (column 1). Therefore, if the Commission were to disallow the 20% incremental amount over the Company's 20% ROM Adjustment for the specified projects with ROM estimate classification based on CUB witness Denzler's position, which it should not, the gas projected capital expenditure disallowance of $2,261,501 (20% of $13,569,004/12*10) for the 10-month bridge period ending 10/31/2025 and $7,209,940 (20% of $13,569,004/12*2 + 20% of $40,545,837/12*10) for the projected test year ending 10/31/2026, would be the correct disallowance amounts.

Q. Explain CUB witness Denzler's argument related to the ARP-Collaboration project.

A. On page 14, lines 1 through 19, of CUB witness Denzler's direct testimony, he states that Company Exhibit A-22 (SHB-7) outlines unit volumes and costs for actual purchases in 2023-2024 and projected purchases for 2025-2026, and shows increasing unit costs without sufficient explanation. Mr. Denzler recommends that that historic unit cost adjusted for productivity and inflation ("PAI") should be used to determine the projected unit costs for 2025-2026.

Q. Do you agree with CUB witness Denzler's arguments related to the ARP-Collaboration project.

A. No. The costs in the ARP-Collaboration project can vary based on the requirements for the specific location the collaboration equipment will be installed. For example, based on vendor quotes, replacing a Surface HUB with a Microsoft Teams Room in a conference room at our Jackson location requires $7,243 where replacing the same equipment in a

conference room at our Grand Rapids location requires $9,269, due to varying sizes of conference rooms that require different wiring, among other differences.

Additionally, CUB witness Denzler's analysis contains inaccuracies. For example, when he calculated the Company Historical Average Unit Cost for the Hub 85" replacements, he only used historical unit costs in Exhibit A-22 (SHB-7), line 34, column b, of $16,679. There are two more instances of 85" Hub purchases on Exhibit A-22 (SHB-7), lines 35 and 114, that contain the historical unit costs of $16,679 and $24,436. Thus, the average unit cost for these three purchases is $19,264, not $16,679. Similarly, he also calculated the Company Historical Average Unit Cost for Hub 50" replacements and PolyCom Refresh using only one historical unit cost, rather than averaging all the historical unit costs.

While Mr. Denzler calls into question the increase in ARP-Collaboration project costs by pointing out that there was no increase in projected Field Device unit costs, field devices tend to be more standard and do not have the complexity of significantly different requirements based on where the equipment will be installed.

Finally, the Company does not agree that projected unit costs should be based on historical costs plus inflation adjusted by PAI. Refer to Company witness Myers' rebuttal testimony.

Q. What adjustment for the ARP-Collaboration project is CUB witness Denzler recommending?

A. On page 14, lines 10 through 12 of his direct testimony, CUB witness Denzler is proposing adjustments of $57,599 in 2025 and $88,718 in 2026 for the ARP-Collaboration project.

Q. Do you agree with the amounts that CUB witness Denzler is proposing adjustments in the ARP-Collaboration project?

A. No. The Company does not agree with the proposed gas allocation adjustments of $57,599 for the projected year 2025 and $88,718 for the projected year 2026 for the reasons stated previously for the ARP-Collaboration project.

Q. Are there any adjustments needed to CUB witness Denzler's proposed adjustments for the ARP-Collaboration project?

A. Yes. The projected test year for the case is 11/1/2025 through 10/31/2026. Therefore, the Company is not requesting the full projected year 2026 amount as stated by CUB witness Denzler. Therefore, if the Commission were to agree with the proposed gas allocation adjustments of $57,599 for the projected year 2025 and $88,718 for the projected year 2026, which it should not, the gas allocation adjustment for the 10 months ending 10/31/2025 should be $47,999 and the projected test year should be $83,532. In addition, as discussed above in response to Staff witness Zichi, the Company has already agreed to the reduction of $6,015 for the bridge period (10 months ending 10/31/2025) and $7,219 for the projected test year for the ARP-Collaboration project.

Q. Explain CUB witness Denzler's arguments related to the ARP-Local Area Network ("LAN") project.

A. On page 14, line 20, through page 15, line 5, of CUB witness Denzler's direct testimony, he argues that a similar situation exists for ARP-LAN as ARP-Collaboration in that in 2023 and 2024, the Company replaced 1,091 LAN switches at a cost of $2,793,094, which is an average unit cost of $2,560 per switch. However, for 2025 and 2026, the Company projected a unit cost of over $5,000 per switch. He argues that the increase in projected

costs lacks sufficient explanation, and that historic unit cost adjusted for PAI should be used to determine the projected unit costs for 2025-2026.

Q. Do you agree with CUB witness Denzler's arguments related to the ARP-LAN project?

A. No. The Company does not agree with CUB witness Denzler's arguments related to the ARP-LAN project. The type of LAN switch that requires replacement determines the unit cost, and the Company's cost projections were based on these specific requirements. For example, a Juniper EX4100 switch has a unit cost of $8,132, where a Juniper EX4400 has a unit cost of $20,512. To simply take the total historical costs and divide them by the total number of historical switches is not a sufficient methodology for projecting these types of costs. As provided in response to Staff Audit request No. U21806-SA-CE-176 (Exhibit A-112 (SHB-15)), the material naming convention used (e.g., LAN Switch A, LAN Switch B, etc.) is solely to differentiate each model within a given calendar year. The actual models associated with these designations may change from year to year, resulting in variations in unit pricing.

The Company also does not agree that projected unit costs should be based on historical costs plus inflation adjusted by PAI. Refer to Company witness Myers' rebuttal testimony.

Q. What adjustment is CUB witness Denzler proposing for the ARP-LAN project?

A. On page 15, lines 3 through 5, of his direct testimony, CUB witness Denzler is proposing adjustments of $55,911 in 2025 and $86,881 in 2026 for the ARP-LAN project.

Q. Do you agree with the amounts that CUB witness Denzler is proposing adjustments for the ARP-LAN project?

A. No. The Company does not agree with the proposed gas allocation adjustments of $55,911 for the projected year 2025 and $86,881 for the projected year 2026 for the reasons stated previously for the ARP-LAN project.

Q. Are there any adjustments needed to CUB witness Denzler's proposed adjustments for the ARP-LAN project?

A. Yes. The projected test year for the case is 11/1/2025 through 10/31/2026; therefore, the Company is not requesting the full projected year 2026 amount as stated by CUB witness Denzler. Therefore, if the Commission were to agree with the proposed gas allocation adjustments of $55,911 for the projected year 2025 and $86,881 for the projected year 2026, which it should not, the gas allocation adjustment for the 10 months ending 10/31/2025 should be $46,593 and the projected test year should be $81,719.

Q. Explain CUB witness Denzler's overall recommendation for the Asset Refresh Programs.

A. On page 15, lines 6 through 14, of his direct testimony, CUB witness Denzler argues that the Company overestimated costs for the ARP-Collaboration devices and ARP-LAN switches, which he argues raises concerns about the Company's methods for estimating costs of other devices. Mr. Denzler recommends that the Commission treat the Asset Refresh program estimates as Class III AACE estimates and disallow 20% of the remaining ARP spend.

Q. Do you agree with CUB witness Denzler's overall recommendation for the Asset Refresh Programs?

A. No. The Company does not agree with CUB witness Denzler's overall recommendation to disallow 20% of the remaining ARP projected expenditures. On page 56, line 10, through page 57, line 12, of my direct testimony, I explain that the Company refreshes hardware based on industry standards recommended refresh cycles to reduce security risk, avoid costs, avoid customer frustration, avoid lost productivity, and ensure continued vendor support. The Company also provides detailed projected actual capital expenditures for each ARP in Exhibit A-22 (SHB-7) and on pages 58 through 75 of my direct testimony. I provided detailed project summaries including refresh cycles, which is the basis for which annual costs are projected and detailed variance explanations for several of the ARPs. The unit costs for ARPs are typically based on either actual historical costs, quotes, or current agreements with vendors. In addition, the basis for CUB witness Denzler's recommendation to disallow 20% of the remaining ARPs, namely, that the Company "overestimated" costs for the ARP-Collaboration devices and ARP-LAN switches is incorrect as previously discussed.

Q. What adjustment is CUB witness Denzler proposing for the remaining ARPs?

A. On page 15, lines 12 through 14, of his direct testimony, CUB witness Denzler is proposing adjustments of $1,413,753 in 2025 and $1,579,067 in 2026 for the remaining ARPs.

Q. Do you agree with these adjustments for the remaining ARPs?

A. No. The Company does not agree with the proposed gas allocation adjustments of $1,413,753 for the projected year 2025 and $1,579,067 for the projected year 2026 for the

reasons stated previously for the ARP-Collaboration project, ARP-LAN project, and remaining ARPs.

Q. Are there any adjustments needed to CUB witness Denzler's proposed adjustments for the remaining ARPs?

A. Yes. The projected test year for the case is 11/1/2025 through 10/31/2026; therefore, the Company is not requesting the full projected year 2026 amount as stated by CUB witness Denzler. Therefore, if the Commission were to agree with the proposed gas allocation adjustments of $1,413,753 for the projected year 2025 and $1,579,067 for the projected year 2026, which it should not, the gas allocation adjustment for the 10 months ending 10/31/2025 should be $1,178,128 and the projected test year should be $1,551,515.

Q. Explain CUB witness Denzler's arguments regarding the Asset Accounting Tax Upgrade project.

A. On page 16, lines 1 through 12, of his direct testimony, CUB witness Denzler argues that the Company did not evaluate other software options and recommends that the Commission disallow the requested $126,165 in O&M for this project in the test year. If the Commission does not disallow the entire project, Mr. Denzler recommends the Commission treat this estimate as a Class III AACE estimate and disallow 20% of the projected test year O&M costs, or $25,233.

Q. Do you agree with CUB witness Denzler's arguments regarding the Asset Accounting Tax Upgrade project?

A. No. The Company does not agree with CUB witness Denzler's arguments regarding the Asset Accounting Tax Upgrade project. On page 76, lines 27 through 28, of my direct testimony, I explain that the Company plans as a part of the scope of the project to evaluate

the current vendor/project solution with market leaders to ensure that it is the best solution. Further on page 76, line 35, through page 77, line 1, I explain that moving to the SaaS version of the current software will reduce hardware and server support costs, and avoid database and server upgrades as a result of this project.

Q. Do you agree with CUB witness Denzler's proposed adjustments for the Asset Accounting Tax Upgrade project?

A. No. The Company does not agree with the proposed gas allocation adjustments of $126,165 in O&M for the projected test year, and does not agree with treating the Asset Accounting Tax Upgrade project like an AACE Class III estimate and disallow $25,233 (20% of $126,165). As stated in my direct testimony on page 76, lines 12 through 21, in 2025 the standard vendor support ends for the current system. This project is critical to ensuring compliance with regulated and financial accounting for fixed assets. In addition, the Company will not have the opportunity to recover these O&M expenses in subsequent years for this project. Unlike capital expenditures, which can be recovered in future cases, O&M expenses generally are not recoverable once the test year has passed.

Q. Explain CUB witness Denzler's arguments regarding spending on IT Enhancements.

A. On page 16, line 15, through page 17, line 12, of his direct testimony, CUB witness Denzler argues that the Company has not sufficiently demonstrated the necessity or benefit of these projects, and many larger-cost projects should be standalone projects and not included as Enhancements.

Q. Do you agree with CUB witness Denzler's arguments regarding spending on IT Enhancements?

A. No. The Company does not agree with CUB witness Denzler's arguments regarding spending on IT Enhancements. As stated in my direct testimony on page 92, lines 9 through 11, and page 93, lines 4 through 6, the Enhancement Worklist Detail Report (Exhibit A-25 (SHB-10)) provides a summary of the Enhancements queue of work requests, it is not intended to be a prioritized list of work. Prioritization of enhancements is ongoing and is completed by cross-functional teams based on the most critical needs. The Company considers enhancements to be up to $500,000 and it could be more if the work is low complexity and low risk. The one item that was included for $2.1 million is Mobile App enhancements, which is broken down into several smaller enhancements.

The Company has demonstrated the necessity and benefit of the projects. As described in my direct testimony on page 95, lines 3 through 15, the Company uses two methods to ensure projected enhancements expenditures and expenses in the test year are reasonable and prudent: (1) three-year historical average and (2) total cumulative demand. For the three-year historical average method, the Company calculates the actual three-year historical average plus known incremental work and compares it to the projected Test Year enhancement expenditures to validate the Test Year projects are in line with historical spend and known incremental work. The second method, total cumulative demand, compares the Total Gas Allocation Cumulative Worklist amount to the projected Test Year enhancement expenditures and expenses to validate the projections are in line with the projected demand.

Q. Did the Company provide further information and value for several of the incremental enhancements in this case?

A. Yes. See Company witness Byrom's rebuttal testimony for further discussion of the value for the Web Chat AI, Customer Self-Service Mobile Application, and LMI enhancements as a part of the Product Family Enhancements-Customer-Capital project.

Q. What adjustments for IT Enhancements is CUB witness Denzler proposing?

A. On page 17, lines 17 through 20, of his direct testimony, CUB witness Denzler is proposing an adjustment of $2,651,057 in 2025 and $2,062,093 in 2026 for IT Enhancements.

Q. Do you agree with CUB witness Denzler's proposed adjustments for IT Enhancements?

A. No. The Company does not agree with the proposed gas allocation adjustments of $2,651,057 in 2025 and $2,062,093 in 2026 for IT Enhancements.

Q. Are there any adjustments needed to CUB witness Denzler's proposed adjustments for IT Enhancements?

A. Yes. The projected test year for the case is 11/1/2025 through 10/31/2026; therefore, the Company is not requesting the full projected year 2026 amount as stated by CUB witness Denzler. Therefore, if the Commission were to agree with the proposed gas allocation adjustments of $2,651,057 for the projected year 2025 and $2,062,093 for the projected year 2026, which it should not, the gas allocation adjustment for the 10 months ending 10/31/2025 should be $2,209,214 and the projected test year should be $2,160,254.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

EXHIBITS

OF

STACY H. BAKER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

U21806-SA-CE-409
Requested By: Brittney M. Klocke (BMK-11 - 1)
Respondent: Stacy H. Baker
Date of Response: 3/19/2025
Page **1** of **1**

Question:

1) What is the current status of the Company's website redesign?

Response:

The Company has put the website redesign on hold due to extended support of the current on-premises Sitecore web content management system and the Company's SAP S/4HANA planned implementation.

The previous timing for the website redesign was developed with the expectation that the Company would need to migrate to the cloud/Software-as-a-Service (SaaS) version of the Sitecore system based on Sitecore's published product support lifecycle at that time. This would have been a major reason to initiate the website redesign. Since then, Sitecore has extended mainstream support for the on-premises version 10.4 to December 31, 2027, giving the Company more flexibility in its migration schedule.

In addition, the Company's implementation of the SAP S/4HANA system will be a major undertaking, which will significantly impact the design of integration between the Company's website and SAP. The Company plans to complete the S/4HANA implementation before starting the website redesign.

U21806-AG-CE-0615
Page **1** of **1**

Question:

233. Refer to lines 26-38 on page 61 of Ms. Baker's direct testimony on the ARP-OT Support Gas. Please:

a. Describe the problems experienced with servers in the last three years and identify the number of problems experienced.

b. Explain why a 5-year replacement cycle is necessary and whether it could be extended to 7 years with no significant repercussions.

c. If the Company is on a 5-year replacement cycle, why is there a significant variance in capital expenditures from year to year, which vary from $245,000 in 2023 to $2.5 million for the projected test year.

Response:

Objection of Counsel: Consumers Energy Company objections to this discovery request because it is argumentative and requires the adoption of an assumption. Without waiving this objection, Consumers Energy responds as follows:

a. Following are the incidents experienced with servers in the last three years for the ARP-OT Support Gas.

Incident Description	Number of Incidents
Memory and storage failures	5
Power Supply issues	3
Network and connectivity issues	5
Hardware faults and failures	4

b. A five-year refresh cycle for server hardware is considered necessary due to increased risks of hardware failure, performance degradation, and the expiration of support. For a natural gas compressor station, maintaining a reliable local control system is critical for ensuring continuous and safe gas flow.

Extending the refresh cycle to seven years has potential risks such as increased hardware failures, higher maintenance costs, security vulnerabilities, and performance issues. Compliance with TSA regulatory requirements, such as those outlined in API 1164, is crucial. API 1164 mandates regular updates to control system software and firmware to protect against known vulnerabilities and threats.

c. The costs vary from 2023 to the projected test year for the ARP-OT Support Gas project due to the need to refresh assets implemented as a part of the Pipeline SCADA project.

Witness: Stacy H. Baker
Date: March 21, 2025

U21806-AG-CE-0616 Revised
Page **1** of **1**

Question:

234. Refer to lines 16-40 on page 62 and lines 1-5 on page 63 of Ms. Baker's direct testimony on the ARP-Physical Security. Please:

a. Identify the problems experienced with security assets in the last three years and the number of problems experienced.

b. Explain why the Company needs advanced door systems and how these systems differ from current door systems.

c. Regarding security cameras, gate and lock systems, confirm that these devices and systems are already in place at the Company. If confirming, explain what is being proposed for the additional expenditures. If not confirming, explain why these devices and systems are not already being used.

d. Regarding Alternatives 1 and 2, what are the specific risks that would exist?

Response:

a. Incidents experienced with physical security assets include cameras no longer working, wiring issues, require cleaning, transmitter failures, hard drive failures, reader failures, door strike failures, and control board failures. Following is a table with the number of incidents for the last three years related to physical security assets.

Year	Number of Incidents
2022	758
2023	554
2024	568

b. Referring to the ARP-Physical Security project starting on page 62, line 16 through page 63, line 5, the Company ~~requires~~ needs to refresh advanced door systems to avoid physical security vulnerabilities and meet FERC requirements. These systems are the same as the current door systems.~~, as the current badges can be easily cloned by off the shelf equipment leading to security vulnerabilities. This project would upgrade badge readers and control boards with encryption.~~

c. Yes, the Company currently uses security cameras, motorized gates, and exterior pedestrian doors at occupied facilities controlled by badge readers for access. Referring to the ARP-Physical Security project starting on page 62, line 16 through page 63, line 5, this project refreshes existing devices to reduce physical security vulnerabilities and meet FERC requirements. ~~This project would upgrade badge readers and control boards with encryption to reduce security vulnerabilities.~~

d. By not refreshing physical security assets or deferring a portion of the asset refreshes, the Company risks utilizing older, unsupported equipment, which results in continued security vulnerabilities and increased O&M costs to maintain older equipment.

Witness: Stacy H. Baker
Date: ~~3/21/2025~~ 5/6/2025

U21806-SA-CE-176
Requested By: Emma Zichi (EZ-4 - 41)
Respondent: Stacy H. Baker
Date of Response: 2/7/2025
Page **1** of **1**

Question:

41. Regarding A-22 (SHB-7), the "ARP-Local Area Network" project:
a. Please provide a breakdown for the costs in line 11 and 30 "Software, labor, contractor and overhead and other costs" to show which categories make up the total cost for 2024, 2025 and 2026.
b. Why did the "Avg. Unit Cost" (column b) for the following significantly increase for 2025 and 2026, compared to 2023 and 2024?
i. Line 1 "LAN Switch A", line 2 "LAN Switch B", line 3 "LAN Switch C", line 5 "LAN Switch E".
c. Why are the materials costs the exact same in Exhibit A-20 (SHB-5) when the breakdown of materials shown in Exhibit A-22 is $225,000 for 2025 and $375,000 for 2026

Response:

a. The gas allocation cost breakdown for software, labor, contractor, non-labor overhead, and non-labor other costs in Exhibit No. A-22 (SHB-7), page 6, lines 11 and 30 for 2024, 2025, and 2026 for the ARP-Local Area Network project are provided in Exhibit A-20 (SHB-5), lines 178, 269, and 349 in columns m, o, p, q, and r.

b. The material naming convention used – for example, LAN Switch A, LAN Switch B, LAN Switch C, etc. - is solely to differentiate each model within a given calendar year. The actual models associated with these designations may change from year to year, which can result in variations in unit pricing.

    i. Refer to part b response.

c. In Exhibit A-20 (SHB-5), lines 269 and 349, column n, the gas allocation material costs for 2025 and 2026 are $108,518 and $180,863 respectively. These amounts are not the same. In Exhibit A-22 (SHB-7), page 6, lines 1 through 10, columns e and f, the total Company material costs for 2025 and 2026 are $225,000 and $375,000 respectively. Exhibit A-20 (SHB-5) provides the gas allocation amounts, while Exhibit A-22 (SHB-7) provides the total Company amounts.

Question:

17. Refer to Baker, pp. 54-55, discussing changes in the projected costs of the Gas SCADA Software Solutions project from previous projections in Case No. U-21490. Baker states, "The contractor costs increased because the vendor professional services were underestimated in the ROM estimate." Please explain how and why the contractor costs were underestimated.

Response:

17. The contractor costs for the vendor professional services were not fully known until the Company conducted a Request for Proposal and received vendor cost estimates based on detailed requirements. Additionally, as discussed in my direct testimony on page 55, lines 4-5, the Company determined that additional third-party resources were required to support testing this new technology.

Witness: Stacy H. Baker
Date: February 20, 2025

U21806-CUB-CE-0122
Page **1** of **1**

Question:

18. Refer to Baker, pp. 54-55, discussing changes in the projected costs of the Gas SCADA Software Solutions project from previous projections in Case No. U-21490. Baker states, "The contractor costs increased because the vendor professional services were underestimated in the ROM estimate." Please explain what services the contractors perform.

Response:

18. The professional services vendor is responsible for providing product and industry experience, building the new solution, which includes, but is not limited to, configuring their products, creating new SCADA screen displays, developing an automated, repeatable process to migrate SCADA information from the current system, configuring and building interfaces to the Historian and Geographic Information System (GIS) systems, and conducting the corresponding testing and project management to ensure a quality solution. Additionally, the Company found that it lacked sufficient internal resources and skills to support user acceptance and parallel testing. Therefore, the Company contracted a third-party to provide additional resources to assist, guide, and support testing of the solution.

Witness: Stacy H. Baker
Date: February 20, 2025

U21806-CUB-CE-0123
Page **1** of **1**

Question:

19. Refer to Baker, pp. 54-55, discussing changes in the projected costs of the Gas SCADA Software Solutions project from previous projections in Case No. U-21490. Baker states, "The contractor costs increased because the vendor professional services were underestimated in the ROM estimate." Please explain why the services the contractors perform cannot be performed in-house.

Response:

19. Building and implementing the new solution requires a level of expertise and resources that necessitates leveraging outside services. The Company lacks the internal gas resources with the necessary expertise and experience to implement the software products.

Witness: Stacy H. Baker
Date: February 20, 2025

U21806-CUB-CE-0124
Page **1** of **1**

Question:

20. Refer to Baker, pp. 54-55, discussing changes in the projected costs of the Gas SCADA Software Solutions project from previous projections in Case No. U-21490. Baker states, "The software licensing costs increased because the ROM estimate planned for a five-year period, but the project required six years of software subscriptions due to the length of the implementation." Please explain why the implementation is taking longer than planned.

Response:

20. The reason the software licensing costs increased is not because the implementation is taking longer than planned, but rather because the planned implementation is more than two years. The Company requires that a software asset have at least a three-year expected life after implementation for capitalization. As the Company refined the initial cost projections it identified that due to the implementation being more than two years, the Company was required to purchase six years of software subscriptions to ensure there was a three-year expected life.

Witness: Stacy H. Baker
Date: February 20, 2025

U21806-CUB-CE-0125
Page **1** of **1**

Question:

21. Refer to Baker, pp. 54-55, discussing changes in the projected costs of the Gas SCADA Software Solutions project from previous projections in Case No. U-21490. Baker states, "The material costs increased because the ROM estimate planned to purchase physical servers, but the Company decided to purchase virtual servers. The Company utilizes virtual servers because they provide cost efficiency, maximize the use of available resources, and offer more flexibility." Please explain how switching to more cost-efficient virtual servers resulted in increased material costs.

Response:

21. The virtual servers cost more upfront due to the hypervisor software licensing required for the hardware to function. The cost efficiencies gained are less on-going support and the flexibility to maximize the use of available server resources without purchasing additional servers. Managing the life cycle of virtual servers is more efficient. For example, rolling out firmware, operating system (OS) upgrades, and patches is more efficient with virtual servers, as it can be done once and deployed automatically and dynamically across many virtual servers. In contrast, physical servers require scheduling an outage, taking down each server, and applying the firmware and OS upgrades one by one.

Witness: Stacy H. Baker
Date: February 20, 2025

U21806-CUB-CE-0126
Page **1** of **1**

Question:

22. Refer to Baker, pp. 54-55, discussing changes in the projected costs of the Gas SCADA Software Solutions project from previous projections in Case No. U-21490. Baker states, "The material costs increased because the ROM estimate planned to purchase physical servers, but the Company decided to purchase virtual servers. The Company utilizes virtual servers because they provide cost efficiency, maximize the use of available resources, and offer more flexibility." Please explain why the Company did not identify virtual servers as the better option during the ROM estimate phase.

Response:

22. The Company did not identify virtual servers during the initial cost projection development because it implemented the new operational technology standard to utilize virtual servers afterward.

Witness: Stacy H. Baker

U21806-AG-CE-0613
Page **1** of **1**

Question:

231. Refer to page 54 of Ms. Baker's direct testimony on the SCADA project. Please:

a. Provide the current phase of development of the project.

b. Identify the start and completion dates of the detailed requirements phase of the project.

c. Provide the actual amount spent in 2024 for capital expenditures and O&M expense and the forecasted amount of capital expenditures for the 10 months ending October 2025 and for the projected test year.

d. Provide the amount of capital expenditures and O&M expense to be incurred in future years past 2025 by year.

Response:

a. The Gas SCADA Software Solution project is currently in the Execute phase.

b. The detailed requirements occurred from 04/1/22 to 10/31/22.

c. Refer to Attachment No. U21806-AG-CE-0613_ATT 1 for the updated total projected project costs including the preliminary actual 2024 capital expenditures and O&M expense. The projected gas allocation capital expenditures for the 10 months ending October 2025 are $4,220,803 and $3,080,968 for the projected test year.

d. Refer to part c response.

U21806-AG-CE-0614
Page **1** of **2**

Question:

232. Refer to pages 50 and 51 of Ms. Baker's direct testimony on the SCADA project. Please:

a. Identify by how much and by what percentage the contractor costs were underestimated and explain why.

b. Confirm that the SCADA project was competitively bid to various vendors. Identify the number of vendors contacted, the number of bids received, and which vendor was selected and why.

c. Provide a copy of the bids received and the analysis showing why the chosen vendor was selected.

d. Explain why a third-party consultant is needed for expertise with the technology when the vendor should provide the needed expertise for the technology they sell.

e. Provide the name pf the third-party and the amount to be paid to this party by year and whether it is included in O&M expense or capital expenditures.

f. Explain whether the Company issued requests for proposals for the third-party, the number of bids received. Provide a copy of the bids received and the analysis showing why the chosen vendor was selected.

g. Identify the length of the implementation. Did the Company consider spreading the implementation over a longer time period to reduce the impact on capital expenditures in the next few years?

h. Explain how the Company uses virtual servers and with whom. If virtual servers are cost efficient, why did they increase the cost of the project?

Response:

a. Refer to Attachment No. U21806-AG-CE-0613_ATT 1 for the updated total projected project costs including the preliminary actuals 2024 capital expenditures and O&M expense. The current projected contractor costs are $4.66 million, which is consistent with the $4.63 million projected in Case No. U-21490.

b. The Gas SCADA Software Solution project conducted a Request for Proposal (RFP) to competitively bid to six vendors. Of the six vendors, three elected not to participate, one vendor could not meet the full requirements, and the vendor selected was Open Systems International, Inc. (now Aspentech).

c. Refer to Attachments U21806-AG-CE-0614_ATT_1_CONF, U21806-AG-CE-0614_ATT_2_CONF, U21806-AG-CE-0615_ATT_3_CONF, and U21806-AG-CE-0615_ATT_4_CONF for a copy of the bids received and the analysis showing why the chosen vendor was selected.

d. Black and Veatch is uniquely qualified to perform the execution and testing support services. Their prior services were key to building the project's detailed requirements that were used in the RFP to ultimately select the best solution. A large part of their services are requirements traceability, ensuring that all requirements have been met in the vendor-built solution and that all testable requirements are indeed tested. Black and Veatch will be building and executing scripts to do parallel

testing, validation to ensure the new solution behaves the same as the existing solution for retrieval of SCADA data from our many endpoints. Further, they will be creating the User Acceptance Test (UAT) testing scripts for the Company to perform to ensure a fully tested solution and readiness for go-live. Both require a deep understanding of our existing gas SCADA environment as well as a solid understanding of our Gas SCADA project requirements. Given the Black and Veatch history on this project, along with the continuity of their personnel, Black and Veatch is uniquely positioned for this testing work.

e. The table below provides the third-party consultant, Black and Veatch, costs total company capital expenditures and O&M expense by year.

Year	Capital	O&M
2025	$625,000	$35,000
2026	$75,000	$35,000
Total	**$700,000**	**$70,000**

f. The Company did not conduct a request for proposal for the third-party.

g. The capital expenditures started for this project in 2023 and are currently planned through February 2026. The original planned Go Live in December 2025 has been extended to February 2026 due to resource availability during the field construction season. Refer to my direct testimony, page 50, line 7 through page 51, line 33, for why the Company determined the current implementation timeline was necessary, as the current system is operating well beyond its original design specifications.

h. The virtual servers cost more upfront due to the hypervisor software licensing required for the hardware to function. The cost efficiencies gained are less on-going support and the flexibility to maximize the use of available server resources without purchasing additional servers. Managing the life cycle of virtual servers is more efficient. For example, rolling out firmware, operating system (OS) upgrades, and patches is more efficient with virtual servers, as it can be done once and deployed automatically and dynamically across many virtual servers. In contrast, physical servers require scheduling an outage, taking down each server, and applying the firmware and OS upgrades one by one.

Witness: Stacy H. Baker

U21806-AG-CE-0847
Page **1** of **2**

Question:

397. Refer to discovery response AG-CE-0614 on the SCADA IT project. Please:

a. The answer to subpart (a) is not responsive to the question. Line 1 of page 55 of Ms. Baker's direct testimony states that contractor costs represented $4.4 million of the $6.6 million total increase in costs. Provide the initial contractor costs before the $4.4 million increase.

b. Regarding the response to subpart (h), who owns and runs the virtual servers? Explain how virtual servers differ from cloud computing.

c. Provide the total SCADA project costs by component as originally estimated at time of approval compared to the costs now and justify in detail any variance of 10% or greater in Excel.

Response:

a. The total Company and gas allocation initial contractor costs from the initial estimate of the Gas SCADA Software Solution project in Case No. U-21308 was $1,800,000 capital expenditures.

b. The Company owns and operates the virtual servers on-premises in our data center for the Gas SCADA Software Solution project because the system is critical for providing safe and reliable gas service. These virtual servers are physically located in the Company's data center, while virtual servers in the cloud are located in Azure's data center, for example, that the Company would subscribe to.

c. The table below provides increase/decrease between the total project costs for the initial estimate provided in Case No. U-21308 and the current estimate provided in response No. U21806-AG-CE-0614. Following are explanations for cost category increases greater than 10%.

The software licensing costs increased because they were initially underestimated and the initial estimate planned for a five-year period, but the project required six years of software subscriptions due to the length of the implementation. The material costs increased because the initial estimate planned to purchase physical servers, but the Company decided to purchase virtual servers. The Company utilizes virtual servers because they provide cost efficiency, maximize the use of available resources, and offer more flexibility. The contractor costs increased because the vendor professional services were underestimated in the initial estimate. Additionally, the Company determined that a third-party was required to support internal resources with testing, as the technology is new to the Company. In U-21308 Overheads & Other Costs were one cost category. In this case, U-21806, the Company began using two cost categories, Non-Labor Overhead and Non-Labor Other. There is a net decrease between the initial estimate for Overheads & Other Costs and the current estimate for Non-Labor Overhead and Non-Labor Other.

Refer to U21806-CUB-CE-0123 through U218096-CUB-CE-0126, for additional variance explanation.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

MARC R. BLECKMAN

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Marc R. Bleckman, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Marc R. Bleckman who previously filed direct testimony in this case on behalf of Consumers Energy Company ("Consumers Energy" or the "Company")?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to provide rebuttal to certain aspects of the direct testimonies of: (i) Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") witnesses Kirk D. Megginson and Justin J. Hecht; (ii) Attorney General Dana Nessel ("AG") witness Sebastian Coppola; and (iii) Association of Businesses Advocating Tariff Equity ("ABATE") witness Christopher C. Walters.

Q. How is your rebuttal testimony organized?

A. In Section I, I will provide rebuttal to portions of the direct testimony of Staff witness Megginson and Staff witness Hecht. In Section II, I will provide rebuttal to portions of the direct testimony of AG witness Coppola. In Section III, I will provide rebuttal to portions of the direct testimony of ABATE witness Walters.

Q. Are you sponsoring any exhibits in connection with your rebuttal testimony?

A. Yes. I am sponsoring the following exhibits:

Exhibit A-114 (MRB-17)	S&P January 14, 2025 Report;
Exhibit A-115 (MRB-18)	MPSC Staff's Answer to Consumers Energy's Second Discovery Request;
Exhibit A-116 (MRB-19)	S&P August 20, 2024 Credit Report;

Exhibit A-117 (MRB-20)	Moody's May 31, 2024 Credit Report; and
Exhibit A-118 (MRB-21)	Attorney General's Answer to Consumers Energy's Third Discovery Request.

Q. Were these exhibits prepared by you or under your direction or supervision?

A. Yes.

I. REBUTTAL OF STAFF WITNESSES MEGGINSON AND HECHT

A. Overview of Areas of Disagreement Addressed

Q. What aspects of Staff's recommendations are you rebutting?

A. I am rebutting Staff's projected common equity balance and the resulting common equity ratio. I am also rebutting Staff's projected cost of long-term debt. Finally, I am responding to Staff's proposed adjustment to the Company's working capital cash balance.

Q. Are there any other aspects of Staff's recommended capital structure that the Company disagrees with?

A. Yes. Consumers Energy does not agree with Staff's recommended Return on Equity ("ROE") of 9.75%. This issue, however, is addressed in the rebuttal testimony of witness Ann E. Bulkley, the Company's ROE witness in this case.

B. Rebuttal to Staff's Recommendation Regarding the Common Equity Ratio

Q. Do you agree with Staff's projected common equity ratio of 50.00%?

A. No. Staff's recommended common equity ratio for the test year in this case is understated. My rebuttal testimony to Staff's recommended equity ratio is organized as follows:

i. Staff Incorrectly Interprets the Company's Credit Ratings and Regulatory Environment

ii. Staff Fails to Consider New Circumstances That Justify a Deviation From a Balanced Capital Structure

iii. Staff Ignores the Potential Negative Financial Impacts of a Lower Equity Ratio

iv. Staff Fails to Consider the Average Equity Ratios of Peer Group Companies

v. Summary

i. Staff Incorrectly Interprets the Company's Credit Ratings and Regulatory Environment

Q. On page 6 of his direct testimony, Mr. Megginson minimizes the importance of Moody's downgrade of the Company's credit rating by stating that the downgrade "put the Company's credit rating more in line with the other two agencies ratings." Mr. Megginson also concludes that "the prior Moody's rating appeared to be an outlier." Do you agree with these statements?

A. No. Each of the credit rating agencies maintains its own ratings methodology and credit rating scale. It is not a universal measure in which the specific credit rating assigned by Moody's, for example, can be directly compared to the credit rating assigned by Standard and Poor's ("S&P") or Fitch. If Mr. Megginson's assertion were true, there would not be a need for more than one rating agency, as all credit rating methodologies and credit rating scales would be the same. Also, Mr. Megginson's attempt to downplay the credit ratings downgrade by implying that it was an inconsequential action should be rejected by the Commission. Each of the Company's debt offerings are rated by the three main rating agencies – Moody's, S&P, and Fitch. A lower credit rating indicates higher risk which, in turn, necessitates a higher interest rate to compensate for that risk. Regardless of the presumed comparative credit ratings between the different credit rating agencies, the fact that the Company's credit rating was downgraded by Moody's was a negative event that had negative financial consequences for the Company and for customers who bear the cost of capital.

Q. Starting on page 6 of his direct testimony, Mr. Megginson describes the impact of the Company's regulatory environment on its credit rating. Mr. Megginson also references credit reports in which the Company's regulatory environment has been described as positive. Does this give support to Mr. Megginson's recommendation to reduce the Company's equity ratio to 50.00% for the test year in this case?

A. No. I believe that Mr. Megginson's assessment of the Company's regulatory environment is incomplete. In his direct testimony, Mr. Megginson references aspects of Michigan's regulatory framework that have been established for several years under the 2008 and 2016 energy legislation, including items such as a forward-looking test year and the 10-month rate case process. Mr. Megginson's assessment fails to capture the results from the Company's most recent rate cases which demonstrate a sharp decline in authorized weighted rate of return (ROE times equity ratio) following a long period of stability. This recent shift is illustrated in the table on page 15 of my direct testimony. In addition, while rating agencies have described the Company's regulatory environment in a positive light, this rating is continuously evaluated. The persistent decline in the Company's authorized weighted rate of return since 2020 could be seen as a material deterioration in the credit supportiveness of the Michigan regulatory environment. Mr. Megginson fails to acknowledge that the Company's positive regulatory environment in past years has been fueled in large part by authorized ROE and equity ratios that were significantly higher than currently proposed by Staff for the Company in this case. In fact, the trend in rate orders with regard to authorized ROE and equity ratio was a cause for concern for Moody's in its downgrade of the Company's credit rating. An equity ratio of 50.75% and an ROE of

10.25% is better aligned with rate of return levels prior to the Company's credit rating downgrade and is therefore supportive of adequate credit quality at this time.

Q. Is there evidence that analysts have started to recognize a decline in the state of the Company's regulatory environment?

A. Yes. Refer to Exhibit A-36 (MRB-14), S&P's State Regulatory Evaluations – Energy. In August 2024, S&P lowered its ranking of Michigan's regulatory environment from "Above Average" to "Average." In downgrading its state regulatory rating, S&P referenced recent rate case decisions in Michigan including authorized ROEs which "compare less favorably" to prevailing industry averages and a "tightening in the regulatory climate." Also refer to pages 20 to 21 of my direct testimony. In updating its regulatory rankings for U.S. utilities in May 2023, UBS moved Michigan down a level from Tier 1 to Tier 2. In describing the negative change, UBS specifically mentioned authorized ROEs as well as a lowering of their "subjective factor" for the Michigan regulatory jurisdiction, which is based on UBS's "knowledge of current commission actions." Refer to Exhibit A-106 (MRB-15). It is apparent that rating agencies and analysts have taken note of the recent trend in the Company's regulatory outcomes with regard to capital structure. A continuation or, even worse, a further degradation of the authorized weighted rate of return puts the Company at risk of dropping further in its regulatory environment rankings which could negatively impact the Company's credit quality and credit rating. Michigan's regulatory standing needs to be protected and bolstered rather than drawn upon to push the Company toward over-leveraging. Broadly speaking, an above average regulatory standing translates into increased potential investment which continues to support affordable utility infrastructure financing for the state of Michigan.

Q. On page 8 of his direct testimony, Mr. Megginson references a report from S&P's Regulatory Research Associates on state regulatory evaluations. Has S&P provided additional insight with regard to the future credit quality of regulated utilities including Consumers Energy?

A. Yes. Refer to Exhibit A-107 (MRB-16). In a February 2024 report "Rising Risks: Outlook for North American Investor-Owned Regulated Utilities Weakens," S&P updated their outlook of the regulated utility industry to negative, citing "headwinds to credit quality" including increased cash flow deficits that are funded to a higher extent with debt versus equity. Also refer to Exhibit A-114 (MRB-17). In a January 2025 report on North American regulated utilities, S&P highlighted lower ratings headroom as "a high percentage of companies are operating with only minimal financial cushion from our downgrade threshold." S&P also notes that, in 2024, downgrades among North America's investor-owned regulated utilities outpaced upgrades for the fifth consecutive year. With regards to the industry credit outlook for 2025, S&P identifies the following risks to utilities' credit quality:

- The portion of equity in the industry has been weak and consistently below expectations and thus pressuring the industry's financial measures. S&P states that "without significantly more common equity issuance, we expect the industry's financial measures will continue to weaken, albeit gradually, supporting our negative outlook;"
- Tax legislation could weaken financial measures if the new Republican administration lowers the corporate tax rate, reduces tax credits, or eliminates their transferability; and
- Robust capital spending and challenging regulatory constructs will persist for 2025, further pressuring the industry's credit quality.

S&P also cites Michigan as one of the regulatory jurisdictions that they "continue to carefully monitor." It is apparent from these rating agency reports that an ROE and equity

ratio combination higher than the current authorized level, and certainly higher than the continued degradation proposed by Staff, is critical to protect the Company from receiving a credit downgrade in the light of the credit risks as described above.

Q. On page 9 of his direct testimony, Mr. Megginson includes a chart showing Consumers Energy's net income from 2010 to 2024 noting that "the Company's net income has risen steadily over the years" which has "enabled Consumers to access credit markets to the tune of billions in short and long-term financing at very competitive rates." Do you agree with Mr. Megginson's interpretation of this data?

A. No. Mr. Megginson reviews the Company's annual change in net income in complete isolation, without considering the changes in investment over time or the changes in rate base. To the extent that the Company has invested in the system over the period from 2010 through 2024, its net income should increase. However, the analysis does nothing to demonstrate that the increases in net income are sufficient to satisfy the investor-required return on that investment, nor does it conclude anything meaningful about the Company's financial integrity. The Company's access to capital markets and its ability to raise capital at competitive rates is not based on net income, but rather is largely based on the Company's credit quality as determined by credit rating agencies. Since net income can be skewed by non-cash transactions, rating agencies instead look to the Company's cash flow metrics, including its Funds From Operation ("FFO")-to-Debt ratio. Rating agencies also look at the strength of the Company's balance sheet, including its equity ratio. These financial measures are a better indicator of the Company's credit quality and credit rating. It should be noted that the Company's "billions in short and long-term financing" over the years was executed during a period in which the Company's authorized equity ratio was

significantly higher than currently proposed by Staff for the Company in this case. As the Company will continue to rely heavily on capital markets to fund capital investment, the Company's proposed equity ratio of 50.75% will help to maintain strong credit ratings and obtain financing at lower interest rates.

Q. On page 9 of his direct testimony, Mr. Megginson points to the Company's debt issuances in 2023 and 2024 and projected debt issuances in this case as evidence that the Company has not been negatively impacted by Moody's credit rating downgrade. Do you agree with this conclusion?

A. No. Neither the Company's ability to issue debt in 2023 and 2024 nor the projection of continued debt issuances in this case is evidence that there has been no negative impacts from Moody's credit rating downgrade. As explained earlier in my rebuttal testimony, a lower credit rating results in negative financial impacts associated with a higher cost of capital. In addition, the Company's debt issuances in 2023 and 2024 do not prove that the Company will undoubtedly have access to capital markets at reasonable rates in the future, especially with a lower weighted rate of return as proposed by Mr. Megginson.

Q. On page 10 of his direct testimony, Mr. Megginson states that "Consumers currently has a revenue decoupling mechanism in place that allows it to collect revenues, including a return on investment, that is unrelated to the amount of gas sold to its customer base." Mr. Megginson also states that "the Company also has several gas infrastructure improvement and replacement programs in place with surcharge payment mechanisms." Mr. Megginson concludes that programs such as this improve the Company's cash flow expectancy and reduce the Company's risk which,

in turn, justifies a reduction in the Company's ROE. Does the Company currently have these mechanisms in place as Mr. Megginson claims?

A. No, revenue decoupling is no longer a regulatory mechanism that the Company has in place. Refer to Staff's discovery response included as Exhibit A-115 (MRB-18). When asked to identify the MPSC proceeding which authorizes the revenue decoupling mechanism currently in place, Staff changes its position stating that the Company's revenue decoupling mechanism "may have discontinued." In addition, the Company does not have any gas infrastructure improvement and replacement programs with surcharge mechanisms. Again refer to Staff's discovery response included as Exhibit A-115 (MRB-18). When asked to identify the "several gas infrastructure improvement and replacement programs" currently in place, Staff referenced the Company's Enhanced Infrastructure Replacement Program. However, there is no surcharge mechanism in place for this program. Staff also identifies the Company's Gas Cost Recovery mechanism which is simply a method for the Company to recover its cost of gas and is clearly not a gas infrastructure improvement and replacement program. Finally, Staff identifies the Company's Energy Waste Reduction program which is also not a gas infrastructure improvement and replacement program but a state-mandated program aimed at reducing energy consumption and improving energy efficiency. Since Mr. Megginson's claims and references to the existence of recovery mechanisms are false, his argument that such programs reduces risk and thus justifies a lower authorized ROE or equity ratio should be rejected by the Commission.

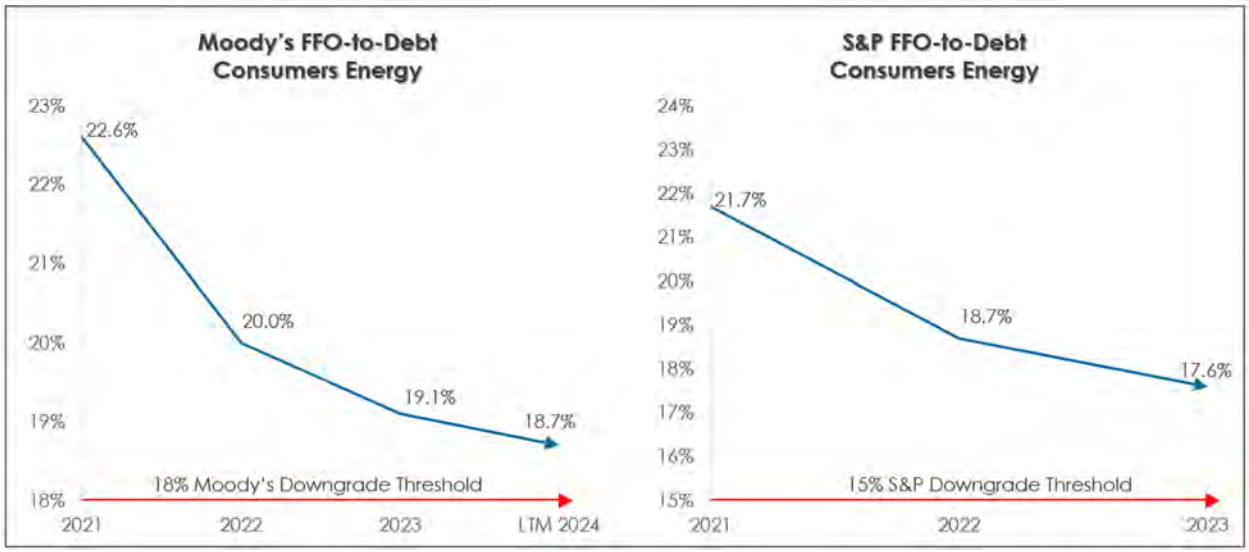
Q. On pages 10 to 11 of his direct testimony, Mr. Megginson references recent credit opinions from S&P and Moody's which describe the rating agencies' expectations with respect to the Company's FFO-to-Debt ratio in future years. Because the rating agencies' expectations are above the credit downgrade thresholds, Mr. Megginson concludes that "rating agencies don't foresee any major deterioration or long-lasting decline in the FFO-to-Debt ratio for Consumers Energy in the foreseeable future." Do you agree with Mr. Megginson's conclusion?

A. No. In assessing credit quality, rating agencies must make certain assumptions with respect to the Company's outlook, including future financial results and regulatory outcomes. However, the assumption of credit metrics holding above the downgrade threshold should not be interpreted as assurance that these assumptions will ultimately materialize, with no risk of a credit rating downgrade. For example, in June 2019, Moody's issued a credit opinion for the Company stating that "Consumers' stable outlook reflects our expectation that the Michigan legislative and regulatory environments will remain constructive." Moody's also stated that they expected the Company's FFO-to-Debt ratio to "range between 20% and 24% over the next few years." In May 2021, Moody's downgraded Consumers Energy's credit rating "due to its weakened credit metrics." Moody's also referenced the outcome of recent rate cases which put pressure on the Company's credit metrics. While rating agencies may assume that the Company will continue to operate in a constructive regulatory environment with credit metrics above the downgrade threshold, the Company's credit rating is continuously evaluated. A reduction in the Company's rate of return lowers cash flow, increases debt, and thereby weakens the Company's FFO-to-Debt ratio. These negative credit metric impacts place the Company's credit quality and

credit ratings at risk. The authorized ROE and equity ratio in this case will be a key component of future rating agency evaluations.

Q. In his assessment of the Company's credit ratings and credit quality did Mr. Megginson take into account the trend in the Company's FFO-to-Debt ratio in recent years?

A. No. Refer to page 5 of S&P's August 2024 credit opinion shown on Exhibit A-116 (MRB-19). The Company's FFO-to-Debt ratio as calculated by S&P has been trending down in recent years from 21.7% in 2021 to 17.6% in 2023, a decrease of 410 basis points and, for 2023, just 60 basis points above the low end of S&P's expected range outlined in its report. In addition, refer to page 2 of Moody's May 2024 credit opinion shown on Exhibit A-117 (MRB-20). The Company's FFO-to-Debt ratio as calculated by Moody's has also been trending down in recent years from 22.6% in 2021 to 19.1% in 2023, a decrease of 350 basis points. Moody's May 2024 credit report also shows a further decline to 18.7% for the 12 months ended March 2024. It is clear from this report that the Company's FFO-to-Debt ratio as calculated by Moody's is trending down and was well below the low end of Moody's expected range (20-21%) for the Company for 2023 and for the 1st quarter of 2024. These credit metric results are shown in the following chart:



The Company's FFO-to-Debt ratio has been trending down in recent years, moving closer to the rating agencies' credit downgrade thresholds. As the credit metric cushion decreases, the Company's credit rating becomes more at risk for a downgrade. The ROE and equity ratio combination proposed by the Company in this case is critical in protecting the Company from a credit downgrade in the light of the credit metric degradation shown above.

ii. Staff Fails to Consider New Circumstances That Justify a Deviation From a Balanced Capital Structure

Q. On pages 13 to 15 of his direct testimony, Mr. Megginson references the Commission's Orders in prior rate cases which reflected its desire for the Company to have a balanced equity ratio. Is this evidence that the Company's equity ratio in the current case should necessarily be 50% as Mr. Megginson proposes?

A. No. The appropriate equity ratio for the Company should be based on the facts and circumstances presented in the current case and not predetermined based on prior Commission orders. While the Commission voiced its desire for the Company to move

toward a balanced capital structure in the cases referenced by Mr. Megginson, the Commission has also made clear that there should be flexibility in its assessment, allowing for a deviation from a balanced capital structure when circumstances warrant it. This approach is illustrated in the following Commission Orders:

> **Case No. U-17990** – "A more complete analysis should be included to explain why such a result is reasonable and prudent" (when referring to an unbalanced capital structure). [MPSC Case No. U-17990, February 28, 2017 Order, page 64.]
>
> **Case No. U-20963** - "The Commission maintains its goal of a capital structure evenly balanced between debt and equity, while continuing to allow a utility to present arguments why a deviation from this ratio is appropriate. As it has done in previous rate cases, the Commission will continue to consider all evidence and circumstances in each rate case to determine the appropriate capital structure." [MPSC Case No. U-20963, December 22, 2021 Order, page 200.]
>
> **Case No. U-21585** - "The Commission, like the ALJ, acknowledges that there is some degree of flexibility and 'that the aspirational goals expressed in previous Commission orders are not permanently binding and that any target for the Company's capital structure should change if evolving circumstances indicate that the target is no longer a sound policy.'" [MPSC Case No. U-21585, March 21, 2025 Order, page 232.]

It is clear from previous orders that the Commission does not consider a balanced capital structure a mandate to be followed blindly, but rather as a basis from which a deviation may be justified upon consideration of the evidence and circumstances of each rate case.

Q. Has the Company presented evidence in this case that an equity ratio of 50.75%, slightly above a balanced capital structure, is warranted?

A. Yes. Refer to pages 10 through 23 of my direct testimony in which I outline reasons why an equity ratio of 50.75% and an ROE of 10.25% as proposed by the Company in this case are well-measured for both the Company and its customers, while still mindful of the Commission's previous orders. This capital structure results in a modest effect on customer rates while bringing the Company more in-line with the authorized weighted rate

of return experienced toward the beginning of the COVID-19 pandemic and prior to the most recent credit rating downgrade. The weighted rate of return as proposed in this case strengthens the Company's balance sheet and credit quality, which will be critical in delivering the Reliability Roadmap investments while doing so in the midst of an elevated interest rate environment.

Q. Are there any new circumstances that give weight to the Company's contention that a deviation from a balanced capital structure to 50.75% equity is justified at this time?

A. Yes. A high degree of volatility and economic uncertainty has emerged in recent months with respect to financial markets, interest rates, and geopolitical tensions. The Trump administration, signaling a significant shift in American trade policy, has placed significantly higher tariffs on imported goods, causing a substantial impact on the U.S. economy. Companies reliant on global supply chains faced elevated input costs, which translated into higher consumer prices and contributed to sustained inflationary pressures. In addition, the heightened trade tensions created an atmosphere of uncertainty that negatively affected business investment and led to heightened volatility in financial markets. An April 2025 Wall Street Journal article titled "Huge Stock Swings Are the New Normal for Frazzled Investors" stated that April 2025 is poised to be the most-volatile calendar month since the COVID crash in 2020. The VIX, a stock market index that measures investors' expectation of volatility, peaked at 52.33 on April 8, 2025. The VIX has not reached 50.00 since April 2020 during the height of the COVID-19 pandemic. Fears of a sharp economic downturn have also dramatically increased. In April 2025, J.P. Morgan Research raised the probability of a U.S. recession occurring in 2025 to 60%.

These developments represent a material change in the Company's risk environment since the previous Commission orders that will most likely continue through the test year of this case. During this period of heightened risk and volatility, it will be critical for the Company to have an authorized ROE and equity ratio that is supportive of its good credit quality. This will be instrumental in the Company's ability to maintain uninterrupted access to needed liquidity and better withstand potential impacts from fuel price spikes, inflationary pressures, and tightening capital markets. As provided for in previous Commission orders, an equity ratio of 50.75% (slightly above a balanced capital structure) is warranted given the facts and circumstances present in the current case.

iii. Staff Ignores the Potential Negative Financial Impacts of a Lower Equity Ratio

Q. Starting on page 15 of his direct testimony, Mr. Megginson references the relatively higher cost of equity compared to debt as justification for a lower equity ratio. Does Staff also discuss the potential negative financial impacts of a lower equity ratio?

A. No. Staff merely states that it is important to "establish a proper equity to debt ratio to maintain reasonable costs to ratepayers." Staff makes this conclusion without analyzing or quantifying the increased costs to the Company and customers that would certainly result from further credit downgrades. Additionally, Mr. Megginson does not provide quantifiable justification as to why his chosen equity ratio of 50.00% is appropriate. This outcome-based conclusion, which is void of an evidentiary analysis of the resulting financial impacts to the Company and its customers, should not be accepted by the Commission.

Q. Mr. Megginson argues that because equity is more expensive than debt, it necessitates a lower equity ratio. Does this rationale have merit?

A. No. Taken to extreme, this rationale would lead to Staff simply recommending that because customers would benefit most from 0% equity, the Commission should authorize a completely debt financed capital structure for the Company. Such a result would clearly ruin the financial soundness of the Company and a recommendation based on such a rationale should be given no merit. Staff's argument points out the obvious fact that the cost of equity is greater than the cost of debt – but no business can or should fund itself with an excessive level of debt. This simplistic argument adds nothing of value for the Commission to consider.

Q. Although Mr. Megginson chooses to ignore the possibility of another credit downgrade and presents no analysis or discussion of the impacts of a credit downgrade on the Company, what would be the effect of a credit downgrade?

A. As explained earlier in my rebuttal testimony, lowering the equity ratio and authorized ROE reduces the Company's overall cost of capital and rate of return. This, in turn, lowers the Company's cash flow and FFO-to-Debt ratio. The Company would also have to increase its long-term debt to achieve a lower equity ratio thereby weakening the Company's FFO-to-Debt ratio. The negative impacts could cause the Company's FFO-to-Debt ratio to drop below the established rating agency thresholds, placing both the Company's credit quality and credit ratings at risk. While it may seem attractive for the benefit of customers in the near-term to minimize the equity layer of the Company, such a move, and the potential resulting credit rating downgrade, could lead to the Company's customers paying higher financing costs over the long term, and it could put at risk the

Company's ability to execute on its critical investment plan on behalf of customers. Thus, it is of great importance for the regulatory response to be balanced and thoughtful, as the financial health of the Company is a critical element of its ability to implement the capital plan needed to deliver safe, reliable, and clean energy to its customers.

Q. What are the customer benefits of the Company maintaining the needed financial cushion to avoid a credit rating downgrade?

A. A higher credit rating ensures that the Company is able to obtain financing at lower interest rates, resulting in long-term customer rate stability. As shown in Exhibit A-35 (MRB-13), the Company has saved customers $153 million annually as a result of improved credit ratings and lowered interest costs. But the customer benefits extend far beyond this long-term rate stability. As set forth in the testimony and exhibits of the Company's multiple capital witnesses, the Company is making significant capital investments to maintain and improve utility infrastructure to improve reliability and resiliency to the benefit of customers. During this time, the Company must rely heavily on the capital markets to fund these investments. Therefore, it will be especially important for the Company to maintain strong credit ratings to ensure beneficial access to capital markets for funding to deliver these critical customer investments and enable the Company to do so at the lowest possible financing cost on their behalf.

iv. Staff Fails to Consider the Average Equity Ratios of Peer Group Companies

Q. How does Mr. Megginson's recommended 50.00% equity ratio compare to equity ratios authorized by other commissions?

A. Mr. Megginson's recommended 50.00% equity ratio is significantly lower than equity ratios authorized by other commissions. I researched all rate case decisions from 2020

through September 2024 of peer companies and determined the authorized or approved equity ratio for each. This is reflected on Exhibit A-32 (MRB-10). The average authorized equity ratio for the peer group was 54.05%, 405 basis points higher than the 50.00% proposed by Mr. Megginson for Consumers Energy in this case. Despite this higher peer average, I am proposing a ratio of 50.75%, which balances the higher peer average with capital investment plans, credit metrics, customer rate impacts, and the guidance of this Commission, and which continues to support affordable utility infrastructure financing for the state of Michigan.

Q. Are the equity ratios reflected on Exhibit A-32 (MRB-10) based on historical financial data or commission-authorized equity ratios?

A. The equity ratios were taken directly from commission orders and public filings and represent actual regulatory equity ratios authorized or approved by the various commissions across the country, as specifically requested by the Commission on page 218 of its Order in Case No. U-20963. It is clear from this analysis that, on average, regulatory commissions of the Company's peer group are granting equity ratios that are much higher than the 50.75% requested by the Company in the current case, and higher still than the 50.00% equity ratio chosen by Mr. Megginson.

Q. Did Mr. Megginson perform an analysis of the national average peer company authorized ROEs consistent with previous rate cases?

A. Yes. Staff considered average gas utility authorized ROE decisions across the U.S. to support its ROE recommendation for the Company in this case.

Q. Did Mr. Megginson also perform an analysis of average peer company authorized equity ratios?

A. Yes. On page 2 of his Exhibit S-4, Schedule D-5, Mr. Megginson calculated an average authorized equity ratio of 53.62%. This is 362 basis points higher than Mr. Megginson's recommended equity ratio in this case of 50.00% and 287 basis points higher than the Company's recommended equity ratio in this case of 50.75%.

Q. Is Mr. Megginson's peer equity ratio analysis a valid basis for purposes of authorizing a permanent equity ratio?

A. No. According to Mr. Megginson's exhibit, the source of the equity ratio data is S&P Global Market Intelligence. S&P Global Market Intelligence tracks the authorized equity ratio as a percentage of <u>total</u> capitalization. Total capitalization can be higher (thereby under-reporting an equally comparable equity ratio) because, in addition to permanent capital components, items such as short-term debt, deferred taxes, and customer deposits can be included. For example, as reflected on Exhibit A-14 (MRB-1), the Company's 50.75% permanent equity ratio in this instant case translates to only 42.58% on a total capitalization basis that would be reported in Staff's referenced database, which is a difference of 817 basis points. The Company's equity ratio, which is based on a percentage of permanent capital, should only be compared to equity ratios of peer utilities based on percentage of permanent capital in order for the comparison to be at all meaningful. The actual commission-authorized equity ratios provide the required data for a comparable analysis and were relied upon in my analysis shown in Exhibit A-32 (MRB-10) which shows the average equity ratio for the peer group utilizing this method to be 54.05%.

Q. Did Mr. Megginson consider his calculation of peer average authorized equity ratios in determining his recommended equity ratio for the Company in this case consistent with his consideration of peer averages to support his ROE recommendation?

A. No, his recommended equity ratio for the Company in this case was inconsistent with even his own substandard peer equity ratio analysis. According to both the Company's calculations as well as Staff's own analysis, Mr. Megginson's recommended equity ratio of 50.00% is drastically understated.

Q. Are there any other reasons why it is appropriate to consider peer company equity ratio averages and trends in determining the appropriate equity ratio for the Company in this case?

A. Yes. In its Order in Case No. U-20963, the Commission cited Staff's average ROE analysis as one of the factors considered in determining the Company's approved ROE. In addition, in Case No. U-21585, the Administrative Law Judge ("ALJ") also considered average authorized ROEs in determining the appropriate ROE for the Company. In its Order, the Commission found that the ALJ appropriately considered the record evidence, weighing the vast testimony, methodologies and proposed ROEs on the record. It is apparent that the Commission considers peer averages an important piece of evidence to inform the ratemaking process. To be consistent with that philosophy, it is appropriate to consider peer company equity ratio averages and trends in determining the equity ratio for the Company in this case.

v. Summary

Q. Please summarize your rebuttal testimony to Staff witness Megginson's recommendation of an equity ratio of 50.00% for the test year in this case.

A. In my rebuttal testimony, I have shown that Mr. Megginson's position on equity ratio is largely not evidence based and that the evidence which he does provide is unsound and should not be relied upon. Further, I have shown that, based on the recent dramatic increase in risk and volatility, a deviation from a balance structure is justified at this time. I have also shown that Staff's recommended equity ratio for the test year in this case is below what is considered supportive of the Company's credit quality and also significantly lower than the average equity ratio of peer group companies. For these reasons, Staff's recommended equity ratio of 50.00% for the test year in this case should be rejected.

C. Rebuttal of Staff's Recommendation Regarding the Cost of Long-Term Debt

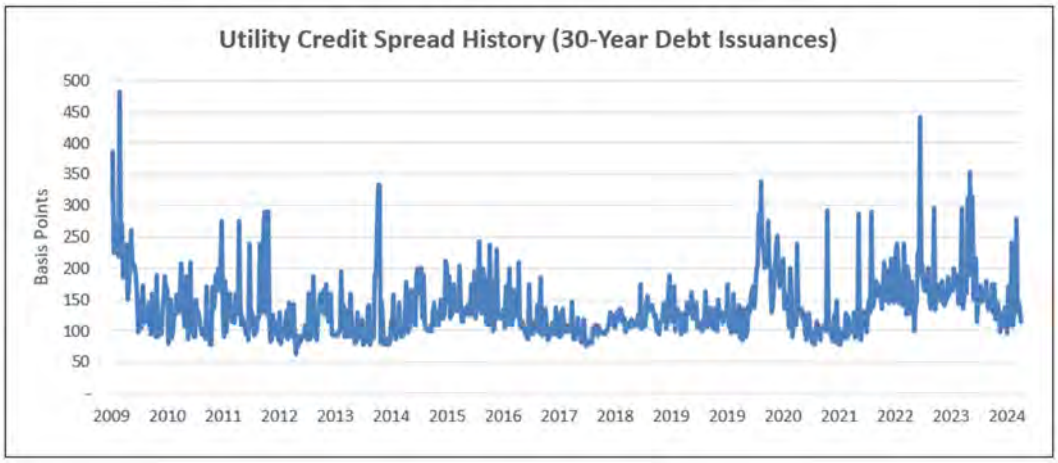
Q. Please explain your disagreement with Staff's cost of long-term debt recommendation of 4.33% as reflected on Mr. Megginson's Exhibit S-4, Schedule D-1.

A. Mr. Megginson's assumed credit spread (added to the U.S. Treasury rate to calculate the total projected interest rate on the new debt issuances) is also unreasonably low.

Q. Mr. Megginson uses the credit spreads on the Company's recent long-term debt issuances as a basis for projecting a 100 basis point credit spread on the Company's forecasted debt issuances through the test year in this case. Is this a reasonable approach?

A. No. As explained on page 33 of my direct testimony, credit spreads for long-term debt issuances are very difficult to predict and can be quite volatile in short periods of time. This is because credit spreads are based on a number of factors, most notably the

Company's credit rating and the market conditions at the time of the debt issuance, including both same-day and short-term supply/demand dynamics. The volatility of credit spreads is illustrated on the following chart:



Mr. Megginson's 100 basis point credit spread is also quite obviously at the very low end of the historical spreads for 30-year debt issuances, as evidenced in the chart above. In addition, as shown in Staff's discovery response included as Exhibit A-115 (MRB-18), Mr. Megginson includes credit spreads on the Company's recent long-term debt issuances which are <u>not</u> 30-year maturities as a basis for projecting the credit spreads on forecasted debt issuances that <u>are</u> assumed to be 30-year maturities. Credit spreads on debt issuances vary based on the tenure or maturity of the debt issuance (for example, a 10-year bond versus a 30-year bond). For these reasons, Mr. Megginson's methodology for estimating the credit spread on the Company's projected long-term debt issuances is faulty and should be rejected by the Commission. Alternatively, the Company has provided a very sound approach to projecting credit spreads. Given the lack of a reliable source for projected credit spreads, I applied the calculated average credit spread on a 30-year debt issuance for investment grade utilities from the last 15 years which was approximately 136 basis points.

Since credit spreads can be volatile in the short-term, a longer-term historical average is a rational approach with regard to credit spreads.

D. Staff's Recommendation Regarding the Projected Working Capital Cash Balance

Q. Does Staff recommend a working capital cash balance for the test year in this case that is lower than the Company's projection?

A. Yes. On page 5 of Staff witness Hecht's direct testimony, he recommends an adjustment to reduce the Company's projected cash balance by $5,263,000. Mr. Hecht states that the Company used incorrect data to calculate the cash balance in its original filing and that the balance should be $23,130,000 rather than $28,393,000.

Q. Does the Company object to Staff's adjustment to the working capital cash balance?

A. No. The Company's methodology of projecting the cash balance of 1% of test year revenues is not in dispute, but rather the correct test year revenues that the 1% should be applied to. The Company agrees that the 1% was applied to the incorrect revenues amount in the Company's original filing and therefore accepts Staff's cash working capital adjustment.

II. REBUTTAL OF AG WITNESS COPPOLA

A. Overview of Areas of Disagreement Addressed

Q. What aspects of AG witness Coppola's recommendations are you rebutting?

A. I am rebutting Mr. Coppola's recommendation regarding the common equity ratio. I am also rebutting Mr. Coppola's recommendation regarding the Company's working capital cash balance.

Q. Are there any other aspects of Mr. Coppola's recommended capital structure that the Company disagrees with?

A. Yes. Consumers Energy does not agree with Mr. Coppola's recommended ROE of 9.75%. This issue, however, is addressed in the rebuttal testimony of Company witness Bulkley.

B. Rebuttal to Mr. Coppola's Recommendation Regarding the Common Equity Ratio

Q. On page 110 of his direct testimony, Mr. Coppola references the Commission's Orders in Case No. U-21585 and Case No. U-21389, the Company's two most recent fully-contested cases, in which both orders authorized a balanced equity ratio. Mr. Coppola then concludes that the Company's capital structure in the current case should "similarly mirror" the common equity ratio last approved by the Commission. Do you agree with this conclusion?

A. No. The appropriate equity ratio for the Company should be based on the facts and circumstances presented in the current case and not predetermined based on prior Commission orders. Refer to my earlier rebuttal testimony to Staff witness Megginson (ii. Staff Fails to Consider New Circumstances That Justify a Deviation From a Balanced Capital Structure). While the Commission authorized a balanced capital structure in the cases referenced by Mr. Coppola, the Commission has also made clear that there should be flexibility in its assessment, allowing for a deviation from a balanced capital structure when circumstances warrant it. It is clear from these orders that the Commission does not consider a balanced capital structure a mandate to be followed blindly, but rather as a basis from which a deviation may be justified upon consideration of the evidence and circumstances of each rate case.

Q. Has the Company presented evidence in this case that an equity ratio of 50.75%, slightly above a balanced capital structure, is warranted?

A. Yes. Refer to pages 10 through 23 of my direct testimony in which I outline reasons why an equity ratio of 50.75% and an ROE of 10.25% as proposed by the Company in this case are well-measured for both the Company and its customers, while still mindful of the Commission's previous orders. Also refer to my earlier rebuttal testimony to Staff witness Megginson. There have been new circumstances that gives credence to the Company's contention that a deviation from a balanced capital structure is justified at this time including extreme financial market volatility, supply chain impacts, inflationary pressures, and increased fears of a U.S. recession in 2025. As provided for in previous Commission orders, an equity ratio of 50.75% (slightly above a balanced capital structure) is warranted given the facts and circumstances present in the current case.

Q. On page 113 of his direct testimony, Mr. Coppola references recent credit opinions from Moody's and S&P, noting that the Company's FFO-to-Debt ratio in recent years for both rating agencies was higher than the threshold that could lead to a further downgrade if the Company fell below. For S&P, Mr. Coppola concludes that "these coverage ratios are not indicative of any concerns about a possible debt rating downgrade." Is the Company's FFO-to-Debt ratio in recent years evidence that the Company is not at risk for further credit rating downgrade?

A. No. First, as explained on pages 15 to 16 of my direct testimony and earlier in my rebuttal testimony to Staff witness Megginson, the Company's FFO-to-Debt ratio as calculated by rating agencies has been trending down in recent years – a decrease of 410 basis points for S&P and a decrease of 350 basis points for Moody's. This sizable amount of credit ratio

deterioration, which is brushed off by Mr. Coppola, should be troubling to the Commission. Second, while the Company's FFO-to-Debt ratios in previous years were higher than the downgrade threshold, the results cover a time when the Company's equity ratio was significantly higher than Mr. Coppola recommends for the Company in this case - 52.7% in 2021 and 53.2% in 2022. Therefore, Mr. Coppola's statement that there is no concern of downgrade should be discounted by the Commission.

Q. On page 114 of his direct testimony, Mr. Coppola references the increase in the Company's net income in 2024. Mr. Coppola concludes that this will have a positive impact on the Company's credit metrics. Do you agree with this conclusion?

A. No. Refer to my earlier rebuttal testimony to Staff witness Megginson on this issue. Higher net income is not necessarily indicative of higher credit metrics or credit quality. Since net income can be skewed by non-cash transactions, rating agencies instead look to the Company's cash flow metrics, including its FFO-to-Debt ratio. Rating agencies also look at the strength of the Company's balance sheet, including its equity ratio. Finally, rating agencies evaluate the supportiveness of the Company's regulatory environment, including the authorized ROE and equity ratio. These measures are a better indicator of the Company's credit quality and credit rating. Based on rating agencies' criteria, the weighted rate of return authorized in this case, and not net income, will be a significant factor in determining the Company's credit quality.

Q. On pages 114 to 115 of his direct testimony, Mr. Coppola refers to the Company's direct testimony which showed that the Company's FFO-to-Debt ratio as calculated by S&P and Moody's has been trending down in recent years. Mr. Coppola dismisses these sharp declines as "temporary" and the result of "unusual and short-term issues." Do you agree with this assessment?

A. No. Mr. Coppola describes events such as unfavorable weather, storm activities, and higher gas prices as the main cause for the Company's decline in credit metrics in recent years. First of all, Mr. Coppola omits that, as explained on pages 15 to 16 of my direct testimony, the decline in the Company's FFO-to-Debt ratio has coincided with recent rate cases which have resulted in a sharp decline in rate of return (ROE multiplied by equity ratio) having a directly negative result on credit metrics, both historic and future. Secondly, there is no guarantee that these issues that Mr. Coppola describes as "temporary" such as storms, will not persist in future years. For example, from the end of March 2025 through the beginning of April 2025, the Company's service territory was hit with the worst ice storm in northern Michigan in over 100 years, as confirmed by the National Weather Service. At the same time, the lower peninsula of Michigan was hit by thunderstorm systems strong enough to produce 13 confirmed tornados. The Company estimates this combined storm event will result in approximately $96 million in operating and maintenance ("O&M") expense, significantly higher than any other Consumers Energy storm event O&M amount in at least the last 20 years. This cost of this storm will have a significant detrimental impact on the Company's credit metrics in 2025 and 2026. In fact, Mr. Coppola's testimony highlighting the negative impact of these events demonstrates the

importance of maintaining strong credit metrics in preparation for such events and not managing the Company toward the lower margins.

Q. On pages 115 to 116 of his direct testimony and his Exhibit AG-49, Mr. Coppola references his calculation of the Moody's FFO-to-Debt ratio for the Company for 2023 assuming a 9.75% ROE and a 50.0% equity ratio. According to Mr. Coppola's calculations, the Company's FFO-to-Debt ratio would have been 20.1%, or 100 basis points higher in 2023 with these assumptions. Do you agree with Mr. Coppola's calculations?

A. No. In his calculations, Mr. Coppola mixes the Company's authorized ROE with the Company's earned ROE, greatly distorting the pro forma FFO-to-Debt impacts. First, Mr. Coppola calculates the Company's actual earned ROE of 8.25% in 2023. Next, Mr. Coppola makes two assumptions: (1) that the Company's authorized ROE was 15 basis points lower in 2023 (9.75% versus 9.90%); and (2) that the Company actually earned that authorized ROE in 2023 (9.75% versus 8.25%). Mr. Coppola's second assumption is false in that he is attempting to show the FFO-to-Debt ratio for the Company for 2023 only assuming an authorized ROE of 9.75% and an equity ratio of 50.0%. In essence, Mr. Coppola is suggesting that if the Company's authorized ROE in 2023 was 15 basis points lower (9.75% versus 9.90%), the Company's FFO would have been $155 million higher. This lacks logical sense and results in a pro-forma FFO-to-Debt ratio that is significantly overstated. Therefore, Mr. Coppola's pro forma FFO-to-Debt analysis for Moody's in 2023 is faulty and should therefore be rejected by the Commission.

Q. On pages 117 to 118 of his direct testimony, Mr. Coppola references recent credit opinions from S&P and Moody's which indicate a stable outlook for the Company. Is this evidence that the Company is not at risk for further credit rating downgrade?

A. No. In assessing credit quality, rating agencies must make certain assumptions with respect to the Company's outlook, including future financial results and regulatory outcomes. However, the assumption of a stable outlook should not be interpreted as assurance that these assumptions will ultimately materialize, with no risk of a credit rating downgrade. For example, Mr. Coppola highlights the rating agencies' assumption that the Company will continue to operate in a constructive regulatory environment. However, the Company's credit rating is continuously evaluated, and the authorized ROE and equity ratio in this case will be a key component of future evaluations. As shown on page 15 of my direct testimony, the results from the Company's most recent rate cases demonstrate a sharp decline in authorized weighted rate of return (ROE times equity ratio) following a long period of stability. The persistent decline in the Company's authorized weighted rate of return since 2020 could be seen as a material deterioration in the credit supportiveness of the Michigan regulatory environment. In addition, refer to my earlier rebuttal testimony to Staff witness Megginson. In August 2024, S&P lowered its ranking of Michigan's regulatory environment from "Above Average" to "Average" referencing less favorable authorized ROEs and a "tightening in the regulatory climate." In updating its regulatory rankings for U.S. utilities in May 2023, UBS also moved Michigan down a level from Tier 1 to Tier 2. In describing the negative change, UBS specifically mentioned authorized ROEs as well as a lowering of their "subjective factor" for the Michigan regulatory jurisdiction, which is based on UBS's "knowledge of current commission actions." It is

apparent that analysts have taken note of the recent trend in the Company's regulatory outcomes with regard to capital structure. A continuation or, even worse, a further degradation of the authorized equity ratio and ROE puts the Company at risk of dropping further in its regulatory environment rankings which could negatively impact the Company's credit quality and credit rating.

Q. On pages 118 to 119 of his direct testimony, Mr. Coppola references the Company's Exhibit A-107 (MRB-16), a report by S&P "Rising Risks: Outlook for North American Investor-Owned Regulated Utilities Weakens." Mr. Coppola argues that this report should be dismissed because it is "generic" and not "directly applicable to Consumers Energy." Do you agree with Mr. Coppola's assessment of this report?

A. No. While certain aspects of this report are not applicable to Consumers Energy, there are also key portions that are directly relevant to the appropriate equity ratio for the Company in this case. For example, in the report S&P cites "headwinds to credit quality" including increased cash flow deficits that are funded to a higher extent with debt versus equity. This concern is relevant in the current case given that the Company's authorized equity ratio has decreased 205 basis points from 2019 to present, weakening credit quality and putting the Company's credit rating at risk. S&P also notes utilities as having "strained financial cushion," defined as an FFO-to-Debt ratio less than 100 basis points above a company's downgrade threshold. This is also relevant to the Company in this case given that, as explained in my direct testimony and earlier in my rebuttal testimony, the Company's FFO-to-Debt ratio as calculated by S&P and Moody's has been trending down in recent years, moving closer to the downgrade thresholds for the Company. Finally, the report cites multiple additional credit headwinds that all utilities (including Consumers Energy) are

facing including higher interest rates, a narrowing spread between U.S. Treasuries and authorized ROE's, and elevated inflation rates. Therefore, Mr. Coppola's assertion that the Commission should dismiss this relevant industry report should be rejected.

Q. On page 119 of his direct testimony, Mr. Coppola references the Company's testimony on the credit metric impact of potential new tax legislation. Mr. Coppola states that this issue should not be considered as a factor in determining the Company's ROE rate and equity ratio in this case. Do you agree with this assertion?

A. No. As explained on pages 16 to 17 of my direct testimony, the new tax legislation, if enacted, would have direct and significant impacts on the Company's cash flow, resulting in a weakening of the Company's financial metrics. These potentially credit harmful legislative actions were highlighted in S&P's January 2025 report on North American regulated utilities which stated that "tax legislation could weaken financial measures." Refer to Exhibit A-114 (MRB-17). With this potential new tax legislation looming during the test year of this case, it is especially important for the Commission to authorize an ROE and equity layer that will be supportive of the Company's credit quality. The authorized ROE and equity ratio are integral components of the Company's financial credit metrics and will be a key factor in combating the negative impacts of this potential tax legislation.

Q. Beginning on page 120 of his direct testimony, Mr. Coppola states that "common equity capital infusions into Consumers Energy by the parent company are being funded to some extent by long term debt." He cites "financial transactions" between Consumers Energy and CMS Energy. Do you agree with these statements?

A. No. Mr. Coppola's assertion that equity investments into the Company from Consumers Energy's parent company, CMS Energy, are the result of CMS Energy borrowing debt and

investing the proceeds into the Company is inaccurate and unsupported. The timing and amounts of long-term debt and equity issued by CMS Energy have no bearing on the timing and amount of equity infusions made into Consumers Energy. Equity infusions are determined after considering the capital spending and financing needs of Consumers Energy. The goals of the parent company include maintaining a strong and healthy utility, capable of serving the needs of its customers. This commitment is reflected in the equity infusions from the parent company to Consumers Energy over the last several years and the resulting actual equity ratio.

Q. On page 122 of his direct testimony, Mr. Coppola provides an analysis of the capital structure of CMS Energy and Consumers Energy from 2010 to 2024, attempting to link changes in long-term debt and equity between the two companies. Does this analysis have any merit in the current case?

A. No. As explained above, the timing and amounts of long-term debt and equity issued by CMS Energy have no bearing on the timing and amount of equity infusions made into Consumers Energy. Also, in Case No. U-18124 the AG made this same argument that Consumers Energy's equity balance is, at least in part, funded by long-term debt from its parent company. In its July 31, 2017 Order in Case No. U-18124, the Commission adopted the findings and recommendations of the ALJ, who determined this argument from the AG "has been considered and rejected by the Commission." Mr. Coppola's analysis has been found to have no merit in the past and should again be rejected.

Q. On page 124 of his direct testimony, Mr. Coppola's argument for setting a 50.00% equity ratio in this case is that the common equity ratio of his peer group was 47.3% in 2024, as shown on his Exhibit AG-44. Is this an appropriate comparison to the projected common equity ratio in this case?

A. No. The average equity ratio calculation for the proxy group on Mr. Coppola's Exhibit AG-44 uses the equity ratio at the parent holding company level and is, thus, a misleading and inappropriate comparison. As the Company has repeatedly explained in response to this exact same argument by the AG over the years, ratios at the parent holding company level may be distorted by other, non-regulated balance sheet items and provides a completely inappropriate point of comparison. Mr. Coppola continues to avoid addressing this discrepancy. Perhaps the 270 basis point differential between the results of his analysis on Exhibit AG-44 and his own recommendation points to Mr. Coppola's recognition that the analysis does not provide a relevant comparison. In addition, Mr. Coppola's analysis is further skewed because the sources for Mr. Coppola's debt and equity balances are Securities and Exchange Commission reported financial statements, which are prepared under Generally Accepted Accounting Principles ("GAAP"). There are major differences in how components of the capital structure are classified on a ratemaking basis and on a financial basis. These differences could easily further distort the equity ratios calculated on Mr. Coppola's Exhibit AG-44.

Q. Is Mr. Coppola's average peer group equity ratio analysis in line with the Commission's stated expectations?

A. No, the Company is the only party in this case that has provided peer equity ratio analysis that is in line with the Commission's stated expectations. In its Order in Case No. U-20963,

the Commission stated that "regulatory and financial data should not be combined" with such an analysis. Further, the Commission deemed in its Order in Case No. U-20963 that such an analysis is invalid assuming one "could not verify that its data contained equity ratios set by a regulatory commission in a rate case." In his analysis of a proper equity ratio for the Company, Mr. Coppola ignores this Commission's ask by consistently utilizing equity ratios based, in part, on financial, and not regulatory, data. He consistently utilizes equity ratios that do not arise out of Commission orders, and he further fails to explain the basis or rationale for doing so. As a result, the AG's equity ratio analysis should be rejected as outside the methodology required by the Commission.

Q. If equity ratios on a financial basis are not considered relevant, what is the more appropriate comparison of average utility equity ratios?

A. It is clear from the Commission's Order in Case No. U-20963 that actual commission-authorized equity ratios is the preferred data source for an average equity ratio analysis. I refer to my Exhibit A-32 (MRB-10) in which I researched all rate case decisions from 2020 through September 2024 of peer regulated companies and determined the authorized or approved equity ratio for each. The equity ratios used for comparison purposes were taken from commission orders and public filings and represent actual regulatory peer equity ratios authorized or approved by different commissions across the country. The average equity ratio for the peer group was 54.05%. This is significantly higher than the equity ratio recommended for Consumers Energy's capital structure in my rebuttal testimony and is also 405 basis points higher than the equity ratio Mr. Coppola recommends for the Company in this case. Despite this higher peer average, I am proposing a ratio of 50.75%, which balances the higher peer average with capital

investment plans, credit metrics, customer rate impacts, and the guidance of this Commission, and which continues to support affordable utility infrastructure financing for the state of Michigan.

Q. On pages 125 through 127 of his direct testimony, Mr. Coppola attempts to discredit the Company's calculation of the peer group average commission-authorized equity ratios reflected on Exhibit A-32 (MRB-10). Do these arguments have merit?

A. No. The Company adhered to an established selection criteria outlined on Exhibit A-32 (MRB-10). Mr. Coppola's claims are false and divert attention away from his own lack of meaningful comparisons, meaningful criteria, and meaningful analyses of various utilities, commission decisions, and basis for equity ratios. As explained in my direct testimony and earlier in my rebuttal testimony, the Company's data source is responsive to previous Commission orders and serves as a valid benchmark for the appropriate equity ratio for the Company in this case. As I will show in my following rebuttal testimony, Mr. Coppola's "problems" with Exhibit A-32 (MRB-10) are completely baseless and are an attempt to devalue the compelling evidence put forth by the Company that average peer company equity ratios are significantly higher than what Mr. Coppola proposes for the Company in this case.

Q. On page 125 of his direct testimony, Mr. Coppola notes that three proxy group companies listed on Exhibit A-32 (MRB-10) are not included as part of the Company's ROE proxy group in the current case. Does this in any way discredit the Company's peer authorized equity ratio analysis?

A. No. As explained earlier in my rebuttal testimony, the Company adhered to an established selection criteria outlined on Exhibit A-32 (MRB-10) which included a scope of all

regulated subsidiaries of the Company's ROE proxy group in Case No. U-21490, the Company's most recent gas rate case before the current case. The purpose of the Company's Exhibit A-32 (MRB-10) is to provide a benchmark of equity ratios recently authorized by other commissions across the country. The fact that three of the proxy group companies included in the Company's analysis were included in the ROE proxy group in Case No. U-21490 and not the current case does not discredit or minimize the value of the analysis, as it is still a representative sample of recent rate case decisions.

Q. On page 125 of his direct testimony, Mr. Coppola claims that the average peer equity ratio calculated on Exhibit A-32 (MRB-10) is overstated due to several of the companies included in the exhibit using short-term debt as a form of permanent financing which, when considered permanent (long-term) debt in the company's capital structure, results in a lower equity ratio. Are Mr. Coppola's claims valid?

A. No. First, as shown on Exhibit A-14 (MRB-1), Schedule D-1, the Company's equity ratio of 50.75% excludes short-term debt. Therefore, in order to produce a comparable and relevant analysis, the peer company authorized equity ratios also exclude short-term debt (as well as other capital structure components such as deferred taxes). Second, Mr. Coppola makes the assumption that companies employ short-term debt as a permanent layer of financing. This is not always the case, a prime example being Consumers Energy which has short-term debt as a component of its capital structure but is not considered "permanent" capital. In a discovery response, the AG explains that the claim of companies in the exhibit using short-term debt as a form of permanent financing was not based on the companies included in the exhibit, but rather for four companies at the parent holding company level, based on Securities and Exchange Commission reported financial

statements. Exhibit A-118 (MRB-21). This invalidates Mr. Coppola's argument entirely. The average peer equity ratio on Exhibit A32 (MRB-10) is appropriately calculated at the regulated subsidiary level based on state commissions' rate case dockets. This is comparable to Consumers Energy's projected capital structure considered in the current case. Conversely, debt held outside of these companies, at the parent holding company level or otherwise, is completely irrelevant to this analysis. As an example, short-term debt balances held by CMS Energy, Consumers Energy's parent company, is irrelevant to the appropriate capital structure for the Company in the current rate case proceeding. Even if the short-term debt of his four proxy group companies is representative of their regulated subsidiaries, as Mr. Coppola argues, he does not provide evidence showing how this impacts the equity ratios of the regulated subsidiaries reflected on the Company's Exhibit A-32 (MRB-10). As with his calculation of the average peer group equity ratio, Mr. Coppola again attempts to introduce parent holding company data in an attempt to obfuscate the Company's sound analysis. Mr. Coppola's comparisons are inappropriate and should be rejected by the Commission.

Q. On page 126 of his direct testimony, Mr. Coppola claims that the Company's peer average authorized equity ratio reflected on Exhibit A-32 (MRB-10) is overstated as a result of the inclusion of smaller companies which "tend to have higher equity ratios to sustain them during potential volatility in their business, which larger utilities can better manage." Do you agree with this conclusion?

A. No. Mr. Coppola presents no evidence showing a correlation between a company's size and its authorized equity ratio. Refer to Exhibit A-118 (MRB-21). When asked in discovery for analyses, studies, or reports supporting this statement, Mr. Coppola indicated

that he "relied on his knowledge and experience." In his discovery response 3-CE-AG-6 Attach 1 (see Exhibit A-118 (MRB-21), Mr. Coppola also included an excerpt from Dr. Robert Morin's book New Regulatory Finance which discusses the relationship between company size and investment risk and return. This is a separate issue from the impact of a company's size on its authorized equity ratio and does not support Mr. Coppola's claim. Therefore, Mr. Coppola's assumption that the inclusion of certain "smaller" companies results in an overstatement of the peer average is unsupported and should be rejected. In addition, Exhibit A-32 (MRB-10) is intended to be an informative survey of all commission-authorized equity ratios for utilities across the country and not filtered to adjust for or exclude companies with certain characteristics (customer count, rate base size, etc.). Finally, Mr. Coppola again presents a criticism of the Company's peer equity ratio analysis without offering an alternative analysis that he believes to be more representative of commission-authorized equity ratios. Mr. Coppola performs no analysis at all, but rather simply relies on the average equity ratio calculation for the parent holding companies of his proxy group of 47.3%. As explained earlier in my rebuttal testimony, this approach is flawed and should not be relied upon in this case.

C. Rebuttal to Mr. Coppola's Recommendation Regarding the Working Capital Cash Balance

Q. On page 103 of his direct testimony, Mr. Coppola references the Company's approach to projecting the cash balance for the test year in this case equal to approximately 1% of test year revenues. Mr. Coppola argues that, if the Company were to instead base its projection on current revenues, the test year cash balance would yield a lower result. Is using current revenues appropriate in projecting the test year cash balance in this case?

A. No. The Company uses a forward looking test year in this case, projecting an adequate level of cash for the test year ending October 2026. Therefore, basing the projected cash balance on current or historical revenues would not be appropriate.

Q. On page 103 of his direct testimony, Mr. Coppola attempts to discredit the Company's approach to projecting the cash balance for the test year in this case, stating that "cash on hand is not used to pay for revenues. It is used to pay operating expenses, capital expenditures and dividends to the parent company." Is this a valid argument against the Company's 1% of test year revenues rule of thumb?

A. No. The Company's cash estimation method is not intended to project all future cash outflows in order to determine a required cash balance. Rather, the 1% of test year revenues is a simple, efficient, and easily calculated benchmark that is useful in estimating a reasonable level of cash for the Company. As the size of the Company grows along with its associated operating revenues, the appropriate level of cash on hand also grows. Thus, the various uses of the Company's cash is not a valid argument against the Company's cash projection methodology.

Q. On page 103 of his direct testimony, Mr. Coppola again attempts to discredit the Company's approach to projecting the cash balance in this case by stating that "utilities maintain different levels of cash on hand during different months of the year depending on their seasonal needs for cash to pay for gas purchases, fund gas inventories and pay for operating expenses and construction costs." Does the seasonality of cash expenditures invalidate the Company's 1% of test year revenues rule of thumb?

A. No. Refer to pages 27 to 29 of my direct testimony which describes the Company's liquidity and financing strategy. Due to the seasonal nature of utility cash inflows and outflows, the Company generally holds more cash in the spring and summer months and relies on short-term borrowing in the fall and winter months. However, the Company is not projecting the cash balance for a point in time, but rather an average cash balance for the entire test year in this case. Therefore, the seasonal nature of cash outflows is already factored into the Company's position.

Q. On pages 103 and 104 of his direct testimony, Mr. Coppola refers to the Company's cash projection methodology of 1% of test year revenues as being based on "an analysis it performed a few years ago for a group of utilities." Mr. Coppola argues that this analysis was based on cash balances presented in GAAP financial statements and is therefore inappropriate. Is this argument valid?

A. No. Refer to Exhibit A-93 (AJD-13) in Case No. U-17990, the Company's 2016 electric rate case. In this exhibit, the Company performed an analysis of the average cash balance as a percentage of operating revenue for the Company's peer group at the regulated subsidiary level. This analysis resulted in a peer average of 1.9%, showing that the

projected test year cash balance in that case was reasonable and appropriate compared to other utilities. While the peer companies' cash balances reflected in that analysis may or may not have included temporary cash investments, the peer average was 90 basis points higher than projected for the Company in the current case. This is another example of Mr. Coppola attempting to muddle the valid analysis that the Company has performed.

Q. On page 104 of his direct testimony, Mr. Coppola argues that the Company's cash analysis from Exhibit A-93 (AJD-13) in Case No. U-17990 was inappropriate because it used data on a GAAP financial basis. Does Mr. Coppola perform an analysis based on GAAP financial data in his testimony and exhibits?

A. Yes. Refer to my earlier rebuttal testimony to Mr. Coppola's peer group equity ratio calculation of 47.3%. Mr. Coppola's analysis is skewed because the sources for Mr. Coppola's debt and equity balances are Securities and Exchange Commission reported financial statements, which are prepared under GAAP. There are major differences in how components of the capital structure are classified on a ratemaking basis and on a financial basis. These differences could easily distort the equity ratios calculated in Mr. Coppola's peer group equity ratio analysis. Following Mr. Coppola's own reasoning on page 104 of his direct testimony, his peer group equity ratio calculation of 47.3% is misleading and should not be used in determining the appropriate equity ratio for the Company in this case.

Q. On page 104 of his direct testimony, Mr. Coppola again attempts to discredit the Company's approach to projecting the cash balance by stating that "every utility has different short-term borrowing facilities and different practices as to how they use or do not use them and may retain more or less cash on hand depending on those circumstances." Does the fact that different utilities have different practices with respect to short-term borrowing and cash on hand invalidate the Company's 1% of test year revenues rule of thumb?

A. No. Refer to the description of the Company's liquidity and financing strategy on pages 27 to 29 of my direct testimony. The Company's 1% of test year revenues rule of thumb is not intended to match other utilities' liquidity and financing practices. The Company acknowledges that different utilities hold different levels of cash and short-term debt based on their individual preferences and liquidity risk tolerance levels. The Company projects its cash balance at a level that is reasonable and appropriate for Consumers Energy, which equates to approximately 1% of test year revenues.

Q. On page 105 of his direct testimony, Mr. Coppola recommends that the level of cash in working capital in this case be equal to the average of the actual cash balances for 2022, 2023, and 2024. This equates to a balance of $12.3 million, $16.1 million lower than forecasted by the Company. Do you agree with this proposal?

A. No. Using the average of actual cash balances from 2022, 2023, and 2024 results in a cash balance much lower than is normally expected and required for the Company in the test year of this case. The spike in natural gas prices in 2022 resulted in cash balances that were lower than what is normally expected and required for the Company and are therefore not representative of typical cash balances historically or in the test year of this case. In

addition, the Company experienced unfavorable weather in 2023, as well as storm restoration activity well beyond the five-year historical average. Both of these conditions negatively affected the Company's operating cash flows and cash balance. It is inconsistent that Mr. Coppola cites those "temporary" issues when discussing the Company's credit metrics from that period of time but ignores them for this argument. Since the Company's cash balance was abnormally low in 2022 and 2023, the average from those years should not be used in projecting the cash balance in this case. Also refer to my earlier rebuttal testimony in which I explain why the use of historical cash balances is not appropriate. Instead, the projected cash balance for the test year in this case should equate to approximately 1% of test year gas revenues, which results in a cash balance of $23.13 million which is reflective of normal levels of cash on hand.

Q. What are the risks associated with the Company maintaining an unreasonably low cash balance of $12.3 million, or 0.5% of test year revenues, as Mr. Coppola recommends?

A. Maintaining an insufficient cash balance would force the Company to rely more heavily on its short-term borrowing facilities. Short-term financing markets can be volatile and, at times, access to those markets completely disappear, as was witnessed during the 2008 credit crisis, again in March 2020 as a result of pandemic-related market fear, and again in March 2023 during the banking industry turmoil. Based on the experience and judgment of the Company's Treasury Department, as well as members of the Financial Planning and Analysis Department, the Company does not pursue a strategy that maintains a permanent balance of short-term debt. However, the Company does fund seasonal fluctuations in its working capital with short-term debt. The Company's projected cash balance for the test

year in this case is reflective of normal levels of cash that are expected and necessary for the Company to manage working capital requirements and manage financial risk.

Q. In addition to managing financial risk, what are some benefits associated with the Company maintaining a cash balance equal to approximately 1% of test year revenues as projected by the Company?

A. In order to obtain an attractive interest rate for long-term bond financing and to minimize the refinancing risk, the Company at times issues new bonds a few months in advance of the actual maturity. Having adequate levels of cash on hand allows the Company additional flexibility in securing the lowest interest rate on its long-term debt issuances which benefits the Company and customers. In addition, given the Company's large capital expenditure program, the Company aims to maintain an overall liquidity that is sufficient to carry out not only the day-to-day operations but also have the flexibility to meet investing activities should there be a delay in accessing long-term capital from capital markets. For these reasons, the Company's projected cash balance included in working capital for the test year in this case is reasonable and is supportive of the Company's operating, investing, and financing activities.

Q. Does the Company's cash balance impact its credit rating and credit quality?

A. Yes. For example, S&P uses a quantitative measure in assessing liquidity in its evaluation of the Company's credit quality. With this measure, S&P looks at cash on hand and projected cash sources and uses in determining the Company's "liquidity cushion." In its ratings methodology document, S&P describes liquidity as "an important component of our financial risk assessment across the entire rating spectrum… In our view, unlike most other rating factors that we blend together in assessing an issuer's risk profile, a lack of

liquidity could precipitate the default of an otherwise healthy entity." Another rating agency, Moody's, has commented on liquidity as saying "we consider liquidity a key element of our analysis of regulated electric and gas utilities." In assessing the Company's credit quality, Moody's performs a similar analysis of the Company's liquidity cushion and flexibility as S&P, estimating the Company's ability to meet near-term cash requirements using its available sources. The third major credit rating agency, Fitch, also has a liquidity measure which is calculated as the amount of readily available cash and credit capacity to service or meet debt maturities and interest obligations. This score indicates if the Company has adequate headroom with cash on hand to cover its operating and short-term liquidity requirements. It is apparent that all three major credit rating agencies consider the level of cash on hand to be an important component of their assessment of the Company's credit quality and credit rating.

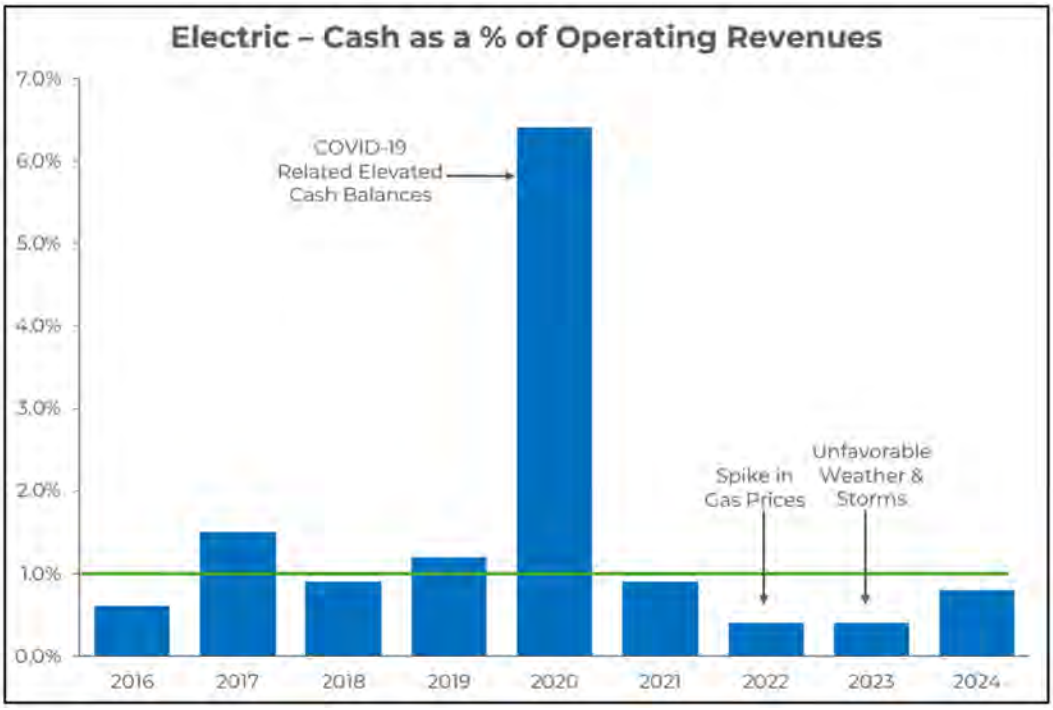
Q. In prior rate cases, has the Company proposed an adjustment to <u>reduce</u> its projected cash balance to a more reasonable level?

A. Yes. Refer to Case No. U-21148 and Case No. U-20963. In those cases, the historical period included several months in 2020, in which the country experienced extreme volatility, disruption, and illiquidity in the financial markets related to the COVID-19 pandemic. During this time, the Company took a proactive approach by issuing long-term debt and temporarily holding elevated cash balances. These actions limited the Company's risk of being unable to raise needed capital, strengthened the Company's liquidity, and ensured funding for the continued operations of the Company during this uncertain time. As a result of these actions, however, using the historical period that included 2020 in those cases would have resulted in a cash balance that was higher than what is normally expected

and required for the Company. As a result, in those cases the Company used cash balances from an alternative historical period that more appropriately reflected normal, lower levels of cash balances.

Q. Has the Company shown that its actual cash balances have approximated 1% of operating revenues over the last several years?

A. Yes. Refer to the following chart which shows a history of the Company's actual cash balances as a percentage of operating revenues from 2016 to 2024:



The chart shows that the Company's actual cash balances have approximated 1% of operating revenues with the exception of 2020, 2022, and 2023. In 2020, as described earlier in my rebuttal testimony, the Company temporarily held elevated cash balances related to the COVID-19 pandemic. In 2022 and 2023, higher gas prices and unfavorable weather and storm restoration activity negatively affected the Company's operating cash flows and cash balances. For the years in which the Company's cash balances were

unusually higher or lower than normally expected, the Company adjusted its rate case projected cash balance (higher or lower) to account for these deviations.

Q. In conclusion, what is the appropriate cash balance for the Company for the test year in this case?

A. As explained in my earlier rebuttal testimony, the Company accepts Staff witness Hecht's working capital adjustment to reduce the Company's projected cash balance by $5,263,000 to $23,130,000. This equates to approximately 1% of test year gas revenues and, as I have shown in my rebuttal testimony, results in a level that is needed, reasonable, and adequately minimizes the Company's financial risk.

III. REBUTTAL OF ABATE WITNESS WALTERS

Q. On page 6 of his direct testimony, Mr. Walters presents Table CCW-2 – Trends in State Authorized Common Equity Ratios which lists average equity ratios by year from 2013 to 2025. What trend does the data in this table reveal?

A. As shown in Mr. Walters' Table CCW-2, the average equity ratio has increased 246 basis points from 49.79% in 2015 to 52.25% in 2024, clearly an upward trend. In fact, Mr. Walters' table shows that the Company's projected equity ratio of 50.75% in this case is below industry averages for the past nine years (2016 through 2024) and is also below the industry average of all years listed (51.64%). Mr. Walters' table shows that his recommended equity ratio for the Company in this case of 50% is significantly understated when compared to his own calculation of industry average equity ratios and trends.

Q. Are the average equity ratios reflected in Mr. Walters' Table CCW-2 understated?

A. Yes. According to footnote 1 of Mr. Walters' Table CCW-2, the source of the equity ratio data is "S&P Global Market Intelligence." S&P Global Market Intelligence tracks the

authorized equity ratio as a percentage of total capitalization. Total capitalization can be higher (making the equity ratio lower) because, in addition to permanent capital components, items such as short-term debt and customer deposits can be included. As described earlier in my rebuttal of Staff witness Megginson, the Company's proposed equity ratio in this instant case as a percentage of total capitalization is 42.58%, 817 basis points lower than the 50.75% proposed as a percentage of permanent capitalization. Excluding short-term debt to be consistent with the equity ratio projected by the Company in this case (as a percentage of permanent capital), the order results in a higher equity ratio. Again, in order to make proper comparisons, the Company's equity ratio, based on a percentage of permanent capital, should be compared to utilities also using an equity ratio based on percentage of permanent capital. By utilizing utility equity ratios that are based on a percentage of total capitalization to support his recommended equity ratio for the Company in this case, Mr. Walters is not making a direct like-for-like comparison at all, and thereby understating his results, which therefore should not be relied upon.

Q. If the equity ratios reflected on Mr. Walters' Table CCW-2 are understated, what is the more appropriate comparison of average utility equity ratios?

A. Refer to my earlier rebuttal testimony to AG witness Coppola in which I explain that actual commission-authorized equity ratios is the preferred data source for an average equity ratio analysis. I refer to my Exhibit A-32 (MRB-10) in which I researched all rate case decisions from 2020 through September 2024 of peer regulated companies and determined the authorized or approved equity ratio for each. Consistent with the Commission's Order in Case No. U-20963, the equity ratios used for comparison purposes were taken from commission orders and public filings and represent actual regulatory peer equity ratios

authorized or approved by different commissions across the country. As stated above, the average equity ratio for the peer group was 54.05%. This is significantly higher than the equity ratio of 50.75% projected by the Company and is also 405 basis points higher than the equity ratio Mr. Walters recommends for the Company in this case.

Q. On page 8 of his direct testimony, Mr. Walters shows S&P ratings data from 2009 to 2024 in Table CCW-3 attempting to show that regulated utility companies have been able to maintain relatively strong credit ratings during periods of declining authorized ROEs. Has S&P commented recently on the credit quality of utilities?

A. Yes. As highlighted on page 17 of Mr. Walters' direct testimony, in a January 2025 report on North American regulated utilities, S&P highlighted lower ratings headroom as "a high percentage of companies are operating with only minimal financial cushion from our downgrade threshold." Refer to Exhibit A-114 (MRB-17). S&P also notes that, in 2024, downgrades among North America's investor-owned regulated utilities outpaced upgrades for the fifth consecutive year. With regard to the industry credit outlook for 2025, S&P identifies risk that will pressure the industry's financial measures, including weak equity ratios, potential new tax legislation, and robust capital spending in challenging regulatory constructs. S&P also sights Michigan as one of the regulatory jurisdictions that they "continue to carefully monitor." It is apparent from this report that an ROE and equity ratio combination higher than the current authorized level, and certainly higher than the continued degradation proposed by Mr. Walters, is critical to protect the Company from receiving a credit downgrade in the light of the credit risks as described above.

Q. Have rating agencies other than S&P also commented on the credit quality of regulated utilities?

A. Yes. As referenced on page 18 of Mr. Walters' direct testimony, Moody's issued a report which it revised its outlook on the U.S. regulated utilities sector from stable to negative citing "increasingly challenging business and financial conditions stemming from higher natural gas prices, inflation and interest rates." In addition, on page 19 of his direct testimony, Mr. Walters references a report by another credit rating agency, Fitch. In describing a "deteriorating outlook for North American utilities, power & gas in 2024," Fitch cited credit headwinds that are putting pressure on utilities' credit metrics. Specifically, Fitch concluded that "the sharp escalation in interest rates has significantly narrowed the headroom in FFO fixed-charge coverage for the sector." It is clear from these reports that rating agencies have recognized a deterioration in credit metrics and credit quality for regulated utilities following what Mr. Walters describes as "periods of declining authorized ROEs." These rating agency comments highlight the importance for the Company to maintain strong financial metrics and to not manage toward the perceived low end of the credit metric bands.

Q. On page 23 of his direct testimony, Mr. Walters states that the Company's projected equity ratio of 50.75% is "relatively higher than the equity ratio for the proxy group used to estimate the cost of equity for Consumers Energy." Mr. Walters then references his Exhibit AB-7, which shows a proxy group average equity ratio of 46.3% (including short-term debt) and 50.4% (excluding short-term debt). This is also highlighted on page 31 of Mr. Walters' direct testimony. Are either of Mr. Walters'

average equity ratios reflected on Exhibit AB-7 in any way relevant or comparable to the Company's projected equity ratio of 50.75% in this case?

A. No. Refer to my earlier rebuttal testimony to AG witness Coppola's Exhibit AG-44. Like Mr. Coppola's Exhibit AG-44, the average equity ratio calculations for the proxy group on Mr. Walters' Exhibit AB-7 uses the equity ratio at the parent holding company level which may be distorted by other non-regulated balance sheet items and provides a completely inappropriate point of comparison. Mr. Walters' equity ratio analysis is clearly not based on the Commission's regulatory authorization and is therefore not comparable or relevant in determining the appropriate equity ratio for the Company in this case. Further, it is not clear which peer average Mr. Walters recommends should be used in determining the appropriate equity ratio for the Company in this case. Earlier in his direct testimony at page 6, Mr. Walters references average state authorized equity ratios in his Table CCW-2 which reflects an average of 52.25% in 2024. While the average equity ratios in this table are understated as explained earlier in my rebuttal testimony, they are dramatically higher than the 46.3% and 50.4% reflected on Mr. Walters' Exhibit AB-7 which Mr. Walters then references on page 23 of his direct testimony. For these reasons, Mr. Walters' comparison of the average equity ratios on his Exhibit AB-7 to the Company's projected equity ratio of 50.75% is not comparable or relevant and should be disregarded.

Q. On page 23 of his direct testimony, Mr. Walters again compares the Company's projected equity ratio of 50.75% to his average equity ratio calculations of 46.3% and 50.4% as shown on his Exhibit AB-7. Mr. Walters references an order from the Arkansas Public Service Commission for the Southwestern Electric Power Company in which an imputed average capital structure of companies with comparable risk was used in determining the overall cost of capital. Does this order give weight to Mr. Walters' recommended equity ratio of 50.0%?

A. No. First, page 23 of the Arkansas Public Service Commission order referenced by Mr. Walters states that "the Arkansas Court of Appeals has upheld that in instances where the utility's capital structure is unsound or out of sync with industry standards, a regulatory commission may calculate the cost of capital based not on the utility's actual capital structure but on a hypothetical capital structure." On Exhibit A-32 (MRB-10), the Company has shown that the average equity ratio for the Company's peer group is 54.05%. Based on this evidence, the only way in which the Company's equity ratio is "unsound or out of sync with industry standards" is that it is too low. Regardless, the Company is not aware of any instances in which the MPSC has accepted the use of an imputed average capital structure of ROE proxy group parent holding companies in developing the projected test year capital structure in a rate case proceeding. Therefore, the Arkansas Public Service Commission's Order for the Southwestern Electric Power Company referenced by Mr. Walters does not give support to his recommended equity ratio of 50.0% in this case and should be disregarded.

Q. Does this conclude your rebuttal testimony?

A. Yes.

What's changed?

Lower ratings headroom. A high percentage of companies are operating with only minimal financial cushion from our downgrade threshold.

Rising capital spending, higher cash flow deficits, and increased wildfire risks led to downgrades outpacing upgrades for the fifth consecutive year.

Data centers spur electricity sales growth at about 1% annually, which will provide modest support to credit quality.

What are the key assumptions for 2025?

High cash flow deficits of about $100 billion, which could harm financial performance if not funded in a credit-supportive manner.

Robust dividends of about $50 billion for 2025 and at a dividend payout ratio of about 60%.

Record amount of hybrid securities. The industry issued $26 billion of them in 2024, and we expect this trend will persist.

What are the key risks around the baseline?

Rising wildfire risks stemming from climate change.

Tax legislation could weaken financial measures if the new Republican administration lowers the corporate tax rate, reduces tax credits, or eliminates their transferability.

Common equity issuance is below our base-case expectations, and has been for the last several years, leading to weaker financial measures.

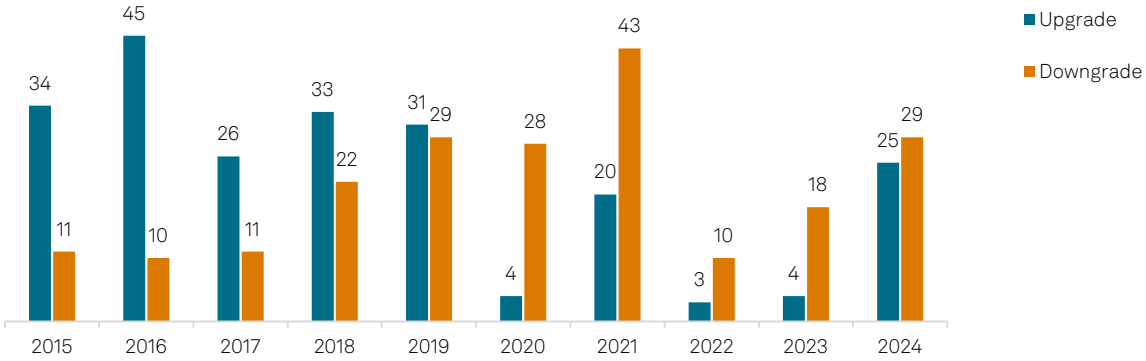
Industry Outlook

Ratings trends and outlook

In 2024, downgrades among North America's investor-owned regulated utilities outpaced upgrades for the fifth consecutive year (see chart 8). Most were directly attributable to rising wildfire risks, robust capital spending, and challenging regulatory constructs. We expect these risks will persist for 2025, further pressuring the industry's credit quality.

Chart 8

North America regulated utilities' upgrades and downgrades



Source: S&P Global Ratings.

Main assumptions about 2025 and beyond

1. Record capital spending.

The industry is heavily investing in safety, reliability, energy transition, and data centers. We expect this spending will exceed $300 billion before the end of the decade.

2. Management of regulatory risk.

This includes constructive rate case orders, minimizing regulatory lag, and earning the authorized return on equity (ROE).

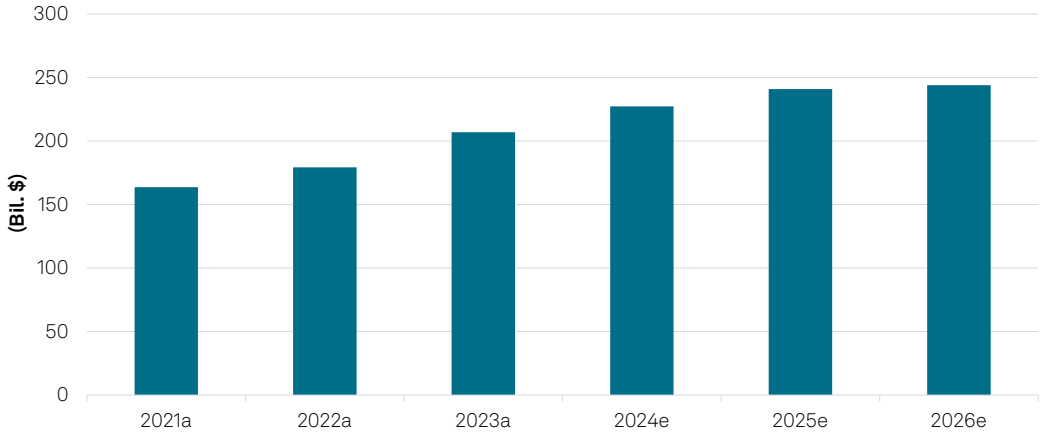
3. Climate change increases risks.

The growing frequency of devastating physical events, including hurricanes, storms, and wildfires, is elevating the industry's credit risks.

Capital spending continues to break records. We expect capital spending for North America's electric, gas, and water utilities will grow by a compound annual growth rate (CAGR) of about 10%. Accordingly, we expect 2025 capital spending to reflect about $240 billion (see chart 9). To date, the industry's capital spending has been primarily focused on safety, reliability, and energy transition.

Chart 9

North America regulated utilities' rising capital expenditures

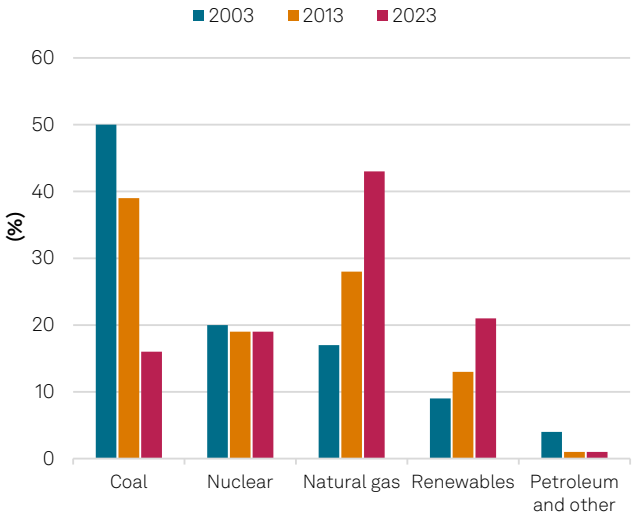


a—Actual. e—Estimate. Capital expenditures represent North American investor-owned electric gas, and water utilities.
Source: S&P Global Ratings.

Energy transition remains key. Over the past decade the industry has invested billions on reducing its reliance on coal-fired generation by about 50% (see chart 10), and today, coal represents only about 15% of total electric generation. Most of the coal was replaced with natural gas, which has about half the carbon emissions. We expect the industry will replace most of its remaining coal-fired generation by about 2030 with renewables and batteries, further reducing its carbon and greenhouse gas (GHG) emissions. The industry has reduced its GHG emissions by nearly 30% over the past decade (see chart 11), and we expect it will reduce them by another 30% by 2035.

Chart 10

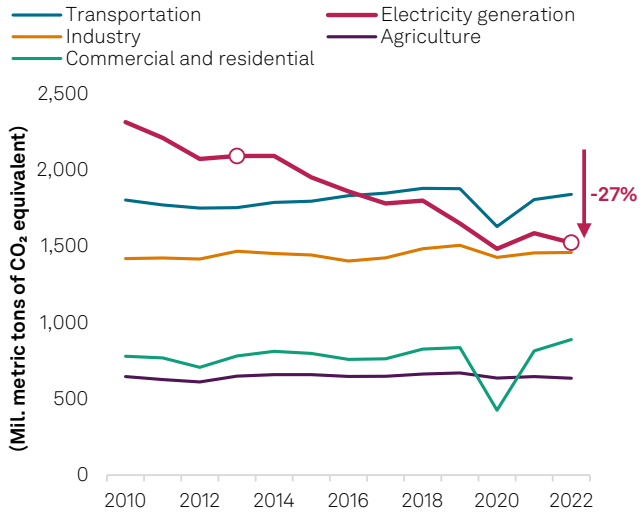
U.S. generation transformation



Source: U.S. Energy Information Administration.

Chart 11

GHG emissions by economic sector (2010-2022)

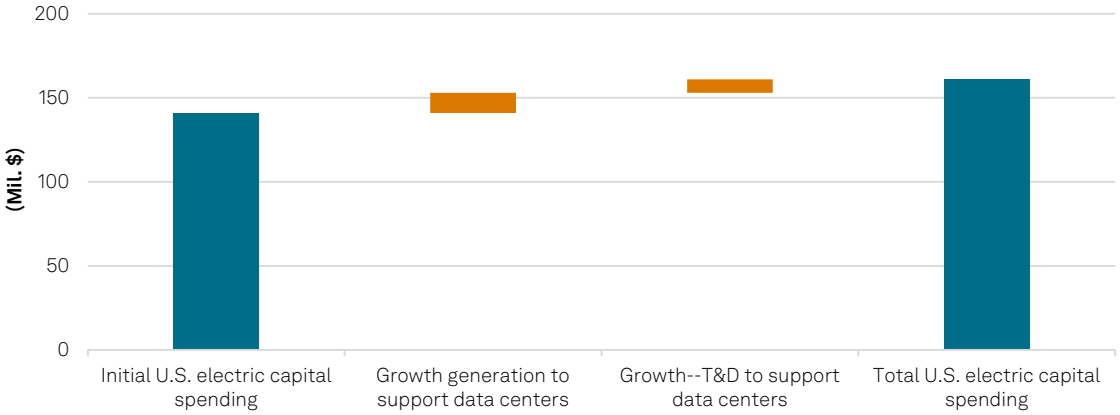


Source: U.S. Environmental Protection Agency.

Data center growth is relatively new, and our current base-case assumptions do not fully incorporate the incremental spending necessary for it. The higher spending for data centers is more likely to begin in 2026. Accordingly, 2026 capex could potentially increase by about another 15% above our current base case (see chart 12).

Chart 12

Data center growth will increase U.S. electric utility annual capital spending by about 15%

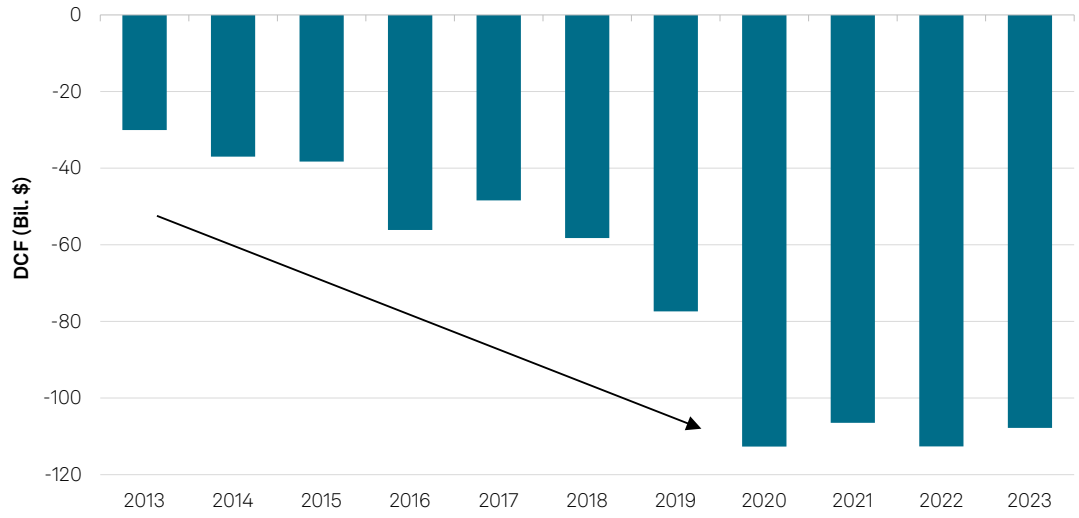


T&D—Transmission and distribution. Source: S&P Global Ratings.

Cash flow deficits will rise as a result, increasing the pressure on the industry's credit quality. Over the past decade the industry's cash flow deficits have grown from about $50 billion to consistently over $100 billion (see chart 13), and we expect this trend will continue.

Chart 13

North America regulated utilities' cash flow deficits



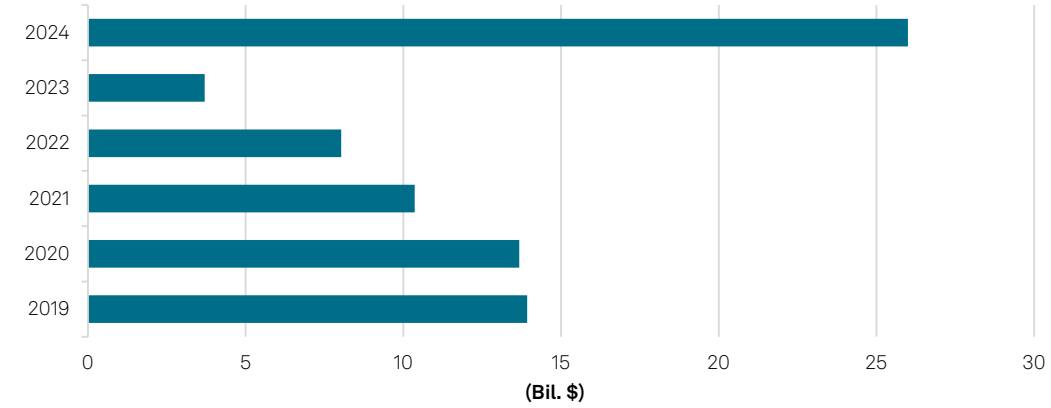
DCF—Discretionary cash flow. Sources: S&P Global Capital IQ, S&P Global Ratings.

Hybrid security issuance reached an all-time high of about $26 billion in 2024, far exceeding the previous record of about $14 billion in 2019 (see chart 14). We expect the industry will maintain this level of issuance in 2025 given its increased capital spending. This robust issuance supported the industry's 2024 financial measures because we typically assess hybrid securities as more

credit supportive than debt, with most of these securities having intermediate (50%) or high (100%) equity content.

Chart 14

North America regulated utilities' annual hybrid securities issuance

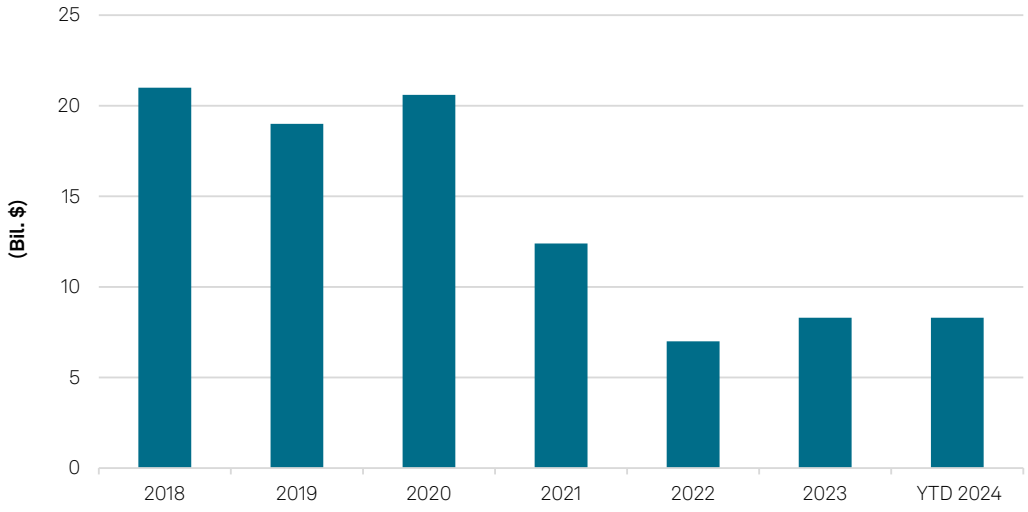


Sources: S&P Global Ratings, S&P Global Market Intelligence.

Common equity issuance has been weak and consistently below our expectations since 2021, pressuring the industry's financial measures. It raised only about $8 billion in 2024, and we estimate that the full year will reflect only about $10 billion. This is well below the industry's average run rate of about $20 billion annually between 2018-2020 (see chart 15). We expect 2025 common equity issuance will again be relatively weak and more reflective of 2024 levels. Without significantly more common equity issuance, we expect the industry's financial measures will continue to weaken, albeit gradually, supporting our negative outlook.

Chart 15

North America regulated utilities' common equity issuance



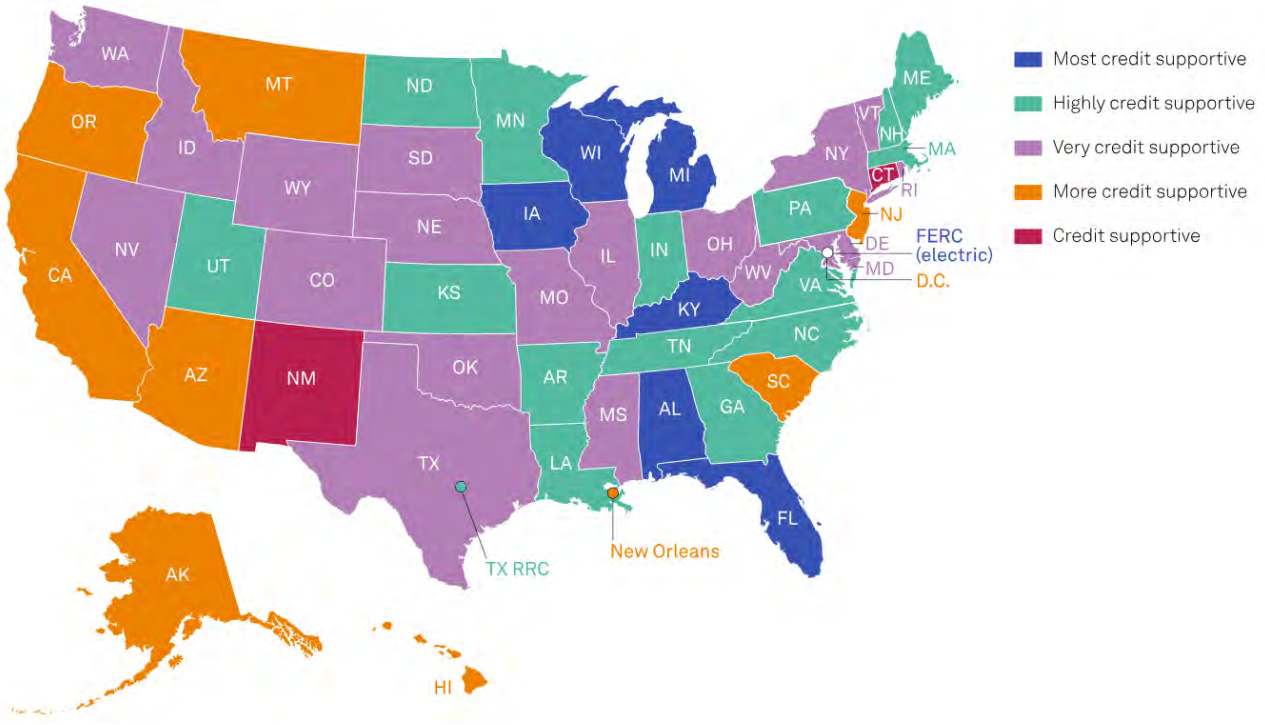
YTD—Year-to-date as of Dec. 15, 2024. Sources: S&P Global Ratings, S&P Global Market Intelligence.

Effective management of regulatory risk will continue. We assess all North America's regulatory jurisdictions as credit supportive or better, reflecting the industry's generally stable and predictable cash flows (see chart 16). Over the past decade much of the industry has implemented regulatory mechanisms such as decoupling, interim rates, capital trackers, formula rate plans, forward test years, muti-year rate case filings, and regulatory riders to significantly improve cash flow stability while minimizing regulatory lag (that is, the timing difference between when a utility incurs costs and when it's recovered from ratepayers).

Chart 16

Regulatory assessment by state

As of November 2024



Source: S&P Global Ratings.

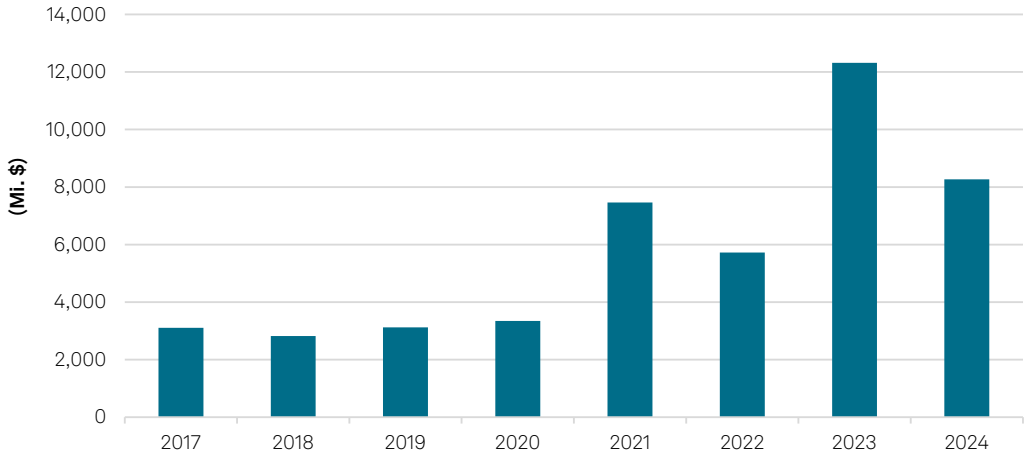
In general, we expect utilities will operate in a regulatory jurisdiction that is supportive of their credit quality by allowing for the full recovery of all their operating and capital costs in a timely manner. We also expect the regulatory jurisdiction will provide a consistent and predictable regulatory framework that results in cash flow stability. Our view of the industry's regulatory constructs supports the industry's mostly investment-grade ratings despite the industry continuing to operate with material cash flow deficits.

Recently, we revised downward our assessment of Connecticut's regulatory construct to credit supportive from more credit supportive. We now expect the state's regulated utilities will be increasingly subject to below-average authorized ROEs, regulatory lag, and an inconsistent ability to earn their lower authorized ROEs. These developments will increase the utilities' cash flow volatility, decrease the stability of their financial performances, and weaken their ability to consistently manage regulatory risk. Other regulatory jurisdictions that we continue to carefully monitor include Arizona, Colorado, District of Columbia, Illinois, Maryland, Michigan, New Mexico, Texas, and West Virginia.

Regulatory rate case order increases have substantially risen over the past four years, reflecting the industry's robust capital spending. Rate case increases for 2021-2024 have increased by more than 2.5x compared to 2017-2020 (see chart 17), and there are more than 100 U.S. rate cases pending, for which utilities are requesting over $16 billion more in revenue. This is in line with our base case that this year's rate case orders will again be robust and most likely in the top three years for rate case order increases.

Chart 17

U.S. rate case orders

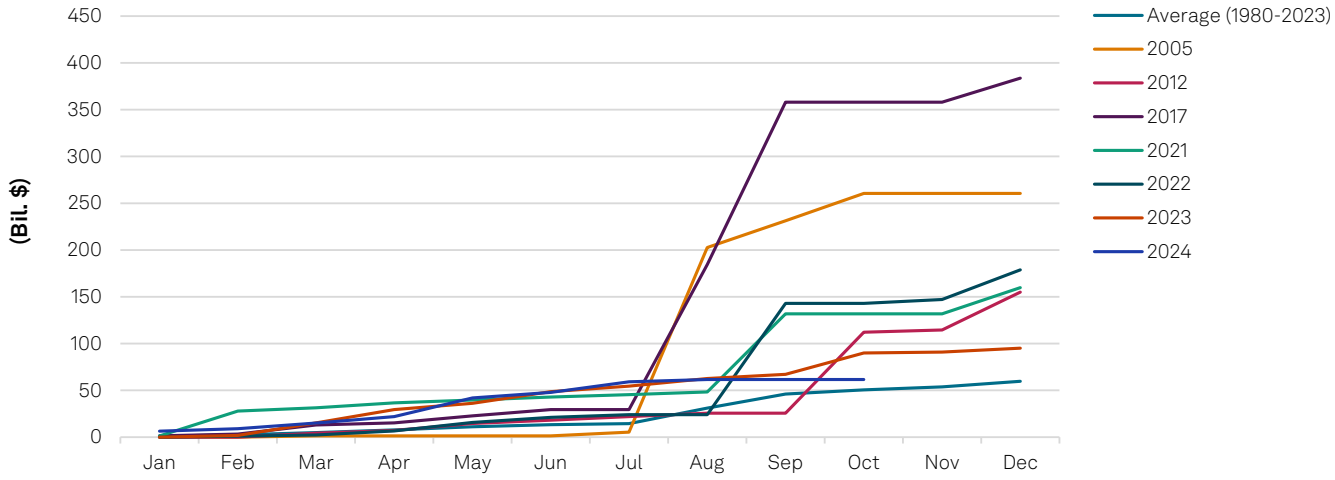


Source: S&P Global Commodity Insights.

Utilities' exposure to physical risks are increasing. According to the National Oceanic and Atmospheric Administration (NOAA), on an inflation-adjusted basis, 2021 and 2022 represent two of the most destructive years for extreme weather events since 1980 (see chart 18). We assume these trends will persist, magnifying physical risks for the utility industry.

Chart 18

U.S. billion-dollar weather disaster year-to-date event cost (CPI-adjusted)



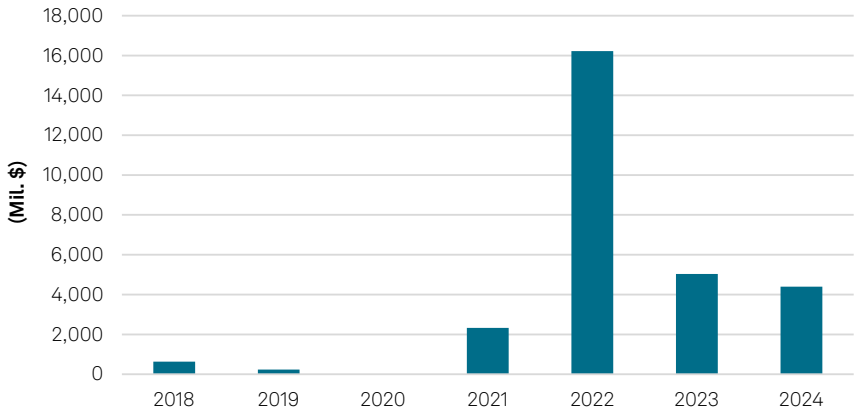
Source: National Ocean and Atmospheric Administration.

Drier, hotter weather has increased the acreage designated as high-fire-risk across the U.S. This is already taking a toll on credit ratings. For example, in 2024 we downgraded parent Xcel Energy Inc. and subsidiary Southwestern Public Service Co. (SPS) because of the scale and severity of the wildfires in the Texas panhandle, which highlights their increasing wildfire exposure. Overall, because of climate change, we expect the industry's wildfire risk will increase.

Securitization increased, which we assess as supportive of credit quality (see chart 19). Securitization allows for the issuance of debt secured by a non-bypassable charge to the customer's bill, allowing the utility to fully recover storm-related costs at a lower interest rate for customers. Because the debt is secured by the high likelihood of customers paying their bills, the associated interest costs are typically lower. We often deconsolidate such debt, resulting in stronger credit measures.

Chart 19

S&P Global Ratings-rated utility-related securitization issuance (2018-2024)



Source: S&P Global Ratings.

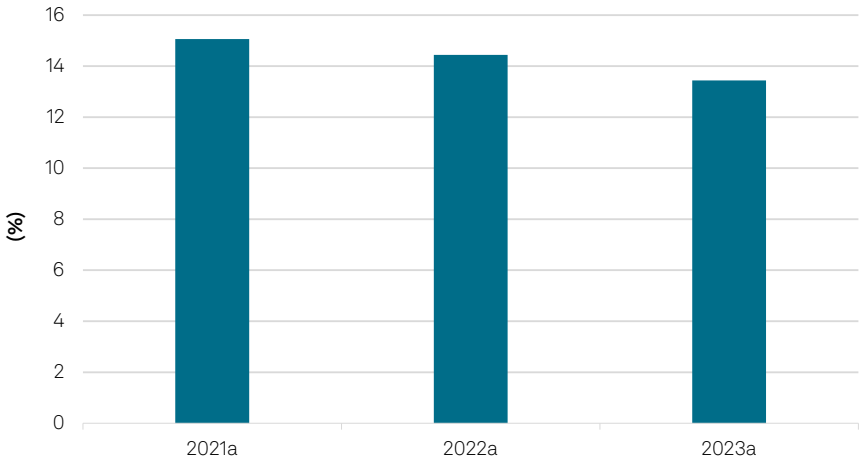
We expect securitization will remain an effective tool that the industry will continue to use. Our base case includes increasing severe natural disasters and weather events as well as continued efforts to decarbonize the energy sector, which sometimes requires securitization to fully recover under-depreciated retiring fossil-fuel generating plants.

Credit metrics and financial policy

We expect rising capital spending and increasing cash flow deficits that are not sufficiently funded in a credit-supportive manner will continue to pressure the industry's financial performance. Its average funds from operations (FFO) to debt was about 15% in 2021 and has gradually fallen to about 13.5%, primarily reflecting rising leverage (see chart 20). Given our expectations for continued increasing capital spending over the next decade, we expect financial performance and credit quality will continue to be pressured.

Chart 20

North American regulated utilities' average FFO to debt



a—Actual. Source: S&P Global Ratings.

Key risks or opportunities around the baseline

1. Wildfire mitigation efforts.

Wildfire risk mitigation, while clearly a credit positive, may not fully address the threats associated with extreme weather events.

2. Data centers and sales growth.

Data center electricity demand will likely boost revenues at North American investor-owned regulated utilities and provide modest support for the industry's credit quality.

3. Managing the customer bill.

The average electric customer bill is about 2% of U.S. median household income, which represents good value for customers relative to other typical household bills. Preserving this value is critical for the industry to maintain credit quality.

Wildfire risk has expanded. Recent events in the Northeast U.S. lead us to believe wildfire risk has spread and now potentially affects nearly every utility across North America. (About 15 years ago, it was primarily limited to just Southern California.)

Wildfire risk is highly negative for credit quality. The scale of potential liabilities, unpredictable nature of exposures, and frequency of events have materially increased wildfire risk for many utility stakeholders. From a credit standpoint, litigation risk is more problematic than risk of damage to infrastructure because it is difficult to predict or quantify and is so far without sufficient mitigation or containment. Also, wildfire-related litigation payments are typically not recoverable in rates or through other regulatory mechanisms, making them more problematic than physical risk.

Additional wildfire risks to credit quality include:

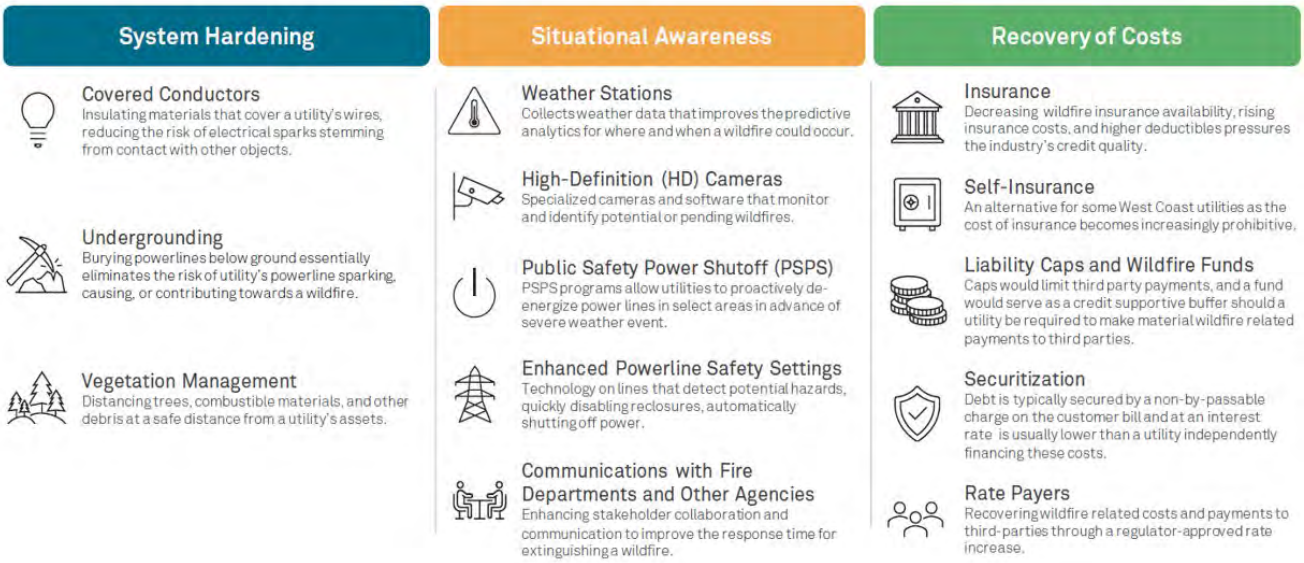
- Insurance is becoming more expensive and less available.
- It only requires a relatively small percentage of damaged or destroyed structures from a wildfire to have a material negative effect on a utility's credit quality.

- The utility industry's relatively high leveraged balance sheets and modest authorized ROEs are not a backstop for wildfire risk.
- Utilities that are impacted by a catastrophic wildfire and material third-party claims typically cannot implement other strategic initiatives.

Mitigation strategies. We expect the industry will develop plans that reduce damages, minimize litigation risk, and expand capabilities for cost recovery from wildfires. We believe the industry will be able to implement much of these strategies over the nearer term because most are not predicated on the development of new technologies or products. That said, because the industry operates in many different service territories and topographies, we expect each utility's mitigation plan will be customized to its unique exposure. Chart 21 represents an array of wildfire mitigation strategies that either have or are being implemented by many utilities across North America.

Chart 21

North American regulated utilities' wildfire mitigation efforts



Source: S&P Global Ratings.

Data centers will likely deliver a return to electricity sales growth. We expect electricity sales will increase at a CAGR of about 1.1%. This reflects our view that systematic and careful planning across the investor-owned utility sector will likely limit its realistic capability to grow at a substantially faster pace. In general, the expansion of utility infrastructure assets is a long-term planning process that requires permitting, siting, and regulatory approvals.

However, even a 1% CAGR for electricity sales will likely prove transformative for the utility industry, which has experienced flat sales growth over the past two decades. In particular, the growing number of data centers will allow the industry to spread its fixed costs over a wider base. We anticipate this will provide some cushion for the industry to effectively manage regulatory risk and maintain credit quality without necessarily requiring that every rate case order is highly supportive of credit quality.

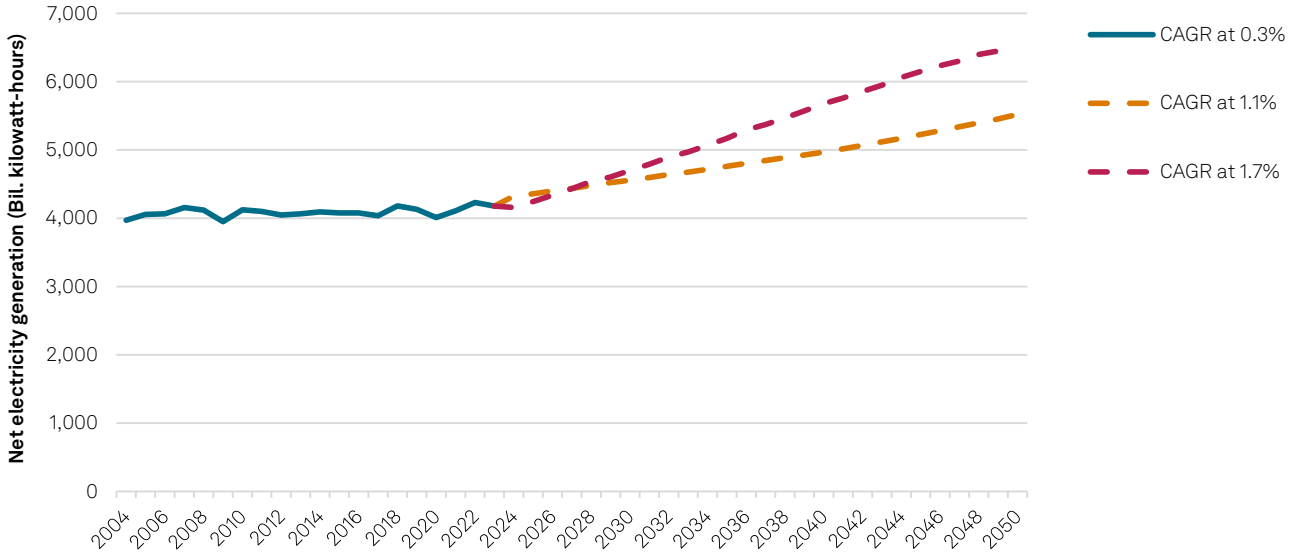
We also expect electric utilities' sales CAGR will be maintained over the longer term (see chart 22), which will support the industry's long-term credit quality. We expect growth in data center numbers will support most of the industry's growth through 2030. In the following decade,

increased onshoring of manufacturing and wider spread adoption of electric vehicles will also support growth.

Chart 22

Growth will be transformative for utilities used to stagnation

Electricity demand: U.S. regulated electric utilities



Data as of June 2024. CAGR—Compound annual growth rate. Sources: U.S. Energy Information Administration (historical and 1.1% CAGR) and S&P Global Commodity Insights (1.7% CAGR).

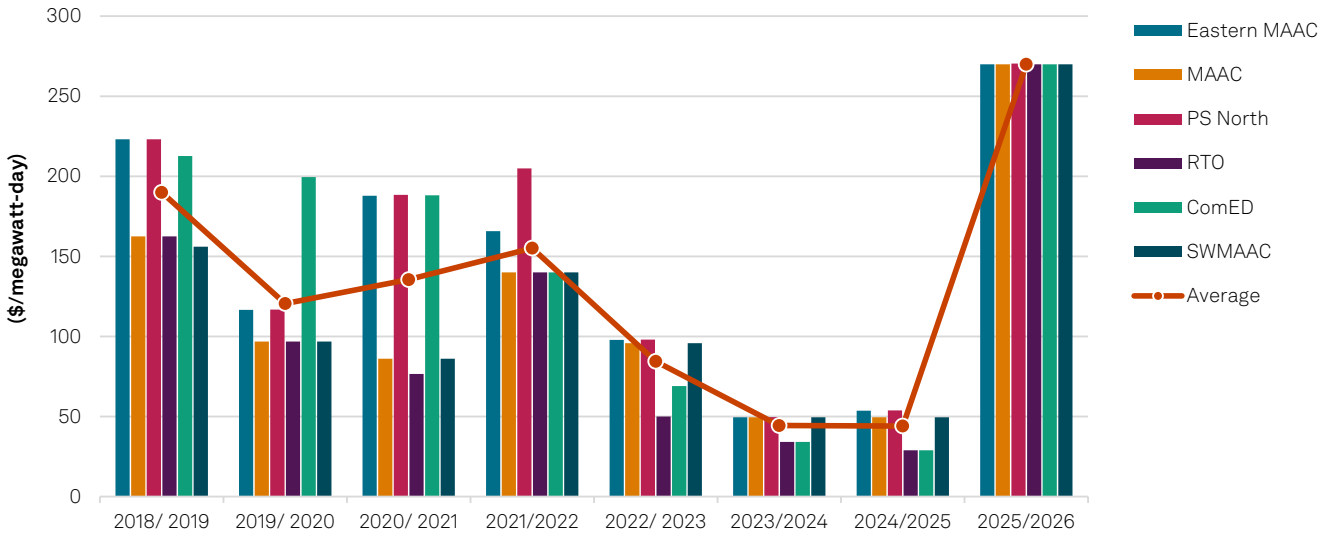
Data center credit risks. The industry must structure rates and contracts to ensure that the new data center customers are paying their share of electricity costs. Meeting the demands of relatively few, but very large, data center customers will require significant capital spending and infrastructure investments. If utilities assign a significant portion of data center-related infrastructure costs to existing residential customers, customer bills would increase. This, in turn, pressures regulators to limit rate case increases, which can negatively affect the industry's ability to effectively manage regulatory risk.

Therefore, we expect the increased capital spending needed to accommodate data center growth will be primarily recovered from data center customers over decades. Such a plan comes with risks. For example, a technological breakthrough that reduces or eliminates the need for data centers could shift the recovery of these long-term infrastructure investments onto residential customers.

Capacity prices. Pennsylvania-New Jersey-Maryland (PJM) Interconnection capacity prices materially increased during its latest capacity auction (see chart 23). These higher prices are directly passed onto customers, significantly increasing the electric utility bill. If these higher prices persist, it will likely result in higher customer complaints, pressuring regulators to limit increases to other areas of the customer bill that could potentially pressure a utility’s ability to effectively manage regulatory risk.

Chart 23

PJM capacity auction results



Source: PJM website.

U.S. Environmental Protection Agency (EPA). In 2024 the EPA released final rules aimed at reducing pollution from fossil fuel-fired power plants, which included carbon pollution standards and effluent limitation guidelines and standards for coal-fired power plants. These rules would have increased costs for utilities, specifically regarding the requirement to install carbon capture and sequestration or storage technology on coal-fired power plants intending to operate beyond 2039.

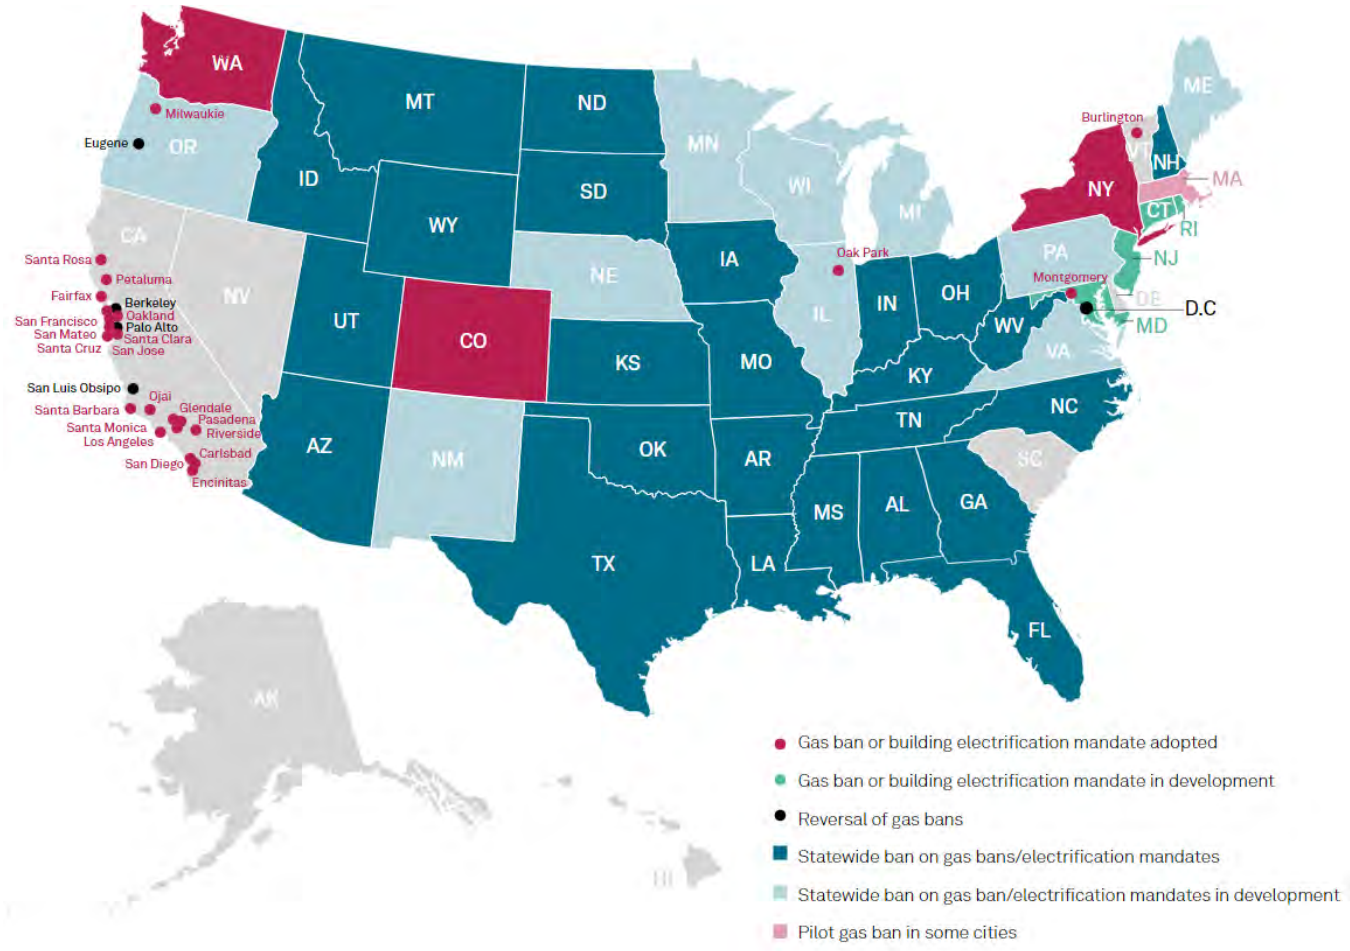
However, we note that the incoming U.S. presidential administration and Republican majority in congress could modify or eliminate these rules. We will monitor executive, legislative, or legal actions that could impact the industry's credit quality.

Full electrification. We expect the longer-term credit quality for some natural gas local distribution companies (LDC) will become increasingly challenging, especially for utilities that operate in warmer climates or whose cities or states have banned new gas connections, severely limiting the growth of natural gas LDCs (see chart 24). We expect this trend will also gradually persist through the passage of local city and town building codes that limit carbon and other emissions.

Offsetting some of this risk is that a majority of states have imposed a ban on the ban of new gas connections. Furthermore, gas LDCs are attempting to reduce their environmental risks by decreasing their carbon footprint through investing in renewable natural gas, blending hydrogen, and initiating various hydrogen infrastructure projects.

Chart 24

Gas bans and electrification mandates



Data as of April 26, 2024. *Municipalities shown on map are a subset of municipalities in the U.S. that have gas ban policies or electric reach codes in place. §Colorado and Burlington mandates target emissions requirements set out in respective laws or regulations. Source: S&P Global Commodity Insights.

Cybersecurity. While cybersecurity breaches against infrastructure assets have been relatively low, we believe the threat of cyberattacks remains high. The 2024 cybersecurity breach against American Water Works Co. Inc. underscores the risks. But the sector has heavily invested to limit this risk. We believe the sector's ongoing vigilance in this area is critical to maintaining credit quality.

Re: In the matter of **Consumers Energy Company** for authority to increase its rates for the distribution of natural gas and for other relief.
MPSC Case No. U-21806

Dear Ms. Uitvlugt:

Attached are Staff's responses to Consumer Energy Company's second round of discovery to Staff in this case. The responses are being served by e-mail. In providing these responses, Staff does not necessarily concede that the requested information is relevant or material to these proceedings. Staff reserves the right to raise objections to the introduction into evidence, through cross-examination or otherwise, of any material supplied in response to discovery.

Staff intends to supplement a prior response if it becomes aware of a material error in the response or if it becomes aware that there has been a significant change in circumstances that would change the prior response in a material way. Staff does not, however, keep prior responses under continuous review.

Sincerely,

Anna B. Stirling
Assistant Attorney General
Public Service Division

DATED: May 7, 2025

MPSC Staff's Answer to the Company's Second Discovery Request
MPSC Case No. U-21806
May 7, 2025

Question:

21806-CE-ST-0004: Refer to the box at the bottom of Mr. Megginson's Exhibit S-4, Schedule D-2. Please provide support for the 2025 and 2026 projected credit spread of 1.00%.

Answer:

The Company's last 30-year debt issuance was in August 2022, with a credit spread of 125 basis points. The Company's recent $700 million debt issuances in August 2024 was a 6-year issuance at a credit spread of 68 basis points. The Company's January 2024, 5-year issuance was at a credit spread of 73 basis points. The Company averaged an 83 basis points spread for its 2023 debt issuances. Thus, a reasonable credit spread is somewhere between 75-125 basis points. Staff provides a 100 basis-point credit spread in its long-term debt cost rate projections in this case.

Respondent: Kirk Meggison

MPSC Staff's Answer to the Company's Second Discovery Request
MPSC Case No. U-21806
May 7, 2025

Question:

21806-CE-ST-0005: Refer to page 10, lines 5 through 13 of Mr. Megginson's direct testimony which refers to a revenue decoupling mechanism and several gas infrastructure improvement and replacement programs with surcharge payment mechanisms in place at Consumers Energy:

i. Please identify the MPSC case number which authorizes the revenue decoupling mechanism currently in place as referenced in Mr. Megginson's testimony.

ii. Please individually list the "several gas infrastructure improvement and replacement programs" the Company has in place as referenced in Mr. Megginson's testimony along with the associated MPSC case numbers.

Answer:

As Staff explained on page 7, lines 13-16 of Mr. Megginson's testimony on the Company's enhanced infrastructure replacement program (EIRP) was authorized by the Commission in Case No. U-20322. The Company also provided a January 29, 2025 audit response (U21806-SA-CE-101), with respect to the Company's riders and other revenue recovery mechanisms currently in place in Consumers' gas division. The Company responded that it currently has a Gas Cost Recovery mechanism as well as an Energy Waste mechanism in place. Staff also provided the Company's response in Case No. U-21148 to the Company's Gas Utility - Regulatory Assets & Liabilities as Exhibit S-4, Schedule D-6, page 1 of 2.

Respondent: Kirk Meggison

MPSC Staff's Answer to the Company's Second Discovery Request
MPSC Case No. U-21806
May 7, 2025

The Company's revenue decoupling mechanism (RDM) was approved by the Commission in Case No. U-20322 and reapproved in Case No. U-20650. The Company requested an updated RDM in December 2021 in its gas rate case, Case No. U-21148, which was approved by the Commission and took effect on October 1, 2023. In the Company's December 2022 gas rate case, Case No. U-21308, the Company did not request an updated RDM because the Company noted that the RDM was discovered to be immaterial given the cadence of filing annual rate cases. (See audit response U21308-SA-CE-128-Partial-Wehner). Thus, the RDM may have discontinued sometime in 2024.

Respondent: Kirk Meggison

Credit Highlights

Overview

Key strengths	Key risks
Monopolistic vertically integrated electric utility and gas distribution utility operations.	Lack of operating diversity that makes the company largely depend on Michigan regulators to sustain its credit quality.
Favorable regulatory construct in Michigan.	Energy transition risks due to its dependence on natural gas and coal-fired generation (about 75% of electricity generated or purchased in 2023), partially mitigated by a plan to retire coal in 2025.
Large customer base of 1.9 million electric and 1.8 million gas customers.	Negative discretionary cash flow, reflecting robust capital spending, which indicates external funding needs.
Insulated subsidiary of its parent, CMS Energy Corp., allowing us to rate it one notch above the parent.	Susceptibility to adverse weather events, including winter storms and convective storms.
	Exposure to cyclical commercial and industrial customers, which account for about 45%-50% of electric utility revenues and 20%-25% of gas utility revenues.

We expect Consumers Energy Co. (CE) to continue to effectively manage its regulatory risk. We believe Michigan's regulatory construct is above average compared with peers because of the benefit of a streamlined 10-month rate case process. Other constructive rate mechanisms include the use of forward test-years, power supply cost rider adjustments, and natural gas

cost rider adjustments. These mechanisms help the company earn its allowed return on equity (ROE) and minimize regulatory lag.

CE is in the middle of an electric rate case and just received a settlement approval in its recent gas rate case. The company filed for a $325 million electric rate increase based on a 10.25% ROE in May and reached a settlement with various intervenors and received an order from the Michigan Public Service Commission (MPSC) for a $35 million gas rate increase based on a 9.90% ROE. The gas rate increase granted was about only a quarter of the rate increase requested. However, this difference was partially because the commission authorized bill credits of $27.5 million per year over four years related to the gain on the sale of CE's appliance service plan business, which happened after and was not a part of the company's case filing.

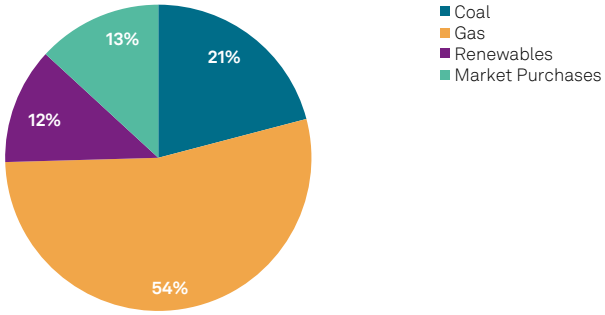
*Company assumption under settlement. Source: S&P CapitalIQ Pro. MPSC--Michigan Public Service Commission.

The company's elevated capital spending plan prioritizes infrastructure upgrades, and its energy transition plans. Over the next five years, CE plans to spend about $17 billion to maintain and upgrade its gas infrastructure and electric distribution systems and reduce its carbon emissions. The capital plan includes investment of about $6.3 billion in the gas segment and about $10.7 billion in electric (of which, about two thirds are dedicated to distribution-related spending). The company also intends to reduce its carbon exposure in line with its Integrated Resource Plan (IRP), which the MPSC approved in June 2022. The plan includes a goal to reach net-zero carbon emission by 2040 and a goal to retire CE's owned coal-fired generation plants in 2025. Furthermore, the company's IRP targets a gradual reduction in its gas-fired generation dependence after 2025, as well as meeting 90% of its customer needs with clean energy sources by 2040. The company also announced a net-zero greenhouse gas emissions target by 2050 and a zero methane emissions target by 2030 for its gas distribution system.

Consumers Energy Co.

CE's 2023 generated and purchased electricity supply by source



Source: Company filings.

The company's credit metrics were weak in 2023, largely because of weather-related issues. Mild weather impaired sales for the company's gas operations, and the company saw heightened winter and convective storm activities. While the company has effectively recovered storm costs in past rate case proceedings, it has not been able to defer storm costs into regulatory assets, which introduced regulatory lag.

A portion of CE's service territory has a relatively high wildfire risk classification from the Federal Emergency Management Agency (FEMA). This area is contiguous and has a population of about 10,000-15,000 people, 7,000-9,000 housing units, of which about 40%-60% are occupied, and median home values if $100,000-$150,000 according to U.S. Census data. Part of the company's capital spending plan is focused on smart electric systems and anticipates pursuing further undergrounding pilots, with the potential to underground up to 400 miles of electric lines per year, starting in 2027, to address some of its climate-related risks. While CE has not been found culpable for any wildfires in its service territory and is not currently party to any such litigation, we will continue to monitor the company's ability to effectively manage its risks associated with adverse weather events.

We expect CE's credit measures to remain within the significant financial risk profile category. Throughout our base-case scenario, we expect funds from operations (FFO) to debt of 17%-19%.

Outlook

The stable rating outlook on CE reflects our expectation that management will focus on its core utility operations and reach constructive regulatory outcomes to avoid increasing business risk. We expect CE will maintain stand-alone financial measures consistent with the middle of the range for its financial risk profile category, specifically FFO to debt of 17%-19%.

Downside scenario

We could lower our rating on CE if:

- The stand-alone financial measures weaken such that FFO to debt weakens to consistently below 15%; or

- We lower our rating on parent CMS Energy.

Upside scenario

Although less likely, we could raise our rating on CE if we raise our rating on CMS Energy and CE's stand-alone financial measures improve, reflecting FFO to debt consistently above 20%.

Our Base-Case Scenario

Assumptions

- Consistent rate case filings and use of existing regulatory mechanisms;
- Elevated capital spending over the forecast period averaging $2.8 billion-$3.0 billion annually;
- Annual dividends averaging about $1 billion-$1.1 billion annually;
- All debt maturities refinanced; and
- Continued negative discretionary cash flow financed in a balanced manner to support the regulated capital structure.

Company Description

CE is a subsidiary of CMS Energy and operates as an electric and gas utility serving about 1.9 million electric and 1.8 million natural gas million customers in Michigan. CE's electric business operates as a vertically integrated utility that generates, distributes, and sells electricity. The electric utility sources about 40%-50% of its generation from purchased power, rather than from its own plants. The company also sells, stores, and transports natural gas. It is based in Jackson, Mich. CE contributes to about 95% of CMS' EBITDA.

Business Risk

Our assessment of CE's business risk profile reflects the company's monopolistic electric and natural gas utility operations and effective management of regulatory risk. The MPSC regulates CE, and we view the regulatory environment in Michigan as above average compared with peers. This is demonstrated through the company's use of forward-looking test years and a streamlined 10-month rate case process. Furthermore, CE benefits from other constructive rate mechanisms, such as the Power Supply Cost Recovery adjustment rider, and the Gas Cost Recovery adjustment rider.

In 2023, the state also passed a law that allows electric utilities in the state to earn a return equal to their pre-tax weighted average cost of capital on payments made under new purchased-power agreements. These constructive rate mechanisms enable CE to generally earn its allowed ROE and minimize regulatory lag.

The company actively manages its gas supply to reduce the effects of price volatility and to support its gas system operations by injecting natural gas into storage during the summer months for use during the winter months. During 2023, 45% of the natural gas supplied to all customers during the winter months came from storage. Additionally, CE's large customer base

of about 1.9 million electric customers and about 1.8 million natural gas customers throughout Michigan bolsters the company's business risk profile. This said, the company is exposed to cyclical commercial and industrial customers for its electric operations, which contribute about 45%-50% of the company's electric revenues.

Financial Risk

We assess CE's financial measures using our medial volatility table, reflecting the company's lower-risk regulated electric and gas utility operations and its effective management of regulatory risk. Under our base-case scenario, we expect:

- Elevated capital spending averaging $2.8 billion-$3.0 billion annually over the forecast period;
- Dividends averaging $1 billion-$1.1 billion annually;
- Equity injections by the parent to maintain the company's capital structure;
- Continued use of existing regulatory mechanisms;
- Negative discretionary cash flow; and
- The refinancing of all debt maturities.

As such, we anticipate financial measures to be consistent with the middle of the range for the significant financial risk category. Specifically, we forecast FFO to debt of 17%-19%.

Liquidity

We assess CE's liquidity as adequate, with sources covering uses by 1.1x over the coming 12 months, and that its sources cover uses even if forecast consolidated EBITDA declines 10%. We believe the supportive regulatory framework provides manageable cash flow stability for the company even in times of economic stress, supporting our use of slightly lower thresholds to assess liquidity.

In addition, CE can absorb high-impact, low-probability events, in our view, as the company maintains about $1.1 billion in committed credit facilities through 2027, another $250 million in committed credit facilities through November 2025, and can likely lower its capital spending (averaging $2.8 billion-$3.0 billion annually) during stressful periods, indicating a limited need for refinancing under such conditions. CE can borrow $500 million from the parent CMS Energy as per its renewed credit agreement in December 2023.

Furthermore, our assessment reflects the company's prudent risk management and sound relationships with its banking group. Overall, we believe that the company can withstand adverse market circumstances over the next 12 months with sufficient liquidity to meet its obligations. The company has around $200 million of long-term debt maturities in 2025, and we expect the company to proactively address these maturities well in advance of their scheduled due dates.

Principal liquidity sources

- Cash FFO of about $2.4 billion;
- Credit facilities of about $1.3 billion;
- Working capital inflows of about $70 million; and
- Available cash of about $1.3 billion following the company's recent debt issuance.

Principal liquidity uses

- Debt maturities of about $772 million over the next 12 months;
- Estimated maintenance capital spending of about $2.7 billion; and
- Dividends of about $900 million.

Covenant Analysis

Requirements

CE's credit agreements contain a covenant for CE to maintain debt to capitalization below 65%.

Compliance expectations

In our base-case scenario, we expect CE to remain compliant with this covenant and have sufficient headroom.

Environmental, Social, And Governance

Environmental factors are a negative consideration in our credit rating analysis of CE. The company's use of fossil fuel generation sources exposes it to heightened energy transition risks. Its generation portfolio's capacity comprises about 36% natural gas, 20% coal, 17%

hydroelectric, 17% oil and gas, and 9% wind and solar as of Dec. 31, 2023. The company's accelerated coal retirement plan for its utility slightly mitigates this risk. It includes a goal to be coal-free in 2025 and have 90% of its utility's capacity portfolio sourced from clean energy resources by 2040.

Furthermore, the company has experienced heightened winter and convective storm activities in recent years. While the company has effectively recovered storm costs in past rate case proceedings, it has not been able to defer storm costs into regulatory assets, which could introduce regulatory lag especially if costs are outsized.

While CMS has not been found culpable for any wildfires in its service territory and is not currently party to any litigation concerning these matters, a portion of its service territory has a relatively high wildfire risk classification from FEMA. This area is contiguous and has a population of about 10,000-15,000 inhabitants, 7,000-9,000 housing units, of which about 40%-60% are occupied, and median home values of $100,000-$150,000 according to U.S. Census data. Part of the company's capital spending plan is focused on smart electric systems and anticipates pursuing further undergrounding pilots, with the potential to underground up to 400 miles of electric lines per year starting in 2027. We will continue to monitor the company's ability to effectively manage its risks associated with adverse weather events.

Group Influence

Under our group rating methodology, we consider CMS Energy to be the parent of the group with a group credit profile (GCP) of 'bbb+'. We assess CE as a core subsidiary of CMS Energy largely because we view the utility as integral to the group's identity, highly unlikely to be sold and having a strong commitment from management, given the company's emphasis on maintaining the size of the regulated utility operations relative to the nonutility businesses.

Given CE's stand-alone credit profile, and because CE is operationally separate and maintains sufficient insulating measures, we rate the utility one notch above the GCP. Some of the key insulating measures are:

- CE is a separate and stand-alone legal entity that functions independently (both financially and operationally), files its own rate cases, and is independently regulated by MPSC;
- CE has its own records and books, including stand-alone audited financial statements;
- The utility has its own funding arrangements, including issuing its own long-term debt, and it has a separate committed credit facility to cover its short-term funding needs;
- CE does not comingle funds, assets, or cash flow with parent CMS Energy or its other subsidiaries, and it does not participate in a money pool;
- We believe there is a strong economic basis for CMS Energy to preserve CE's credit strength, reflecting CE's low-risk, profitable, and regulated utility business model. CE is also a significant portion of CMS Energy, accounting for about 95% of the consolidated company; and
- There are no cross-default provisions between parent CMS Energy and CE that could directly lead to a default at the utility.

Issue Ratings--Subordination Risk Analysis

Capital structure

CE's capital structure consists of about $12.5 billion of long-term debt, including about $11.7 billion in first-mortgage bonds (FMBs), $787 million of securitized debt (all of which is deconsolidated from our credit metrics), and about $110 million of tax-exempt revenue bonds.

Analytical conclusions

We rate the company's senior unsecured debt 'A-', in-line with the long-term issuer credit rating on CE as the rated issuances are senior unsecured debt issued by a qualifying investment grade utility as per our criteria.

We base our 'A-2' short-term rating on our 'A-' issuer credit rating.

Issue Ratings--Recovery Analysis

Key analytical factors

- We assign recovery ratings to FMBs issued by U.S. utilities, which can result in issue ratings being notched above an issuer credit rating on a utility, depending on the rating category and the extent of the collateral coverage. The FMBs issued by U.S. utilities are a form of secured utility bonds that qualify for a recovery rating as defined in our criteria.
- CE's FMBs benefit from a first-priority lien on substantially all of the utility's real property owned or subsequently acquired. Collateral coverage of more than 1.5x supports a recovery rating of '1+' and an issue rating one notch above the issuer credit rating.

Consumers Energy Company

Update to credit analysis

Summary

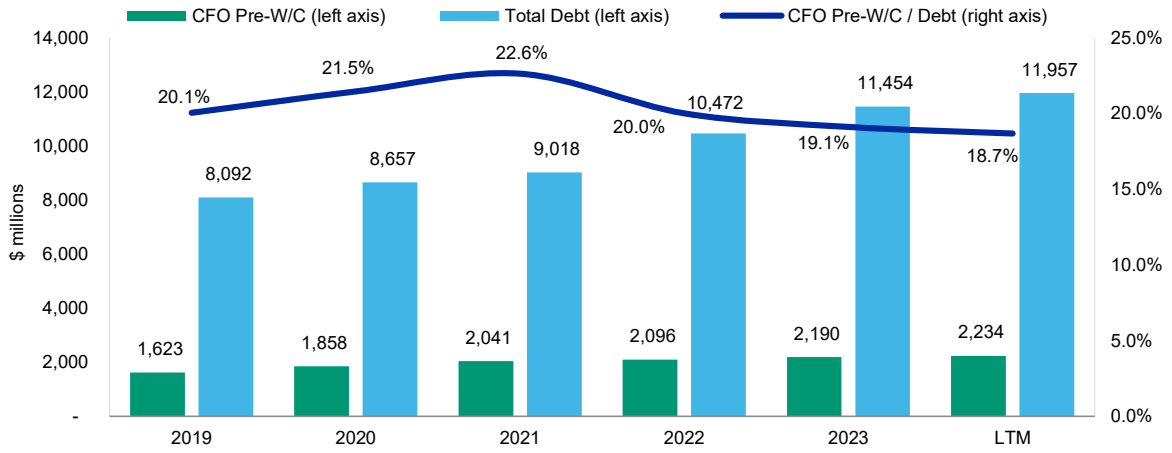
Consumers Energy Company's (Consumers Energy) credit profile reflects its business risk as a vertically integrated electric and gas utility operating in the credit supportive regulatory environment of Michigan. We expect the utility to maintain a stable financial profile with cash flow from operations before changes in working capital (CFO pre-WC) to debt averaging around 20-21%, including an adjustment to exclude securitization debt, over the next 2-3 years. At the end of the latest twelve month (LTM) period ending 31 March 2024, Consumers Energy's CFO pre-WC to debt ratio was 20%, including the adjustment to exclude securitization bonds. The company will continue to execute its robust capital investment plan and have an active regulatory calendar over this period. Based on the Michigan regulatory framework, we expect the utility to recover its investment costs on a timely basis and to earn an appropriate return on its investments.

Consumers Energy's stand-alone financial performance has historically been affected by the significant debt at its parent company CMS Energy Corporation (CMS, Baa2 stable). However, CMS has made notable progress in reducing the percentage of parent debt in its capital structure in recent years. We now estimate that the percentage of parent debt will remain below 25% of total consolidated debt. All of Consumer Energy's outstanding debt obligations are secured.

Recent development

In November 2023, Michigan enacted a new energy law (2023 Energy Law), which raised the state's renewable energy standard while providing additional authority to the Michigan Public Service Commission (MPSC). Consumer Energy's operations are under the purview of MPSC. In general, we view this development to be constructive because the utilities in the state will now outline a renewable energy plan with greater transparency, and the MPSC will have an expanded scope of consideration for various factors influencing Consumers Energy' plan to decarbonize.

Exhibit 1
Historical CFO Pre-WC, Total Debt and CFO Pre-WC to Debt



When we adjust the total debt to exclude securitization debt, Consumers Energy's CFO pre-WC/debt would be 20.3%, 20.4% and 20.0% in 2022, 2023 and LTM ending 31 March 2024, respectively.
Source: Moody's Financial Metrics

Credit strengths

» Credit supportive regulatory environment in Michigan

» Transparent and timely cost recovery

» Stable financial profile

Credit challenges

» Robust capital investment plan

» Maintaining regulatory support for these capital investments

» Lack of geographic and regulatory diversity with single state service territory

Rating outlook

The stable outlook reflects our expectation that financial metrics will remain stable and that Consumers Energy will continue to benefit from a consistent and generally credit supportive regulatory environment. The stable outlook also incorporates our view that Consumers Energy will maintain prudent financial policies while managing through its robust investment cycle and that debt levels at the parent will not increase materially.

Factors that could lead to an upgrade

A rating upgrade could be considered if credit metrics improve such that CFO pre-WC to debt is above 21% on a sustained basis. In addition, if the Michigan regulatory framework becomes even more formulaic, transparent or timely with its suite of cost recovery mechanisms for Consumers Energy, a rating upgrade could be possible.

This publication does not announce a credit rating action. For any credit ratings referenced in this publication, please see the issuer/deal page on https://ratings.moodys.com for the most updated credit rating action information and rating history.

Factors that could lead to a downgrade

A rating downgrade could be considered if there is a material deterioration in the credit supportiveness of the Michigan regulatory environment; or if the CFO pre-WC to debt ratio declines below 18% on a sustained basis.

Key indicators

Exhibit 2

Consumers Energy Company

	2019	2020	2021	2022	2023	LTM
CFO Pre-W/C + Interest / Interest	6.2x	6.6x	7.5x	7.1x	5.8x	5.6x
CFO Pre-W/C / Debt	20.1%	21.5%	22.6%	20.0%	19.1%	18.7%
CFO Pre-W/C – Dividends / Debt	12.7%	14.1%	14.6%	12.7%	13.0%	13.0%
Debt / Capitalization	46.0%	44.9%	43.7%	45.1%	45.8%	46.7%

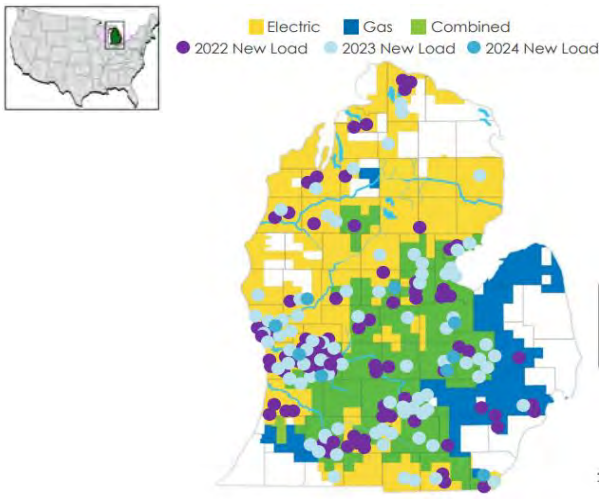
All ratios are based on 'Adjusted' financial data and incorporate Moody's Global Standard Adjustments for Non-Financial Corporations.
Credit metrics included in the exhibit include securitization bonds. When we adjust the total debt to exclude securitization debt, Consumers Energy's CFO pre-WC/debt would be 20.3%, 20.5% and 20.0% in 2022, 2023 and LTM ending 31 March 2024, respectively.
Source: Moody's Financial Metrics

Profile

Consumers Energy is a vertically integrated electric and gas utility serving approximately 1.9 million electric and 1.8 million gas customers in the state of Michigan with an average rate base of $25 billion in 2023. Consumers Energy's electric operations account for approximately two thirds of its revenue, cash flow and asset base. The utility is a wholly-owned subsidiary of CMS and, as the primary subsidiary of the parent company, it represents over 95% of CMS's consolidated earnings. In addition to Consumers Energy, CMS has a subsidiary called NorthStar Clean Energy, a non-utility domestic independent power producer and marketer.

Exhibit 3

Consumers Energy's Service Territory



Source: Company Presentations

Detailed credit considerations

Credit supportive regulatory environment

Consumers Energy is regulated by the MPSC, which has a regulatory framework that we view to be more credit supportive than most other states. As a result of 2008 and 2016 energy legislation in Michigan, the regulatory framework has been streamlined, improving both the rate case process and the timeliness of cost recovery. The 2016 legislation provided additional assurance of utility investment recovery by expanding the certificate of necessity (CON) process, which had already included pre-construction approval for large

generating resources, into an integrated resource planning (IRP) process. The IRP process considers a wide range of factors including fuel costs, demand forecasts, resource adequacy, competitive pricing, environmental mandates and transmission options before the construction of major projects.

In November 2023, new energy legislation (2023 Energy Law) was enacted. Under the new law, the state's renewable energy standards were raised to 50% by 2030 and 60% by 2035 from the previous 15% by 2021 requirement. It also set a clean energy standard of 80% by 2035 and 100% by 2040. Under the law, zero to low-carbon emitting sources, such as nuclear generation and natural gas generation with carbon capture, are considered clean energy sources. Along with these new standards, the new legislation expanded the authority of the MPSC to oversee their implementation. CMS's utility subsidiary Consumers Energy will file updates to its renewable energy plans in 2024 and its Clean Energy Plan in or before 2027. Given the existing regulatory framework in Michigan, we expect the company's collaborative dialogue with both stakeholders and regulator to continue under the new legislation.

In June 2022, Consumers Energy and key stakeholders in Michigan reached a settlement related to the company's latest IRP. The settlement included the retirement of all of its remaining coal power plants (all three units at the Campbell power plant site) in 2025 as a result of the 2021 IRP. Consumers Energy will be able to record approximately $1.3 billion of the remaining book value of these power plants as a regulatory asset and earn a 9% return on equity (ROE) through the remaining life. Instead of securitizing the remaining book value, the settlement will minimize the impact of the accelerated coal retirements on Consumers Energy's credit metrics. We view this settlement to be constructive and evidence of continued credit supportiveness in Michigan.

Timeliness of cost recovery based on a prescriptive suite of recovery mechanisms

Michigan utilities benefit from numerous formulaic rate adjustment mechanisms that provide a high degree of cash flow stability and assurance of recovery. For example, Consumers Energy has forward-looking Power Supply Cost Recovery (PSCR) and Gas Cost Recovery (GCR) mechanisms that are intended to ensure that it can recover prudently incurred power and gas supply costs. The PSCR covers fuel and purchased power costs as well as transmission and emission allowance costs. Differences between actual and forecast costs are deferred for recovery or refunded in the following year. The PSCR is a surcharge mechanism and provides a degree of base rate and cash flow stability, a credit positive. The GCR mechanism may be adjusted monthly within a capped range to minimize over/under recoveries, although interim gas inventory buildup could substantially increase the company's working capital financing when gas prices increase sharply.

Gas utilities in the state also benefit from programs designed to assure recovery of needed infrastructure improvements. Consumers Energy's RDM compares and adjusts for differences between weather normalized actual and authorized revenues. The company's enhanced infrastructure replacement program (EIRP) is a MPSC authorized 25-year incremental investment program to upgrade natural gas infrastructure, including replacing less than 250 miles of cast iron pipe and other high-risk components.

Active rate case filing cadence

Consumers Energy maintains an active regulatory schedule with its electric and gas general rate cases typically filed annually in an alternating pattern. The utility currently has its gas rate case pending before the MPSC, and filed its request for an electric rate increase on 31 May 2024. Over the last three years, Consumers Energy experienced downward pressure on its allowed ROE in its rate cases although the company was able to maintain a 9.9% allowed ROE. We expect Consumers Energy to maintain a stable financial profile because there are other offsetting mechanisms such as usage of forward test year to allow the utility to earn appropriate returns and to recover investment costs on a timely basis. However, further deterioration of the allowed ROE is likely to put negative pressure on the company's overall financial profile.

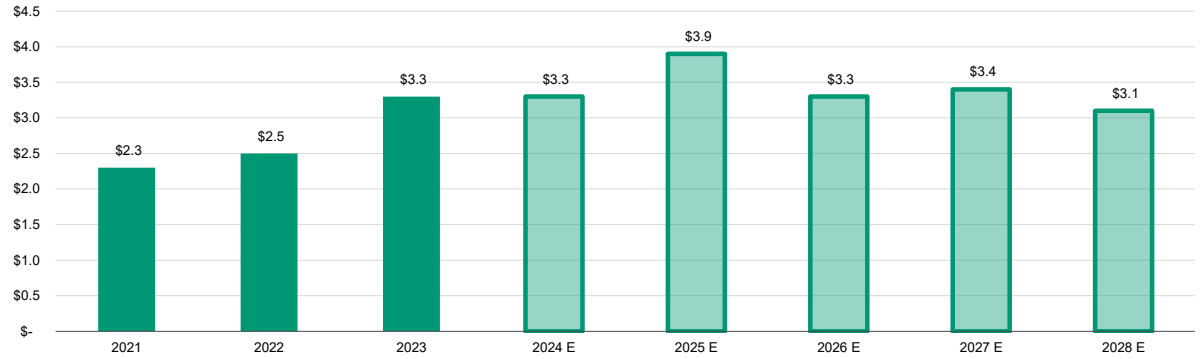
On 1 March 2024, the commission authorized a $92 million increase based on a 9.9% ROE, 50.02%% equity capital structure and a $13.67 billion rate base value. Also, the final order approved an Investment Recovery Mechanism (IRM) rider for distribution reliability projects totaling $99 million over two years.

On 15 December 2023, the utility filed a gas rate case, seeking a $136 million increase based on a projected test year for the 12-month period ending 30 September 2025, requesting a 10.25% ROE, 51.5% equity capital structure and a rate base value estimated around $10.97 billion. In April 2024, the MPSC Staff recommended an $70.77 million increase based on a 9.85% ROE, 49.92% equity capital structure and a $10.88 billion rate base value. A final decision is expected by 15 October 2024.

Stable credit metrics expected to be maintained through its high capital investment cycle

Consumers Energy's capital spending continues to be robust as it is currently in the midst of a large capital investment plan. The company increased its five-year capital expenditure plan through 2028 to $17 billion, approximately $1.5 billion higher than the previous plan. Consumers Energy will invest approximately $6.3 billion primarily to maintain and upgrade its gas utility infrastructure; $7.3 billion related to its electric distribution and other infrastructure; and $3.4 billion related to clean energy generation. These investments should enhance the company's reliability and safety as well as help it execute its decarbonization plan.

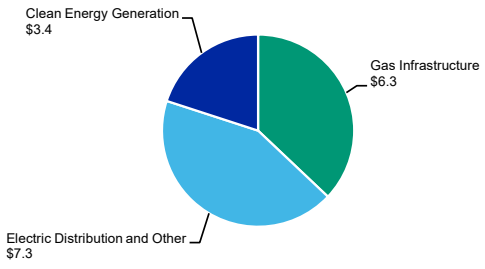
Exhibit 4
Consumers Energy's elevated capital program will extend at least through 2028
$ billions



Source: Company 10K

Through this period, Consumers Energy plans to keep rate increases modest, which should help to maintain regulatory support for investment cost recovery. Funding for these investments will be provided by internally generated cash flow, the issuance of debt at Consumers Energy and equity contributions from CMS. We expect Consumers Energy to maintain its CFO pre-WC to debt at around 20%-21% on average over the next 2-3 years. At the end of 2023 and for the LTM period ending 31 March 2024, Consumers Energy produced a CFO pre-WC to debt ratio of 20.5% and 20%, respectively, excluding securitization debt.

Exhibit 5
Planned Capital Expenditures 2024 - 2028
$ billions



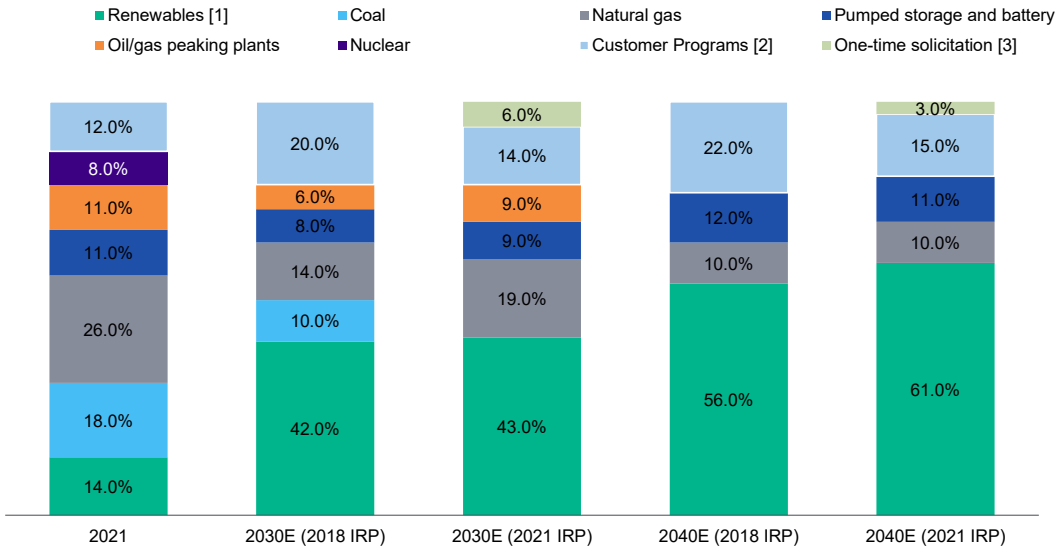
Source: Company 10K

Based on Consumers' latest IRP approved in 2022, the utility will add up to 8 GW of solar power, which is 2 GW more than what was approved in the company's 2018 IRP. As a result, by 2040, more than 60% of Consumers Energy's generation capacity will be from renewable sources. In order to replace the retiring coal capacity, the utility acquired the Covert natural gas-fired power plant for

approximately $815 million in 2023. It issued requests for proposals (RFP) for two purchased power agreements (PPA) for 500 MW of dispatchable generation and 200 MW of clean energy sources.

Exhibit 6

Based on the latest IRP settlement, more than 60% of Consumers Energy's generation sources will be renewables by 2040



[1] Does not include renewable RECs.
[2] Includes energy waste reduction, demand response, and conservation voltage reduction program.
[3] One-time solicitation to acquire approximately 700 MW of capacity from sources in Michigan's Lower Peninsula beginning in 2025.

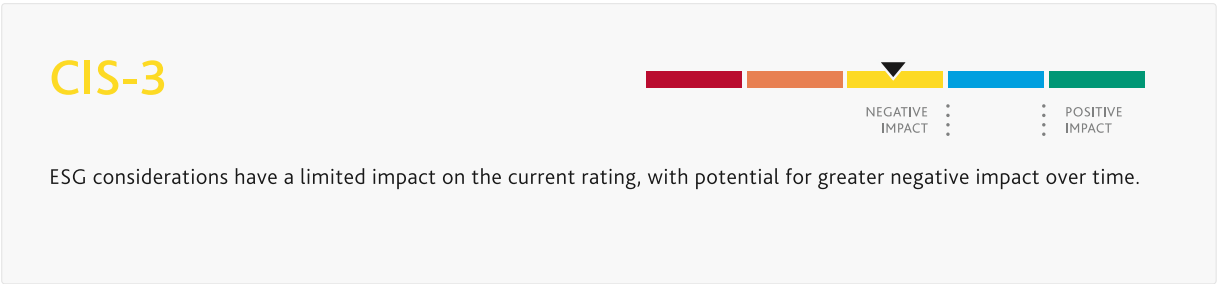
ESG considerations

Consumers Energy Company's ESG credit impact score is CIS-3

Exhibit 7

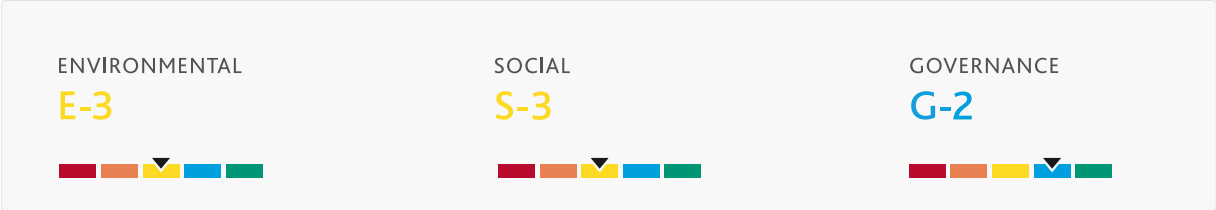
ESG credit impact score



Source: Moody's Ratings

Consumers Energy's **CIS-3** indicates that ESG considerations have limited impact on the current credit rating with greater potential for negative impact over time. It reflects some exposure to physical climate risk and moderating carbon transition risk. It also incorporates social risks stemming from inherent risk associated with regulated utilities and governance risk that is not a material driver.

Exhibit 8
ESG issuer profile scores



Source: Moody's Ratings

Environmental

Consumers Energy's **E-3** issuer profile score reflects its moderate position for the carbon transition with tangible strategies and plans in place that substantially mitigate its carbon transition exposure. The utility is currently in a transition to phase out its coal-fired generation and targets zero coal-fired generation output in 2025, accelerated from its prior target of 2039. The utility also established a goal of net zero methane emission for its gas delivery system by 2030; net zero carbon emissions for its electric business by 2040, including MISO market purchases and PPAs; and net zero greenhouse gas emissions for its entire business, including customer and supplier emissions, by 2050. Michigan's regulatory framework supports the utility's transition plan by allowing certain investment cost recovery and renewable energy plan surcharges, for example.

Social

S-3 issuer profile score for Consumers Energy is primarily related to its customer and regulatory relations as well as demographic and societal trends. The utility's regulatory environment, as well as its interaction with the Michigan Public Service Commission, are important in considering the utility's social risk. Also, the safety and reliability of its operations are important social considerations.

Governance

Consumers Energy's **G-2** issuer profile score reflects our view that its governance does not pose a particular risk and is not a material driver in the company's overall credit profile. It also incorporates its position as a subsidiary of CMS whose corporate governance considerations including financial policy and risk management influence Consumers Energy.

ESG Issuer Profile Scores and Credit Impact Scores for the rated entity/transaction are available on Moodys.com. In order to view the latest scores, please click here to go to the landing page for the entity/transaction on MDC and view the ESG Scores section.

Liquidity analysis

We expect Consumers Energy's liquidity profile to be adequate over the next 12-18 months.

Consumers Energy's external liquidity sources include a $1.1 billion secured revolving credit facility expiring in December 2027 and, as of 31 March 2024, net availability was $1.073 billion with $27 million of letters of credit outstanding. Consumers Energy also maintains a $250 million secured credit facility terminating in November 2025 and had $197 million available as of 31 March 2024. Both facilities are secured by first mortgage bonds. These credit facilities provide support for working capital needs and act as a backstop to Consumer Energy's $500 million commercial paper program. At 31 March 2024, the company had no commercial paper notes outstanding under the program. The credit facilities do not include a material adverse change representation for new borrowings, and have only one financial covenant, setting the maximum debt to capital at 65%. At 31 March 2024, debt to capital was 50%.

These facilities includes sustainability linked pricing metrics, which permits pricing adjustments for meeting targets related to sustainability. Targets include renewable generation and diverse supplier spend, highlighting its commitment to shifting its exposure to a greater renewable content and to supplier diversity.

The utility's continuing capital expenditure program and dividend policy will result in negative free cash flow for the foreseeable future. However, the company has a reasonable amount of external liquidity, demonstrated market access, and regularly receives capital contributions from its parent.

For the LTM period ended 31 March 2024, Consumers generated approximately $2.3 billion of cash from operations, invested $3.2 billion and distributed $673 million of dividends to CMS, resulting in negative free cash flow of approximately $1.6 billion. Given its robust investment plan, we expect Consumers Energy to maintain its negative free cash flow position over the 12-18 months.

In January 2024, Consumers Energy issued $600 million first mortgage bonds with 4.6% rate maturing in May 2029.

MPSC Case No.	**U-21806**
Responding Party:	Attorney General
Respondent:	Sebastian Coppola
Requestor:	CECo
Question No.:	**3-CE-AG-5**

3-CE-AG-5

On page 125 of his direct testimony, Mr. Coppola addresses Company witness Bleckman's Exhibit A-32 (MRB-10) - Peer Company Commission Authorized Equity Ratios. Mr. Coppola claims that "commissions in those jurisdictions also included a permanent layer of short-term debt as part of the permanent capital structure." With regard to this statement, please:

i. Identify all companies included in Mr. Bleckman's Exhibit A-32 (MRB-10) that employ short-term debt as a permanent financing tool along with supporting evidence.

ii. What criteria did Mr. Coppola apply to determine whether or not a given company's short-term debt is "permanent"?

Response:
i and ii.

In the past two years, the companies and related utility subsidiaries that have used short-term debt to meet permanent financing (long-term) needs are NiSource, One Gas, Spire Missouri, and WEC Energy. My criterion in evaluating each individual situation was that if a company had substantial short-term debt for five consecutive quarter ends, then the company was using short-term debt to supplement long-term debt. This is similar to how the accounting profession views long-term liabilities. All of these companies meet this criterion. The quarterly balances below for each of the companies were sourced from SEC filings. It should be recognized that WEC Energy, and NiSource act as the financing arm for their utility subsidiaries and therefore it is these companies' financial statements that are relevant and not the subsidiaries where debt coming in from the parent companies can also be categorized as common equity capital at the utility subsidiary. Similarly, One Gas operates on a divisional basis and therefore its financial statements are the relevant source of debt/equity capitalization for the utility divisions. Spire Missouri's financial statements are filed with its parent company on Form 10-K and 10-Q reports.

Quarter End Short-Term Debt (Millions of Dollars)

	WEC Energy 2023-2024	NiSource 2023-2024	One Gas 2023-2024	Spire Mo. 2023-2024

MPSC Case No.	**U-21806**
Responding Party:	Attorney General
Respondent:	Sebastian Coppola
Requestor:	CECo
Question No.:	**3-CE-AG-6**

3-CE-AG-6

Refer to page 126 of Mr. Coppola's direct testimony which states that "Smaller utilities tend to have higher equity ratios to sustain them during potential volatility in their business, which larger utilities can better manage." Please provide all analyses, studies, or reports Mr. Coppola relied on in making this statement.

Response:

In establishing that smaller utilities tend to have higher equity ratios, Mr. Coppola relied on his knowledge and experience accumulated over the past nearly 50 years that he has been involved in the utility industry. Appendix A to Mr. Coppola's direct testimony shows his vast background as Chief Financial Officer, Treasurer, and financial manager involved in various aspects of financing and managing large and small utilities.

Mr. Coppola has also relied on research and a publication issued by financial expert, Dr. Roger A. Morin. The attached excerpt from Dr. Morin's book New Regulatory Finance provides supporting evidence on the higher business and financial risks faced by smaller utilities. See 3-CE-AG-6 Attach 1.

Date: 5/2/2025

MPSC Case No.	**U-21806**
Responding Party:	Attorney General
Respondent:	Sebastian Coppola
Requestor:	CECo
Question No.:	**3-CE-AG-7**

3-CE-AG-7

On page 127 of his direct testimony, Mr. Coppola addresses Company witness Bleckman's Exhibit A-32 (MRB-10) – Peer Company Commission Authorized Equity Ratios. Mr. Coppola claims that the Company's analysis is inflated due to the fact that "utilities on the east coast of the United States were not represented in Mr. Bleckman's exhibit, where equity ratios and ROEs tend to be lower and more conservative." Please provide all analyses, studies, or reports Mr. Coppola relied on in making this statement.

Response:

The following information sourced from S&P Global (Regulatory Research Associates Division) shows ROE decisions from regulatory commissions pertaining to several east coast utilities. This information is also included in Exhibit AG-48. The Common Equity ratios reported by Regulatory Research Associates from related rate cases are also shown below.

	Utility	State	ROE Date	ROE	Equity Ratio
a.	Consolidated Edison of NY	NY	Jul 20, 2023	9.25%	48%

MPSC Case No.	**U-21806**
Responding Party:	Attorney General
Respondent:	Sebastian Coppola
Requestor:	CECo
Question No.:	**3-CE-AG-8**

3-CE-AG-8

Refer to page 103, lines 1 through 4, and page 104, lines 5 through 11, of Mr. Coppola's direct testimony which refers to an analysis that the Company performed to use as a basis for its 1% of revenues measure for projecting the test year cash balance. Please state the specific testimony and/or exhibit along with the relevant case number that contains the Company's analysis Mr. Coppola is referring to.

Response:

Refer to the direct and rebuttal testimony of Company witness Andrew Donato and Exhibit A-93 filed in Case No. U-17990. This information should already be available to the Company.

Date: 5/2/2025

S T A T E O F M I C H I G A N

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

LUTHER A. BONNER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Luther A. Bonner, and my business address is 530 West Willow Road, Lansing, Michigan 48906.

Q. In what capacity are you employed?

A. I am employed as Senior Manager of Engineering Support for Consumers Energy Company ("Consumers Energy" or the "Company").

Q. What is your educational background?

A. I earned an Associates of Business Administration from Baker College in 2003. I also hold an associate certificate in Project Management from George Washington University.

Q. What have your job responsibilities entailed with Consumers Energy?

A. I began working for Consumers Energy in 2003 and have held positions of increasing responsibility over my 21 years with the Company. My roles have included Senior Manager Engineering Support, Manager Engineering Support, Senior Engineering Technical Analyst Lead, Senior Business Support Consultant III, Regional Project Coordination Manager, Customer Energy Specialist Principal Team Lead, Customer Energy Specialist Team Leader III, Senior Customer Energy Specialist, Customer Energy Specialist III, Customer Energy Specialist II, and Customer Energy Specialist I. From 2003 through 2014 prior to my leadership roles, my responsibilities included designing electric and natural gas systems, planning customer requested projects, project management, facilitating easements, permitting, and generating costs estimates. These tasks were undertaken in the service of providing natural gas and electric services to residential customers, new developments, commercial & industrial customers, and municipal electric generating facilities from natural gas. From 2014 through 2019, my

experience was in leading teams that designed, planned, and managed those various types of projects. Since 2019, my responsibilities have included developing processes and procedures used across the work management stream, and developing technology platforms for project management.

Q. Please summarize your experience with Rule C8. Customer Attachment Tariff.

A. Since the beginning of my career with the Company in 2003, I have followed and administered Rule C.8, Customer Attachment Tarriff, which is the regulatory requirement for this process. My experience includes running customer requested scenarios through the model, and reviewing projects modeled by others to ensure compliance. This modeling involved the determination of any revenue deficiency and assessing the amount that a customer requesting service under Rule C8 needed to pay as an upfront contribution in aid of construction based on the model's output.

Q. Please summarize your experience with the use of, administration, and development of the Gas Engineering Model that is used to calculate gas line extensions and service contributions for new connecting customers, which is part of the New Business Mains, Services, and Meters Program and follows the Customer Attachment Tariff, Rule C.8.

A. From 2003 through 2014, part of my responsibilities involved the use of the original Gas Engineering Model to calculate estimates for the natural gas projects I was assigned to as a Customer Energy Specialist for the Company in support of customers who requested service, line extensions, and/or new developments and generation facilities. During 2014 through 2022, my responsibilities included reviewing and approving cost estimates to validate compliance with RuleC.8 Customer Attachment Tariff and identifying ways to improve the technology used. In 2022, I was assigned overall responsibility of the Gas

Engineering Model. During 2022, my team and I developed the most current version of the model using a web-based application.

Q. Have you previously testified before the Michigan Public Service Commission ("MPSC" or the "Commission")?

A. No, I have not.

Q. Are you sponsoring any exhibits?

A. Yes. I am sponsoring the following exhibits:

Exhibit A-119 (LAB-1)	Footage Allowance & Excess Service Charge Trends 2003-2025;
Exhibit A-120 (LAB-2)	Excess Service Cost Formula;
Exhibit A-121 (LAB-3)	CE Gas Consumption Jan2020-Jan2025;
Exhibit A-122 (LAB-4)	Customer Gas Service Retirement Trend;
Exhibit A-123 (LAB-5)	MPSC-MNS CAP Conversion Update Sep 2022;
Exhibit A-124 (LAB-6)	Average Vintage Year Gas Retirements;
Exhibit A-125 (LAB-7)	Customer Gas Alteration Trend; and
Exhibit A-126 (LAB-8)	MPSC CAP Pricing Update March 2023.

Q. Were these exhibits prepared by you or under your supervision?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my testimony is to rebut certain assertions and recommendations made by Michigan Environmental Council and Sierra Club (collectively "MEC") witness Alice Napoleon regarding Consumers Energy's Line Extension Policy. My testimony specifically rebuts claims that (1) the Company is providing increasing footage allowances that are subsidized by existing customers, (2) the Company's model uses outdated data and assumptions to calculate customers contributions, (3) the Company overstates the period

of time that customers will receive natural gas service in the modeling of customer contributions, and (4) the Company has not fulfilled its requirements resulting from a settlement agreement in a prior gas rate case.

I. MEC WITNESS NAPOLEON

Q. On page 20, lines 5 through 9, of her direct testimony, MEC witness Napolean discussed the Company's line footage allowance and claimed that longer footage allowances result in lower costs for new customers and greater costs spread across ratepayers. Do you agree with this assessment?

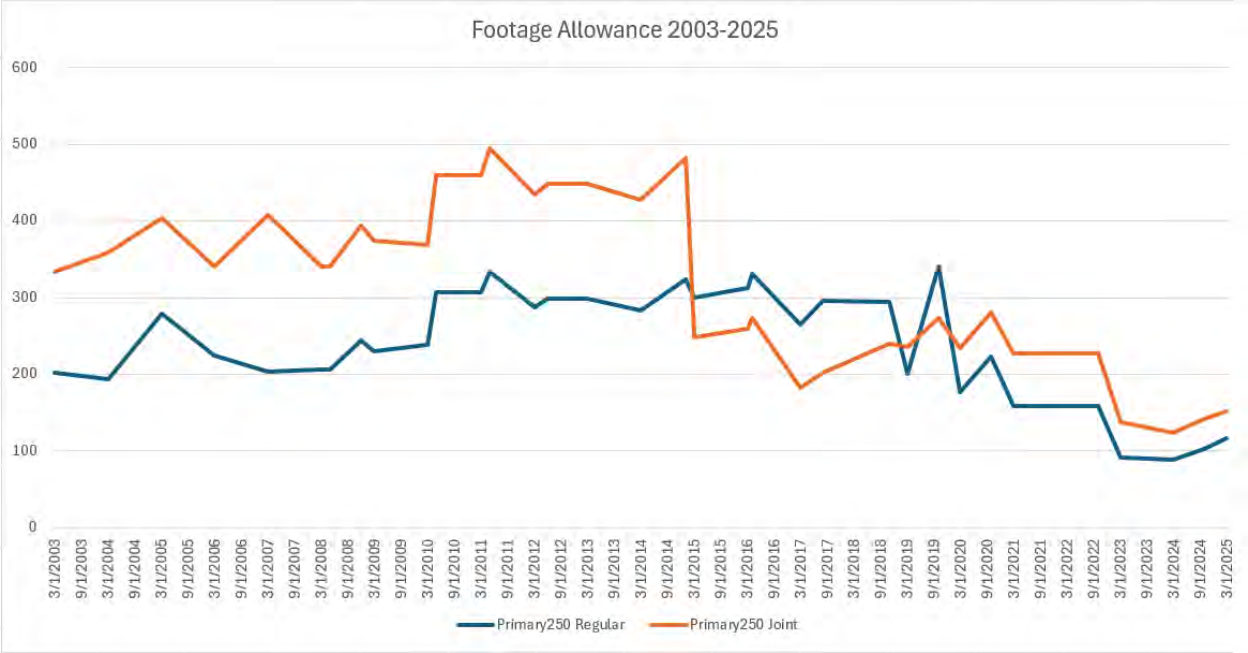
A. No. While I can confirm that the footage allowances of 88 feet (for gas only service) and 124 feet (for joint gas and electric service) that were implemented on March 1, 2024 increased to 117 feet and 152 feet, respectively, on March 1, 2025, the Company has significantly decreased its footage allowances since 2003 thereby increasing upfront costs for connecting services and reducing costs that are being recovered through the new service revenue included in the 20-year modeling period. In 2024, the footage allowance was at its lowest point in the past two decades. This is demonstrated in Exhibit A-119 (LAB-1).

From 2003 through 2024, the footage allowance decreased for various classifications of metering. For example, for the most common services with 250 class gas meters (for gas only service), there has been a footage allowance decrease of 42.08% (202 ft to 117 ft) from 2003 to its current value and a 65.69% (341 ft to 117 ft) decrease from its highest point in October 2019. For the most common services with 250 class meters (with joint gas/electric service), there has been a footage allowance decrease of 54.35% (333 ft to 117 ft) to its current value and a 69.29% (495 ft to 117 ft) decrease from its highest point in May 2011.

Some metering classifications, such as a 3M meter with joint gas/electric service, no longer offer footage allowances based on average revenue. Instead, a customer specific revenue deficiency amount using the net present value ("NPV") calculation is performed to ensure that the Company will recover its costs using the appropriate amount of revenue over the first 20 years.

In addition, the recent slight increases in footage allowances also reflect the Company's ongoing efforts to reduce its actual unit costs, which results in lower plant in service cost amounts input to the model calculations. The plant in service cost is one of the inputs to the model that influences the NPV calculation. The Company uses the model to determine the amount of footage allowance that results in a model calculation of NPV that is greater than $0. Reductions in service installations costs would cause the footage allowance to increase (based on the previous three years of actual costs incurred).

For example, the most current model update estimates that the Company will recover 100% of the annual revenue requirements from the new service attachment of a 117-foot gas only service based on average annual consumption of 94 mcf over 20 years. In this 117-foot service scenario, the NPV is $5.65. In that scenario, there is no calculated revenue deficiency to recover upfront costs from this attaching service.



The Company has continued to make necessary adjustments to the footage allowances since 2003 to ensure that new service revenues will recover the costs of installing new services as required by Rule C.8.

Q. On page 20, line 11, through page 21, line 2, of her direct testimony, Ms. Napoleon asserts that residential customers who exceed the footage allowance are responsible for a flat $200 revenue deficiency charge, an excess footage charge for gas-only connections of $21.26 per foot beyond the footage allowance ($17.28 for joint gas and electric hookups), and a connection fee and direct charges for things such as permitting and inspections. Is this accurate?

A. No. Customers with footage less than the footage allowance will pay a $200 connection fee and any direct charges such as permitting and inspections. Customers that exceed the footage allowance will pay a $200 connection fee, as well as any excess footage charges (or revenue deficiency) and any other direct charges. For example, a customer requesting service that is 55 feet long and requires work in a municipal road right-of-way with a permit

fee of $320 would be responsible for a $200 connection fee and the permit fee of $320, totaling $520. A customer requesting service of 150 feet for gas only, with the same permit costs, would be responsible for a $200 connection fee, an excess service fee of $701.58 (150 feet - 117 feet = 33 feet x $21.26 = $701.58), and a permit fee of $320, totaling $1,221.58.

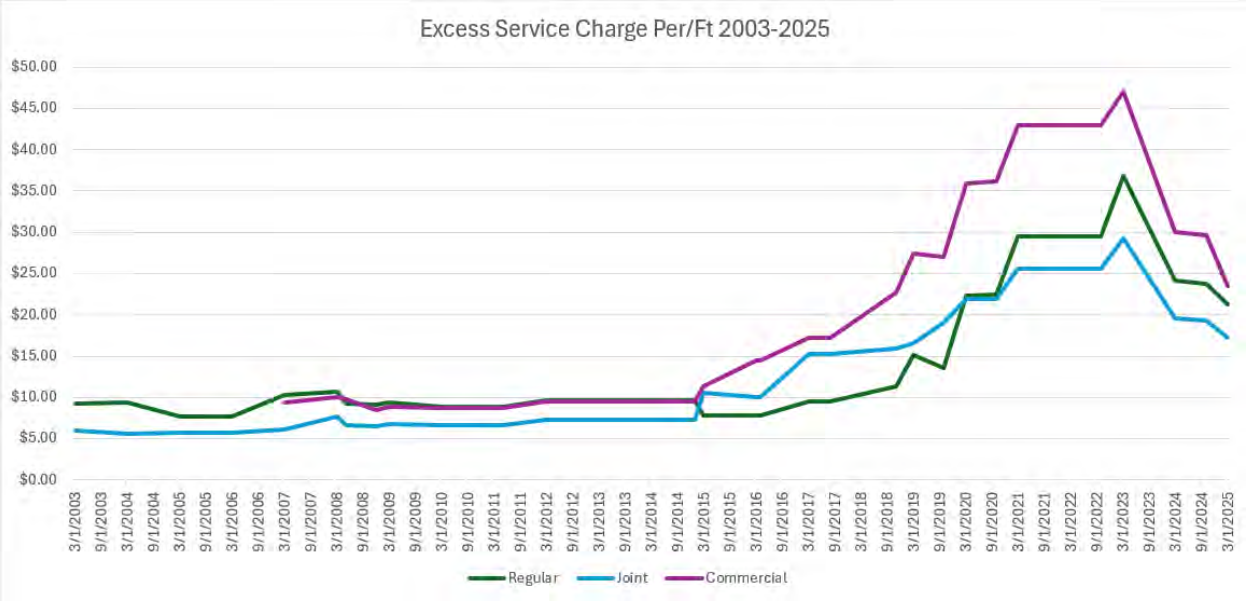
Q. On page 23, line 9, of her direct testimony, Ms. Napoleon indicates that it is not clear how the $200 flat charge for residential customers was determined and what it covers. Can you explain the Company's $200 connection fee?

A. The $200 connection fee is outlined in the Company's tariff and is separate from the revenue deficiency calculation. Every connecting customer is required to pay this direct connection fee per the Rule C.8 Customer Attachment Tariff.

Q. On page 23, lines 10 through 19 of her direct testimony, MEC witness Napoleon claims it is unclear what data Consumers used to produce these calculations, how frequently the Company updates excess footage charges, and why Consumers Energy decided to switch to a fixed model in the first place. Can you clarify the excess service charge calculation, how frequently they are updated, and why the Company uses a fixed model?

A. Yes, the calculation used to determine the excess service charge is (NetPresentValueProjectCost at X Feet - NetPresentValueProjectCost at Y Feet) / (X-Y) as referenced in Exhibit A-120 (LAB-2) to show how the $21.26 per ft charge was determined. The Company updates the excess footage charges at a minimum annually, the exception to this was during Covid where the Company opted not to update costs to support the building industry during those unprecedented times. In 2023, the excess service charge

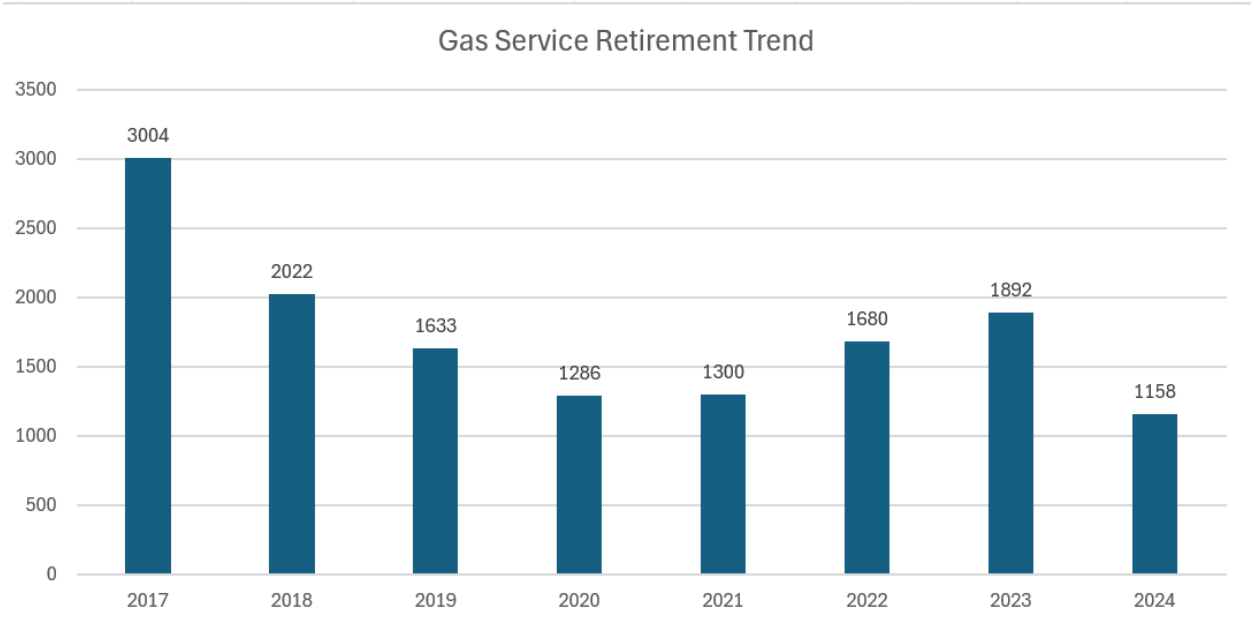
was at its highest point in the past two decades, as referenced in Exhibit A-119 (LAB-1). The Company uses a fixed model of footage allowance and excess footage charge to simplify the NPV calculation for customers, builders, and internal employees calculating invoices. The long-range trends of footage allowances and excess footage charges indicate that the Company is increasing costs for the customers requesting service and reducing the costs that are estimated to be recovered from the expected incremental revenue over 20 years. The chart below demonstrates the trend of excess footage charges from 2003 through 2025 as referenced in Exhibit A-119 (LAB-1).



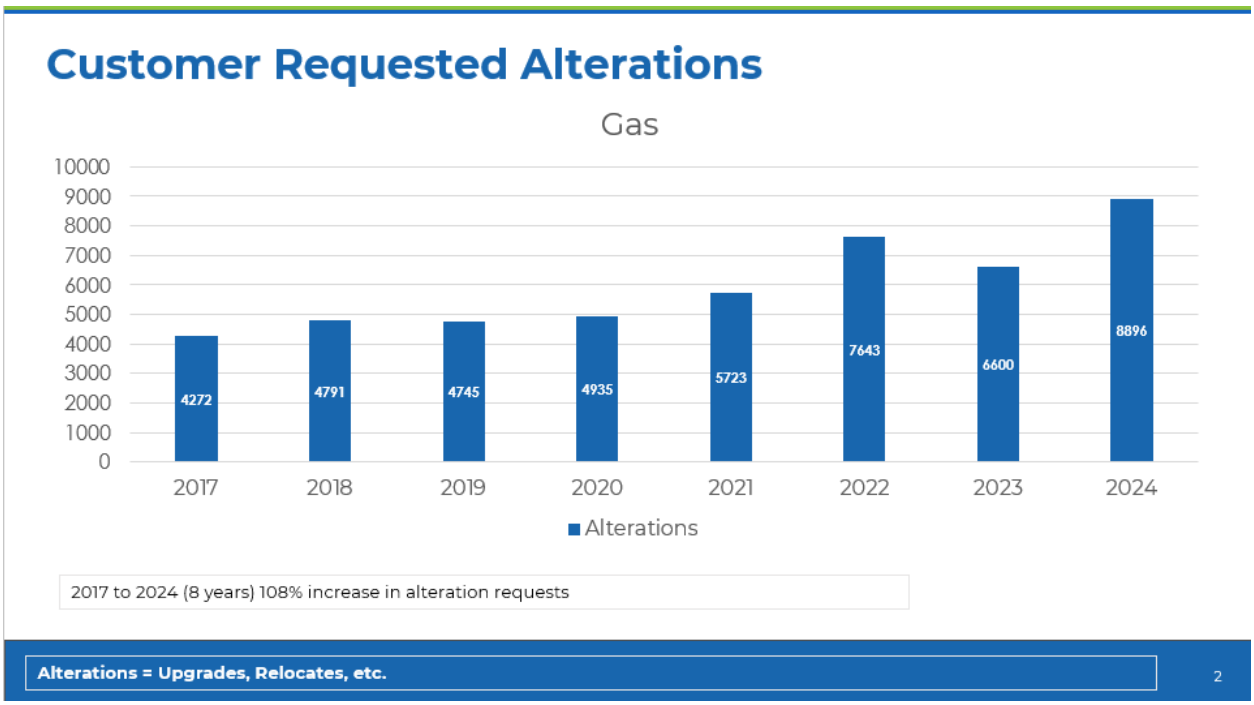
Annually the Company uses the model to determine what the footage allowance should be based on the previous three years of historical service installation cost and customer usage data. The calculated footage allowance is the point where the Company expects to recover all its service installation revenue requirements from the attaching customer over the 20-year period modeled per Rule C.8 Customer Attachment Tariff.

Q. On page 24, lines 1 through 8, of her direct testimony, Ms. Napoleon discusses calculating the revenue deficiency charge for non-residential customers and indicates that the Company takes into account equipment specifications, load diversification, and annual usage patterns to calculate a constant level of new customer sales, and the Company assumes the customer will remain connected to the gas system for 20 years. Could you share how the model accounts for non-residential revenue and the volume of service retirements?

A. The Company designs the natural gas distribution system for a minimum life span of 50 years, the sizing of the services and meters that attach to the distribution system are sized based on the current equipment specifications to be attached to the service, the load is diversified if deemed necessary based on those specifications and the Company accounts for the annual usage patterns provided by the customer for revenue that is accounted for in the NPV calculations. The Company does assume that the service will remain active for a minimum of 20 years in that calculation and the revenue received will remain constant. This assumption is based on the fact that the Company has only received requests from customers to retire on average 1463 services annually over the past five years as referenced in Exhibit A-122 (LAB-4) and the average lifespan of retired services over the past five years has been 43 years based on the vintage year the services were installed when retired as shown in Exhibit A-124 (LAB-6).



The Company also has received 8,896 gas service alteration requests in 2024; these requests are to either relocate the service or upgrade the service due to load increases. This is a 108% increase from the 4,272 alteration requests received in 2017, and the Company has experienced consistent increase in alteration requests year over year as shown in Exhibit A-125 (LAB-7). This is a clear indication that customers continue to utilize natural gas in the state of Michigan and request to utilize more natural gas even though there are alternative options available.



Q. On page 24, lines 10 through 12, of her direct testimony, Ms. Napoleon states that Consumers Energy has not provided the model, despite the terms of the Case No. U-21148 settlement which called for Consumers Energy to transition to a new model that was transparent and capable of being shared with stakeholders by the end of 2022. Did the Company meet the terms of the Case No. U-21148 settlement by transitioning to a new model that is transparent and capable of being shared?

A. Yes. The new model was built and implemented to be used to determine the annual costs on March 1, 2023. During the development of the model the Company met with MNSC and MPSC Staff to review the assumptions, the changes, and the impacts to the customers with the proposed assumption changes, referenced in Exhibits A-123 (LAB-5) and A-126 (LAB-8).

Q. Is the new model more transparent?

A. Yes. The transition to this new model was driven by several key factors:

1. **Age and Outdated Software**: The previous model was over 20 years old, and the software it was built on was outdated. This made it difficult to maintain and enhance the model.

2. **Technological Advancements**: The new .Net application allows for continuous enhancements as technology evolves, ensuring the model remains up-to-date and efficient.

3. **Transparency and Usability**: The new model is more transparent and is built on a software platform commonly used by Project Managers. This improves accessibility and usability.

4. **Updated Assumptions**: During the transition to the current model, key assumptions within the model were reviewed and updated. The new model enables annual updates to these assumptions, ensuring its accuracy and relevance.

The current model is more robust, transparent, user-friendly, and better meets the needs of the Company's team and stakeholders by providing more transparency in the calculations. For example: The most current model shows a view with a summary of the calculations as referenced Exhibit A-120 (LAB-2) The model is also built on a platform so the Company can create necessary reports or data extractions for its team and stakeholders, while no reporting or data extraction methods have been built at this time it now has that capability that the original model did not.

Q. How is the new model capable of being shared with stakeholders?

A. Yes. The model is shareable, but with certain limitations. The Company can bring external parties into its offices to demonstrate how the model works. However, since it is built on the internal network, it cannot provide external access due to security concerns.

The new model is designed to offer a more transparent view of the inputs, outputs, and calculations when shared internally. Consumers Energy has offered to arrange a meeting, invite the stakeholders, and walk them through the model, including its assumptions, calculations, and the inputs and outputs.

Q. On page 26, lines 14 through 16, of her direct testimony, Ms. Napoleon states the Company is likely using outdated assumptions for household gas consumption. Does the Company's customer contribution model use outdated assumptions for household gas consumption?

A. No, the assumptions within the model are updated annually and the average household consumption used is a rolling three-year historical average for all residential households and all residential multi-units (apartments, condos) using full heating seasons (Jul through Jun is an annual total), as shown in Exhibit A-121 (LAB-3).

Q. On page 26, lines 16 through 17, of her direct testimony, Ms. Napoleon states that there is significant risk associated with the Company's decision to subsidize new customer connections. Does the Company agree with this assertion that new connections are subsidized by other customers?

A. No. The primary objective and design of the program is to enable the expansion of cleaner, safer, more reliable, and more affordable gas utilities without requiring existing customers to subsidize these expansions. In this program, the costs of installing the necessary equipment for expansions are charged to new customers. These costs are balanced by the revenue generated by the newly attached customers over a period of 20 years. The risk of subsidization only exists if the new service is retired prematurely or the Company does not receive the forecasted revenue over the course of the next 20 years, as referenced in Exhibit A-121 (LAB-3). The volume of natural gas services is not declining, and the customers who moved in to utilize the attached services is stable (reference gas consumption).

Q. Should the Commission adopt the recommendations of Ms. Napoleon?

A. No, for the reasons stated above in my testimony, the Company believes the line extension policy is reasonable. However, if the Commission is interested in examining the Company's line extension policy, this should be done across all utilities through a work group. Using the same model across all utilities will ensure consistency across the industry.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

Customer Attachment Program
Line Extension Assumptions

Review with MNS & MPSC Staff
September 7, 2022

Consumers Energy
Count on Us®

Agenda

- *Introductions*
- *Meeting Purpose*
- *Review 2021-2022 CAP changes*
- *Discuss Assumptions and Updates*
- *Q&A*

Introductions

- *Dean Beach – Executive Director, Customer Energy Management*
- *Luther Bonner – CEM Process, Performance, & Technology Lead*
- *Chad Ammerman – CEM Process, Performance, & Technology*
- *Tyler Haney – CEM Data & Analytics*
- *Mike Rampe – Legal*
- *Doug Chapel – Regulatory Affairs*

Meeting Purpose

- ***July 2022 Gas Rate Case Settlement:***

  "Consumers Energy agrees to meet with MNS and Staff to review and update the line extension assumptions within 90 days of the Commission issuing and order in this case. Consumers Energy additionally agrees to transition to a new line extension model that is transparent and capable of being shared with stakeholders for review to be completed by the end of 2022."

- ***Assumptions raised in Gas Rate Case:***
  - *Free footage*
  - *Gas throughput/consumption*

- ***Today, we will discuss data underlying these assumptions and our status on analyzing this data***

2021 Rates – No Change for 2022

Residential	Service	2" Main	4" Main	6" Main
Gas Only	$ 29.47	$ 17.13	$ 54.01	$ 61.58
Joint	$ 25.60	$ 22.49	$ 68.13	$ 44.66
Directional Bore	Addl $8.80/ft	$ 53.15	$ 104.21	$ 182.17
Non-Residential				
Gas Only	$ 42.90	$ 17.13	$ 54.01	$ 61.58
Joint	$ 25.60	$ 22.49	$ 68.13	$ 44.66
Directional Bore	Addl $8.80/ft	$ 53.15	$ 104.21	$ 182.17

Residential	Allowable Footage	
Category	Gas Only	Joint
Primary 250	158	227
Primary 425	544	672
Primary 800	1071	1278
Seasonal	0	24
Mobile Home	52	105

Re-cap - Why No Change for 2022?

- ***COVID Impacts in 2020/2021***
  - *Out of normal construction practices from previous years*
    - *Review of the new normal, how this impacts costs*
  - *In Support of Providing an exceptional customer experience*
    - *Hold off on rate increase during unprecedented times*
- ***2022 will be a transition year for the model***
  - *Existing model is approx. 20 years old*
    - *Outdated software*
    - *Manual data pulls, scrubbing and calculations*
    - *3 different software tools used to provide analysis*
  - *New Model being built in 2022*
    - *Using Current software technology thru a .NET application*
      - *Ability to be enhanced as technology evolves*
    - *Updating assumptions based on data analysis and current construction practices*
    - *Synced to Company Data Tables*
      - *Consistent data structure through query of data tables*
      - *Calculations built into software to provide analysis for leadership*
      - *Simple structure for updating costs through analysis*
    - *1 tool, 1 set of data, 1 analysis with options/recommendations based on data for rate adjustments*

Current CAP Assumptions

- ***Tariff C8 Customer Attachment Program***
  - *Model Assumptions to review*
    - *Incremental Revenue*
      - *Residential - Fixed table from study completed over 20 years ago*
    - *Incremental Costs*
      - *Plant in Service*
        - » *Determined by 3-year average costs (Service/Main) Size and installation method*

Status of Incremental Revenue Assumptions

- ***Data Analysis***
  - *Building Report View of all customer consumptions from Aug 2021 – July 2022*
    - *Completed*
      - *Consumption Data identified and included (monthly/Sum to annual)*
      - *Customer Location Data identified and included (city/county)*
      - *Number of installations per premise included (quantity to determine if single family home or multi unit)*
      - *Customer Rate Code data*
    - *In Progress*
      - *Customer Meter Size and Meter Location*
      - *Date of installation or date of contract account/decision on Removal of no usage from average*
  - *Report Query will be set up to pull based on a range in time to reduce size of data set*
  - *Report will be run annually to determine if incremental revenues applied should be adjusted*
  - *Views will be built to view data in different slices*
    - *(previous 12 months/3 year average) In Progress*
      - *Average consumption during heating season for each rate/meter size*
      - *Average consumption yearly for each rate/meter size*

- ***Data analysis will help us better understand assumptions and any potential updates that are needed***

Status of Incremental Cost Assumptions

- ***Pulling data to review Cost Variability***
  - *Joint and non joint*
  - *Installation Method (trench, boring, plowing etc.)*
  - *Timing of installation (spring, summer, winter)*
  - *Contractors (contracts change) and internal crews*
  - *Variability in Volume of pipe installed year over year*
  - *Restoration costs in right of way*
  - *Location of installation and difficulty installing*
- *Cost variables will help determine the time period for an average cost*

- ***Data analysis will help us better understand assumptions and any potential updates that are needed***

Questions?

Table provides the average year services were installed that have been retired 2020 through 2024.

Customer Impacts

- **38% of NBS Customers & 27% of NJS Customers with longer service requirements will see higher costs due to excess service charges per ft after the service line limit**

- **Average residential customer will see $736.40 increase based on average service length**
  - **62% of NBS customers within the past 3 years would have had no impact**
  - **73% of NJS customer within the past 3 years would have had no impact**

- **20 lot Subdivision scenario –**
  - **$86,196.39 increase using the service line limit 92'**
  - **$88,783.94 increase using the average service length of 112'**
  - **$78,174.94 Typical Subdivisions have an average of 30' services for subdivisions**

- **Developments with larger lots & longer service requirements will see increase in upfront costs**
- **Customers requiring larger meters will only see increase in costs if service length exceeds limit**
- **Company is truing up recovery of costs of service based on current consumption data (2-year average) and current construction costs (3-year average)**

I. INTRODUCTION

Q. Please state your name and business address.

A. My name is Ann E. Bulkley. My business address is One Beacon Street, Suite 2600, Boston, Massachusetts 02108. I am a Principal at The Brattle Group ("Brattle"), a consulting firm that advises clients on regulatory finance and ratemaking issues.

Q. Are you the same Ann E. Bulkley that previously filed direct testimony in this proceeding?

A. Yes. I previously submitted direct testimony before the Michigan Public Service Commission ("MPSC" or the "Commission") in this proceeding on behalf of Consumers Energy Company ("Consumers Energy" or the "Company").

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to the issues raised in the testimonies of Kirk D. Megginson on behalf of the Commission Staff ("Staff"),[1] Sebastian Coppola on behalf of the Attorney General,[2] Matthew J. Bandyk on behalf of Citizens Utility Board of Michigan ("CUB"),[3] and Christopher Walters on behalf of the Association of Businesses Advocating Tariff Equity ("ABATE"),[4] regarding the just and reasonable return on equity ("ROE") for the Company in this proceeding. To the extent that I do not address a

[1] Michigan Public Service Commission, Case No. U-21806, Testimony of Kirk D. Megginson, April 23, 2025 ("Megginson Direct").

[2] Michigan Public Service Commission, Case No. U-21806, Testimony of Sebastian Coppola, April 23, 2025 ("Coppola Direct").

[3] Michigan Public Service Commission, Case No. U-21806, Testimony of Matthew J. Bandyk, April 23, 2025 ("Bandyk Direct").

[4] Michigan Public Service Commission, Case No. U-21806, Testimony of Christopher W. Walters, April 23, 2025 ("Walters Direct").

particular issue raised by these witnesses in my rebuttal testimony should not be viewed as acceptance of that issue.

Q. Are you sponsoring any exhibits in support of your rebuttal testimony?

A. I am sponsoring the following exhibits:

Exhibit A-127 (AEB-2) Cost of Common Shareholder's Equity; and

Exhibit A-128 (AEB-3) Jurisdictions Using ECAPM.

Q. Was this exhibit prepared by you or under your supervision?

A. Yes.

Q. Have you updated the cost of equity analyses that you presented in your direct testimony to reflect current market conditions?

A. Yes. As discussed in more detail herein, I have updated my cost of equity analyses based on market data through April 30, 2025. These results provide continual support for my recommended ROE range of 10.25% to 11.25% and the Company's requested ROE of 10.25%. While the analytical results of the cost of equity estimation models provide a starting point, I continue to base my recommendation on consideration of not only the results of multiple cost of equity models, but also other factors, including capital market conditions, the capital attraction and comparable return standards, and Company-specific risks.

Q. How is the remainder of your rebuttal testimony organized?

A. The remainder of my rebuttal testimony is organized as follows:

- Section II provides a summary and overview of my rebuttal testimony and the important factors to be considered in establishing the authorized ROE for the Company.

- Section III provides cost of equity analyses based on market data as of April 25, 2025.

- Section IV discusses the changes in capital market conditions since my direct testimony and their effect on the cost of equity and authorized ROEs for comparable utilities nationwide relative to the witnesses' ROE recommendations in this proceeding.

- Section V provides my response to the issues raised by the parties regarding the proxy group.

- Section VI provides my response to the issues raised by the parties regarding the Discounted Cash Flow ("DCF") model.

- Section VII provides my response to the issues raised by the parties regarding the Capital Asset Pricing Model ("CAPM") analysis.

- Section VIII provides my response to the issues raised by the parties regarding the Empirical CAPM ("ECAPM") analysis.

- Section IX provides my response to the issues raised by the parties regarding the Bond Yield Plus Risk Premium analysis.

- Section X provides the adjusted results of the cost of equity analyses of Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters based on the issues that I have identified with their respective analyses.

- Section XI provides my response to the issues raised by the parties regarding the Company's business risks.

II. SUMMARY OF ANALYSES AND CONCLUSIONS

Q. What factors should be considered in evaluating the results of the cost of equity analyses and establishing the authorized ROE?

A. The primary factors that should be considered are: (1) the importance of providing a return that is comparable to returns on alternative investments with commensurate risk; (2) the need for a return that supports a utility's ability to attract needed capital at reasonable terms; (3) the effect of current and expected capital market conditions; and (4) achieving a reasonable balance between the interests of investors and customers.

Q. Please summarize the ROE recommendations of the parties in this proceeding.

A. Figure 1 below summarizes the results of the cost of equity analyses presented by Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters in this proceeding and each of their final ROE recommendations. As shown, the ROE recommendations of Mr. Megginson and Mr. Coppola are 9.75%, Mr. Bandyk recommends 9.24%, and Mr. Walters recommends 9.45%. Despite a significant increase in interest rates since the Company's last rate proceeding suggesting a higher overall cost of capital, all intervening witnesses recommend an ROE for the Company lower than the Company's currently authorized ROE of 9.90 percent. None of their recommendations are reasonable or appropriate based on changes in the cost of equity as reflected in current market conditions and the Company's overall risk profile.

Figure 1: Summary of Cost of Equity Analyses Results and ROE Recommendations of Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters

Methods	Megginson	Coppola	Bandyk	Walters
DCF				
Constant DCF	9.40%	9.11%	-	8.38-8.70% and 10.74%-13.54%[5]
Two-Stage DCF	-	-	9.22%	-
Multi-Stage DCF	-	-	-	8.47%-9.26%
CAPM	8.25%-9.93%	10.66%	7.95%	8.72%-10.74%
Risk Premium	9.46%-9.72%	9.20%	-	9.73%-10.23%
Current Authorized ROE	-	-	9.90%	-
Recommended ROE Range	9.25%-10.25%	-	-	9.00%-9.90%
Recommended ROE	**9.75%**	**9.75%**	**9.24%**	**9.45%**

[5] Mr. Walters's results of 8.37% - 8.70% use a "sustainable growth" rate, and the results of 10.74% – 13.54% use analyst earnings growth projections.

Q. What are your key conclusions and recommendations regarding the appropriate ROE for the Company?

A. Nothing in the direct testimonies of Mr. Megginson, Mr. Coppola, Mr. Bandyk, or Mr. Walters has caused me to change my conclusions or recommendations. My key conclusions regarding a reasonable ROE for the Company in this proceeding are as follows:

Cost of Equity

- Updated cost of equity analyses based on data through April 25, 2025 continue to support the reasonableness of the Company's proposed ROE of 10.25%.
- Changes in market conditions and heightened uncertainty in the macro environment support a higher ROE than the Company's last proceeding, and Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters do not adequately consider current capital market conditions.
- Mr. Bandyk recommends an ROE that is more than a *65-basis point decrease* relative to the Company's currently authorized ROE, which is primarily a function of his CAPM estimate that is substantially below any authorized ROE for a natural gas or electric utility since at least 1980.
- When reasonable adjustments are reflected to the cost of equity analyses prepared by Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters to update and correct their analyses, it demonstrates that the Company's proposed ROE is reasonable.
    - The adjusted results of Mr. Megginson's, Mr. Coppola's, Mr. Bandyk's and Mr. Walters's analyses indicate a cost of equity in the range of 10.50% to 10.70%, which is higher than the Company's proposed ROE of 10.25%.
- There is no basis to Mr. Bandyk's claim that regulators have incorrectly authorized ROEs substantially higher than the cost of equity for decades.
- No intervening witness has independently evaluated the comparative risk of the Company relative to their respective proxy groups. Therefore, there is no basis to conclude that the risk factors that I evaluated in my direct testimony should not be considered.

III. COST OF EQUITY ANALYSES

Q. Have you prepared cost of equity analyses to support your rebuttal testimony?

A. Yes. I updated the results of the cost of equity analyses conducted in my direct testimony based on market data through April 25, 2025, to rebut the outdated cost of equity analyses provided by Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters. To develop my updated cost of equity analyses, I relied on the same methodologies used in my direct testimony except for one modification. In my direct testimony, I relied on projected earnings per share ("EPS") growth rates provided by *Yahoo! Finance* as one of the estimates of long-term growth in my constant growth DCF model; however, *Yahoo! Finance* no longer reports consensus projected three to five-year EPS growth rates. As a result, in my rebuttal testimony, I am now instead relying on the consensus projected three to five-year EPS growth rates reported by *S&P Capital IQ Pro* in my constant growth DCF model.

Q. What are the updated results of your cost of equity analyses?

A. Figure 2 summarizes the results of my updated analyses, which are also presented in Exhibit A-127 (AEB-2), pages 1 through 42.

Figure 2: Cost of Equity Model Results

Constant Growth DCF

	Minimum Growth Rate	Average Growth Rate	Maximum Growth Rate
Mean Results:			
30-Day Avg. Stock Price	9.99%	10.86%	11.68%
90-Day Avg. Stock Price	10.09%	10.97%	11.78%
180-Day Avg. Stock Price	10.17%	11.05%	11.86%
Average	10.08%	10.96%	11.77%
Median Results:			
30-Day Avg. Stock Price	9.78%	10.91%	12.14%
90-Day Avg. Stock Price	9.92%	11.06%	12.28%
180-Day Avg. Stock Price	10.10%	11.24%	12.47%
Average	9.93%	11.07%	12.30%

CAPM / ECAPM / Bond Yield Risk Premium

	30-Year Treasury Bond Yield		
	Current 30-Day Avg	Near-Term Projected	Longer-Term Projected
CAPM:			
Current *Value Line* Beta	11.25%	11.23%	11.22%
Current Bloomberg Beta	10.11%	10.05%	10.02%
Long-term Avg. *Value Line* Beta	10.23%	10.18%	10.14%
ECAPM:			
Current *Value Line* Beta	11.42%	11.40%	11.39%
Current Bloomberg Beta	10.56%	10.52%	10.49%
Long-term Avg. *Value Line* Beta	10.65%	10.61%	10.59%
Bond Yield Risk Premium	10.55%	10.41%	10.33%

Q. Do the updated results support the Company's requested ROE of 10.25% in this proceeding?

A. Yes. The results of each of the DCF analyses have increased since the filing of my direct testimony, while the results of my CAPM and ECAPM analyses are generally consistent

with those filed in my direct testimony (i.e. the results of some scenarios have slightly increased while others have slightly decreased). The results of the Bond Yield Risk Premium have generally increased modestly since the filing of my direct testimony. Therefore, as shown, the results of the cost of equity analyses continue to support my direct testimony and exhibits and the Company's proposed ROE of 10.25% in this proceeding.

IV. CAPITAL MARKET CONDITIONS AND A COMPARABLE RETURN

Q. Do any parties analyze capital market conditions and its impact on the Company's ROE?

A. Only Mr. Walters addresses capital market conditions in the context of setting an ROE,[6] while Mr. Coppola discusses interest rates in the context of mortgages, housing starts, and service connections.[7] Mr. Megginson and Mr. Bandyk do not discuss capital markets in any context.

Q. What do Mr. Walters and Mr. Coppola say about capital market conditions?

A. Mr. Walters believes that "economic activity is expanding solidly, with solid labor market conditions though inflation remains somewhat elevated," and cites a Federal Reserve Board statement from March 19, 2025 in support of this view.[8] Mr. Walters observes that there have been more credit downgrades than upgrades to utilities due to higher capital expenditures, wildfire risk, and uneven regulatory outcomes,[9] and he further observes that utility stocks have outperformed the broader market since the second half of 2021 due to a

[6] Walters Direct, at 11-21.
[7] Coppola Direct, at 20.
[8] Walters Direct, at 13.
[9] *Id*., at 17.

macro environment with "elevated inflation, rising interest rates, and uncertainty because of geopolitical events around the world."[10]

Mr. Coppola acknowledges that "persistently high inflation rates and other economic factors have prevented the Federal Reserve Bank from lowering interest rates with no clear expectation currently of further declines in 2025."[11] To account for "uncertainty of the timing in the decline in interest rates," Mr. Coppola arbitrarily adds 23 basis points to his cost of capital results of 9.52% to reach his recommended 9.75%.[12]

Q. Do changes in capital market conditions since the Company's last rate proceeding continue to indicate an increase in the cost of equity?

A. Yes. Changes in long-term bond yields since the Company's last rate proceeding, as well as since the filing of the Company's direct testimony in this proceeding, demonstrate an increase in the cost of capital. Specifically, as shown in Figure 3, although the federal funds rate has declined since the filing of the Company's direct testimony in this proceeding, long-term interest rates have increased 20 basis points over this period, which is indicative of an increase in the cost of equity. Core inflation has declined since the last rate proceeding and the filing of the direct testimony; although, it remains above the Federal Reserve's long-term target of 2.00%. The VIX, which is a measure of volatility, has increased significantly since both the Company's previous rate case and the Company's direct testimony in this proceeding, indicating heightened uncertainty in capital markets.

[10] *Id.*, at 20-21.
[11] Coppola Direct, at 20.
[12] *Id.*, at 153.

Figure 3: Change in Market Conditions Since Consumers Energy's Last Rate Proceeding[13]

Docket	Date	Federal Funds Rate	30-Day Avg 30 Year Treasury Bond Yield	Core Inflation Rate	30-Day Avg VIX Index
Previous Case: U-21490	7/23/2024	5.33%	4.44%	3.23%	13.04
Current Case: U-21806					
Direct	12/16/2024	4.58%	4.50%	3.21%	14.77
Rebuttal	4/30/2025	4.33%	4.70%	2.81%	28.20
Increase / (Decrease):					
Previous Case to Direct		-0.75%	0.05%	-0.01%	1.74
Previous Case to Rebuttal		-1.00%	0.26%	-0.42%	15.16

Q. Do you agree with Mr. Coppola's assessment of his recommended ROE in the context of current and projected interest rates?

A. Although I appreciate that Mr. Coppola attempts to consider the uncertainty in the direction of interest rate policy, his recommended ROE, which includes an arbitrary adjustment to his model results of 23 basis points is inadequate.[14] Current market conditions demonstrate that there is no basis for a reduction in the Company's currently authorized ROE of 9.90%, and further demonstrate that there has been an increase in interest rates and uncertainty that suggests that the investor-required return has increased since the Company's last rate proceeding.

Q. Do you agree with Mr. Walters's assessment of capital market conditions and its impact on the ROE?

A. No. While I agree with Mr. Walters's summary of macroeconomic conditions, I disagree with his contention that utilities have been performing well since the second half of 2021.[15]

[13] St. Louis Federal Reserve Bank; Bureau of Labor Statistics; Bloomberg Professional.

[14] Coppola Direct, at 153.

[15] Walters Direct, at 20-22.

In addition, Mr. Walters fails to sufficiently discuss the heightened uncertainty in the economy that has an impact on capital investments.

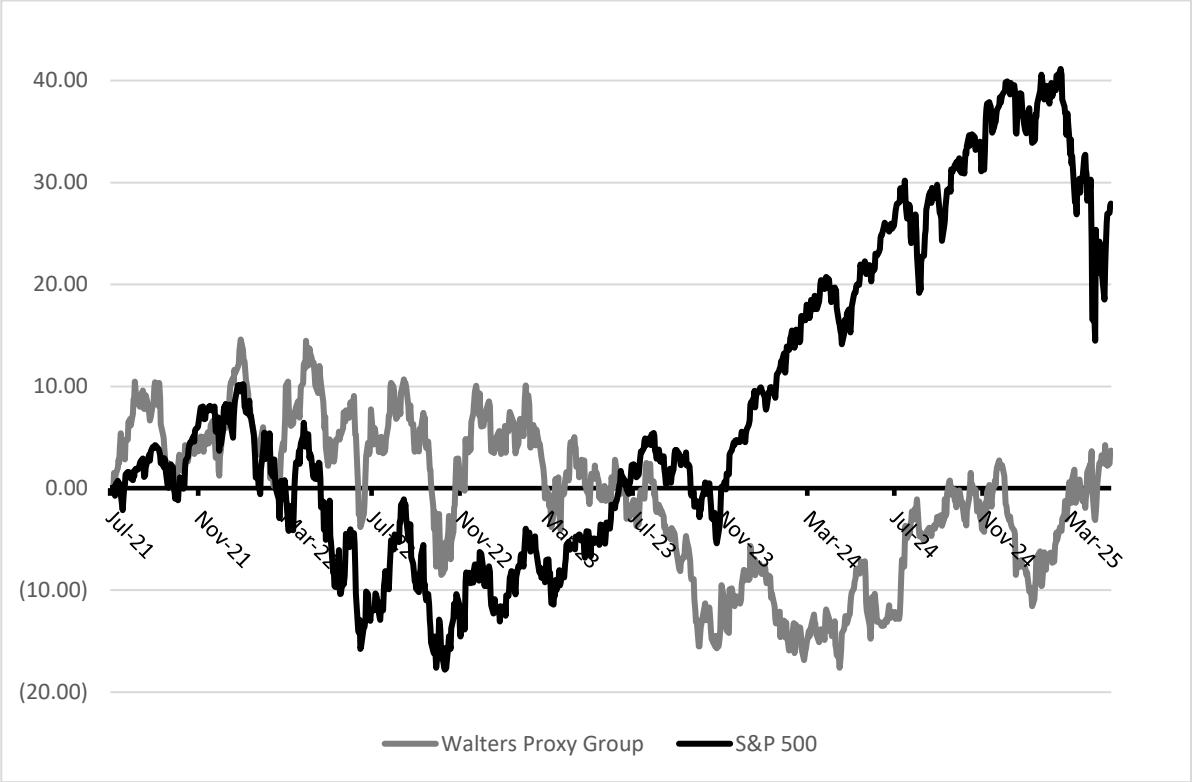
First, Mr. Walters's Figure CCW-4 provides misleading conclusions that the natural gas utility sector has outperformed the broader market in the recent period characterized by "elevated inflation, rising interest rates, and uncertainty because of geopolitical events around the world."[16] Specifically:

- Mr. Walters chooses to begin his analysis in the second half of 2021.
- Mr. Walters's S&P 500 Gas Utilities Sub Ind Index is misleading because there are only two gas utilities in the S&P 500, Atmos and NiSource, which is not representative of the entire natural gas industry.
- Mr. Walters does not show how water companies performed during this time, which is important considering he includes water companies in his proxy group, implying that he believes they have comparable risk profiles to natural gas utilities.

Figure 4 below shows the returns of the S&P 500 and Mr. Walters' proxy group since the second half of 2021, the same starting time-period Mr. Walters selects in his Figure CCW-4.[17] Because Mr. Walters views his proxy group as comparable to Consumers Energy, an index consisting of his proxy group companies is the appropriate benchmark to compare to the overall market. As shown in Figure 4, the S&P 500 significantly outperforms his proxy group; therefore, his conclusion that utilities have had "positive and relatively stable returns" is misleading.[18]

[16] *Id.*, at 21.
[17] Capital IQ Market Charts created a market capitalization weighted index.
[18] *Id*.

Figure 4: Mr. Walters' Weighted Proxy Group Return and S&P 500 Index Price Index July 2021 through April 2025[19]



In addition, despite mentioning it in passing, Mr. Walters does not sufficiently discuss uncertainty in macro conditions and its impact on capital markets and the cost of equity. He does not present any data on elevated volatility or market uncertainty. A recent article from *The Wall Street Journal* reports that companies are delaying investments and projects due to heightened uncertainty driven by the recent Trump tariffs.[20] Increased uncertainty means increased risk, which, all else equal, increases the cost of equity.

[19] *S&P Capital IQ*. Proxy group return is market capitalization weighted.

[20] Chip Cutter, "America Inc. Slashes Spending as Tariff Uncertainty Swirls," *The Wall Street Journal*, April 27, 2025.

Q. What are the expectations for inflation and monetary policy over the near-term?

A. At the March 2025 Federal Open Market Committee ("FOMC") meeting, Chairman Powell noted that labor market conditions are "solid" and while inflation has declined it remains above the Federal Reserve's target of 2.00%, as a result, the FOMC decided to maintain the current federal fund rate range of 4.25% to 4.50%.[21]

Regarding the possible path of monetary policy, Chairman Powell continued to reiterate that policy is "not on any preset course"; but he acknowledged increased uncertainly due to the implementation of significant policy changes (i.e. trade, immigration, fiscal policy, and regulation) by the Trump administration.[22] Mr. Walters' citation from the Federal Reserve notes that "[u]ncertainty around the economic outlook has increased."[23] Chairman Powell noted that the FOMC will continue to analyze incoming data to determine the effect of such policy changes and was in a good position to adjust the course of monetary policy if needed.[24] Thus, the FOMC's forecast of the federal funds rate remained unchanged from the December 2024 meeting, forecasting just two rate cuts before the end of 2025.[25]

More recently, during an event at the Economic Club in Chicago, Chairman Powell acknowledged that the recent tariff policy of the Trump Administration has caused volatility and uncertainty in the market, but that policy was currently well positioned and that the Federal Reserve could rely on incoming economic data to gain greater clarity on

[21] Transcript of Chair Powell's Press Conference, March 19, 2025.

[23] Walters Direct, at 13.
[24] *Id.*
[25] Federal Reserve, Summary of Economic Projections, March 19, 2025, at 2.

the economic effects of the tariffs before considering changes to policy.[26] Further, in regard to economic conditions, Chairman Powell reiterated that the labor market was "in solid condition" but he did acknowledge that tariffs would cause temporary inflation that could be more persistent depending on how long it takes the tariffs to fully flow through to prices which the Federal Reserve is monitoring.[27]

Q. Has the recent tariff policy of the Trump Administration resulted in increased volatility in financial markets?

A. Yes, financial markets have been extremely volatile since President Trump announced a significant set of tariffs on April 2, 2025. For example, as shown in Figure 5, the VIX, which measures investors' expectation of volatility in the S&P 500 over the next 30 days, has remained elevated since April 2, 2025, and peaked at 52.33 on April 8, 2025. The VIX has not reached 50.00 since April 2020 during the height of the COVID-19 pandemic. The high level of uncertainty associated with the economic effects of the Trump Administration's tariff policy has resulted in significant volatility increasing the risk of holding equity investments and implying an increase in the cost of equity.

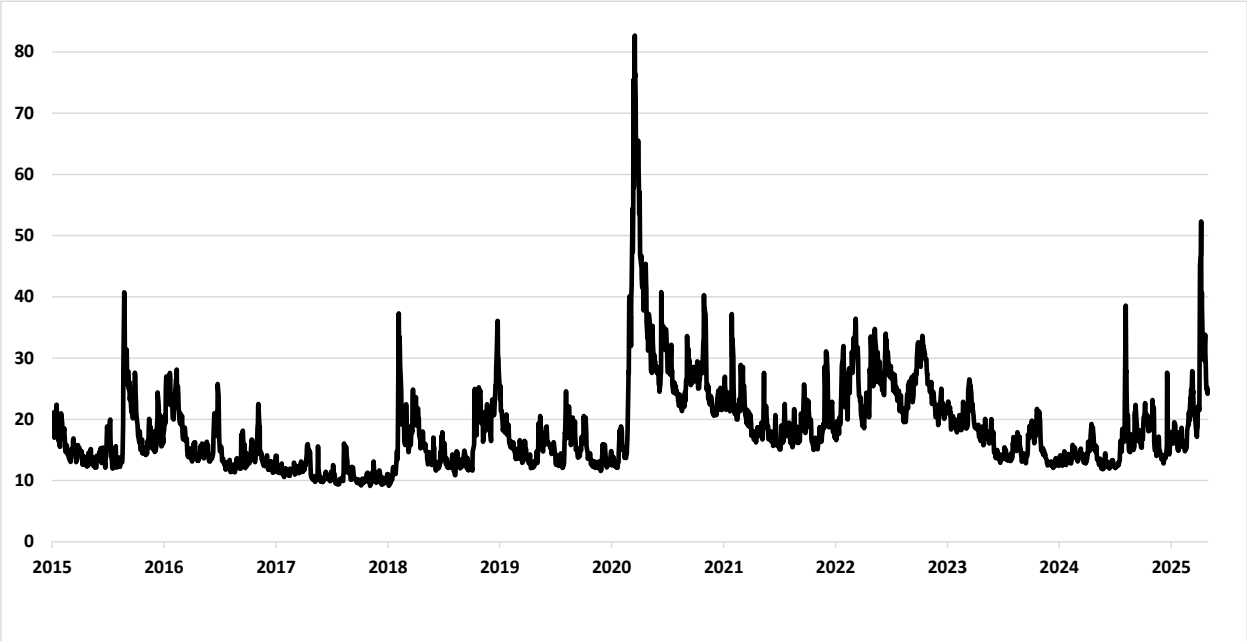
[27] *Id*.

Figure 5: CBOE VIX, January 2015 – April 2025[28]



Q. Have you reviewed any other indicators that show that the Trump Administration's tariff policy has resulted in increased uncertainty?

A. Yes. In addition to the recent high volatility as measured by the VIX, the University of Michigan's consumer sentiment index indicates consumer sentiment is at its second lowest point since 1952 and that inflation expectations are at the highest levels in 44 years.[29] Furthermore, a recent Bank of America Global Fund Manager Survey conducted in April 2025, shows investor sentiment at its 5th lowest point since the study began in 2001.[30]

[28] Bloomberg Professional Services.

[29] Harriet Torry, "'From anxious to petrified': Consumer sentiment plunges further," *Wall Street Journal*, April 11, 2025.

[30] Michael Hartnett, *et al*., "Global Fund Manager Survey: The Bear Necessities," *BoA Global Research*, April 15, 2025.

Q. What are investors' expectations for the yields on long-term government bonds given the sustained elevated levels of inflation and the Federal Reserve's restrictive monetary policy?

A. Economists and analysts are expecting elevated rates. *Blue Chip Financial Forecasts* provides a forecast from economists on the 30-year Treasury bond. In the most recently published *Blue Chip Financial Forecasts* report, economists projected the 30-year Treasury bond yield to remain relatively stable and decrease only slightly from 4.60% in Q2/2025 to 4.40% in Q2/2026.[31] Additionally, the most consensus estimate over the longer-term (i.e. 2026-2030) is 4.30%.[32] This is important because it means that long-term interest rates are expected to remain elevated during the period that the Company's rates will be in effect.

Q. What are your conclusions regarding current market conditions?

A. Although the federal funds rate and core inflation have decreased since the Company's last rate proceeding, the 30-year Treasury bond yield remains elevated and the VIX has significantly increased as a result of tariffs and the uncertainty related to the current administration's policies. Chairman Powell has indicated that the Federal Reserve is in wait-and-see mode and will rely on incoming data to determine when it is appropriate to adjust the federal funds rate. Furthermore, there are economic indicators that suggest both consumer and investor sentiment is weakening. With elevated expected interest rates, borrowing is more expensive, which in turn raises the cost of capital. As a result, investors demand higher returns on equity, leading to an increase in the cost of equity.

[31] *Blue Chip Financial Forecasts*, Vol. 44, No. 5, May 1, 2025, at 2.
[32] *Blue Chip Financial Forecasts*, Vol. 43, No. 12, November 27, 2024, at 14.

Q. What is Mr. Megginson's view on recently authorized ROEs?

A. Mr. Megginson provides the average authorized ROE for 2022, 2023, and 2024, which recognizes that the authorized ROEs have been increasing, from 9.53% to 9.72%. Mr. Megginson suggests that the three-year average is 9.63%, which he concludes is "well below" Staff's ROE recommendation of 9.75%.[33]

Q. Do you agree with Mr. Megginson's analysis of authorized ROEs?

A. No. As discussed in more detail in the remainder of my testimony, the relationship between the cost of equity and interest rates is important to consider. In averaging data for the three-year period from 2022 through 2024, Mr. Megginson fails to consider the interest rate environment over this time-period. As shown in Figure 4 of my direct testimony, in 2022, the yield on the 10-year Treasury bond was significantly lower than in current market conditions, beginning at 1.50% and increasing over the year, reaching approximately 4.25% by year end. Given the lag associated with the regulatory process, it is reasonable to expect that many of the ROEs that were authorized in 2022 were based on 2021 data or data as of the beginning of 2022; a time-period that does not reflect the current interest rate environment. Including data from 2022 in the average return that he uses to benchmark his proposed ROE in the current interest rate environment, is not an appropriate comparison.

[33] Megginson Direct, at 35.

Q. Have you reviewed more current authorized ROEs data than Mr. Megginson presented?

A. Yes. I reviewed the range of authorized ROEs in 2024 and the averages. While I agree with Mr. Megginson that the average authorized ROE in 2024 for natural gas utilities was 9.71%, the high end of the range was 11.88%.

Q. What is Mr. Bandyk's position regarding previously authorized ROEs?

A. Mr. Bandyk claims that the Commission, as well as all other regulatory commissions across the United States, have incorrectly authorized ROEs for decades. Mr. Bandyk cites three sources to support his claim. Specifically, Mr. Bandyk contends that regulated utilities have "been awarded ROEs above market return," and that "regulatory commissions have tended to accept estimates for ROE that are above fair, market-based ROE estimates."[34] Based on this assumption, Mr. Bandyk suggests that previously authorized ROEs should not be considered for purposes of establishing the ROE for the Company in this proceeding. Furthermore, Mr. Bandyk claims that the Commission's goal is to help maintain a utility's "financial integrity":

> But a return sufficient to maintain "financial integrity" only implies that the utility be able to attract capital – not that it can attract capital on the terms that it currently does. A utility can still attract capital with a lower ROE. For example, if a lower ROE causes the stock price to drop, that lower price will attract new investors.[35]

[34] Bandyk Direct, at 7.

[35] *Id*., at 8.

Q. Is Mr. Bandyk's position consistent with Mr. Megginson's, Mr. Coppola's, or Mr. Walters' testimony?

A. No, Mr. Bandyk is alone in his position. Mr. Megginson specifically considers previously authorized ROEs for natural gas utilities in developing his recommended ROE in this proceeding, Mr. Coppola also references previously authorized ROEs as support for his recommended ROE, and Mr. Walters analyzes trends in authorized ROEs when reviewing capital markets and his Risk Premium analysis. [36]

Q. Based on his position that regulators have consistently incorrectly authorized ROEs in the past, what is Mr. Bandyk's ROE recommendation for the Company?

A. Mr. Bandyk states that the average of his cost of equity model results suggests a market-based cost of equity for Consumers Energy that is lower than his recommended ROE of 9.24%. However, Mr. Bandyk acknowledges that there is uncertainty in any financial model and there is a need "not to create unnecessary instability in the company's market value, which is based to a great degree on the outcomes of regulatory proceedings like this one."[37] Therefore, Mr. Bandyk states that his ROE recommendation represents "gradualism" in moving from the Company's currently authorized ROE to his recommended ROE, despite his claim that his recommendation is higher than the market-based cost of equity for Consumers Energy.[38]

[36] Megginson Direct, at 35-36; Coppola Direct, at 146-147; Walters Direct, at 4-5, and 44.
[37] Bandyk Direct, at 12.
[38] *Id*.

Q. Does Mr. Bandyk indicate the point or range to which he believes the Company's ROE should transition to over time?

A. No. Mr. Bandyk has not defined where he believes the ultimate end point is of his proposed "gradualism."

Q. Do you agree with Mr. Bandyk's position?

A. No. Mr. Bandyk and I have a fundamental disagreement regarding his claim that regulators have incorrectly authorized ROEs substantially higher than the cost of equity for decades. I agree with him that: (1) there is a distinction between the cost of equity and the ROE authorized by regulatory commissions in setting just and reasonable rates; (2) the cost of equity cannot be definitively determined and therefore must be estimated by analysts; and (3) there is significant disagreement as to the way in which to estimate the cost of equity. However, he has provided no evidence that supports his position that regulatory commissions, including this Commission, have consistently erred for decades in establishing utilities' ROEs.

Q. Why is this disagreement with Mr. Bandyk so fundamental?

A. Regulatory commissions have an obligation to establish rates that balance the interests of customers and shareholders and that are just and reasonable. There is no evidence that Mr. Bandyk's estimate of the cost of equity, which includes the results of his CAPM analysis that is substantially lower than any ROE that has been authorized by a regulatory commission in the past, is in fact reasonable and that regulatory commissions have been consistently approving unjust and unreasonable rates.

Q. As a threshold matter, are you aware of any other regulatory jurisdiction in the United States that has adopted Mr. Bandyk's views?

A. No. I am not aware of any regulatory commission in the United States – state or Federal – that has adopted Mr. Bandyk's position.

Q. Are you aware of any regulatory commissions that have specifically disagreed with Mr. Bandyk's notion that there is and has been a substantial difference between authorized ROEs and the cost of equity for utilities?

A. Yes. For example, when the same argument was made by the Minnesota Department of Commerce, Division of Energy Resources, the Minnesota Public Utilities Commission clearly stated in a recent decision that it did not agree that utility ROEs have exceeded the cost of equity historically:

> The Department's recommended cost of equity of 9.30% is informed by an underlying assumption that the cost of equity and the return on equity are distinct concepts in the sense that utility earnings exceed the cost of equity over time. This understanding, according to the Department, undermines the reliability of earnings' estimates in predicting long-term growth and instead justifies the use of a multi-stage DCF analysis that uses GDP to forecast the long-term cost of equity. ***The Commission does not share this concern***.[39]

Q. Are you aware of examples where capital attraction and willingness to invest have been hampered when a regulatory jurisdiction is perceived as not being credit supportive?

A. Yes. Connecticut and Illinois are two recent examples. In Illinois, market reactions to regulatory decisions in December 2023 for Ameren Illinois Co. and Commonwealth

[39] Minnesota Public Utilities Commission, Docket No. E-015/GR-21-335, Findings of Fact, Conclusions, and Order, February 28, 2023, at 45; emphasis added.

Edison Co. were universally negative and both utilities considered shifting investment to their other utility operating subsidiaries outside of Illinois.

Connecticut, which is viewed by research analysts, equity analysts, and investors as among the least credit supportive jurisdictions in the United States for utilities, is the most recent example of where capital attraction and a willingness to invest have been hampered. For example:

- The two major utility holding companies operating in Connecticut (i.e. Eversource Energy ("Eversource") and Avangrid Inc. ("Avangrid")) have announced their unwillingness to continue discretionary investment in the state until the regulatory environment and cost recovery outcomes change.
- Avangrid's utility operating subsidiaries in Connecticut (i.e. Connecticut Natural Gas Corporation ("CNG") and Southern Connecticut Gas Company ("SCG")) have recently experienced difficulty fully subscribing bond issuances, and while able to do so, the premiums were higher than anticipated.

Specifically, in May 2024, Eversource, which owns Connecticut Light & Power and Aquarion Water in Connecticut, announced on its earnings call that it would be cutting investment by its utilities within the state due to "unreasonable, arbitrary decisions by the regulator," (i.e. the Public Utilities Regulatory Authority ("PURA")), and that the company had "grave concerns" regarding the Connecticut regulatory environment.[40] Eversource executives stated that the company is unwilling to place capital at risk within Connecticut given that the state's regulatory policy discourages investment.[41] Driving the cut in utility investment is Eversource's view that utility regulators have been slow to approve the recovery of $635 million in storm costs incurred from 2018 through 2021, $400 million in

[40] Mark Pazniokas, "Eversource escalates CT fight, saying it will cut investments," CT Mirror, May 2, 2024.

[41] Jared Anderson, "Eversource cutting investment in Connecticut by up to $500 million over 5 years," S&P Capital IQ Pro, May 3, 2024.

uncollected bills from ratepayers, a rate reduction imposed on Aquarion Water in its most recent rate proceeding, and elimination of a program supporting electric vehicles.[42] Consequently, Eversource stated that it is taking a "hard look" at its capital deployment priorities in Connecticut and plans to reduce its capital investment in Connecticut by $500 million over the next five years, which will likely come from reliability areas until "Connecticut's regulatory decisions come back into alignment with law and state policy."[43] Eversource indicated that it will not reduce safety spending, but that it has made significant investments in reliability over the past decade but is unwilling to continue doing so without a secure and predictable cost recovery path.[44] Moreover, since that time, Eversource has entered into an agreement to sell Aquarion Water.[45]

Similarly, Avangrid, which owns United Illuminating, CNG, and SCG in Connecticut, has also announced that its planned $191 million in capital investment in the state hinges on the regulatory decisions associated with the pending rate cases of CNG and SCG, and the resolution of Avangrid's ongoing legal appeal of PURA's August 2023 order whereby United Illuminating's rate request was reduced from $131 million to $23 million, which the utility says will require it to operate at a loss.

In addition, Avangrid has indicated that it experienced difficulties in attracting adequate subscription levels for debt issuances by its Connecticut utilities that closed in

[42] Mark Pazniokas, "Eversource escalates CT fight, saying it will cut investments," CT Mirror, May 2, 2024.

[43] Jared Anderson, "Eversource cutting investment in Connecticut by up to $500 million over 5 years," S&P Capital IQ Pro, May 3, 2024.

[44] *Id*.

[45] "Eversource Energy Announces Sale of Aquarion Water Company," Business Wire, January 27, 2025.

December 2023, and the bonds priced at a higher coupon rate than anticipated.[46] Specifically, as stated in its currently pending rate proceeding:

> The debt issuance was a private offering in which four banks served as lead placement agents and worked with the Company to market the transaction to investors in advance of pricing. On the day of pricing, November 15th, the subscriptions sought for CNG and SCG were only 65% and 50% fulfilled, respectively. This compares to the offering for one of the other Avangrid utilities which was more than two-times subscribed. After some additional negotiation, the banks were able to get one investor to fill the remaining portions of the issuance sought for CNG and SCG and the full transaction priced on the following day; however, the credit spreads were wider than anticipated across the Avangrid Connecticut utilities, raising the financing cost by approximately 10-15 basis points. *The bankers informed Avangrid that the difficulty in fulfilling the necessary subscription levels and the wider credit spreads attracted were caused in part by the limited interest to invest in Connecticut utilities due to concerns over the regulatory environment and potential impacts to current ratings*.[47]

Q. Have utilities shifted investment outside of a jurisdiction that is viewed as unsupportive?

A. Yes. After Eversource's announcement to curtail investment in Connecticut, Guggenheim Partners analyst Shahriar Pourreza noted that the threats to reduce investment should be taken seriously and that it has happened in other states, most recently in Illinois. Because utilities are capital intensive and inherently cash-flow negative, Mr. Pourreza stated that he has seen utilities that operate in multiple jurisdictions shift capital to where the return is more predictable.[48]

[47] *Id*., emphasis added.

[48] Mark Pazniokas, "Eversource escalates CT fight, saying it will cut investments," CT Mirror, May 2, 2024.

Q. What three sources does Mr. Bandyk cite to claim that awarded ROEs are too high and why are they not credible sources to support his conclusions?

A. The three sources that Mr. Bandyk cites are: (1) a paper published by Rode and Fischbeck (2019) on the growing market risk premium; (2) an Energy Institute *working paper* that Mr. Bandyk claims is published to presumably lend it more credibility; and (3) an op-ed article from *Fortnightly Magazine* from 2016 by a lawyer.[49] None of these sources credibly support Mr. Bandyk's claim that "public regulatory commissions on average have tended to set electric utility ROEs above what economists would arrive at using the widely-accepted methods for estimating ROE."[50]

Rode and Fischbeck (2019) is the only peer-reviewed published academic article, and it studies the spread between *electric* ROEs and risk-free rates. As a threshold matter, this paper does not look at *natural gas* ROEs. The paper does not use causal empirical techniques to support a conclusion that ROEs are too high. The paper only considers the CAPM model, and it does not evaluate the DCF and other considerations that may impact ROEs such as capital market conditions. Most strikingly, the authors conclude that "[o]ur research does not necessarily imply that the rates of return authorized by regulators are too high, or otherwise necessarily inappropriate for utilities."[51] Therefore the paper does not support Mr. Bandyk's conclusion that a "market-based ROE" should be lower than recently authorized ROEs.

[49] Bandyk Direct, at 5-6.

[50] *Id*., at 5.

[51] David Rode and Paul Fischbeck, "Regulated equity returns: A puzzle," *Energy Policy*, October 2019.

The working paper by Werner and Jarvis suffers from several limitations. First, the study, which benchmarks authorized returns to corporate bond yields and Treasury bond yields, incorrectly assumes that a 1.00 percentage point change in the yield on Treasury bonds will result in a 1.00 percentage point change in the authorized returns. However, the authors provide no references to studies or other information to support their assumption. Further, when the authors calculated an alternative scenario that assumed the authorized return would change at only half the rate of change in the Treasury yield (i.e. a 100 basis point increase in the Treasury yield would result in a 50 basis point increase in the authorized ROE), the spread between the estimated benchmark returns and the authorized returns decreased significantly and did not show an increasing trend over the study period, which suggests that their initial 1-to-1 relationship between the change in the yield on Treasury bonds and the change in authorized ROEs is flawed.[52]

Second, the authors acknowledged that their analysis, which compares authorized returns to the cost of equity estimates resulting from the CAPM, is highly dependent on the assumptions used to calculate the CAPM. Further, their analyses demonstrated the sensitivity of their results to the assumptions relied on in the CAPM. The authors used two CAPM analyses, with significantly different assumptions and demonstrated that the spread between the cost of equity results of these models and authorized returns were dramatically different. For example, the first CAPM analysis resulted in a spread between the estimated cost of equity and the authorized return of 3.89 percentage points in 2022, while the second

[52] Karl Dunkle Werner and Stephen Jarvis, "Rate of Return Regulation Revisited," Working Paper, Energy Institute, University of California at Berkeley, 2024, at 20.

CAPM analysis produced a spread of only 1.19 percentage points.[53] Therefore, this test demonstrated that their analysis was highly dependent on the assumptions used in the CAPM and did not support a conclusion that authorized ROEs were systematically higher than the cost of equity:

> Bolstering the financial expertise of regulators is another promising path forward. Seemingly objective methods like the capital asset pricing model cannot provide a definitive answer on the cost of equity. As we have documented, a range of plausible input assumptions can lead to widely divergent estimates of the cost of equity. When incorporating evidence from these methods regulators need to have the expertise to understand their limitations and push back on the assumptions utilities put forward when using them.[54]

Finally, the authors acknowledge that "there are many differences between the utility sector and investor environment in the US and UK," and these differences in the risk factors between utility operations in the United States and the United Kingdom ought to be addressed but are not addressed in their work.[55] Given that the authors acknowledge there are differences in the regulatory environments, yet have not considered the effect of those differences on the cost of equity for the electric and natural gas utilities in either the UK or US, it is not reasonable to conclude that the authorized ROEs in the US are too high based on a comparison to the returns authorized for utilities in the UK. As a result, the limitations of the Werner and Jarvis (2024) study do not support Mr. Bandyk's contention that US state regulatory commissions have consistently authorized ROEs in excess of the cost of equity.

[53] *Id*., at Appendix B.2 page 12.
[54] *Id*., at 39.
[55] *Id*., at 21.

The third source cited by Mr. Bandyk is an op-ed from *Public Utilities Fortnightly* from 2016 by Steve Huntoon, a utility attorney who claims that commissions set authorized ROEs at rates that are higher and not consistent to utilities' risk level.[56] As a threshold matter, although Mr. Huntoon has a background in energy, he is not a cost of capital expert, and this article is merely his opinion. Mr. Huntoon recommends individuals invest in Vanguard's utility ETF, VPU, because there have been periods where regulated utilities have outperformed the broader market. However, since the article's publication in August 2016, the VPU has significantly lagged the S&P 500 Index through April 30, 2025, with the VPU returning approximately 94% over this period, while the S&P 500 has returned approximately 199%.[57] Clearly, this refutes Mr. Bandyk's claims that utilities violate "the economic reality that lower risk means lower return."[58]

Q. Does Mr. Bandyk define "financial integrity" or at what point a utility will struggle to attract capital with a low ROE?

A. No. Mr. Bandyk believes that a utility can attract capital and new investors under any circumstances, regardless of a low ROE leading to a stock price decline.[59] This ignores the opportunity cost principle in finance. As discussed in my direct testimony, utilities compete for capital with other investments of similar risk.[60] If both ROE and stock price decrease, investors' required returns would increase as the perceived Company's risk increases. Mr. Bandyk does not suggest at what low ROE level it becomes infeasible to

[56] Steve Huntoon, "Nice Work If You Can Get It," *Fortnightly*, August 2016; Mr. Bandyk did not provide the article as the article is behind a paywall, and only two pages of the article is accessible.

[57] *S&P Capital IQ* from August 1, 2016 – April 30, 2025.

[58] Bandyk Direct, at 6.

[59] Bandyk Direct, at 8.

[60] *Id*., at 7.

attract capital, nor does he describe the difficulty Consumers Energy would face to fund its operations with a lower ROE and lower stock price.

In conclusion, I strongly disagree with Mr. Bandyk's suggestion that authorized ROEs have been set too high by regulatory commissions across the United States, including this Commission, and that ROEs of any level can attract adequate capital even with resulting lower stock price.

V. PROXY GROUP

Q. How have Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk specified their respective proxy groups?

A. To estimate the cost of equity for Consumers Energy, Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk develop their respective proxy groups as follows:

- Mr. Megginson utilizes a proxy group of eight companies, six of which overlap with my proxy group. Relative to my proxy group, Mr. Megginson includes two additional companies: New Jersey Resources ("NJR") and DTE Energy ("DTE"). While DTE did not meet the screening criteria applied by Mr. Megginson, he includes DTE because it is the "primary comparison utility" to Consumers Energy in Michigan.[61]

- Mr. Coppola relies on a proxy group of eight companies, six of which are the companies in my proxy group. The two additional companies in Mr. Coppola's proxy group are: Black Hills Corp. ("BKH") and Chesapeake Utilities ("Chesapeake").[62]

- Mr. Walters starts with the same proxy group that I have utilized, but excludes NiSource since, in early 2024, the company completed the sale of a 20% ownership interest in Northern Indiana Public Service Company ("NIPSCO"). In addition, Mr. Walters states that since there are only five companies remaining in the proxy group once he excludes NiSource, he includes six

[61] Megginson Direct, at 20.
[62] Coppola Direct, at 131.

additional water utilities in his proxy group in order to expand the proxy group.[63]

- Mr. Bandyk relies on the same proxy group for his cost of equity analyses as I have utilized.

Q. Do you have any concerns with the screening criteria relied upon by Mr. Megginson?

A. Yes, I disagree with Mr. Megginson's screen that ensures the companies included in the proxy group derive a certain portion of their operations from regulated natural gas distribution operations for two reasons. First, Mr. Megginson's screen relies on revenue instead of operating income. However, operating income is the more appropriate screening criterion because it better reflects the contribution of each business segment to the corporation's earnings. For regulated utilities that collect the cost of purchased gas, fuel, and/or power on a pass-through basis through rates, regulated revenue can fluctuate materially with changes in weather without affecting the corporation's earnings or financial position. In contrast, operating income, which excludes purchased commodity costs, more closely represents the effect of each business segment on the corporation's overall risk profile.

Second, Mr. Megginson requires that a company derive at least 50% of revenues from regulated natural gas distribution operations; however, the required percentage should be greater than 50% because Mr. Megginson's screen could result in a company being included in the proxy group that derives 50% of total revenue from unregulated operations. It is unreasonable to conclude that a company that derives 50% of total revenue from

[63] Walter Direct, at 30.

unregulated operations would be considered comparable to a company that derives 100% of revenue from regulated natural gas distribution operations such as Consumers Energy.

Q. Would the composition of Mr. Megginson's proxy group change had he relied on an operating income screen as opposed to a revenue screen?

A. Yes. If Mr. Megginson correctly relied on an operating income screen as opposed to a revenue screen, he would have excluded NJR from his proxy. As shown in Exhibit A-127 (AEB-2), page 25, NJR derived only 50.02% of its total operating income from regulated natural gas distribution operations for the three-year period of 2022-2024. While NJR would meet an operating income screen that, similar to Mr. Megginson's screen, required a company to have greater than 50% of total operating income derived from natural gas operations; as also shown in Exhibit A-127 (AEB-2), page 25, NJR derives only 56.48% of total operating income from regulated operations for the three-year period of 2022-2024. Therefore, NJR has significant unregulated operations and should have been excluded from Mr. Megginson's proxy group.

Q. Do you agree with Mr. Megginson's inclusion of DTE in his proxy group?

A. No. While I do not agree with the screening criteria developed by Mr. Megginson, he developed the criteria to select companies that would be viewed by investors as comparable to Consumers Energy's natural gas operations. However, as Mr. Megginson acknowledges, DTE did not meet his screening criteria. Furthermore, DTE is classified by *Value Line* as an electric utility because DTE provides electric service to approximately 2.3 million customers across Michigan and owns and operates approximately 12,000 MW

of electric generation.[64] As shown in Exhibit A-127 (AEB-2), page 25, DTE derived only 22.49% of total operating income from regulated natural gas operations for the three-year period of 2022-2024 whereas DTE derived 65.83% of total operating income from regulated electric operations. Given DTE's substantial electric operations, it is clear that DTE is not comparable to Consumers Energy's natural gas operations and should have been excluded from Mr. Megginson's proxy group. It is not reasonable to conclude as Mr. Megginson has that a company such as DTE should be included in the proxy group if the company operates in the same state as the subject company.

Q. Do any of the other witnesses include either NJR or DTE in their respective proxy groups?

A. No. Neither Mr. Coppola, Mr. Walters, nor Mr. Bandyk have included NJR or DTE in their respective proxy groups. Further, Mr. Coppola specifically notes that he excluded NJR because "it earns less than 50% of its income from the utility business".[65]

Q. Have you identified any errors in Mr. Coppola's application of his "utility business" screen?

A. Yes. Mr. Coppola appears to rely on a screen that requires a company to derive approximately 50% of its operations (as measured by either revenue, operating income or net income) from its utility business (i.e. regulated electric and natural gas operations) to be included in his proxy group.[66] However, Mr. Coppola incorrectly calculated the percentage of total operating income derived from regulated electric and natural gas

[64] DTE, 2024 Form 10-K, at 7-8.
[65] Coppola Direct, at 131.
[66] *Id*.

operations, which resulted in the erroneous inclusion of Chesapeake in Mr. Coppola's proxy group. Specifically, Mr. Coppola incorrectly classified the operating income associated with Chesapeake's natural gas transmission assets as operating income associated with its "utility business." Further, as shown in Exhibit AG-46, this classification is in direct conflict with his calculation for Atmos Energy where he excluded the pipeline business from its "utility business". As a result, as shown in Exhibit AG-46, Mr. Coppola incorrectly concluded that Chesapeake derived 86 percent of their total operating income from utility operations. However, as shown in Exhibit A-127 (AEB-2), page 25, excluding the operating income derived from natural gas transmission operations, Chesapeake derived only 44.03% of its total operating income from regulated electric and natural gas operations (i.e. "utility business") for the three-year period of 2022-2024. Further, excluding both the operating income from natural gas transmission operations and electric operations, Chesapeake only derived 39.52% of its total operating income from regulated natural gas operations, which, as shown in Exhibit A-127 (AEB-2), page 25, is less than NJR, a company that Mr. Coppola excluded from his proxy group. It is clear that Mr. Coppola should have excluded Chesapeake from his proxy group.

Q. Do you agree with Mr. Coppola's decisions to include BKH in his proxy group?

A. No. As Mr. Coppola acknowledges, BKH is classified by *Value Line* as an electric utility. Further, while I agree with Mr. Coppola that approximately 50% of the company's operating income is from natural gas utility operation, the reason that *Value Line* classifies BKH as an electric utility is that the company provides electric service to approximately 222,000 customers across four states and owns and operates approximately 1,400 MW of

electric generation.[67] The fact that the company has substantial vertically-integrated electric utility operations makes it not comparable to Consumers Energy's natural gas utility operations in Michigan.

Q. Do any of the other witnesses include either Chesapeake or BKH in their respective proxy groups?

A. No. Neither Mr. Megginson, Mr. Walters, nor Mr. Bandyk have included either Chesapeake or BKH in their respective proxy groups.

Q. Do you have any concerns with Mr. Walters's proxy group?

A. Yes. My primary concern with Mr. Walters's proxy group is that he excludes NiSource because he contends the company was engaged in a transformative transaction.

Q. Do you agree that companies engaged in transformative transactions should be excluded from the proxy group?

A. Yes. As noted in the proxy group screening criteria discussed in my direct testimony, I agree with Mr. Walters that significant merger and acquisition ("M&A") activity that materially affects a company's finances should be excluded from use in a proxy. The purpose of applying an M&A screen is to isolate companies that are involved in transformative transactions that cause a fundamental change in a company and its financials. The larger the size of the transaction, the greater the likelihood that the transaction will have a significant effect on the share prices of the firms involved. Thus, it is important to exclude the companies involved in transformative transactions from the proxy group so that the temporary effect of the transaction does not affect the inputs to the

[67] S&P Capital IQ Pro.

cost of equity analyses. However, excluding companies based on non-transformative transactions unnecessarily reduces the size of the proxy group and eliminates companies that investors would consider alternatives.

Q. Was the NiSource transaction transformative?

A. No. As Mr. Walters notes, NiSource announced the sale of a minority ownership interest in one of its subsidiary utilities (i.e. a 19.9% noncontrolling interest in NIPSCO) on June 20, 2023. However, this sale of a noncontrolling interest in NIPSCO did not affect the stock price of NiSource when the transaction was announced, and thus there is no reason to exclude it from the proxy group. Specifically, in the 10 trading days prior to the transaction announcement, NiSource's stock price traded between $25.76 and $26.36. Likewise, in the 10 trading days after the transaction announcement, NiSource's stock traded between $25.71 and $26.82 – or effectively the same range.[68] Thus, there is no evidence to suggest that NiSource's sale of a noncontrolling interest in NIPSCO was transformative, and thus, there is no basis to exclude NiSource from the proxy group.

Q. Are there other reasons that this transaction should not be the reason that NiSource is excluded from a proxy group at this time?

A. Yes. The transaction occurred in June 2023, which means that it is prior to the analytical period that was used by any of the witnesses in this proceeding. Since the transaction preceded the analytical period that is being used in this case, it cannot have an effect on the current market data, which is the reason that we eliminate transformative transactions. For

[68] Stock prices reflect the adjusted closing price for NiSource as reported by *Yahoo! Finance*.

this reason, it is unreasonable to exclude NiSource from the proxy group based on this transaction.

Q. Have the other witnesses included NiSource in their respective proxy groups?

A. Yes. Mr. Megginson, Mr. Coppola, and Mr. Bandyk have each included NiSource in their respective proxy groups.

Q. What is your conclusion regarding the appropriate proxy group for Consumers Energy?

A. I continue to support the use of the screening criteria outlined in my direct testimony to develop the proxy group for Consumers Energy.

VI. DCF ANALYSIS

Q. Please summarize the DCF analyses of these witnesses.

A. Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk have each conducted a form of the DCF analysis. Specifically:

- Mr. Megginson conducts a constant growth DCF, and for each of his proxy group companies relies on (1) an average of closing monthly stock prices as of January 1, February 1, and March 1, 2025; (2) annualized dividends that reflect one-half of the estimated growth rate; and (3) projected EPS growth rates from *Value Line* and *Zacks Investment Research* ("*Zacks*"). The average cost of equity resulting from Mr. Megginson's constant growth DCF analysis is 9.40%.[69]

- Mr. Coppola conducts a constant growth DCF, and for each of his proxy group companies relies on (1) an average of the 30-day high and low stock prices; (2) projected dividends as reported by *Value Line*; and (3) analysts' projected EPS growth rates as published by *Value Line* and *Zacks* as his growth rates.[70] Mr. Coppola does not rely on the projected EPS growth rates published by *Value Line*, but instead calculates projected EPS growth rates using the actual

[69] Megginson Direct, at 24.
[70] Coppola Direct, Exhibit AG-43.

EPS for 2024 and projected EPS for 2029 as published by *Value Line*. The average cost of equity from Mr. Coppola's constant growth DCF analysis is 9.11%.

- Mr. Walters conducts three DCF analyses: two constant growth DCF models (i.e. one version that relies on analysts' projected EPS growth rates and the other that relies on estimated sustainable growth rates), and a multi-stage DCF model. Mr. Walters' multi-stage DCF model relies on analysts' projected EPS growth rates in Stage 1 (years 1-5) and a growth rate of 4.14% in Stage 3 (year 11 onward) to represent projected long-term gross domestic product ("GDP") growth, while the growth rate in Stage 2 (years 6-10) transitions between the Stage 1 and Stage 3 growth rates.[71] The results of these analyses range from 8.38% to 13.54%.[72]

- Mr. Bandyk conducts a two-stage DCF analysis whereby he relies on: (1) an average of the 30-day high and low stock prices; (2) annualized dividends that I relied on in my direct testimony; (3) projected EPS growth rates that I relied on in my direct testimony; and (4) a projected nominal GDP growth rate of 3.80%. To calculate the growth rate, Mr. Bandyk applies a weighting of 80% to the average of the analysts' projected EPS growth rates and a weighting of 20% to his long-term growth rate of 3.80%.[73] The resulting cost of equity of Mr. Bandyk's constant growth DCF is 9.22%.

Q. What is your primary area of disagreement with the constant growth DCF analyses conducted by Mr. Megginson?

A. I have two primary concerns with Mr. Megginson's constant growth DCF model. First, as noted previously, I disagree with Mr. Megginson's inclusion of DTE and NJR in the proxy group. NJR has substantial unregulated operations and DTE has substantial vertically integrated electric utility operations; thus, neither company is comparable to Consumers Energy.

[71] Walters Direct, at 37-38.

[72] *Id.,* at 43.

[73] Bandyk Direct, at 23 and Exhibit CUB-18.

Second, while Mr. Megginson contends that he has relied on projected EPS growth rates from *Zacks* as of March 12, 2025, the projected EPS growth rates he relies on for each of the companies included in his proxy group do not appear to tie to the projected EPS growth rates reported by *Zacks*. For example, while I do not have access to the projected EPS report by *Zacks* on March 12, 2025, I did download from *Zacks* the projected EPS growth rates for each of the companies included in Mr. Megginson's proxy group as of February 28, 2025, and March 31, 2025. As shown in Figure 6 below, for seven of the eight companies included in Mr. Megginson's proxy group, the projected EPS growth rate from *Zacks* did not change from February 28, 2025 to March 31, 2025. However, of the seven companies that did not have a change in the projected EPS growth rate, Mr. Megginson reported a different growth rate for six out of the seven companies. Therefore, while the source of Mr. Megginson's projected EPS growth rates appears unclear, it is reasonable to conclude that they do not represent the projected EPS growth rates reported by *Zacks* on March 12, 2025.

Figure 6: Projected EPS Growth Rates – Zacks

Company	Ticker	Megginson (March 12, 2025)	Zacks (Feb. 28, 2025)	Zacks (March 31, 2025)
Atmos Energy Corporation	ATO	7.10%	7.10%	7.10%
DTE Energy Company	DTE	n/a	7.60%	7.60%
New Jersey Resources Corporation	NJR	6.00%	n/a	n/a
NiSource Inc.	NI	6.00%	8.20%	8.20%
Northwest Natural Gas Company	NWN	3.70%	n/a	n/a
ONE Gas, Inc.	OGS	3.98%	4.70%	4.70%
Southwest Gas Corporation	SWX	5.00%	6.60%	6.60%
Spire, Inc.	SR	5.62%	5.80%	6.50%

Q. Did you adjust Mr. Megginson's constant growth DCF analysis to reflect the issues you have identified?

A. Yes. Specifically, I adjusted Mr. Megginson's constant growth DCF analysis to: (1) exclude NJR and DTE from his proxy group; (2) rely on projected EPS growth rates from *Zacks* as of March 31, 2025. As shown in Exhibit A-127 (AEB-2), page 27, applying these reasonable adjustments and corrections to Mr. Megginson's constant growth DCF increases his constant growth DCF result 95 basis points from 9.40% to 10.34%.

Q. Did you also update Mr. Megginson's constant growth DCF analysis to reflect more recent market data?

A. Yes. Given the recent changes in market conditions referenced in Section IV, I updated Mr. Megginson's constant growth DCF analysis to reflect market data through April 30, 2025. As shown in Exhibit A-127 (AEB-2), page 28, when Mr. Megginson's analysis is updated with current data and DTE and NJR are excluded from his proxy group, the mean cost of equity results is 10.58%.

Q. What are your primary disagreements with Mr. Coppola's application of the constant growth DCF model?

A. In addition to the adjustment to Mr. Coppola's proxy group discussed in Section V above, I also disagree with Mr. Coppola's reliance on the projected EPS growth rates from *Zacks* that I relied on in my direct testimony which were as of September 30, 2024. The projected EPS growth rate from *Zacks* as of September 30, 2024 are clearly outdated and should have been updated by Mr. Coppola considering his constant growth DCF analysis relies on share prices through March 17, 2025.

Q. Have you adjusted Mr. Coppola's constant growth DCF analyses to address the issues you just discussed?

A. Yes, I have. I modified Mr. Coppola's constant growth DCF analysis to: (1) remove CPK and BKH from his proxy group, and (2) reflect market data (i.e. share prices, dividends, and growth rates) through April 30, 2025. As shown in Exhibit A-127 (AEB-2), page 30, by making these reasonable adjustments to Mr. Coppola's constant growth DCF analysis, the mean ROE result increases by 68 basis points from 9.11% to 9.79%.

Q. How does Mr. Walters use the results of his DCF models to establish his ROE recommendation?

A. While his specification of the DCF analyses have not changed, Mr. Walters's use of the DCF model results to establish his ROE range has changed over time. Specifically, Mr. Walters has gone from primarily weighting his constant growth DCF using projected EPS growth rates, to generally weighting all three of his DCF analyses equally, to now in the current proceeding, stating that he gives primary weight to his constant growth DCF using sustainable growth rates and his multi-stage DCF.[74]

[74] See, e.g., Oklahoma Corporation Commission, Case No. 2021-00164, Responsive Testimony of Christopher C. Walters, April 22, 2022, at 35, 38 and Exhibit CCW-3; Oklahoma Corporation Commission, Case No. 2022-000093, Responsive Testimony of Christopher C. Walters, March 7, 2023, at 35, 38 and Exhibit CCW-3; Wyoming Public Service Commission, Docket No. 20000-633-ER-23, Direct Testimony of Christopher C. Walters, August 14, 2023 at 41, 43 and WOCA Exhibit No. 602.5; Michigan Public Service Commission, Case No. U-21389, Direct Testimony of Christopher C. Walters, August 29, 2023, at 39, 42 and Exhibit AB-14.

Q. Why does Mr. Walters contend that primary weight should be placed on the results of his constant growth DCF model that relies on sustainable growth rates and his multi-stage DCF analyses?

A. Mr. Walters states that he supports placing less weight on his constant growth DCF that relies on analysts' projected EPS growth rates because the average projected EPS growth rate exceeds his projected GDP growth rate.[75]

Q. Is this rationale for the change in his approach credible?

A. No. While Mr. Walters offers this as his current rationale for limiting the weight on his DCF models that rely on EPS growth rates, the fact is that the average projected EPS growth rates that he has relied on in prior cases referenced previously have exceeded his projected GDP growth rates in each of those cases.

Q. Are the results of Mr. Walters' constant growth DCF using sustainable growth rates reasonable?

A. No. As a threshold matter, Mr. Walters' constant growth DCF results using the sustainable growth rate, which range from 8.38% to 8.70%, are not reasonable as they are either below or at the very low-end of the range of comparable authorized returns for natural gas utilities in the last 40 years, including even the lowest interest rate environments. The *Hope* and *Bluefield* decisions[76], which Mr. Walters acknowledges are standards to be followed in setting a just and reasonable return, require the authorized return to be comparable to other

[75] Walters Direct, at 42.

[76] *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) ("Hope"); *Bluefield Waterworks & Improvement Co., v. Public Service Commission of West Virginia*, 262 U.S. 679 (1923) ("Bluefield").

returns available to investors in companies with similar risk. Mr. Walters' constant growth DCF results using the sustainable growth rate do not meet this standard.

Q. Why do you disagree with Mr. Walters's constant growth DCF analysis that relies on sustainable growth rates?

A. The use of a sustainable growth rate in the DCF suggests there is a positive relationship between future earnings and the retention ratio; however, the amount of earnings retained and not paid as dividends varies as a result of management decisions as opposed to earnings that are largely market driven. For example, management may decide to: (1) conserve cash for capital investments; (2) manage the dividend payout for the purpose of minimizing future dividend reductions; (3) manage its capital structure; or (4) signal future earnings prospects. These decisions can and do influence the amount of earnings retained versus paid out as dividends, and such decisions have been seen recently in the market. For example, due to the economic effects of COVID-19, more than 40 S&P 500 companies temporarily suspended their dividends.[77]

Q. Is there academic research that supports your conclusion?

A. Yes. Zhou and Ruland (2006), Gwilym, et. al. (2006) and Vivian (2006) discussed the theory that high dividend payouts (i.e. low retention ratios) are associated with low future earnings growth.[78] Each of these studies also cited Arnott and Asness (2003) that found,

[77] Karen Langley, "U.S. Companies Slashed Dividends at Fastest Pace in More Than a Decade," *The Wall Street Journal*, July 8, 2020.

[78] Ping Zhou and William Ruland, "Dividend Payout and Future Earnings Growth," *Financial Analysts Journal*, Vol. 62, No. 3, 2006; Owain Gwilym, James Seaton, Karina Suddason, and Stephen Thomas, "International Evidence on the Payout Ratio, Earnings, Dividends and Returns," *Financial Analysts Journa*l, Vol. 62, No. 1, 2006; Andrew Vivian, "The Payout Ratio, Earnings Growth Returns: UK Industry Evidence," Working Paper, School of Economics, Finance and Business, University of Durham, 2006.

over the course of 130 years of data, future earnings growth is associated with high, rather than low payout ratios.[79] Specifically, Arnott and Asness (2003) concluded:

> Unlike optimistic new-paradigm advocates, we found that low payout ratios (high retention rates) historically precede low earnings growth. This relationship is statistically strong and robust. We found that the empirical facts conform to a world in which managers possess private information that causes them to pay out a large share of earnings when they are optimistic that dividend cuts will not be necessary and to pay out a small share when they are pessimistic, perhaps so that they can be confident of maintaining the dividend payouts. Alternatively, the facts also fit a world in which low payout ratios lead to, or come with, inefficient empire building and the funding of less than-ideal projects and investments, leading to poor subsequent growth, whereas high payout ratios lead to more carefully chosen projects. The empire-building story also fits the initial macroeconomic evidence quite well. At this point, these explanations are conjectures; more work on discriminating among competing stories is appropriate.[80]

All four studies found that there is a negative, not a positive, relationship between earnings growth rates and retention ratios. As such, Mr. Walters's reliance on retention growth rates in the constant growth DCF model is not appropriate.

Q. Are there other reasons why you believe that sustainable growth rates should not be used in the DCF model?

A. Yes. First, the use of the sustainable or retention growth rates involves estimating investor expectations for four separate variables over the near-term: (1) the retention ratio, reflected as the "b" variable; (2) the expected return on book equity, reflected as the "r" variable;

[79] Robert Arnott and Clifford Asness, "Surprise: Higher Dividends = Higher Earnings Growth," *Financial Analysts Journal*, Vol. 59, No. 1, January/February 2003. Since the payout ratio is the inverse of the retention ratio, the authors found that future earnings growth is negatively related to the retention ratio.

[80] *Id*.

(3) the growth in the number of share of common equity, reflected as the "s" variable; and (4) the portion of the market-to-book ratio that exceeds unity, reflected as the "v" variable. This means that the growth estimate includes the forecasting error of the four separate variables.

Second, Mr. Walters relies on two growth rates that he suggests represent the long-term growth of the proxy group (i.e. the sustainable growth rate assumed in his constant growth DCF analysis and the long-term growth rate assumed in his multi-stage DCF analysis); however, these assumed growth rates are significantly different from one another and affect the results of his DCF analyses. The average long-term "sustainable" growth rate that Mr. Walters relies on in a constant growth DCF model is 5.32%.[81] Mr. Walters states that the sustainable growth rate is limited by the projected long-term GDP growth rate as that reflects the projected long-term growth in the economy as a whole, yet this growth rate is inconsistent with the long-term growth rate that he assumes in his multi-stage DCF model (i.e. 4.14%).[82]

Finally, the use of sustainable growth rates ignores the extensive academic research demonstrating that EPS growth rates are most relevant in stock price valuation.[83]

Evidence from stock

Continued on next page

Q. Do you agree with Mr. Walters' and Mr. Bandyk's use of multi-stage DCF analyses to estimate the ROE for the Company?

A. No, I do not. The utility industry is considered a mature industry due to its regulated status and relatively stable demand. Thus, financial projections such as earnings growth rate projections are also likely to be relatively stable over the long-term. The relative stability of the financial forecasts for utilities supports the use of a constant growth DCF model to estimate the cost of equity for a mature industry like utilities. As noted, both Mr. Megginson and Mr. Coppola also conduct constant growth DCF analyses and do not rely on a multi-stage DCF model. For these reasons, the constant growth DCF model is the more appropriate model to estimate the cost of equity for the Company rather than the multi-stage analyses conducted by Mr. Walters and Mr. Bandyk.

Q. Do the two-stage and multi-stage forms of the DCF model increase the number of subjective inputs required to estimate the DCF model?

A. Yes. The multi-stage DCF model introduces additional assumptions and potential analyst bias. Specifically, the multi-stage DCF models presented by Mr. Walters and Mr. Bandyk in this proceeding resulted in the following additional assumptions that require subjective judgment:

- Specification of the Model: In this case, Mr. Bandyk and Mr. Walters present two different specifications of the model (i.e. Mr. Bandyk presents a two-stage growth DCF which is a form of the constant growth DCF model but relies on a blended growth rate calculated using a weighted average of short-term and long-term growth, and Mr. Walters presents a multi-stage DCF with three stages of growth).

recommendations and career outcomes," *Journal of Accounting and Economics*, Vol. 53 Issues 1-2, February-April 2012.

- Selection of the Growth Rates: Mr. Bandyk's DCF that relies on a blended growth rate requires selecting a short-term and long-term growth rate, while Mr. Walters's multi-stage DCF with three stages of growth requires the additional selection of an intermediate growth rate.

- Weighting Factors for the Blended Growth Rate: Mr. Bandyk places 80% weight on the short-term growth rate and 20% on the long-term growth rate when calculating his blended growth rate, which is consistent with the Federal Energy Regulatory Commission ("FERC") methodology.[84] The selection of the weighting factor will have a direct effect on the result produced by Mr. Bandyk's two-stage DCF model.

- Duration of Each Stage of the Multi-Stage DCF Model: For his multi-stage DCF model with three stages of growth, Mr. Walters assumes stage 1 growth is years 1-5, stage 2 growth is years 6-10, and stage 3 growth is year 11 and after.

Given the number of additional subjective assumptions required, it is reasonable to conclude that a multi-stage DCF analysis creates greater opportunity for an analyst to influence the results of the DCF model.

Q. How do you respond to Mr. Walters' and Mr. Bandyk's contention that the use of projected EPS growth rates is not consistent with the infinite time horizon in the DCF model?

A. There are multiple reasons why there is no basis to Mr. Walters's and Mr. Bandyk's claims.

First, both Mr. Bandyk[85] and Mr. Walters[86] appear to support their conclusion by comparing the projected EPS growth rates to their respective projected GDP growth rates, noting that it is not reasonable to assume that utilities can grow at a rate that is greater than

[84] FERC Opinion No. 569-A, issued May 21, 2020, at P57.
[85] Bandyk Direct, at 22-23.
[86] Walters Direct, at 64-65.

the economy over the long-term. However, this comparison relies entirely on the accuracy of Mr. Bandyk's and Mr. Walters' estimate of the long-term GDP growth rate.

Second, considering the empirical studies comparing the total factor productivity ("TFP") growth of the utility industry relative to the economy, it is not unreasonable to assume that earnings growth for utilities could exceed GDP growth over the long term. In a study filed as part of the Rate Regulation Initiative of the Alberta Utilities Commission, the authors calculated TFP growth[87] for 72 U.S. electric and combination electric and natural gas utilities and for the U.S. economy for the period of 1972 through 2009. For the U.S. utility group, TFP growth averaged 0.96% over the period of 1972 to 2009,[88] while TFP growth for the U.S. economy was 0.91%,[89] indicating that electric and combination electric and natural gas utilities were approximately 5% more productive than the U.S. economy over the study period. Therefore, the authors demonstrated that utility growth exceeded growth for the U.S. economy for approximately 40 years.

Q. Is there academic research that refutes Mr. Bandyk's and Mr. Walters' contention that the use of analysts' projected EPS growth rates is not consistent with a long-term growth rate that matches investors' expectations of the domestic economy as a whole.

A. Yes. Both Mr. Walters and Mr. Bandyk support their conclusion that a multi-stage DCF is necessary by comparing the analysts' projected EPS growth rates to their respective projected GDP growth rates and suggests that it is not reasonable to assume that utilities

[87] TFP growth is a measure of productivity calculated as the difference between output growth and input growth. Higher TFP growth indicates that a company is converting inputs into higher levels of output growth (i.e. increased productivity).

[88] Alberta Utilities Commission, Jeff Makholm and Agustin Ros, "Update, Reply and PBR Plan Review for AUC Proceeding 566 – Rate Regulation Initiative", February 22, 2012, at 5.

[89] *Id*., at 19.

can grow at a rate that is greater than the economy over the long term. However, as noted above, there is significant academic literature that supports the use of earnings growth rates in the DCF analysis and texts that challenge the assumption of GDP growth used in a multi-stage DCF model. For example, in a recent publication, Dr. Roger Morin notes the following:

> One central assumption in Multi-Stage DCF models, and a potential Achilles' heel, in my view, is that utility growth rates will eventually match the growth of the macroeconomy usually measured by the growth of the Gross Domestic Product (GDP). I am not aware of any financial literature supporting the notion that utility earnings per share are expected to grow at the average growth of the economy, or GDP.
>
> As discussed in Chapter 10, based upon the wealth of empirical and academic literature that supports the superiority of analyst's forecasts as a measure of investor expectations for the use of such forecasts in the DCF model, current earnings growth forecasts are the appropriate growth rates to use in a DCF analysis. Besides, to the extent that economic trends influence growth, it is reasonable to assume that they are already captured in analysts' growth estimates for utilities.
>
> Multi-stage DCF applications appear somewhat disconnected from the assumptions of the method and the consensus expectations of investors. The investment community does not look to GDP growth over the next several decades when evaluating an investment in utility stocks, nor does it anticipate a series of discrete muti-stage decennial stages. I am not aware of any evidence that investors evaluate the future based on the assumptions and data sources required to apply the two-stage or three-stage DCF model.[90]

[90] Roger A. Morin, *Modern Regulatory Finance*, Public Utilities Reports, Inc., 2021, at 486.

Q. How do Mr. Bandyk and Mr. Walters develop their projected GDP growth rates?

A. Mr. Bandyk relies on the projected nominal GDP growth rate over the period of 2028-2035 from the Congressional Budget Office ("CBO") of 3.80%.[91] Mr. Walters relies on a projected nominal GDP of 4.14% as reported by *Blue Chip Economic Indicators*.[92]

Q. Do you agree with Mr. Bandyk's and Mr. Walters's projected GDP growth rate?

A. No. Mr. Bandyk relies on a projected nominal GDP growth rate from CBO for the period of 2028 to 2035. However, Mr. Bandyk's two-stage DCF analysis relies on a blended growth rate that continues into perpetuity. Therefore, the projected nominal GDP growth rate from CBO would only reflect growth for the seven-year period of 2028 through 2035, even though his two-stage DCF model extends into perpetuity. In other words, his assumed long-term growth rate only covers a small portion of the long-term period to which it is being applied in his DCF analyses. As a result, the projected GDP growth rates from CBO may not be indicative of the expected growth in GDP over the long term, and therefore, cannot be used as the basis to conclude that the projected EPS growth rate for my proxy group will not be sustained in perpetuity.

Mr. Walters relies on a projected nominal GDP growth rate of 4.14% as reported by *Blue Chip Economic Indicators,* which is only for the next 5 to 10 years. As a result, similar to the growth rate of CBO relied on by Mr. Bandyk, the projected GDP growth rate from *Blue Chip Economic Indicators* may not be indicative of the expected growth in GDP over the long term and therefore cannot be used to conclude that my projected EPS growth rates are not sustainable.

[91] Bandyk Direct, at Exhibit CUB-19.
[92] Walters Direct, at 40.

Q. Is Mr. Walters's assumed long-term growth rate in his multi-stage DCF consistent with the analyst literature that he relies on?

A. No. Mr. Walters's assumed long-term growth rate in his multi-stage DCF of 4.14% is inconsistent with the analyst literature he cites in his testimony. When discussing the long-term growth rate for his multi-stage DCF, Mr. Walters references the following quote from the *Ibbotson* SBBI 2013 Valuation Yearbook:

> Another approach to estimating long-term growth rates is to focus on estimating the overall economic growth rate. Again, this is the approach used in the *Ibbotson Cost of Capital Yearbook*. To obtain the economic growth rate, a forecast is made of the growth rate's component parts. Expected growth can be broken into two main parts: expected inflation and expected real growth. By analyzing these components separately, it is easier to see the factors that drive growth.[93]

However, Mr. Walters cites only a portion of the quote and omits the remainder of the discussion, which indicates that his assumed long-term growth rate is inconsistent with the approach recommended by *Ibbotson* for establishing a long-term growth rate:

> Once the long-term expected inflation rate is estimated, the real growth rate must be determined. The growth rate in real Gross Domestic Product (GDP) for the period 1929 to 2012 was approximately 3.22 percent. Growth in real GDP (with only a few exceptions) has been reasonably stable over time; therefore, its historical performance is a good estimate of expected long-term (future) performance.
>
> By combining the inflation estimate with the real growth rate estimate, a long-term estimate of nominal growth is formed.[94]

[93] *Id.,* at 39.

[94] *Morningstar, Inc*., Ibbotson SBBI 2013 Valuation Yearbook, at 52.

The *Ibbotson* SBBI 2013 Valuation Yearbook recommends that the long-term growth rate reflect the sum of the long-term historical average real GDP growth rate and the expected inflation rate. As shown in Exhibit A-127 (AEB-2), page 31, had Mr. Walters used the *Ibbotson* approach, based on the full citation, taking into consideration the real GDP growth rate and expected inflation, the resulting long-term growth is 5.45%. As a result, Mr. Walters understates the long-term growth rate consistent with *Ibbotson's* methodology that he cites in his testimony.

Q. If Mr. Walters had appropriately included NiSource in his proxy group and placed primary weight on the results of his constant growth DCF model that relies on analysts' EPS growth rates consistent with his approach in prior proceedings, what is the resulting cost of equity?

A. As shown in Exhibit A-127 (AEB-2), page 33, when Mr. Walters' constant growth DCF relying on analysts' projected EPS growth rates is updated to rely on a proxy group including NiSource, the median cost of equity result is 11.05%.[95]

Q. Did you also adjust Mr. Bandyk's DCF analysis?

A. Yes. I modified Mr. Bandyk's DCF analysis to: (1) rely on the constant growth DCF model as opposed to the two-stage DCF model; and (2) reflect market data (i.e. share prices, dividends, and growth rates) through April 30, 2025, because Mr. Bandyk was relying on the annualized dividends and projected EPS growth rates that I relied on in my direct

[95] The mean was not considered due to a projected EPS growth rate for California Water Service Group of approximately 42 percent from Zacks, S&P and I/B/E/S, which has a significant effect on the average. It is more appropriate to rely on the median which is not affected to a large degree by the presence of outliers.

testimony which are outdated.[96] As shown in Exhibit A-127 (AEB-2), page 35, by making these reasonable adjustments to Mr. Bandyk's DCF analysis, the mean ROE result increases by from 9.22% to 10.99%.

VII. CAPM ANALYSIS

Q. Please summarize the CAPM analyses prepared by Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk.

A. Mr. Megginson conducts three CAPM analyses, one using a historical market risk premium, and two additional scenarios using different implied projected market risk premia, one based on the trailing 12-month cash yield and the other based on the average cash yield over the past 10 years.[97] For all three of his CAPM analyses, Mr. Megginson relies on (1) a risk-free rate of 4.25%, which is based on a weighted average of projected 30-year Treasury bond yields for 2025 and 2026 as reported by S&P Global Market and *econforecasting.com*; and (2) current betas for each of the proxy group companies as published by *Value Line*. Mr. Megginson calculates his historical market risk premium, which is 6.94%, as the arithmetic mean realized return on large company stocks over the period 1928-2024 minus the income-only total return on long-term government bonds over that same period. For each of his CAPM scenarios relying on a projected market risk premium, Mr. Megginson relies on data reported by Professor Damodaran. The average cost of equity result of Mr. Megginson's CAPM analyses are 10.63% (historical market

[96] In my direct testimony, I relied on projected EPS growth rates from *Yahoo! Finance*; however, *Yahoo! Finance* is no longer reporting projected EPS growth rates. Therefore, when updating my constant growth DCF analysis in my rebuttal testimony, I instead relied on projected EPS growth rates from S&P Capital IQ Pro. Thus, when adjusting Mr. Bandyk's DCF analysis, I relied on projected EPS growth rates from S&P Capital IQ Pro in addition to the projected EPS growth rates from *Zacks* and *Value Line*.

[97] Megginson Direct, Exhibit No. S-4, Schedule D-5, at 8-9.

risk premium), 8.25% (12-month trailing projected market risk premium), and 9.93% (10-year projected market risk premium).[98]

Mr. Coppola conducts a CAPM analysis that relies on (1) a risk-free rate of 4.00%, based on the near-term projected 30-year Treasury bond yield as reported by *Blue Chip Financial Forecasts* as of October 1, 2024; (2) current betas for each of the proxy group companies as published by *Value Line*; and (3) a market risk premium of 7.30%, which is the historical market return of large company stocks minus the income-only return on long-term government bonds from 1926 through 2023 as published by *Kroll*.[99] The cost of equity resulting from Mr. Coppola's CAPM analysis is 10.66%.

Mr. Walters produces 12 different cost of equity estimates from his CAPM analysis, relying on different estimates of the risk-free rate, beta, and market risk premium. Specifically, for the risk-free rate, Mr. Walters relies on a projected 30-year Treasury yield in eight scenarios, and a *Kroll* "normalized" risk-free rate in the remaining four scenarios. For beta, Mr. Walters relies on four estimates for the proxy group companies: (1) current five-year betas published by *Value Line*; (2) historical average betas published by *Value Line*; (3) current beta estimates from S&P Market Intelligence's Beta Generator ("Market Intelligence"); and (4) current three-year raw betas published by Market Intelligence and then applying the Blume adjustment similar to *Value Line's* adjustment. For the market risk premium, Mr. Walters also relies on three estimates: (1) the long-term historical arithmetic average real return on the S&P 500 plus an expected inflation rate, less the risk-free rate; (2) a constant growth DCF-derived return on the S&P 500, averaging the

[98] Megginson Direct, at 27-30 and Exhibit S-4, Schedule D-5, at 7-9.
[99] Coppola Direct, at 134-136 and Exhibit AG-44.

method prescribed by FERC in Order No. 569-A with an alternative where all the companies in the S&P 500 are used rather than just the dividend-paying companies, less the risk-free rate; and (3) a "normalized" market risk premium published by *Kroll*. Mr. Walters's CAPM results produce a cost of equity range from 8.19% to 11.44%.[100]

Mr. Bandyk's CAPM analysis relies on (1) a risk-free rate of 4.41%; (2) current betas for each of the proxy group companies as published by *Value Line* and Bloomberg, but adjusted to remove the Blume adjustment reflected in those betas such that he relies on the raw betas; and (3) an estimated market risk premium that is an average of three sources: Professor Damodaran; the IESE Business School survey; and *Kroll*.[101]

A. Risk-Free Rate

Q. Is the risk-free rate that Mr. Coppola relies on in his CAPM analysis reasonable?

A. No. Mr. Coppola's risk-free rate is outdated and does not reflect current expectations and therefore should not be relied upon. Specifically, Mr. Coppola relies on a risk-free rate of 4.00% based on the *Blue Chip Financial Forecasts* as of October 1, 2024, and states that his 4.00% risk-free rate is "forecasted for the first quarter of 2026, which is about the mid-point of the projected test year."[102] However, the *Blue Chip Financial Forecast* is a monthly publication, and thus Mr. Coppola's analysis should have been based on the most recent data available. It is unclear why Mr. Coppola relies on an outdated risk-free rate that is more than six months old given the availability of more current data prior to the filing of his testimony on April 23, 2025.

[100] Walters Direct, at 49-58 and Exhibit AB-20.
[101] Bandyk Direct, Exhibits CUB-15, CUB-16, and CUB-17.
[102] Coppola Direct, at 140.

Q. Is the current consensus estimate of the 30-year Treasury bond yield significantly different than assumed in Mr. Coppola's CAPM analysis?

A. Yes. As reported in the most recent publication of the *Blue Chip Financial Forecasts*, the consensus estimate of the 30-year Treasury bond yield for the first quarter of 2026 as relied on by Mr. Coppola is 4.50%.[103]

Q. Is Mr. Megginson's calculation of the risk-free rate similarly understated?

A. Yes, at least in part. As noted, Mr. Megginson relies on two projections of the 30-year Treasury bond yield for his risk-free rate: a projection published by S&P Global Market Intelligence from IHS Markit and a projection published by *econforecasting.com*. While I do not have access to the source of Mr. Megginson's risk-free rate published by S&P Global Market Intelligence from IHS Markit, the current projections from *econforecasting.com* indicate a projected 30-year Treasury bond yield for the remainder of 2025 of 4.69%, and for calendar year 2026 of 4.12%.[104] Even assuming no change in Mr. Megginson's S&P Global Market Intelligence data, the resulting risk-free rate, when updating the *econforecasting.com* data and weighting the sources in the same manner as Mr. Megginson has in his testimony, results in a risk-free rate of 4.38% as compared to Mr. Megginson's assumed 4.25%.

[103] *Blue Chip Financial Forecasts*, Vol. 44, No. 4, April 1, 2025, at 2.

[104] *econforecasting.com*; data accessed as of April 28, 2025.

B. Market Risk Premium

Q. What is the primary criticism that you have of the development of the market risk premium used by each of the witnesses recommending an ROE for the Company in this proceeding?

A. Each of the other witnesses in this proceeding develop their market risk premium independent from the risk-free rate that they are using in their CAPM analyses, which ignores the academic research that there is an inverse relationship between the risk-free rate and the market risk premium.[105] As I will discuss, this misalignment of the risk-free rate and market risk premium in their respective CAPM analyses serves to underestimate the cost of equity.

Q. Do you disagree with other aspects of the market risk premium assumptions developed by the witnesses in this proceeding?

A. Yes. I also disagree with the use of the historical market risk premium, as applied by Mr. Megginson and Mr. Coppola, and I disagree with the projected market risk premium developed by Mr. Megginson and find the methodologies that he uses in this case to develop the market risk premia to be inconsistent with his prior testimony and the prior testimony of other staff members.

[105] See e.g., S. Keith Berry, "Interest Rate Risk and Utility Risk Premia during 1982-93," *Managerial and Decision Economics*, Vol. 19, No. 2, March, 1998. *See also*, Robert S. Harris, "Using Analysts' Growth Forecasts to Estimate Shareholder Required Rates of Return," *Financial Management*, Spring 1986, at 66.

Q. Please explain why you disagree with Mr. Megginson's and Mr. Coppola's use of a historical market risk premium for estimating the CAPM.

A. Fundamentally, the market return and market risk premium should be forward-looking. Neither Mr. Megginson nor Mr. Coppola have provided any evidence that the historical averages that they calculate for the market return or the market risk premium reflect the expected market conditions during the period in which the Company's proposed rates will be in effect. As *Morningstar* has observed, the market risk premium is a forward-looking concept, not a historical analysis:

> It is important to note that the expected equity risk premium, as it is used in discount rates and the cost of capital analysis, is a forward-looking concept. That is, the equity risk premium that is used in the discount rate should be reflective of what investors think the risk premium will be going forward.[106]

Interest rates have increased significantly since historical lows and are expected to remain elevated over at least the next year. Inflation remains above the Federal Reserve's target level, and uncertainty (i.e. overall higher risk) in the market has increased because of the effect of the current administration's policies with respect to tariffs, immigration, and taxes on the economy. All of these conditions affect the current and projected equity risk premium and should be considered in establishing the ROE in this proceeding.

[106] *Morningstar Inc*., 2010 Ibbotson SBBI Valuation Yearbook, at 55.

Q. Are there other reasons why using a historical market risk premium for estimating the forward-looking cost of equity is not appropriate in the calculation of the CAPM based on current market conditions?

A. Yes. As noted previously, Mr. Megginson's and Mr. Coppola's use of the historical market risk premium disregards the demonstrated relationship between interest rates and the market risk premium. Both Mr. Megginson and Mr. Coppola calculate the cost of equity using the CAPM by relying on a long-term historical average market risk premia and a near-term projected risk-free rate. However, in Mr. Megginson's and Mr. Coppola's specification of the CAPM, their respective near-term projected risk-free rates bear no relationship to the historical average interest rates underlying the historical average market risk premia on which they rely. Therefore, the use of assumptions from different time periods fails to account for the inverse relationship that exists between the risk-free rate and the equity risk premium. Both academic literature and market evidence indicate that the equity risk premium is inversely related to the level of interest rates (i.e. as interest rates increase, the equity risk premium decreases, and vice versa), and given that current interest rates on long-term government bonds are below the historical average interest rate of those same bonds, the market risk premium should be *greater than* the long-term historical average market risk premium – which is not the case for either Mr. Megginson's or Mr. Coppola's CAPM analyses.

Q. Can you illustrate the inconsistency between Mr. Megginson's and Mr. Coppola's risk-free rate and equity risk premium?

A. Yes. Mr. Megginson's estimate of the historical market risk premium, relies on the arithmetic average market risk premium for the period of 1928-2023 (i.e. 6.94%), which is

based on the difference between the historical average return on large company stocks (i.e. 11.79%) and the historical average income-only return on long-term government bonds (i.e. 4.85%) over this period.[107] However, Mr. Megginson relies on a near-term projected risk-free rate on long-term government bonds of 4.25% to estimate the cost of equity in the CAPM, which is *lower than* the historical average return on long-term government bonds (i.e., 4.85%) that he relies on to estimate the market risk premium. Considering the academic research that demonstrates the inverse relationship between interest rates and the market risk premium, since Mr. Megginson's current return on long-term government bonds is *less than* the historical average return on those same bonds, the current market risk premium should be *greater than* the long-term historical average of 6.94% that Mr. Megginson assumes. Consequently, Mr. Megginson's use of a historical market risk premium understates the market risk premium in the current market environment when interest rates are below the long-term average. This flaw in Mr. Coppola's analysis is even more pronounced given that he uses the same historical average return on long-term government bonds that Mr. Megginson relies on (i.e. 4.85%) to estimate the equity risk premium, but relies on an even lower forward-looking risk-free rate of 4.00%.[108] Therefore, Mr. Coppola's CAPM analysis also understates the cost of equity.

[107] Megginson Direct, Exhibit No. S-4, Schedule D-5, at 7.
[108] Coppola Direct, Exhibit AG-44.

Q. Has *Kroll*, the publisher of the historical data on which Mr. Megginson and Mr. Coppola rely to estimate the historical market risk premium, highlighted a potential inconsistency with relying on historical data for a forward-looking analysis such as the CAPM?

A. Yes. *Kroll* has stated that, "[i]n using a historical measure of the equity risk premium, one assumes that what has happened in the past is representative of what might be expected in the future."[109] However, because the near-term projected long-term government bond yields are currently below those that Mr. Megginson and Mr. Coppola have relied on in their historical average market risk premium estimates, the market risk premium based on long-term historical average data is certainly not representative of what is expected in the future. Given the inverse relationship between the market risk premium and interest rates, since the projected interest rate is lower than the historical average, it is reasonable to expect that the market risk premium would be higher than the historical average.

Q. Is there also evidence that the use of a historical market premium can produce counter-intuitive results?

A. Yes. Figure 7 illustrates the problem with relying on the historical market risk premium such as Mr. Megginson and Mr. Coppola have done. Specifically, the figure shows that from 2007-2009, the historical market risk premium decreased even as market volatility (the primary statistical measure of risk) significantly increased. Further, this figure demonstrates the significant swings in the annual equity risk premium that are averaged into the long-term historical average calculations. As shown, in 2008, the annual equity

[109] *Kroll*, 2022 SBBI Yearbook, at 198.

"premium" was actually negative, which implies a discount for equity holders relative to the cost of debt. It is incomprehensible that the perceived risk for equity was negative (implying a lower required return) in the height of the financial market collapse when the overall market return was a negative 37%. As shown, this individual observation alone, which runs counter to the theory of the equity risk premium, reduces the historical average market risk premium for the prior 80 years by 60 basis points.

Figure 7: Historical Market Risk Premium and Market Volatility

	Market Volatility	Market Return	Annual Equity Premium	Long-term Average Historical Market Risk Premium[110]
2007	17.54	5.49%	0.63%	7.10%
2008	32.69	-37.00%	-41.45%	6.50%
2009	31.48	26.46%	3.47%	6.70%

The assumption that investors would expect or require a lower equity risk premium during periods of increased volatility is counter-intuitive and leads to unreliable analytical results. As noted earlier, the relevant objective in the application of the CAPM is to ensure that all three components of the model (i.e. the risk-free rate, the beta, and the market risk premium) are consistent with market conditions and investor perceptions. The forecasted market risk premium estimates used in my original and rebuttal CAPM analyses specifically address that concern.

[110] Ibbotson SBBI Yearbook. *Morningstar Inc*. 2008, at 28. *Ibbotson SBBI Yearbook. Morningstar Inc*. 2009, at 23; Ibbotson SBBI Yearbook. *Morningstar Inc*. 2010, at 23. The historical market risk premium equals the total return on large company stocks less the income-only return on long-term government securities.

Q. Is the method that Mr. Megginson relies on for purposes of estimating his historical market risk premium consistent with Staff's prior methodology?

A. No. The calculation of the historical average market risk premium that Mr. Megginson relies on is inconsistent with the method that Staff utilized previously in another recent proceeding. As noted, Mr. Megginson relies on a historical average market risk premium of 6.94%, which is based on a subset of the historical data reported by *Kroll*, from 1928 through 2023, plus data for 2023 and 2024 obtained from other market sources since *Kroll* has discontinued publishing the SBBI Yearbook. However, in Case No. U-21461, the Staff witness also relied on a historical market risk premium based on the data published by *Kroll*, however they used the full analytical period that *Kroll* publishes from 1926 through the current year – not arbitrarily starting in 1928 as Mr. Megginson has done in this proceeding.[111]

Q. What is the effect of relying on a shorter historical data set than what Staff has relied on in prior cases?

A. Relying on data starting in 1928 rather than the full data set understates the long-term market return and market risk premium. Mr. Megginson calculates a market return of 11.79% and a market risk premium of 6.94% using the truncated data set. However, on their online Cost of Capital Navigator, *Kroll* reports that the historical long-term market return for 1926 through 2024 is 12.17% and that the long-term income-only return on long-term government bonds over the same period is 4.86%, and thus the long-term

[111] Michigan Public Service Commission, Case No. U-21461, Qualifications and Direct Testimony of Joseph E. Ufolla, January 18, 2024, at 13.

historical average equity risk premium over this period is 7.31%.[112] This historical calculation is higher than Mr. Megginson's market risk premium and is consistent with the historical market risk premium on which Mr. Coppola relies for this CAPM analysis.[113] Therefore, while Mr. Megginson's and Mr. Coppola's use of a historical average market risk premium in their CAPM analyses understates the market risk premium and thus understates the cost of equity by failing to account for current market conditions and the inverse relationship between interest rates and the market risk premium, Mr. Megginson has further understated the historical average market risk premium, and thus cost of equity, by arbitrarily not relying on the entire historical data set published by *Kroll*.

Q. Mr. Megginson also calculates two CAPM analyses using projected market risk premia. Are these analyses reasonable?

A. No. First, as a threshold matter, the first of Mr. Megginson's CAPM analyses that relies on the 12-month trailing market risk premium of 4.35% results in a cost of equity of 8.25%, which is unreasonable,[114] as it is well below the low end of any authorized ROE in a comparable regulatory jurisdiction for a natural gas utility since at least 1980. Moreover, his CAPM scenarios that rely on projected market risk premia are also inconsistent with the inverse relationship between the risk-free rate and the market risk premium, and, as a result, significantly understate the cost of equity. Specifically, Mr. Megginson relies on a risk-free rate of 4.25%, which is well below the historical average return on long-term government bonds (i.e. 4.85%), which means that one would expect Mr. Megginson's

[112] *Kroll*, Cost of Capital Navigator, Historical Long-Term (1926-2024) equity risk premium; https://costofcapital.kroll.com/coc-inputs/rfr-and-erp.

[113] Coppola Direct, Exhibit AG-44; see "Sources, column (d)."

[114] Megginson Direct, Exhibit No S-4, Schedule D-5, at 8.

projected market risk premia to be *greater than* the long-term historical average market risk premium of 7.31%; however, Mr. Megginson's projected market risk premia are nearly 300 basis points and more than 110 basis points, respectively, below the long-term historical average.[115]

Q. Is Mr. Megginson's projected market risk premium consistent with his prior testimony?

A. No. In the recent Michigan Gas Utilities proceeding in Case No. U-21540, Mr. Megginson relied on a projected market risk premium as calculated in the same manner as I have done in my direct testimony (i.e. the projected return on the S&P 500 less the assumed risk-free rate).[116] In addition, in the Company's last electric division rate proceeding in Case No. U-21585, Mr. Megginson also relied on a similar approach, although he used an outdated market risk premium based on data filed more than 16 months prior in another rate proceeding.[117] Mr. Megginson has provided no basis for his change in approach in this proceeding.

[115] *Id*., at 8-9.

[116] Qualifications and Direct Testimony of Kirk D. Megginson, Case No. U-21540, July 1, 2024, Exhibit No. S-4, Schedule D-5, at 6 of 11. Note, the heading in column (e) of this exhibit mistakenly refers to the market risk premium as a "historical market risk premium;" however, the exhibit is clear that the market risk premium assumed by Mr. Megginson is a projected market risk premium consistent with the method relied on by the company in that proceeding.

[117] Direct Testimony of Kirk D. Megginson, Case No. U-21585, September 27, 2024, Exhibit No. S-4, Schedule D-5, at 8, whereby Mr. Megginson referenced and relied on the market risk premium in the Direct Testimony of Todd A. Wehner, Case No. U-21389, May 1, 2023, Exhibit No. A-14, Schedule D-5, page 10 of 12.

Q. Does this change in Mr. Megginson's approach when using a projected market risk premium produce a significantly different result for his projected market risk premium?

A. Yes. If Mr. Megginson had calculated the market risk premium in a manner consistent with his prior testimony in Case No. U-21540, his projected market risk premium would be 7.79% (i.e. the market return of 12.04% as shown in my direct testimony in Exhibit No. A-14, Schedule D-5, page 16, minus Mr. Megginson's assumed risk-free rate in this proceeding of 4.25%), or *nearly 350 basis points higher* than the 4.35% that he assumes for his projected market risk premium in the current proceeding.

Q. Do the market risk premia relied on by Mr. Walters and Mr. Bandyk suffer from the same failure to appropriately reflect the inverse relationship between interest rates and the market risk premium as you previously discussed in your response to Mr. Megginson and Mr. Coppola?

A. Yes. As shown in Figure 8, Mr. Walters' four CAPM analyses that rely on his *Kroll* "normalized" market risk premium, as well as the assumed market risk premium in Mr. Bandyk's CAPM analysis, which reflects an average of his three sources (i.e. Professor Damodaran; the IESE Business School survey; and *Kroll*), are also inconsistent with the inverse relationship between interest rates and the market risk premium and thus understates the cost of equity. Specifically, the risk-free rate assumptions used in their CAPM analyses are either below or consistent with the long-term average risk-free rate, and yet contrary to the inverse relationship between interest rates and the market risk premium, their respective market risk premia are well below the long-term term average market risk premium.

Figure 8: Misalignment of Market Risk Premia Relied on by Mr. Walters and Mr. Bandyk[118]

Witness	Source	Market Risk Premium	Amount Below Long-Term Avg.	Risk-Free Rate	Amount Below Long-Term Avg.
	Long-Term Historical Avg.	**7.31%**		**4.86%**	
Walters	*Kroll* - Normalized	5.00%	-2.31%	4.78%	-0.08%
Bandyk	Damodaran (TTM sustainable payout)	4.43%	-2.88%	4.24%	-0.62%
Bandyk	Damodaran (TTM)	4.61%	-2.70%	4.24%	-0.62%
Bandyk	Damodaran (smoothed)	5.91%	-1.40%	4.24%	-0.62%
Bandyk	Damodaran (normalized)	4.07%	-3.24%	4.24%	-0.62%
Bandyk	Damodaran (net cash yield)	4.33%	-2.98%	4.24%	-0.62%
Bandyk	IESE Survey	5.70%	-1.61%	4.10%	-0.76%
Bandyk	*Kroll*	5.00%	-2.31%	4.88%	0.02%

Q. Are there other issues with the data used by Mr. Walters and Mr. Bandyk?

A. Yes. Both Mr. Walters and Mr. Bandyk rely on outdated estimates of the market risk premium. Both witnesses use a *Kroll* projected risk premium of 5.00% as part of their respective CAPM analyses; however, the current forecasted market risk premium by *Kroll* is 5.50%.[119] Furthermore, as shown in Figure 8 above, Mr. Bandyk relies on five different estimates from Professor Damodaran for purposes of deriving an average market risk premium; however, these data are from September 2024, and are therefore more than eight months old and do not reflect current market conditions.[120]

[118] *Kroll*, Cost of Capital Navigator, Historical Long-Term (1926-2024) equity risk premium; https://costofcapital.kroll.com/coc-inputs/rfr-and-erp.

[119] *Kroll*, Cost of Capital Navigator, https://costofcapital.kroll.com/coc-inputs/rfr-and-erp. Mr. Bandyk also states on page 16 of his testimony that he relies on data from September 2024 for estimating his market risk premium; however, it appears that is in error as Exhibit CUB-16 indicates that the data was accessed as of April 2025.

[120] Bandyk Direct, at 16.

Q. Are the results of either Mr. Walters's CAPM analyses that rely on the *Kroll* "normalized" market risk premium or Mr. Bandyk's CAPM reasonable?

A. No. The cost of equity results from their CAPM analyses are unreasonable. Specifically, the results of Mr. Walters's *Kroll* "normalized" market risk premium CAPM scenarios are 8.19%, 8.57%, 8.72%, and 9.17%,[121] while the results of Mr. Bandyk's CAPM analysis is 7.95%. Due to their misspecification of the market risk premium in these scenarios, all of these results are either at or well below the low end of any authorized ROE in a comparable regulatory jurisdiction for a natural gas utility in nearly half a century. I recognize that Mr. Bandyk believes it is not appropriate to compare his CAPM result to previously authorized ROEs given that he claims that regulatory commissions have consistently authorized ROEs well in excess of the cost of equity for decades; however, as I have discussed, his position is unsupported and unfounded given the obligation of regulatory commissions to authorize just and reasonable rates.

Q. What are your concerns with Mr. Walters' "forward-looking" risk premium-derived market return and thus market risk premium?

A. I disagree with what Mr. Walters considers a "forward-looking" estimate of the market return. Mr. Walters calculates what he terms a "forward-looking" estimate of the market return, which reflects the long-term historical arithmetic average real return of the S&P 500 from 1926 through 2023 of 9.02% plus a projected inflation rate based on the Consumer Price Index of 2.50% as reported by *Blue Chip Financial Forecasts* as of February 28, 2025.[122] From this market return of 11.75%, Mr. Walters then subtracts his

[121] Walters Direct, Exhibit AB-20, at 1.
[122] Walters Direct, at 53.

projected risk-free rate of 4.60% to estimate a market risk premium that he then uses in four of his 12 CAPM scenarios.[123]

Q. Why do you disagree with Mr. Walter's "forward-looking" risk premium-based estimate of the market return?

A. Mr. Walters's risk premium-derived estimate of the market return is neither "forward-looking" nor does it reflect the current and expected market conditions during which the Company's rates will be in effect. First, while Mr. Walters characterizes his market return as "forward-looking," which presumably is to recognize that the market return estimate of the CAPM should be forward-looking, simply applying a projected inflation rate to a long-term historical average market return does not produce a "forward-looking" market return. Second, while Mr. Walters' use of the average real return of the S&P 500 from 1926 through 2023 is reflective of the returns realized by investors under different market and economic conditions, it is not necessarily reflective of the market return required by investors in the current and expected market environment. Mr. Walters provides no evidence that the historical average market return is reflective of the expected market conditions during the period in which the Company's proposed rates will be in effect.

Q. Have you identified inconsistencies in the analyses prepared by Mr. Bandyk?

A. Yes. The assumptions used in Mr. Bandyk's CAPM are inconsistent with the results of his DCF analyses. As shown in Figure 9, in four of the five estimates of the market risk premium on which Mr. Bandyk relies from Professor Damodaran, the market risk premium

[123] *Id*.

reflects an implied *market* return that ranges from 8.31% to 8.35%, which are all lower than his average DCF result for his proxy group of natural gas distribution companies of 9.22%.[124] This result is counterintuitive, as it is reasonable to expect that the return on the overall market, with a presumed beta of 1.0, would be higher than the return on Mr. Bandyk's proxy group of natural gas utilities, which he assumes have an average beta coefficient of 0.81 (*Value Line*) and 0.64 (*Bloomberg*) in his CAPM analysis. However, as shown in Figure 9, the results of Mr. Bandyk's analyses indicate the exact opposite of the expected risk/return trade off. As shown in Figure 9, Mr. Bandyk's overall market return is lower than the return he estimates for the natural gas utility proxy group, despite the expectation that this proxy group has lower overall risk than the market.

Figure 9: Mr. Bandyk's Implied Market Return in the CAPM Analysis as Compared to His DCF Results

	Mr. Bandyk CAPM Assumptions				Mr. Bandyk
Source	Market Risk Premium	Risk-Free Rate	Implied Return for the *Market*		DCF Return for *Gas Utilities*
Damodaran (TTM sust. payout)	4.43%	4.24%	8.67%		9.21%
Damodaran (TTM)	4.61%	4.24%	8.85%		9.21%
Damodaran (normalized)	4.07%	4.24%	8.31%	v.	9.21%
Damodaran (net cash yield)	4.33%	4.24%	8.57%		9.21%

Q. Is it reasonable for Mr. Bandyk to have relied on the IESE Business School survey as an estimate of the market risk premium?

A. No. It specifically states in the IESE Business School survey that the average of the distribution of the required equity premium from the survey, which Mr. Bandyk relies on,

[124] Bandyk Direct, at 12 and Exhibit CUB-18.

cannot be interpreted as the required equity premium of the market nor of a representative investor.[125]

Further, there are several other academic sources that caution against the use of survey data:

- The drawbacks of survey data include biased responses and biased sampling as noted by Brigham, Shome, and Vinson (1985).[126]
- Professor Damodaran, who Mr. Bandyk also relies on for his other market risk premium estimate, noted that survey results were affected by how the questions were asked in the survey and on recent stock price movements.[127]
- The response rates to surveys can be limited, as Graham and Harvey (2018) noted in their CFO survey where the response rate was only 5% to 8%.[128]

C. Beta Coefficients

Q. What are the primary areas where you disagree with the betas used by the witnesses in this case?

A. I disagree with Mr. Bandyk's reliance on raw betas, and Mr. Walters' reliance on betas from S&P Market Intelligence that reflect a Vasicek adjustment whereby the raw beta is adjusted to assume that a company's beta coefficient will trend toward the *industry* average as opposed to the *market* average of 1.0.

[125] Pablo Fernandez, Diego Garcia de la Garza, and Lucia Fernandez Acin, "Survey: Market Risk Premium and Risk-Free Rate used for 96 countries in 2024," IESE Business School, March 11, 2024, at 11; emphasis added.

[126] Eugene F. Brigham, Dilip K.Shome, and Steve R. Vinson, "The Risk Premium Approach to Measuring Utility's Cost of Equity," *Financial Management*, Vol. 14, No. 1, 1985, at 33.

[127] Aswath Damodaran, "Equity Risk Premiums (ERP): Determinants, Estimation, and Implications," March 23, 2023, at 28.

[128] John R. Graham and Campbell R Harvey, "The Equity Risk Premium in 2018," *Social Science Research Network*, March 27, 2018.

Q. Why you do you disagree with these betas relied on by Mr. Bandyk and Mr. Walters?

A. The use of either raw betas as Mr. Bandyk has utilized or the Vasicek-adjusted betas that Mr. Walters has utilized is not appropriate for regulated utilities because these beta coefficients likely understate the true beta of utility stocks given that the utility sector is not only correlated to the broader market, but is also sensitive to changes in interest rates, which are *not* factored into either the raw beta or Vasicek-adjusted beta calculations. Therefore, neither of Mr. Bandyk's raw beta coefficients nor Mr. Walters's Vasicek-adjusted betas consider interest rate risk and likely understate the actual risk, which in turn understates the result of the CAPM analysis. Conversely, the Blume adjustment applied by *Value Line* and *Bloomberg* adjusts the raw beta coefficients toward the market average of 1.0, thus likely better reflecting the true beta of the utility sector inclusive of interest rate risk.

Q. Do any of the other witnesses in this proceeding rely on the raw beta coefficients that Mr. Bandyk has relied on for his CAPM analysis?

A. No. Mr. Megginson, Mr. Coppola, Mr. Walters, and I have all relied on beta coefficients that have been adjusted using the Blume adjustment for purposes of our CAPM analyses, and as discussed, Mr. Walters has also relied on betas in one scenario adjusted using the Vasicek adjustment.

D. <u>Response to Intervenor Positions</u>

Q. What are the positions of Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk regarding your CAPM analysis?

A. These witnesses offer the following positions regarding my CAPM analyses:

- Mr. Coppola alleges that my use of multiple risk-free rates "seems to be a hunt for an approach that will result in a higher ROE rate."[129]

- Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk contend that my market risk premium is excessive, with Mr. Walters and Mr. Bandyk suggesting that I should have considered multiple methodologies to estimate the expected market return and market risk premium.[130]

- Mr. Coppola also contends that a problem with my calculation of the market return is that there are many companies with dividend yields and long-term growth estimates that are omitted.[131]

Q. Is your use of three different risk-free rates an intentional attempt to achieve a higher CAPM result as Mr. Coppola alleges?

A. No. There is no basis to Mr. Coppola's claim that I have intentionally selected three risk-free rates in an attempt to increase the resulting cost of equity from the CAPM. The Company's authorized ROE should be a forward-looking estimate of the cost of equity, and, as stated in my direct testimony, I have relied on a current risk-free rate, a near-projected risk-free rate, and a longer-term risk-free rate consistent with estimating a forward-looking cost of equity. While Mr. Coppola suggests my use of a longer-term projected risk-free rate is used to achieve a specific result, it is important to note that the long-term risk-free rate is the lowest of the three risk-free rates that I have relied upon in my analyses. Therefore, it is inconceivable that I would have relied on this projection to increase the results of my analyses.

[129] Coppola Direct, at 140.
[130] Megginson Direct, at 23; Bandyk Direct, at 17-18; Walters Direct, at 67.
[131] Coppola Direct, at 141.

Q. Is there any basis to the claims by Mr. Megginson, Mr. Walters, or Mr. Bandyk regarding your market return and thus market risk premium?

A. No. There are multiple reasons why there is no basis to their contention regarding the market return and thus market risk premia used in my CAPM analyses. As discussed, the market return used in my CAPM analyses is reasonable, consistent with the range established by historical market return data,[132] and has been relied upon in other regulatory jurisdictions.

First, as shown in Figure 7 of my direct testimony, an expected market return of 12.04% is reasonable given that the realized total equity return was at least at this level or greater in 52 out of the past 98 years (i.e. 53% of the observations). In addition, as reflected in Exhibit A-127 (AEB-2), pages 15-20, the forward-looking market return has declined slightly since the filing of my direct testimony and is currently 11.92%.

Second, in a cost of capital proceeding for the electric utilities in California, the California Public Utilities Commission ("California PUC") noted that all parties recognized historical market returns, and economically logical projections, fall within the range of 12%.[133]

Third, various state utility regulatory commissions have supported the use of a constant growth DCF model to estimate the market return in the CAPM such as I have done. As shown in Figure 10, the Staff of the Illinois Commerce Commission ("ICC"), the Bureau of Investigation and Enforcement ("I&E") of the Pennsylvania Public Utility

[132] Bulkley Direct, at 42-43.

[133] California Public Utilities Commission, Application No. 22-04-008, Decision No. 22-12-031, December 15, 2022, at 23.

Commission ("Pennsylvania PUC"), and the Staff of the Maine Public Utilities Commission ("Maine PUC") have each supported the forward-looking market risk premium, and the market return estimates using the constant growth DCF model. In each of these cases, the respective regulatory commission relied on the estimated CAPM results by these parties to determine the authorized ROE and did not dispute the use of the constant growth DCF model to calculate the market return.

Figure 10: Examples of Jurisdictions Where Market Return Estimated Using the Constant Growth DCF Model

Intervening Party	Applicant	Docket No.	Approach of Intervening Party to Calculating the Market Return	Date of Order	Did the Commission Rely on the Intervening Party's CAPM?
Staff of the ICC	North Shore Gas Company	20-0810	Constant growth DCF of the dividend-paying companies in the S&P 500 (11.95%)[134]	9/8/21	Yes[135]
I&E	Aqua Pennsylvania, Inc.	R-2021-3027385	CGDCF of the Value Line Universe and S&P 500 (12.14%)[136]	5/12/22	Yes, the regulator placed primary weight on I&E's CAPM[137]
Staff of the Maine PUC	Northern Utilities, Inc.	2019-00092	CGDCF of the dividend-paying companies in the S&P 500 (11.33%-13.49%)[138]	4/1/20	Yes[139]

Fourth, the Federal Reserve Bank of New York published an analysis in 2015 that reviewed 20 methodologies over the period 1960 through 2013 for estimating the market risk premium. The result of this study demonstrates that my market risk premium

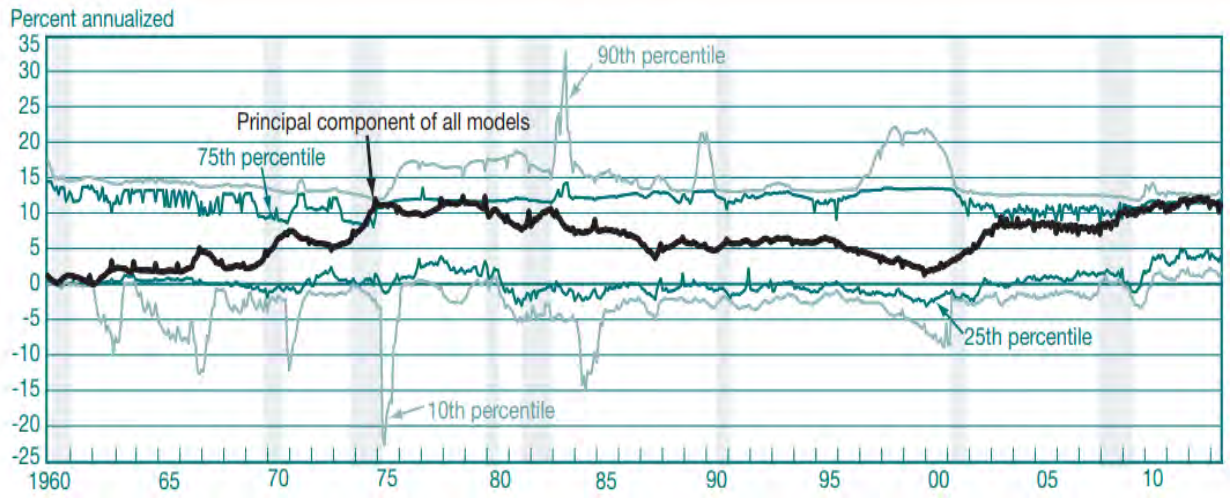
138 Maine Public Utilities Commission, Docket No. 2019-00092, Bench Analysis, October 29, 2019, at 21.

139 *Id*., Order Part II, April 1, 2020, at 58.

estimates, which, as shown on Exhibit A-127 (AEB-2), pages 5-13, of my rebuttal cost of equity analyses, are in the range of 7.24% to 7.62%, are reasonable. Specifically, the key conclusions from this study are:

- The 20 methodologies reviewed reflected a range for the market risk premium of between -1.0% to 14.5%.
- As shown in Figure 11, the principal component analysis of the 20 models (i.e. the bold black line) produced a range for the market risk premium of approximately 0% to over 10% from 1960 through 2013.
- The one-year-ahead market risk premium was consistently greater than 10% following the financial crisis of 2008/09.

Figure 11: The Federal Reserve Bank of New York, One-Year-Ahead Market Risk Premium[140]



Further, the Federal Reserve Bank of New York also noted the following:

> Chart 2 shows the first principal component of all twenty models in black (the black line is the same principal component shown in black in each of the panels of Chart 1). ***As expected, the principal component tends to peak during financial turmoil, recessions, and periods of low real GDP growth or high inflation***. It tends to bottom out after periods

[140] Fernando Duarte and Carla Rosa, "The Equity Risk Premium: A Review of Models," Federal Reserve Bank of New York, 2015, at 50.

> of sustained bullish stock markets and high real GDP growth. Evaluated by the first principal component, the one-year ahead ERP [*equity risk premium*] reaches a local peak in June 2012 at 12.2 percent. The surrounding months have ERP estimates of similar magnitude, with the most recent estimate in June 2013 at 11.2 percent. This behavior is not so clearly seen by simply looking at the collection of individual models in Chart 1, a finding that highlights the usefulness of principal component analysis. Similarly high levels were observed in the mid- and late 1970s, during a period of stagflation, while the recent financial crisis had slightly lower ERP estimates, closer to 10 percent.[141]

Thus, the Federal Reserve Bank of New York noted that the market risk premium is higher during periods of increased inflation. As discussed at length in my direct testimony as well as herein, inflation remains well above the Federal Reserve's target of 2% and is expected to remain elevated over the near term. Given the results of the analysis conducted by the Federal Reserve Bank of New York, it is clear that my estimates of the market risk premium are reasonable.

Lastly, it is also important to note that, despite their criticisms:

- Mr. Walters calculates a market risk premium using a forward-looking single stage DCF analysis in this proceeding (which are both higher than in my direct testimony).[142]

- As discussed previously, Mr. Megginson has conducted a CAPM scenario using a forward-looking single stage DCF analysis in prior cases and offers no discussion as to why he has changed his methodology in this proceeding.

- Mr. Coppola relies on a historically based market risk premium of 7.30%, which is not materially different than the market risk premium of 7.74% in my direct testimony. In fact, while Mr. Coppola inappropriately compares the results of his CAPM analysis to the highest result of my CAPM analysis, the resulting

[141] *Id*.; emphasis and clarification added.

[142] As shown in Exhibit AB-20, the market return in his analysis is 12.48% and the market risk premium is 7.90%, which are both higher

cost of equity from Mr. Coppola's CAPM is 10.66%, which is higher than the average of all of my CAPM analyses in my direct testimony of 10.43%.[143]

Therefore, for all of the reasons just discussed, the market return, and thus market risk premium, in my CAPM analyses are reasonable and consistent with the findings of the Federal Reserve and other utility regulatory commissions, and there is no basis for the claims that the market return, and thus market risk premium, in my CAPM analyses is excessive.

Q. Have courts addressed these witnesses' assertion that your forward-looking market return is inflated?

A. Yes. In its review of FERC Opinion No. 569-B, the U.S. State Court of Appeals for the District of Columbia addressed the concern regarding the use of projected EPS growth rates in a constant growth DCF model to estimate the market return. In the Court's decision, it acknowledged that FERC has relied on the use of projected EPS growth rates in the calculation of the market return on the S&P 500 because the S&P 500 is regularly updated to include companies with high market capitalization and it includes companies at all stages of growth, including lower and higher growth potential. The Court determined that FERC's rationale for using projected EPS growth rates was sufficient and did not accept the challenge to this assumption.[144]

[143] Coppola Direct, at 139 and Exhibit AG-44; Bulkley Direct, at 48.

[144] United States Court of Appeals, District of Columbia Circuit, Opinion, Docket No. 16-1325, August 9, 2022, at 19.

Q. Mr. Coppola also suggests that there is a concern with your market return in that certain companies have been omitted. Is there any merit to Mr. Coppola's contention?

A. No. Mr. Coppola's suggestion that my calculation of the market return on the S&P 500 Index results in a modified population of companies that is inconsistent with the S&P 500 Index or the equity markets is incorrect. As shown on Exhibit A-14, Schedule D-5, of my direct testimony, companies in the S&P 500 Index are only excluded from my constant growth DCF analysis if their projected EPS growth rate was either negative or greater than 20%. While I believe that the calculation of the weighted projected earnings growth rate for the S&P 500 Index should include all of the companies in the index, my calculation of the market return for the CAPM and ECAPM excludes companies in the S&P 500 Index that have a long-term earnings growth rate that is negative or greater than 20% to address previously raised concerns by parties regarding the use of a constant growth DCF model relying on projected EPS growth rates.

E. <u>Adjusted CAPM Results</u>

Q. Have you recalculated the CAPM analyses of Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk to address your concerns with their reliance on a historical market risk premium?

A. Yes, I have adjusted their respective CAPM analyses to address the issues that I have discussed:

- As noted, Mr. Megginson relies on both a historical market risk premium and projected market risk premia for his CAPM analysis.
  - First, rather than relying on the historical market risk premium for the reasons discussed, I have adjusted Mr. Megginson's CAPM analysis to

calculate the market risk premium as the historical arithmetic average market return from 1926 through 2023 minus his estimate of the risk-free rate. While I do not agree with the use of the historical market return as the estimate of the forward-looking market return for the reasons discussed, a calculation that at least derives the market risk premium from the risk-free rate that is being used in the CAPM to estimate the cost of equity is more appropriate than the calculation performed by Mr. Megginson. This is because the derived market risk premium will reflect an inverse relationship between interest rates and the market risk premium that is established in the CAPM equation (i.e. because near-term interest rates are lower than the long-term historical average, the market risk premium should be greater than the historical average risk premium). As shown on Exhibit A-127 (AEB-2), page 37, when the market risk premium is adjusted as just discussed, the average cost of equity for Mr. Megginson's CAPM analysis is 11.53%, which is an increase of 90 basis points from his as-filed position.

- Second, given that Mr. Megginson's approach for his projected market risk premia is inconsistent with his prior testimony, I have updated his CAPM analysis to rely on a projected market risk premium consistent with his prior approach. As shown on Exhibit A-127 (AEB-2), page 38, this results in a cost of equity of 11.41%.

- Therefore, whether using Mr. Megginson's historical market risk premium or his prior approach of a projected market risk premium, the cost of equity results support the reasonableness of the Company's proposed ROE in this proceeding.

- I have also adjusted the market risk premium for Mr. Coppola's CAPM analysis in the same manner as I just discussed regarding Mr. Megginson's CAPM analysis, and I have also updated Mr. Coppola's risk-free rate through April 30, 2025. As shown on Exhibit A-127 (AEB-2), page 40, this results in a cost of equity of 11.50%, which fully supports the reasonableness of the Company's proposed ROE in this proceeding.

- As discussed, four of Mr. Walters's 12 CAPM scenarios rely on a *Kroll* "normalized" market risk premium that does not properly reflect the inverse relationship between interest rates and the market risk premium. When those scenarios of Mr. Walters's CAPM analyses are excluded for this reason, the average result of his remaining eight CAPM scenarios is 10.38%, which

supports the reasonableness of the Company's proposed ROE in this proceeding.

- Mr. Bandyk's projected market risk premium also is inconsistent with the inverse relationship between interest rates and the market risk premium. As a result, I have adjusted Mr. Bandyk's CAPM analysis to rely on the projected market return of 12.04% that I relied on in my direct testimony, which is a more reasonable estimate of the market return than the implied market return based on the market risk premia in his CAPM analysis. As shown on Exhibit A-127 (AEB-2), page 42, making this adjustment produces a cost of equity result of 9.99%, or approximately 200 basis points higher than Mr. Bandyk's as-filed position. At a minimum, this supports the reasonableness of an increase in the Company's ROE for this proceeding. I also do not agree with Mr. Bandyk's use of raw betas for the reasons discussed; however, I have not adjusted his betas for purposes of the analysis shown on Exhibit A-127 (AEB-2), page 42.

VIII. ECAPM ANALYSIS

Q. Please summarize the positions of Mr. Megginson, Mr. Coppola, Mr. Walters, and Mr. Bandyk regarding your ECAPM analyses.

A. Mr. Megginson, Mr. Coppola, and Mr. Walters suggest that the use of an adjusted beta in the ECAPM analysis is duplicative, as the weighting adjustments applied in the ECAPM are mathematically the same as adjusting beta, and thus the ECAPM produces a result that is overstated.[145] In addition, Mr. Megginson and Mr. Coppola also claim that the use of long-term interest rates as the risk-free rate is inconsistent with the ECAPM.[146] Mr. Bandyk states that he has not conducted an ECAPM since the Staff has historically declined using an ECAPM and the Commission has not previously recognized the ECAPM as a valid methodology.[147]

[145] Megginson Direct, at 31-33; Coppola Direct, at 142-143; Walters Direct, at 68-71.
[146] Megginson Direct, at 31; Coppola Direct, at 142-143.
[147] Bandyk Direct, at 21.

Q. Is it appropriate to use adjusted betas in the ECAPM?

A. Yes, it is entirely appropriate to use adjusted betas in the ECAPM, and doing so is consistent with academic literature and the estimation of the ECAPM in this manner has been accepted by various regulatory commissions. There is no merit to any of these witnesses' contentions regarding the ECAPM.

Q. What is the purpose of using adjusted betas in the ECAPM?

A. The purpose of adjusting beta in the CAPM is to account for the tendency of beta to trend back over time to the market beta of 1.00. As noted by Mr. Megginson, the betas published by *Value Line* include this adjustment,[148] which was first proposed by Marshall E. Blume in 1975.[149] The use of adjusted betas in the CAPM is important because if beta trends towards 1.00, as Blume noted, then the adjusted beta will be more reflective of the beta that can be expected over the near-term. This is equally important in the specification of the CAPM in this case since the cost of equity for the Company is being estimated over the near term.

The ECAPM does not account for the tendency of beta to trend toward 1.00. The purpose of the ECAPM is to account for the fact that the risk-return relationship is flatter than what is estimated by the CAPM, ***even when using adjusted betas***. While beta is not observable and must be estimated, the theory behind the ECAPM is that even if the true value of a stock's beta were observable, the CAPM would understate the results for stocks with betas less than 1.00 and overstate the results for stocks with betas greater than 1.00.

[148] Megginson Direct, at 32.

[149] Marshall E. Blume, "Betas And Their Regression Tendencies," *The Journal of Finance*, Vol. 30, No. 3, 1975, at 785-795.

Therefore, contrary to the assertions of Mr. Megginson, Mr. Coppola, and Mr. Walters, the purpose of each adjustment is different and thus applying both adjustments in the ECAPM is not duplicative.

Q. Mr. Coppola cites a chapter in Dr. Morin's text *New Regulatory Finance* to support his view that there is academic disagreement with the studies that led to the use of the ECAPM.[150] Do you agree with Mr. Coppola's conclusion from this text?

A. No. Reviewing the excerpt provided by Mr. Coppola, it is clear that, while Dr. Morin identifies some who have argued that the use of ECAPM is inconsistent with the use of adjusted betas, Dr. Morin further explains that the argument that has been used to support this concern is erroneous. Importantly, Dr. Morin's text fully supports the use of adjusted betas in the ECAPM and explains why it is appropriate:

> Some have argued that the use of the ECAPM is inconsistent with the use of adjusted betas, such as those supplied by Value Line and Bloomberg. This is because the reason for using the ECAPM is to allow for the tendency of betas to regress toward the mean value of 1.00 over time, and, since Value Line betas are already adjusted for such a trend, an ECAPM analysis results in double-counting. This argument is erroneous. Fundamentally, the ECAPM is not an adjustment, increase or decrease, in beta. This is obvious from the fact that the expected return on high beta securities is actually lower than that produced by the CAPM estimate. The ECAPM is a formal recognition that the observed risk-return tradeoff is flatter than predicted by the CAPM based on myriad empirical evidence. The ECAPM and the use of adjusted betas comprise two separate features of asset pricing. Even if a company's beta is estimated accurately, the CAPM still understates the return for low-beta stocks. Even if the ECAPM is used, the return for low-beta securities is understated if the betas are understated…***Both adjustments are necessary. Moreover, recall from Chapter 3 that the use of adjusted betas compensates for interest***

[150] Coppola Direct, at 142-143.

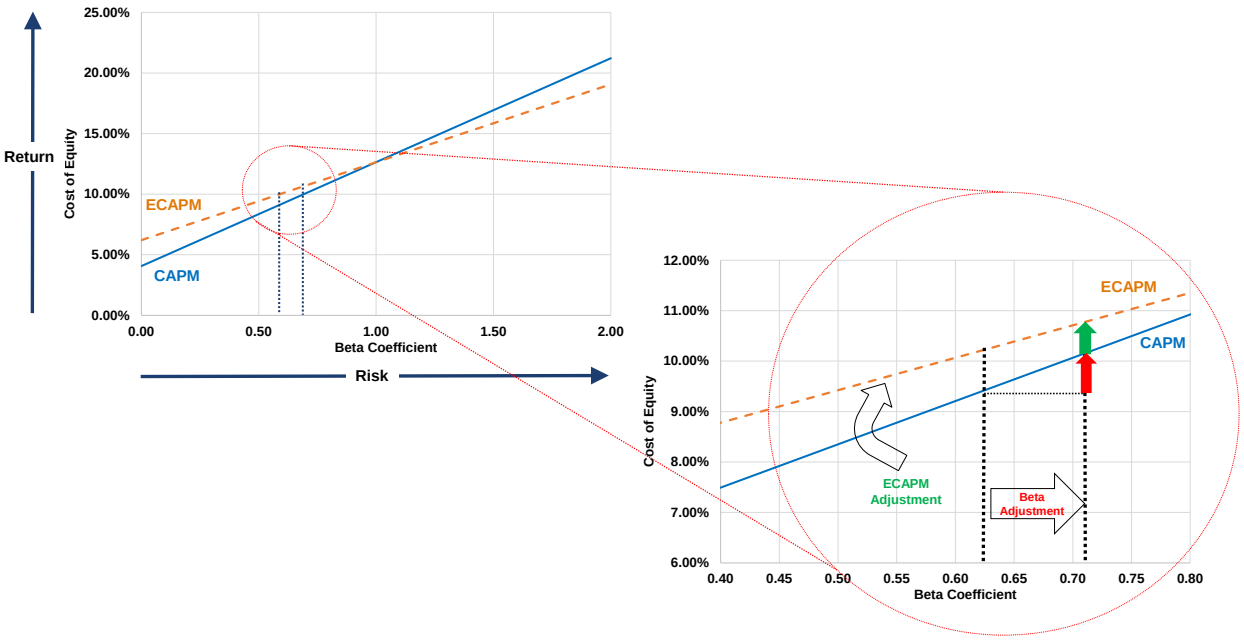
rate sensitivity of utility stocks not captured by unadjusted betas.[151]

Q. Can you demonstrate that using adjusted betas in the CAPM and relying on the ECAPM are two distinct adjustments to the CAPM?

A. Yes. Figure 12 demonstrates the point that adjusting betas and adjusting the slope of the risk/return relationship through the ECAPM are two distinct adjustments and are not duplicative as alleged by Mr. Megginson, Mr. Coppola, and Mr. Walters. As shown in Figure 12, when beta is adjusted to recognize that betas revert to the market mean of 1.0 over time and used in the CAPM, the resulting adjustment is shown by the red arrow in the lower right-hand corner. Separately, when the ECAPM is employed to recognize that the risk/return relationship is flatter than predicted by the CAPM, the resulting adjustment is shown by the green arrow in the lower right-hand corner. To the extent that a company with a beta greater than 1.0 is being evaluated, the same process of two separate adjustments would apply, albeit in the opposite direction from what is shown in Figure 12 and would result in a decrease in the cost of equity otherwise predicted by the CAPM.

[151] Dr. Roger A. Morin, *New Regulatory Finance*, Public Utilities Reports, Inc., 2006, at 191 (emphasis added).

Figure 12: Risk/Return Relationship between CAPM and ECAPM



Q. Are you aware of academic studies that have used adjusted betas to estimate the ECAPM?

A. Yes. For example, Litzenberger, Ramaswamy, Sosin (1980) studied the ability of the CAPM to estimate the returns for utilities, and found that the CAPM tends to understate the return for stocks such as utilities, which have a beta less than 1.0.[152] To develop the analysis, Litzenberger, *et al*. utilized both adjusted and raw betas, and in both cases, the CAPM understated the return for utilities with betas less than 1.0. In addition, Chrétien and Coggins (2011) studied the CAPM and its ability to estimate the risk premium for the utility industry in particular subgroups of utilities for a data set that included market data through the end of 2006.[153] Chrétien and Coggins considered the CAPM, the Fama-French

[152] Robert Litzenberger, *et al*., "On the CAPM Approach to the Estimation of A Public Utility's Cost of Equity Capital," *The Journal of Finance*, Vol. 35, No. 2, 1980, at 369-383.

[153] Stéphane Chrétien and Frank Coggins, "Cost Of Equity For Energy Utilities: Beyond The CAPM," *Energy Studies Review*, Vol. 18, No. 2, 2011.

three-factor model, and a model similar to the ECAPM. The study shows that the ECAPM significantly outperformed the traditional CAPM at predicting the observed risk premium for the various utility subgroups.

Additionally, Dr. Morin directly addresses the issue in his 2021 text *Modern Regulatory Finance* as follows:

> Because of this adjustment, some critics of the ECAPM argue that the use of Value Line adjusted betas in the traditional CAPM amounts to using an ECAPM. This is incorrect. The use of adjusted betas in a CAPM analysis is not equivalent to the ECAPM. Betas are adjusted because of the regression tendency of betas to converge towards 1.0 over time. We have seen that numerous empirical studies have determined that the SML [Security Market Line] described by the CAPM formula at *any given moment* in time is not as steeply sloped as the predicted SML. The slope of the SML should not be confused with Beta. On the point, Eugene F. Brigham, finance professor and the author of many financial textbooks states:
>
> > The Slope of the SML (5% in Figure 6-16) reflects the degree of risk aversion in the economy. The greater the average investor's aversion to risk, then (a) the steeper the slope of the line, (b) the greater the risk premium for all stocks, and (c) the higher required rate of return on all stocks. Students sometimes confuse beta with the slope of the SML. This is a mistake.
>
> The use of an adjusted beta by Value Line is correcting for a different problem than the ECAPM. The adjusted beta captures the fact that betas regress towards one over time. The ECAPM corrects for the fact that the CAPM under-predicts observed returns when beta is less than one and over-predicts observed returns when beta is greater than one.[154]

[154] Roger A. Morin, *New Regulatory Finance*, Public Utilities Reports, Inc., 2006, at 223-224 (emphasis added).

Q. Do you agree with Mr. Megginson and Mr. Coppola that your ECAPM is flawed because of the use of a long-term risk-free rate as opposed to a short-term risk-free rate?

A. No. While Mr. Megginson does not explain his disagreement on this issue, Mr. Coppola contends that Dr. Morin concluded in *New Regulatory Finance* that the use of the ECAPM was not required if long-term interest rates were used as the risk-free rate as opposed to short-term interest rates.[155] However, Mr. Coppola misquotes Dr. Morin and, thus, misrepresents Dr. Morin's conclusion regarding the ECAPM. Specifically, Dr. Morin states the following:

> ***An alpha range of 1%-2% is somewhat lower than estimated empirically. The use of a lower value for alpha leads to a lower estimate of the cost of capital for low-beta stocks such as regulated utilities. That is because the use of a long-term risk-free rate rather than a short-term risk-free rate already incorporates some of the desired effect of using the ECAPM. That is, the long-term risk-free rate version of the CAPM has a higher intercept and a flatter slope than the short-term risk-free rate version which has been tested. Thus, it is reasonable to apply a conservative alpha adjustment***. Moreover, the lowering of the tax burden on capital gains and dividend income enacted in 2002 may have decreased the required return for taxable investors, steepening the slope of the ECAPM risk-return trade-off and bring it closer to the CAPM predicted returns.[156]

Thus, Dr. Morin developed the ECAPM based on a conservative estimate of alpha (i.e. 1% to 2%) relative to the range of alphas estimated empirically to account for the effect of using a long-term risk-free rate as opposed to a short-term risk-free rate. Figure 13 provides the list of studies summarized by Dr. Morin. As shown, six of the eight studies

[155] Coppola Direct, at 142-143.

[156] Dr. Roger A. Morin, *New Regulatory Finance*, Public Utilities Reports, Inc., 2006, at 191; emphasis added.

estimated positive values of the constant term, and among the six studies that estimate only positive values of the constant term, the range of the constant term was 1.63% to 13.56%. It is evident that Dr. Morin's use of an alpha in the range of 1% to 2% to develop the 0.25 and 0.75 factors included in the ECAPM is conservative. The ECAPM was developed to be used with a long-term risk-free rate, and thus the use of a long-term risk-free rate is not a substitute for the ECAPM as suggested by Mr. Megginson and Mr. Coppola.

Figure 13: Empirical Evidence on the Alpha Factor (Constant Term)[157]

Author	Range of Alpha
Fischer (1993)	-3.6% to 3.6%
Fischer, Jensen and Scholes (1972)	-9.61% to 12.24%
Fama and McBeth (1972)	4.08% to 9.36%
Fama and French (1992)	10.08% to 13.56%
Litzenberger and Ramaswamy (1979)	5.32% to 8.17%
Litzenberger, Ramaswamy and Sosin (1980)	1.63% to 5.04%
Pettengill, Sundaram and Mathur (1995)	4.6%
Morin (1989)	2.0%

[157] Roger A. Morin, *Modern Regulatory Finance*, Public Utilities Reports, Inc., 2021, at 222.

Q. While Mr. Megginson and Mr. Bandyk state that the Commission has not previously considered the merits of the ECAPM,[158] and Mr. Coppola states that the ECAPM is not widely accepted by state regulatory commissions,[159] are you aware of state regulatory commissions that have accepted the use of the ECAPM in the manner as you have conducted?

A. Yes. While Mr. Coppola references a Company data response from a proceeding filed in 2017 as support for his position,[160] there are various regulatory commissions that have supported the use of the ECAPM in establishing an authorized ROE and have done so when adjusted betas are used in the ECAPM analysis. For example, the New York Public Service Commission ("NYPSC"), the Montana Public Service Commission ("Montana PSC"), and North Carolina Utilities Commission ("NCUC") have accepted the ECAPM analysis with the use of adjusted beta coefficients in establishing the authorized ROE for regulated utilities. Specifically, the NYPSC gives equal weight to the CAPM and ECAPM (which it refers to as the "Zero Beta" CAPM) results,[161] the Montana PSC has expressed preference for the ECAPM analysis,[162] and the NCUC has recently found that both the adjustment to beta in the CAPM and the adjustment in the ECAPM were needed because they correct for different things.[163] Exhibit A-128 (AEB-3).

IX. BOND YIELD RISK PREMIUM ANALYSIS

Q. Do any of the witnesses conduct a Risk Premium analysis?

A. Yes. Mr. Megginson, Mr. Coppola, and Mr. Walters have each conducted a Risk Premium analysis. Specifically:

- Mr. Megginson conducts two forms of a Risk Premium analysis: one reflecting the historical equity risk premium of gas utility stock returns less utility bond yields over the period 1954 to 2024 plus a projected utility bond yield on A-rated rated utility bonds ("Utility Bond Approach"); and another reflecting the historical equity risk premium of gas utility stock returns less 30-year Treasury bond yields over the period 1954 to 2024 plus a projected 30-year Treasury bond yield ("Treasury Bond Approach"). The cost of equity resulting from Mr. Megginson's Utility Bond Approach is 9.56%, respectively, while the cost of equity from his Treasury Bond Approach is 9.46%.[164]

- Mr. Coppola's Risk Premium analysis is similar to Mr. Megginson's Utility Bond Approach, as Mr. Coppola's analysis reflects the historical equity risk premium of gas utility stock returns less A-rated utility bond yields over the period 1954 to 2023 plus a projected average yield on A-rated/BBB-rated utility bonds. Mr. Coppola calculates his projected utility yield by averaging the 2024 spreads between A-rated utility bonds and the 30-year Treasury, and BBB-rated utility bonds and the 30-year Treasury. He adds this average spread to the 4.00% 30-year Treasury rate from his CAPM. Mr. Coppola's risk premium model produces a cost of equity of 9.20%.[165]

- Similarly, Mr. Walters develops five cost of equity estimates based on two forms of a Risk Premium analysis: one reflecting the risk premium relative to yields on 30-year Treasury by subtracting the average 30-year Treasury yield from the average authorized Gas ROE over the period 1986-2024 plus a projected 30-year Treasury yield ("Treasury Bond Approach") to produce a 10.23% cost of equity; and four based on the utility equity risk premium relative to yields on both the Moody's A-rated and Baa-rated utility bonds both using

[164] Megginson Direct, at 33-34 and Exhibit S-4, Schedule D-5.

[165] Coppola Direct, at 137 and Exhibit AG-45.

3-month average yield data and 6-month yield data ("Utility Bond Approach") to produce a cost of capital estimate ranging from 9.73% to 9.98%.[166]

Q. Do you agree with Mr. Megginson's, Mr. Coppola's, and Mr. Walters' Risk Premium analyses?

A. No. The key issue, as previously discussed, is that their analyses apply a historical risk premium to a projected interest rate which fails to consider the inverse relationship between interest rates and the market risk premium. Specifically, the witnesses' risk premium methods add a current or projected yield (i.e. a utility bond yield or a Treasury bond yield) that differs from the historical average rate used to estimate the risk premium. There is an interest rate mismatch in their calculation. Consequently, their Bond Yield to Risk Premium ("BYRP") results do not reflect what it would be if the historical rate had been used consistently, resulting in ROEs that fail to appropriately account for the dynamic, inverse relationship between risk premiums and interest rates. Because historical bond yields are higher than the bond yields utilized by the witnesses in their analyses, and given inverse relationship between risk premiums and interest rates, their analyses, which utilize a historical risk premium, understate the cost of equity.

For example, in his Treasury Bond Approach, Mr. Megginson adds a near-term projected Treasury bond yield of 4.25% to his historical average Treasury bond risk premium of 5.21%, resulting in his estimated cost of equity of 9.46%.[167] However, as shown on Mr. Megginson's Exhibit S-4, Schedule D-5, the average 30-year Treasury bond yield over the 1954-2024 period was 5.73%, *or more than 145 basis points higher* than the

[166] Walters Direct, at 43-47.
[167] Megginson Direct, at 34.

near-term projected Treasury bond yield of 4.25% that he relies on to calculate the cost of equity for this version of his Risk Premium analysis.

Q. Can you show the impact to ROE estimates by mismatching historical and projected interest rates?

A. Figure 14 shows how the witnesses' mismatching of the historical and projected interest rates leads to understated cost of capital estimates. All witnesses projected interest rates are less than the historical interest rates that were used for their risk premium calculation. When adding the historical interest rate to the risk premium for consistency, estimates for the cost of capital are significantly higher by at least 54 basis points[168] in all cases and on average 115 basis points higher.[169] Please note that I do not endorse this method, but simply demonstrate how the witnesses materially understate the ROE by being inconsistent with their interest rates usage in their risk premium models.

[168] Mr. Walters' adjusted 10.77% less his 10.23% ROE result.

[169] Average spread between ROE using only historical bond yield less ROE as reported from Figure 14.

Figure 14: Update of Mr. Megginson's, Mr. Coppola's, and Mr. Walters' Risk Premium Analyses[170]

	Historical Bond Yield	Current or Projected Bond Yield	Historical Risk Premium as Reported	ROE as Reported	ROE Using Only Historical Bond Yield
Mr. Megginson					
Utility Bond Approach (A-Rated)	7.14%	5.76%	3.80%	9.56%	10.94%
Treasury Bond Approach	5.73%	4.25%	5.21%	9.46%	10.94%
Mr. Coppola Utility Bond Approach	7.14%	5.40%	3.80%	9.20%	10.94%
Mr. Walters					
Treasury Bond Approach	5.14%	4.60%	5.63%	10.23%	10.77%
3-Month Average Yields					
Utility Bond Approach (A-Rated)	6.50%	5.51%	4.27%	9.78%	10.77%
Utility Bond Approach (Baa-Rated)	6.70%	5.71%	4.27%	9.98%	10.97%
6-Month Average Yields					
Utility Bond Approach (A-Rated)	6.50%	5.46%	4.27%	9.73%	10.77%
Utility Bond Approach (Baa-Rated)	6.70%	5.67%	4.27%	9.94%	10.97%

Q. Do you have any additional concerns with the Risk Premium analysis conducted by Mr. Coppola?

A. Yes. As discussed previously in my response to Mr. Coppola's CAPM analysis, he relies on an outdated near-term projected risk-free rate as of October 2024 from the *Blue Chip Financial Forecasts* when more current data is available, particularly when his testimony was filed on April 23, 2025.[171]

[170] Megginson Exhibit S-4, Schedule D-5; Coppola workpapers; Walters Exhibit AB-15, Exhibit AB-16, and Exhibit AB-18. Mr. Walters uses the same risk premium derived from A-rated utility bonds as he does for Baa-rated utility bonds. As a result, the 6.70% historical Baa-rated bond is implied.

[171] Coppola Exhibit AG-44 and Exhibit AG-45.

Q. What are the positions offered by Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters regarding your Risk Premium analyses?

A. The following summarizes the reasons offered by each of these witnesses to suggest that my Risk Premium approach should be given little weight or not be relied upon:[172]

- Mr. Megginson and Mr. Coppola claim that my Risk Premium analyses reflect a simplistic inverse relationship between equity risk premiums and interest rates and contend that this relationship can be influenced by factors other than interest rates.[173]

- Mr. Megginson and Mr. Coppola oppose the use of my Risk Premium analysis because they contend that authorized ROEs are not market behavior but rather a reflection of regulator behavior.[174]

- Mr. Coppola objects that interest rates of up to 12.10% in the late 1980s are not comparable to today's environment, and therefore should not be included in a BYRP analysis.[175]

- Mr. Walters believes that my BYRP analysis uses electric utilities and uses overstated equity risk premiums.[176]

- Mr. Bandyk believes that authorized ROEs used as an input in my BYRP have been "excessive." Mr. Bandyk rejects my BYRP and does not perform one himself.[177]

- Mr. Walters believes that my BYRP analysis is predicated on an overstated risk premium.[178]

[172] Megginson Direct, at 35. Walters Direct, at 73. Coppola Direct, at 138. Bandyk Direct, at 24.
[173] Megginson Direct, at 34-35; Coppola Direct, at 138.
[174] *Id*.
[175] Coppola Direct, at 138.
[176] Walters Direct, at 72.
[177] Bandyk Direct, at 24-25.
[178] Walters Direct, at 73.

Q. Is there any validity to Mr. Megginson's or Mr. Coppola's claims regarding your Risk Premium analyses?

A. No. While authorized ROEs are not "market data," it is unreasonable to suggest that investors are not aware of authorized ROEs and do not consider them in their assessment of the value of a utility stock. Recent market data demonstrates that unconstructive ROEs have resulted in sharp declines in utility stock prices, as well as commentary from equity analysts and rating agencies. Accordingly, it is appropriate for the Commission to accept and consider the results of my Risk Premium analyses. In addition, while I disagree with his approach, Mr. Walters also relies on a risk premium-based methodology as one of the methodologies he uses to estimate the cost of equity.

Q. Do you agree with Mr. Megginson that it is more appropriate to use historical authorized ROEs for comparison as opposed to an input in your BYRP analysis?[179]

A. No. As discussed in my direct testimony, it is important to recognize that both academic literature and market evidence have identified a relationship between the equity risk premium and the level of interest rates (i.e. as interest rates increase, the equity risk premium decreases, and vice versa). Consequently, it is important to develop an analysis that: (1) reflects the inverse relationship between interest rates and the equity risk premium; and (2) relies on recent and expected market conditions. Accordingly, I have developed such an analysis based on a regression of the risk premium as a function of 30-year Treasury bond yields. As discussed, neither Mr. Megginson's nor Mr. Coppola's Risk Premium analyses appropriately account for this inverse relationship, and I have

[179] Megginson Direct at 35.

demonstrated that their use of an historical average market risk premium fails to account for this inverse relationship. Therefore, there is no basis to Mr. Megginson's suggestion that the results of my Risk Premium analysis do not appear to align simply because I do not utilize a historical market risk premium, but rather appropriately apply the regression results of the historical data to the current and projected interest rates.

Q. Do you agree with Mr. Megginson and Mr. Coppola that your Risk Premium results are invalid because you have not considered other factors in addition to interest rates in your regression analyses?

A. No. Mr. Megginson and Mr. Coppola fail to recognize the large body of research that supports the inverse relationship between equity risk premia and interest rates and have failed to present any research to support their positions. For example, Berry (1998) came to similar conclusions regarding the inverse relationship between interest rates and the risk premia.[180] Also, as summarized in *New Regulatory Finance*:

> Published studies by Brigham, Shome, and Vinson (1985), Harris (1986), Harris and Marston (1992, 1993), Carleton, Chambers, and Lakonishok (1983), Morin (2005), and McShane (2005), and others demonstrate that, beginning in 1980, risk premiums varied inversely with the level of interest rates—rising when rates fell and declining when interest rates rose. The reason for this relationship is that when interest rates rise, bondholders suffer a capital loss. This is referred to as interest rate risk…. Conversely in low interest rate environments, when bondholders' interest rate fears subside and shareholders' fears of loss of earning power dominate, the risk differential will widen and hence the risk premium will increase.[181]

[180] S. Keith Berry, "Interest Rate Risk and Utility Risk Premia during 1982-93," *Managerial and Decision Economics*, Vol. 19, No. 2, March, 1998.

[181] Dr. Roger A. Morin, *New Regulatory Finance*, Public Utilities Reports, Inc., 2006, at 128.

In his more recent textbook, *Modern Regulatory Finance*, Dr. Morin outlines the issues and academic research and concludes the following with respect to the relationship between interest rates and the equity risk premium:

> This is particularly true in a high inflation environment. Interest rates rise as a result of accelerating inflation, and the interest rate risk of bonds intensifies more than the earnings of common stocks, which are partially hedged from the ravages of inflation. This phenomenon has been termed as a "lock-in" premium. Conversely, in low interest rate environments, when bondholders' interest rate fears subside and shareholders' fears of loss of earnings power dominate, the risk differential will widen and hence the risk premium will increase.
>
> Published empirical studies demonstrate that risk premiums vary inversely with the level of interest rates, rising when rates fell and declining when interest rates rose. Studies by Brigham, Shone, and Vinson (1985), Harris (1986), Harris and Marston (1992, 1993), Carleton, Chambers, and Lakonishok (1983), and Morin 2020), and others ***demonstrate that, beginning in 1980, risk premiums varied inversely with the level of interest rates – rising when rates fell and declining when rates rose***.[182]

These studies demonstrate that my Risk Premium analysis is consistent with academic and scholarly research. Mr. Megginson and Mr. Coppola do not present any academic studies that refute the bases and methodology that I have used in my Risk Premium analyses.

[182] Roger A. Morin, *Modern Regulatory Finance*, Public Utilities Reports, Inc., 2021, at 146; graphic referenced in cite and shown in text has been omitted.

Q. Does the regression analysis that you have conducted for your Risk Premium analysis demonstrate a strong inverse relationship between interest rates and the equity risk premium?

A. Yes. As shown both in my direct testimony on Exhibit A-14, Schedule D-5, page 22, and as updated herein on Exhibit A-127 (AEB-2), page 21, the regression equation for my Risk Premium analysis has an R^2 of approximately 0.86, which means that 86.00% of the variation in historical implied utility equity risk premia can be explained by changes in interest rates. The regression indicates that there indeed exists a strong negative correlation between utility equity risk premia and interest rates, and that the regression equation is an effective tool for predicting authorized ROEs at specified interest rate levels, whether current or projected interest rates. Mr. Megginson and Mr. Coppola fail to address this strong relationship demonstrated by the data in my Risk Premium analysis, which invalidates the critiques offered by Mr. Megginson that there are "numerous" factors that are unaccounted for in my analyses and by Mr. Coppola that regulators establish "ROEs based on many factors" that are not in lock-step with interest rates.[183]

Q. Do you agree with Mr. Megginson and Mr. Coppola that your Risk Premium methodology does not measure investor behavior and is therefore invalid?

A. No. As noted previously, it is unquestionable that both credit rating agencies and investors consider the authorized ROE data in their determination of the valuation of utility stocks. As I discussed both earlier in this rebuttal testimony and in my direct testimony, both credit rating agencies and investors have responded negatively to authorized ROEs deemed to be

[183] Megginson Direct, at 35; Coppola Direct, at 138.

too low.[184] Therefore, the relationship between recently authorized ROEs and the prevailing interest rates at the time that the ROE was authorized is reasonable to consider when setting the ROE in the context of a rate proceeding.

Moreover, it is important to recognize the inconsistency in both Mr. Megginson's and Mr. Coppola's position regarding the reliance of authorized ROEs in the Risk Premium analysis. Each of these witnesses suggest that my Risk Premium approach cannot be relied upon because the authorized ROEs reflect regulatory commission behavior and not investor behavior. However, despite that claim, both Mr. Megginson and Mr. Coppola evaluate the same authorized ROE and 30-year Treasury bond yield data that I use in my Risk Premium analyses in their own testimony as support for their recommended ROEs for the Company in this proceeding.[185] Therefore, Mr. Megginson and Mr. Coppola are inconsistent in their positions on the use of this information, seeking only to rely on it in establishing their own ROE recommendations while disregarding the historical relationship developed in my Risk Premium approach.

Q. Please respond to Mr. Coppola's concern that interest rates of the 1980s are not comparable to today's interest rates.

A. The high interest rates of the 1980s correspond with high authorized natural gas ROEs. Therefore, as seen in Exhibit A-14, Schedule D-5, page 23, of my direct testimony, the individual risk premium data points from the 1980s are comparable, if not lower than risk premiums in recent quarters.

[184] Bulkley Direct, at 39-47.

[185] Megginson Direct, at 34-35; Coppola Direct, at 146, Exhibit AG-45, and Exhibit AG-48.

Mr. Coppola undermines his own methods with his critique by relying on the very type of data he dismisses. While he takes issue with my use of data from the 1980s in the BYRP, he has no problem using historical equity and bond data, not only from the same period, but going as far back as 1952 in his Risk Premium approach.[186]

Q. Please respond to Mr. Walters' claim that your risk premium is overstated.

A. As a threshold matter, I use natural gas authorized ROEs in my BYRP analysis, not electric authorized ROEs as Mr. Walters states.[187]

Mr. Walters' claim that my risk premium is overstated is based on his own long-term historical average risk premium. However, as discussed earlier, his long-term average risk premium does not reflect current market conditions and bond yields. As shown on Mr. Walters' Exhibit AB-15, Mr. Walters' long-term historical average risk premium over 30-year Treasury bond yields is 5.63%, but his long-term historical average 30-year Treasury bond yield is 5.14%. This is despite Mr. Walters acknowledging that current 30-year Treasury bond yields are lower at approximately 4.60%.[188] Therefore, based on the inverse relationship between interest rates and the equity risk premium, an interest rate that is lower than the historical average means that the equity risk premium should be higher than his historical average of 5.63% – which is the case for my analysis. Therefore, Mr. Walters's criticism of my BYRP analyses is unfounded.

[186] Coppola Direct, at 137.
[187] Walters Direct, at 72.
[188] Walters Direct, at 46.

Q. What is Mr. Bandyk's position regarding your Risk Premium analyses?

A. Mr. Bandyk states that the results of my Risk Premium analyses should be disregarded because it relies on the ROEs authorized by other commissions, which he argues is not objective data but rather reflects the fact that regulatory commissions have historically and consistently authorized excessive ROEs for utilities.[189]

Q. Is there any merit to Mr. Bandyk's position regarding your Risk Premium analyses?

A. No. As I discussed previously, there is no merit to Mr. Bandyk's claim that regulatory commissions have consistently authorized "excessive" ROEs.

Q. Do any witnesses use regression analysis?

A. No.

Q. What are some benefits of using regression analysis as opposed to reviewing simple averages?

A. The benefit of conducting a regression analysis is that the resulting predictive equation can be used to estimate a *forward-looking* equity risk premium corresponding to *any* interest rate one wishes to specify. By specifying the interest rate projected for the time period that the Company's rates from this proceeding will be in effect, one can estimate an equity risk premium (and thus an ROE) for the *forward-looking* time period that corresponds with the rates that are set in this proceeding.

While using average authorized ROEs can be useful starting point for analysis, regression analysis formalizes comparing previous ROEs in a systematic way that allows for forward-looking estimating. Regression analysis is a common forecasting tool.

[189] Bandyk Direct, at 24-25.

X. SUMMARY OF THE ADJUSTED RESULTS

Q. Have you considered how the ROE recommendations of Mr. Megginson, Mr. Coppola, Mr. Bandyk, and Mr. Walters would change if their cost of equity analyses were corrected for the issues you have identified with each of their analyses?

A. Yes, I evaluate how each of these witnesses' ROE recommendations would change once their analyses are updated and corrected.

Q. How do the results of Mr. Megginson's cost of equity analyses change if the issues that you have identified are addressed with each of his analyses?

A. Figure 15 presents the results of Mr. Megginson's cost of equity analyses based on the updates and corrections to those analyses that I have discussed. As shown, when the results of Mr. Megginson's cost of equity analyses based on the updates and corrections to those analyses that I have discussed are considered, the average cost of equity resulting from his analyses is 10.68%, which is greater than the Company's requested ROE of 10.25% in this proceeding.

Figure 15: Results of Mr. Megginson's as Filed and Adjusted Cost of Equity Analyses

		Mr. Megginson As Filed	Mr. Megginson As Adjusted
Constant Growth DCF	[1]	9.40%	10.58%

Utility Bond Risk Premium (A-rated)		9.56%	10.94%
Treasury Bond Risk Premium		9.46%	10.94%
Average	[3]	9.51%	10.94%
Authorized ROEs			
2024 Avg. Auth'd Gas ROE	[4]	9.72%	9.72%
Average of [1], [2], [3], [4]		**9.56%**	**10.68%**
Recommended ROE		9.75%	
Company's Proposed ROE			10.25%

Q. How do the results of Mr. Coppola's cost of equity analyses change if the issues that you have identified are addressed with each of his analyses?

A. Figure 16 presents the results of Mr. Coppola's cost of equity analyses based on the updates and corrections to his analyses that I have discussed. As shown, Mr. Coppola applies a 50% weighting to the result of his constant growth DCF and a 25% weighting each to the results of his CAPM and Risk Premium analyses. As shown in Figure 16, applying these same weightings to the updates and corrections to Mr. Coppola's analyses produces a cost

of equity of 10.51%, which supports the Company's requested ROE of 10.25% in this proceeding.

Figure 16: Results of Mr. Coppola's as Filed and Adjusted Cost of Equity Analyses

	Model Weighting	As Filed	As Adjusted
Constant Growth DCF	50.00%	9.11%	9.79%
CAPM	25.00%	10.66%	11.50%
Risk Premium	25.00%	9.20%	10.94%
Wgtd. Avg. Cost of Equity		**9.52%**	**10.51%**
Recommended ROE		9.75%	
Company's Proposed ROE			10.25%

Q. How do the results of Mr. Walters's cost of equity analyses change if the issues that you have identified are addressed with each of his analyses?

A. Figure 17 summarizes the results of Mr. Walters' cost of equity models based on the adjustments to his analyses that I have discussed. Based on these changes, the average results of each of Mr. Walters' three analyses range from 10.38% to 11.05%, with a midpoint of 10.72%, which supports the Company's proposed ROE of 10.25%, and is significantly greater than Mr. Walters' recommended ROE of 9.45%.

Figure 17: Results of Mr. Walters's As-Filed and Adjusted Cost of Equity Analyses[190]

Midpoint	**9.83%**		**10.72%**	
Recommended ROE	9.45%			
Company's Proposed ROE			10.25%	

Q. Lastly, how do the results of Mr. Bandyk's cost of equity analyses change if the issues that you have identified are addressed with each of his analyses?

A. Figure 18 presents the results of Mr. Bandyk's cost of equity analyses based on the updates and corrections to his analyses that I have discussed. As shown, Mr. Bandyk calculates his

[190] The mean constant growth DCF result using projected EPS growth rates was excluded due to a projected EPS growth rate for California Water Service Group of approximately 42% from *Zacks*, S&P and I/B/E/S, which has a significant effect on the average. It is more appropriate to rely on the median which is not affected to a large degree by the presence of outliers.

recommended ROE by taking the average of the results of his two cost of equity analyses, and then average that result with the Company's currently authorized ROE. I disagree with this approach for determining the ROE in this proceeding given that the existing authorized ROE is not representative of the current or projected capital market conditions during the period in which the rates established in this proceeding will be in effect. Therefore, a more appropriate ROE recommendation for the Company based on Mr. Bandyk's corrected cost of equity analyses would be the average of the results of his DCF and CAPM analyses, which is 10.48% and is greater than the Company's requested ROE of 10.25% in this proceeding. Nonetheless, even if the same approach that Mr. Bandyk applies for determining his recommended ROE is applied, the recommended ROE is still 10.19%, or substantially higher than the 9.24% that he reflects in his testimony.

Figure 18: Results of Mr. Bandyk's As-Filed and Adjusted Cost of Equity Analyses

	As Filed	As Adjusted
DCF	9.22%	10.99%
CAPM	7.95%	9.96%
Average	8.59%	10.48%
Consumers Existing ROE	9.90%	9.90%
Recommended ROE	**9.24%**	**10.19%**

XI. BUSINESS RISK

Q. What are Mr. Megginson's, Mr. Coppola's, Mr. Bandyk's, and Mr. Walters' positions regarding the business and financial risks of the Company relative to the ROE that should be authorized for the Company in this proceeding?

A. The witnesses have the following positions:

- Mr. Megginson testifies that: Consumers Energy experiences enhanced infrastructure replacement and decoupling, has experienced several years with positive net income growth,[191] and believes that the Commission's prior approval of the Company's main replacement program, as well as other programs and surcharge mechanisms to pay for those programs, "all but ensure recovery and reduces the Company's overall business and financial risk,"[192] and that Consumers Energy's filing every 12-months "borders on a 100% risk-free investment."[193]

- Mr. Coppola claims that his proxy group is riskier than Consumers Energy due to other non-regulated business operations and higher financial leverage.[194]

- Mr. Bandyk dismisses the use of commission rankings as a measure of regulatory risk,[195] and believes that the Company does not possess additional business risk as a result of large capital expenditures and having fewer mechanisms relative to my proxy group.[196]

- Mr. Walters cites an S&P stable outlook and a Barclays analyst who believes that Consumers Energy's parent CMS Energy has financially performed strongly, as evidence that the Company is financially healthy and a lower ROE is warranted.[197]

- None of the witnesses address flotation costs.

196 *Id*., at 27-32.
197 Walters Direct, at 28.

Q. Is Mr. Megginson correct about the mechanisms that Consumers Energy currently has available to facilitate timely recovery of costs?

A. Not entirely. As discussed in the testimony of Mr. Bleckman, Consumers Energy does not currently have a decoupling mechanism and currently does not have a surcharge for an Enhanced Infrastructure Replacement Program. Further, while Staff references the Company's Gas Cost Recovery Mechanism and Energy Waste Reduction programs, neither of these programs provides for the recovery of investments made to improve or replace the Company's infrastructure.

Q. Has Mr. Megginson conducted any analysis to support his position that Consumers Energy has less risk as a result of rate mechanisms?

A. No. As noted in the testimony of Mr. Bleckman, the mechanisms that Mr. Megginson references are not implemented by Consumers Energy, and therefore it is not possible for such mechanisms to be risk reducing factors. Further, even if Consumers Energy did have certain mechanisms, in order to determine whether or not the risk mitigation should be considered in setting the ROE, it is necessary to review what types of mechanisms have been implemented by the proxy group companies, and therefore are reflected in the market data that is used to estimate the ROE. Mr. Megginson has not done that analysis, nor could he, since the mechanisms that he references are not implemented by Consumers Energy, or the mechanisms do not recover infrastructure improvements. As discussed in my direct testimony, I evaluate Consumers Energy's business and regulatory risk relative to the operating utilities of the proxy group and, based on that analysis, demonstrate that Consumers Energy has moderately greater regulatory risk as compared to the operating

subsidiaries of the proxy group companies given the more-timely cost recovery of the proxy group companies.

Q. Please respond to Mr. Megginson's analysis of Consumers steady earnings.

A. Mr. Megginson's analysis is incomplete and inconclusive. Mr. Megginson reviews the Company's annual change in net income in complete isolation, without considering the changes in investment over time or the changes in rate base.[198] To the extent that the Company has invested in the system over the period from 2010 through 2024, its net income should increase. However, the analysis does nothing to demonstrate that the increases in net income are sufficient to satisfy the investor-required return on that investment, nor does it conclude anything meaningful about the Company's financial integrity. Accordingly, in its current form, this analysis cannot be used to conclude anything meaningful about the Company's earnings or its financial integrity and should be disregarded.

Q. Please respond to Mr. Megginson's claim that the frequency of Consumers Energy's rate filings "borders on a risk-free investment for the Company."[199]

A. No, filing a rate case is not akin to a risk-free investment. If Mr. Megginson's claim was correct, investors would flood Consumers Energy with capital and bid up its bond prices. The Company's bond yields would converge to risk-free government Treasury yields. Mr. Megginson's claim ignores principles of finance including the risk-reward tradeoff, opportunity cost, and regulatory risk, and he has provided no support for his claim.

[198] Megginson Direct, at 9.
[199] *Id*., at 37.

Q. Has Mr. Coppola performed an analysis that his proxy group is riskier than Consumers Energy?

A. No. Mr. Coppola simply claims this because some proxy group companies have non-regulated business segments.[200] He does not refer to specific companies nor does he attempt to measure any impact of non-regulated activities of his proxy group. On the other hand, my proxy screening criteria involves quantifying companies' non-regulated operating incomes. Companies in my proxy group who derive some operating income from non-regulated activities have similar cost of equity estimates to companies that derive 100% operating income from regulated operations. Furthermore, when discussing regulatory and business risk in my direct testimony, I only consider regulated business operations of my proxy group for comparability.[201] Therefore, Mr. Coppola's claim that his proxy group, or mine for that matter, is riskier than the Company is baseless.

Q. Is Mr. Bandyk's rejection of considering regulatory environment rankings reasonable?

A. No. Mr. Bandyk believes that the rankings "appear to be judgments for how generous utility commissions tend to be with the ROEs they tend to grant utilities."[202] This is incorrect. A recent publication that summarizes commission rankings from S&P Global Ratings states that:

> We assess all North America's regulatory jurisdictions as credit supportive or better, reflecting the industry's generally stable and predictable cash flows (see chart 16). Over the past decade much of the industry has implemented regulatory mechanisms such as decoupling, interim rates,

[200] Coppola Direct, at 145.
[201] Bulkley Direct, at 33-47.
[202] Bandyk Direct, at 9.

> capital trackers, formula rate plans, forward test years, muti-year rate case filings, and regulatory riders to significantly improve cash flow stability while minimizing regulatory lag.[203]

The statement emphasizes cash flow, not "how generous" commissions are towards awarding ROEs. The rankings are simply an additional input for the Commission to consider in their decision.

Q. Do you agree with Mr. Bandyk's assessment of the risk factors that you evaluated?

A. No. Mr. Bandyk rejects the notion that the Company has additional risk that should be considered. Rather, he believes that relative to the proxy group, the Company's lower capital expenditure and the absence of comparable rate mechanisms do not support my position that the Company faces more risk.[204]

To be clear, the capital investment analysis in my direct testimony concludes that Consumers Energy faces slightly higher risk than the proxy group because it has a significant capital spending plan and does not have a mechanism to recover those investments. In comparison, the majority of the proxy group companies have some form of capital tracking mechanism. Therefore, Consumers Energy has slightly higher risk than the proxy group on this basis.

Mr. Bandyk's alternative analysis confirms my conclusion that the Company has fewer mechanisms relative to the proxy company. Mr. Bandyk compares rate mechanisms between Consumers Energy and my proxy group using an alternative weighting. His alternative method equally weights proxy group companies instead of my equal weighting

[203] S&P Global Ratings. "North America Regulated Utilities: Capex and climate change pressures credit quality." Industry Credit Outlook 2025. January 14, 2025.

[204] Bandyk Direct, at 26-32.

to each subsidiary such that each of my six proxy group companies receive a 1/6th (i.e. an approximately 16.67%) weight. Although I disagree with Mr. Bandyk's method of limiting subsidiary weights by parent company in the proxy group, his results still show that most companies in my proxy group have more capital investment recovery mechanisms than Consumers Energy. [205]

Q. Do you agree with Mr. Megginson that a utility should not recover flotation costs if the equity is issued at the parent company level?

A. No. Mr. Megginson's position with respect to the recovery of flotation costs related to equity issuances is inconsistent with his position on the recovery of the costs associated with debt issuances.[206] Mr. Megginson acknowledges that the cost of debt issuances should be and are recovered by utilities; however, he suggests that the cost of issuing equity should be born at the parent company level because that is where equity is issued. I disagree entirely. The cost of equity capital that is raised on behalf of the operating company results in a permanent reduction in the overall capital that is received through an issuance and is properly reflected in the cost of equity for the operating company that is in receipt of the equity capital.

Q. Does this conclude your rebuttal testimony?

A. Yes.

DEPARTMENT OF PUBLIC SERVICE REGULATION
BEFORE THE PUBLIC SERVICE COMMISSION
OF THE STATE OF MONTANA

IN THE MATTER OF the Joint Application for Approval to Change and Establish Natural Gas Delivery Service Rates for Energy West Montana, Inc. and Cut Bank Gas Company	)))))	REGULATORY DIVISION DOCKET NO. D2017.9.80 ORDER NO. 7575c

FINAL ORDER

PROCEDURAL HISTORY

1. On September 29, 2017, Energy West Montana, Inc. ("EWM") and Cut Bank Gas Company ("CBGC") submitted their Joint Application to the Montana Public Service Commission ("PSC" or "Commission") for authority to increase and establish natural gas delivery service rates for each utility's service territory ("Joint Application"). EWM and CBGC request that the Commission: authorize EWM and CBGC to change their existing rates and establish new rates as set forth in their Joint Application and supporting testimony; authorize EWM and CBGC to establish the rate design described in the direct testimony filed in support of their Joint Application; and provide such other processes and relief as the Commission deems necessary for final resolution of the issues raised in their Joint Application and supporting testimony. EWM proposed an increase in total operating revenues of $1,526,960 or an increase of 6.53%. This would result in increases in the typical residential bills of EWM and West Yellowstone residential customers of 7.03% and 2.29% respectively. CBGC proposed an increase in total operating revenues of $183,284 or an increase of 14.23%. This would result in an increase in the CBGC typical residential bill of 5.42%. Test. Schulz 2 (Feb. 22, 2018).

2. EWM and CBGC stated the factors contributing to their application to increase rates are: increased investment in physical plant (a significant portion of which relates to the purchase of the Southern Montana Electric Cooperative ("SME") pipeline), general inflation, a new enterprise resource software planning ("ERP") system, which is a Systems, Applications, and Products Software ("SAP"), and decreased consumption by customers. In addition, the

Company proposes to introduce a Gas Infrastructure Reliability Clause ("GIRC") and an accompanying rate adjustment mechanism to fund the GIRC. Test. Degenstein 15 (Sept. 29, 2017).

3. On October 3, 2017, the Commission issued a *Notice of Application and Intervention Deadline*. On October 27, 2017, the Commission issued a *Notice of Staff Action Granting Intervention* to the Montana Consumer Counsel ("MCC"). On October 24, 2017, the Joint Applicants submitted the Supplemental Testimony of Charles E. Loy, making the Joint Application complete and compliant per Commission rules. *See* Mont. Admin. R. 38.2.315 (2017).

4. On November 20, 2017, the Commission issued Procedural Order 7575 setting deadlines for discovery. The Commission established March 8, 2018, as the final day for the Commission to identify additional issues in this docket.

5. On February 22, 2018, EWM/CBGC filed supplemental testimony incorporating the impact of the December 2017 Federal Tax Cut and Job Act ("TCJA") and an increase to the Additions to Plant Account due to a lease buyout of the SAP software from Verilease. These changes reduced the revenue increases requested by EWM and CGBC to $1,361,817 and $178,328, respectively.

6. The final revenue requirement increases submitted by EWM and CBGC incorporating certain of the adjustments suggested by the MCC were $1,144,172 for EWM and $177,964 for CBGC. These represent increases in Operating Revenues of 4.7% and 11.0%, respectively. Hr'g. Ex. JA-12, updated version of JDH-CBG-2R and Hr'g. Ex. JA-13, updated version of JDH-EWM-2R.

7. MCC submitted intervenor testimony on February 22, 2018, which concluded that EWM's requested annual revenue increase was excessive and recommended that the Commission approve a revenue increase of no more than $316,134. MCC recommended CBGC should be authorized an increase of no more than $109,367. These MCC increases did not incorporate the impact of the TCJA. Test. Schulz 2.

8. At a regularly scheduled work session held on March 6, 2018, the Commission voted to identify EWM's line extension policy as an additional issue, requesting additional testimony. The Commission issued a *Notice of Commission Action* providing direction on this

decision. Accordingly, on March 15, 2018, the Commission issued a revised procedural schedule to allow for testimony and discovery.

9. The Commission held a public hearing in this matter on May 9 and 10, 2018, in Great Falls, Montana.

10. At the hearing the MCC had not yet provided an update to rate base or revenue requirements incorporating the TCJA. MCC later provided its updated recommendations in post-hearing exhibits which include the impact of the TCJA. With these updates, MCC recommends a $133,017 increase for EWM and a $70,534 increase for CBGC. MCC Post Hrg. Provides (June 6, 2018).

DISCUSSION AND FINDINGS OF FACT

Gas Infrastructure Replacement Clause (GIRC)

11. EWM and CBGC are requesting the Commission approve a new cost recovery and infrastructure replacement program referred to as the GIRC. The Pipeline and Hazardous Materials Safety Administration ("PHMSA") required EWM/CBGC to establish a Distribution Integrity Management Plan ("DIMP"). The DIMP requires EWM/CBGC to identify and prioritize infrastructure that constitutes a public safety concern for maintenance and replacement. EWM states that "[t]he GIRC plan is a rate mechanism that would allow EWM/CBGC to accelerate DIMP associated capital investment with limited regulatory lag while avoiding the need for more frequent rates." Test. Degenstein 15. Mr. Degenstein states that "[a]n infrastructure replacement mechanism puts structure around activities that are going to take place regardless of rate treatment, as proven by the track record of EWM and CBGC . . . ." *Id.* at 18. Degenstein testifies that without the accelerated investment from the GIRC program, and based on historical replacement rates and current staffing, it would take approximately 45 years to replace the infrastructure identified in its DIMP. With the GIRC, the replacement could be accomplished in 10-12 years. *Id.* at 16. He argued that the lines would eventually leak. Hr'g Tr. 54:11-15 (May 9, 2018). Mr. Degenstein testified that he would accept a sunset provision in the GIRC that would require rate cases at three to five-year intervals. Hr'g Tr. 91:1-12. He also stated that if EWM replaces infrastructure that doesn't need to be replaced, via the GIRC, the Commission has the authority to deny it. Hr'g Tr. 95:20-23.

12. Under the GIRC, there would be an annual filing each year which would allow EWM/CBGC a return on and recovery of the GIRC capital investment from the previous year

(subject to certain tests within the mechanism). Test. Loy, Ex. CEL-EWM-2 (Sept. 29, 2017). The GIRC investment is cumulative on a going-forward basis and every year the associated revenue requirement increases. Per the testimony of EWM, assuming 2018 is the first year of the GIRC investment to be recovered in 2019, and GIRC investment continues for five years in similar amounts, the GIRC revenue requirement grows from $2.34 per year per customer in 2019 to $20.26 per year per customer in 2023. The proposed rate structure includes the same amounts for each customer rate class that would be recovered via a special tariffed GIRC rider. (Test. Loy, Table 2, p. 12).

13. MCC's witness, Mr. Donkin, argues that the GIRC would involve single-issue ratemaking. Donkin states that with or without the GIRC, EWM and CBGC have an obligation, as public utilities, to provide safe and reliable natural gas distribution service to their customers. This suggests they should pursue a proactive mains and services replacement program with or without the GIRC. Mr. Donkin states, "This obligation does not rest on its agreement with Commission rate setting decisions such as trackers like the GIRC proposal, authorized equity returns or other allowances." Test. Donkin 51 (Feb. 22, 2018).

14. The Commission finds that the GIRC program is in the public interest and is approved with a number of necessary modifications. The Commission appreciates the MCC's arguments regarding single-issue ratemaking and the fact that the program will be completed without a GIRC. The Commission agrees with MCC and expects the companies which have the privilege of monopoly to deploy capital at an accelerated pace when it is necessary to meet safety goals, so long as the Commission establishes a fair return on that investment, as this Order does. *Infra* ¶¶ 112-148. However, the Commission is also aware that in circumstances where anticipated incremental capital investment significantly outpaces the recovery of the utility's historic invested capital, the process of filing rate cases may impose such transaction costs and time lag that it may result in a misalignment of a firm's financial incentive with the goals of public utility regulation. Here, several factors combine to warrant the Commission's approval of the GIRC, which is single-issue ratemaking albeit subject to several key protections which protect consumers from the negative phenomena associated with other trackers. First, the spending in question is closely tied to specifically identified goals and discrete from other lines of capital spending by virtue of PHMSA's particularized requirements on natural gas local distribution companies. Test. Degenstein 15-19. Second, the transaction costs associated with a

rate case for companies the size of the Joint Applicants are significant. In this case, rate case expenses for the Joint Applicants are $350,000, which if amortized over five years, results in an annual increase of the revenue requirement for just the rate case expenses in the amount of $70,000. Rebut. Test. Henthorne 8 (Apr. 9, 2018). Although this rate case has allowed a thorough evaluation of the Joint Applicants, and has led the Commission to disallow substantial requests of the utilities in question, it is clear that the transaction costs are significant. Third, the incremental capital investments in question, while no doubt welcomed by a firm that seeks to invest capital and be paid a return largely assured by government for doing so, is being invested pursuant to legal requirements associated with public safety, which alongside affordability is the Commission's foremost priority.

15. In order to remedy the MCC's concerns, the Commission accepts the Joint Applicants' proposal that the GIRC be limited to incremental capital spending net of depreciation and be subject to an earnings test, although the Commission finds that these are unartfully described in the Joint Applicants' proposed tariff. The Commission orders more precise language for these calculations. In the GIRC tariff the Commission approves, language has been added specifying the rate of return used in the earnings test, specifying how the excess accumulated deferred income tax ("EDIT") amortization credit to the GIRC will be quantified, how the annual current year depreciation will be calculated, and how the current year average GIRC plant will be calculated. Likewise, a welcome attribute of the Joint Applicants' proposed GIRC is that its collections in rates are in arrears, only after the spending is made, and not made on projections. The Commission also approves this feature, but adds a reporting requirement of the utilities' anticipated spending, together with a rate filing, which the Commission believes will allow for greater regulatory oversight in both the ongoing surveillance of the GIRC and at that time when the spending is ultimately proposed for inclusion permanently in rate base through a general rate case. In order to cabin the specific programmatic costs, and to prevent the GIRC from becoming a catch-all mechanism for any spending said to be undertaken for the omnibus cause of public safety, the Commission includes specific, identifiable property elements within the tariffs. *See* Attachment A. These are tied to Mr. Degenstein's representations about the need for this program. To ensure transparency on an accounting level, the company will also be required to clear plant to specifically designated FERC accounts. Finally, while the Joint Applicants propose that this surcharge become active with respect to incremental capital

spending undertaken during the 2018 construction season, the Commission defers the implementation of the program by one year; the first year in which incremental capital spending under the GIRC is subject to be surcharged is 2019. The Commission does this in recognition of the fact that the construction season for 2018 is nearly passed, and because the Commission's requirements for the GIRC includes pre-submittal of a plan for each year's deployments, to ensure that the program is fully transparent and subject to ongoing surveillance. Clearly it would not be possible to effectuate such protection if the program were started in reference to 2018.

16. The Commission approves several additional features to the GIRC. First, because the GIRC is designed to avoid transaction costs of more frequent rate cases, it will include an automatic termination provision if either or both of the Joint Applicants file a rate case prior to several years' operation of the GIRC surcharge. Second, it will facilitate a review of whether the investments, in both their need and in the manner in which they have been deployed, were prudentially deployed and in fact used and useful. It does so by including an automatic termination provision for the surcharge after five years of its operation, before which time the Joint Applicants should again file a rate case if they desire these costs to be permanently included in rates. Finally, the GIRC surcharge will likewise automatically terminate if the either or both of the Joint Applicants file a proposal pursuant to Mont. Code Ann. § 69-3-308 (state and local tax tracker). One of the reasons the Commission is granting these utilities a GIRC is their unique regulatory setting, where they have chosen not to use tax tracking mechanisms. While the Joint Applicants are clearly legally entitled to use such a tax tracker, nothing in law permits to them the unilateral right to obtain the GIRC here approved, and because the Commission recognizes that the nature of its decision here is made relative to the overall regulatory setting facing the Joint Applicants, it conditions the GIRC's continued existence on the premise that all else in the regulatory setting is held even. These sunset provisions are an essential consumer protection without which the GIRC might ceaselessly grow without the normal rigors of oversight; without these provisions, the Commission would not approve the GIRC.

17. The Joint Applicants propose to recover the costs of the GIRC through a monthly surcharge on each customer's bill, which is not differentiated by customer class. The Commission, consistent with its discussion of the allocated cost of service of the utility, rejects the proposal insofar as it would charge each customer, regardless of its size, the same surcharge. *Infra* ¶ 158. Instead, the Commission will differentiate the size of the surcharge based on the

allocation factors established in this proceeding. *Id.* The Commission otherwise approves the rate design. While there may be arguments that such incremental capital investment is best recovered through a rate which is partially billed on the sale of gas volumes, such a design would be complex to administer, necessitating deferred accounts to remedy weather-driven over collections or under collections, and would thus frustrate the intention of making the GIRC straightforward but transparent. The Commission, meanwhile, considers the likely presence of a monthly fixed surcharge in the coming years in its decision to hold the existing charge at its present level. *Infra* ¶¶ 157-160.

18. Part of the tax benefits resulting from the Tax Cut and Jobs Act will constitute an offset of the programmatic costs of GIRC. The Commission applies the ongoing effects of the statutory rate reduction into the general rates it sets in this proceeding. *Infra* ¶ 50. The EDIT, which varies significantly year to year, is a coincidental but happy match against a program of variable spending, such as GIRC. The Commission will apply proceeds under EDIT to the program on a matched-year basis, in order to comply with IRS normalization requirements. Meanwhile, for the deferred tax savings that the Commission requires from the effective date of the Act to the date in which rates established under this order are effective, those 2018 savings will be applied to the 2019 spending under GIRC. Likewise, the EDIT from 2018 will be applied against the 2019 spending under GIRC. All of these tax benefits will be treated as customer-contributed capital, reducing the overall incremental capital investments made before a revenue requirement is calculated with respect to the balance. If, during GIRC, there is a year where the incremental capital spending does not meet the earnings test or the net-of-depreciation provision, the GIRC will be allowed to function as a vehicle to refund these tax benefits, although otherwise the surcharge never would be a negative value.

19. All of the associated capital investments made under GIRC, just like all other capital investments that are made in between rate cases, are subject to a complete review at the time when either or both of the utilities file their next general rate case. This will ensure that the annual GIRC proceeding is not unduly bogged down by such a review, addressing one concern MCC raises about the possibility that GIRC will *increase* transaction costs. MCC Br. 3 (June 22, 2018).

20. The Commission is sufficiently comfortable with the design of GIRC, as discussed above, that it is authorizing the program. However, the Commission also is conscious

that this is the first time in its history that such an incremental-capital surcharge has been authorized. The Commission regards the Joint Applicants' new GIRC as a pilot, and the Commission upon its review of the GIRC performance in the utilities' next rate case will be able to draw conclusions about GIRC's performance and may, if it is reauthorized, make modifications that are necessary or reasonable. For this reason, the Commission cautions that it is unlikely to approve similar mechanisms until it can be reasonably confident of the program's actual performance. While this may seem unfair to the other utilities the Commission regulates, the Commission reasons that the Joint Applicants have pressed this cause while others have settled cases by withdrawing such a proposal. *See* MDU/MCC Stipulation, D2017.9.79 ¶ 11 (Apr. 24, 2018). The Joint Applicants' persistence is therefore rewarded by the GIRC as it is here designed. The Commission hopes the GIRC will surface valuable insights about whether such mechanisms are reasonable to use generally and, if so, how they might be designed.

21. The Commission finds a GIRC tariff is appropriate, subject to the various protections written in the tariff, attached to this Order. *See* Attachment A.

SAP Software

22. In 2015, GNI and its subsidiaries, including EWM and CBGC, installed ERP system referred to as the SAP. Test. Henthorne 13 (Sept. 29, 2017). The initial estimate to complete the development and implementation of the SAP to GNI (now Hearthstone) was $4 million. However, the final cost of the SAP software to GNI/Hearthstone was approximately $18 million. *See* Appendix A, and Hr'g Ex. JA-9. Four separate components were considered in arriving at the $18 million figure. First, GNI obtained $10,091,490 in financing from Verilease. *Id.* In addition to the Verilease-provided financing, GNI contributed $3,155,616 of investor-supplied capital towards the purchase; this contribution is referred to as a Deferred Rent Asset by the Joint Applicants. *Id.* GNI also contributed $1,253,811 in additional investor-supplied capital, which is not included as part of the Deferred Rent Asset. *Id.* Finally, GNI bought out the lease obligation with Verilease for $3,558,629. *Id.* The utilities requested that the Commission approve an accounting order permitting them to reclassify the Deferred Rent Asset as a regulatory asset to be amortized over the remaining life of the SAP software (10 years). Test. Henthorne 14, 36; Test. Degenstein 10; Hr'g Tr. 106:17-22; 187:18-23. EWM initially proposed including $627,640 and CBGC proposed to include $51,575 in their rate base for the Deferred Rent SAP asset. Test. Henthorne 14, 36.

23. The MCC expressed concern that the SAP software's final cost far exceeded the initial estimated cost of $4 million. Test. Schulz 13-18; *see* DR PSC-040(b) (Dec. 7, 2018) and DR PSC-083(a) (Feb. 9, 2018). The MCC argued that the utilities are seeking an unusual application of an accounting order in order to recover expenses that exceeded initial estimates and resulted in operating costs that exceeded those they replaced, after those expenses were incurred, i.e., those portions of the SAP system spent by GNI beyond those received from Verilease. *Id.* at 13 (referencing Test. Henthorne 14, 16). According to the MCC, the SAP system "provides no cost 'advantages' but rather represents a dramatic increase in comparable costs from the last rate case," arguing that ratepayers are being "asked to pay for 'value' that cannot be quantified other than to suggest operating efficiencies that have no corresponding economic efficiencies." *Id.* at 14. Further, the MCC points out there are no shown reductions in payroll costs related to saving employee time because of the improved reporting, and "[i]n fact, it appears there are substantial contract labor costs" involved in running the system. *Id.* at 15.

24. The MCC argues that the Joint Applicants suggest "that the lessons of ring-fencing and the cost advantages that are supposed to follow from being part of a larger corporate organization should not apply" to the SAP and recommends the utilities should earn a return of, but not a return on, the $3.1 million deferred rent asset; in other words, the MCC recommends "a disallowance of deferred rent from the rate base." Test. Schulz 17-18. This treatment results in a reduction to rate base of $627,640 for EWM and $51,575 for CBGC. *See* Test. Schulz, Ex. PRS-6EW and Ex. PRS-6CB.

25. There were three schedules to the lease agreements with Verilease. The first terminated in December 2017, and the other two schedules would have terminated in September and October 2018. Hr'g Tr. 120:17-21. At the end of each lease schedule, the Joint Applicants could choose to buy out, extend, or terminate with a fee and with the sale of assets. *Id.* at 108:7-14 and PSC-045 (Dec. 19, 2017). On December 31, 2017, the first schedule reached its maturity and the Joint Applicants made an agreement to buy out the remaining two schedules, but were still obligated to pay the lease obligation through September and October. *Id.* at 120:17-24. The utilities state they did not include the exact buyout amount in the original filing because the final amount was not known and measurable, but argue they included an estimate of additional construction work in progress ("CWIP") they believed they would incur prior to the end of 2017 for the buyout of the SAP lease. DR PSC-138(d) (Mar. 23, 2018); DR PSC-154

(Apr. 20, 2018) ("This can be seen in [EWM's original filing] column F, "Estimated Additions Sep-Dec" of page 3 of Rule No. 38.5.124. In our supplemental filing on February 26, 2018 we trued-up these estimates to actual CWIP additions through the end of 2017, which included additional costs for the SAP asset.")

26. As noted above, the total amount of the SAP asset was $18 million: $13.6 million for the three lease schedules (which includes the $3.558 million lease buyout); $3.1 million for the deferred rent associated with the three lease schedules; and $1.25 million in additional SAP costs. *Id.* at 125:14-126:19; *see* Hr'g Ex. JA-9. When allocated from the parent GNI to EWM, according to Henthorne, "the effect on rate base for EWM of the SAP system is $3.2 million and then we've reduced it by the amount of the capital lease obligation of $1.5 million, so the effect to EWM in rate base in this case is $1.8 million." Hr'g Tr. 112:25-113:4. The Joint Applicants determined the cost of service for the utilities was $738,633 for EWM and $63,071 for CBGC. *Id.* at 127:16-19; *see* Hr'g Ex. JA-9. Ultimately, EWM and CBGC are requesting to place 38% of their allocated SAP costs into rate base at $1,793,345 and $147,898, respectively. Hr'g Ex. JA-9.

27. The Joint Applicants are treating the outstanding lease balance as a reduction to rate base. At hearing, Joint Applicants' witness Henthorne admitted they did not consider an accounting order before incurring expenses until it was raised by the MCC. Hr'g Tr. 107:10-16 ("To be honest with you, I didn't know that avenue was available. When I read Mr. Schulz's testimony, I thought oh, I didn't realize that was an option.").

28. In addition to their capital investment, EWM and CBGC are requesting to recover $291,273 and $26,196, respectively, of ongoing, annual, operating expenses related to the SAP software. DR PSC-013(c) (Nov. 29, 2017). This compares to the $82,452 in annual IT operating costs EWM included in its 2009 filing. Test. Schulz 14. The MCC proposes adjustments to operating expenses related to the SAP software. Mr. Schulz states that "[t]he ERP system resulted in operating costs that are three and a half times comparable costs included in the last EWM rate case. Ratepayers should not be the default insurers of a costly project that increased expenses." *Id.* at 19. In arriving at an alternative figure, the MCC applied the cumulative GDP Implicit Price Deflator of 12% to the comparable software costs reflected in the 2009 rate case filing. *Id.* This adjustment reduces operating expenses from $291,273 to $92,346, a reduction of

$198,927. *Id.* The MCC recommends reducing allowed IT expenses from $26,196 to $8,305 for CBGC. *Id.* at 19-20.

29. The Commission agrees with the Joint Applicants that the information technology landscape has changed dramatically since 2009. Rebut. Test. Henthorne 7. Perhaps the best evidence of this is that CBGC, in its last rate case, recorded no IT expense at all, because its billing was done entirely by hand. Hr'g Tr. 350:19-20. Likewise, in a more digital world, an enterprise system may not be a zero sum game, instead conferring on customers and the utility new benefits. The Commission acknowledges the Joint Applicants' argument that the new software provides customers and the utility benefits the previous software did not. DR PSC-013 (Nov. 17, 2017). However, the record, with a noteworthy exception related below, is absent of what such an enterprise system reasonably should have cost. The Commission reasons that in an era of cloud computing, increased Operations and Maintenance ("O&M") expenses would tradeoff against decreased capital costs. Here, both O&M expenses and capital spending have increased substantially. It is possible that the attendant costs of a more digitized utility are offset by efficiencies elsewhere, as EWM suggested at the hearing. *See* Hr'g Tr. 51:1-22. If indeed that is true, it is hidden amid the overall operations of these utilities, rather than shown by any kind of direct effect.

30. The Commission has not in recent memory seen cost overruns of so significant a magnitude as they present with respect to GNI's enterprise system. The lack of a clear explanation for what contributed to these overruns is frustrating. The situation is all the more confounding because the Joint Applicants' proposal to include the SAP in rates is an accounting morass which defies easy comprehension, as is evident from the summation of parties' testimony above. There is little in the way of a convincing explanation for the more dubious elements of the financial and accounting arrangement in which the Joint Applicants engaged. Two specific examples of this emerge through the parties' testimony and exhibits. First, the $3.2 million Deferred Rent represents, essentially, a cost overrun heaped atop a previous overrun of estimated costs; it goes almost fully unexplained. Meanwhile, the costs associated with the $3.6 million lease buyouts are both speculative, in the sense that testimonial evidence does not establish them as known and measurable changes, and in any case the costs are not convincingly argued relative to their benefits by the Joint Applicants. The Commission finds that the Joint Applicants in this regard have not met their burden of proof. The Commission is persuaded by MCC that absent a

clear showing of benefits relative to the excess costs that some of the cost overrun should be the Joint Applicants' responsibility. Indeed, even the Joint Applicants appear to believe the ultimate cost of the system was unreasonable. As Mr. Degenstein testified at hearing:

> If I were to look at an enterprise software system across a holding company that has multiple utilities with the abilities it has today, my personal opinion is I think it should have been in the 8 to $10 million range and the cost overruns were probably due to the nature of SAP and the difficulty to implement it. But I don't think 4 million was ever realistic.

Hr'g Tr. 75:25, 76:1-8. The Commission accepts Mr. Degenstein's and Mr. Schulz's representations in this regard. Based on both parties' testimony, the Commission disallows from rate base the two accounting elements that the Joint Applicants have provided the least justification for, and which appear to have been incurred only as the cost overrun continued to grow: the Deferred Rent and the lease buyout amounts. This resolution allows the Commission to see the forest for the trees, arriving at a total GNI asset amount of $11,345,301, still above what Mr. Degenstein thinks "should have been" the total cost, while founding its judgment on a disallowance of two of the most peculiar elements of this strange arrangement. When allocated to the Joint Applicants using the undisputed allocation methodology for GNI's subsidiaries, the Commission finds EWM's portion of this asset allowable in rate base is $702,525 and CBGC's portion of this asset is $57,727.

31. The MCC also questions the O&M expenses for GNI, including the costs for consultants. Test. Schulz 15 ("The costs for those consultants alone are more than double all the comparable expenses from the 2009 test year filing of $82,452.") While the Commission acknowledges this concern, the MCC's remedy is unpersuasive because it benchmarks a proposal for allowed spending on 2009 data. Given the degree to which the IT landscape has rapidly transformed life in the United States, it seems unreasonable to tie the allowed costs with those from the previous decade using a generic measure of inflation. Lacking an obvious alternative benchmark, the Commission accepts the Joint Applicants' proposal in this regard. To the degree the costs appear high, their levels will be mitigated in the next rate proceeding. This stands in distinction to the Commission's decision on capital returns; if the Commission were instead to accept the Joint Applicants' representations, it would in effect *reward* the companies for cost overruns for a substantial period of time. The Commission therefore finds that including

the $291,273 (EWM) and $82,452 (CBGC) annual operating costs for recovery in ongoing O&M associated with IT is appropriate.

Tax Cut and Jobs Act and EDIT

32. On December 22, 2017, the federal Tax Cut and Jobs Act ("TCJA") was signed into law. The TCJA, among other things, reduced the federal corporate income tax rate for EWM/CBGC from 34% to 21%, and required public utilities like EWM/CBGC to review their EDIT to align with the reduction in tax rates. TCJA of 2017, Pub. L. No. 115-97, 131 Stat. 2054 § 13001 (2017). On December 27, 2017, the Commission required that information regarding impacts of the TCJA be filed by EWM and CBGC for their gas operations in Montana, and EWM/CBGC filed an amended revenue requirement, accordingly.

33. The Commission identified four rate issues to be addressed as the result of the TCJA:

a. The reduction in the corporate tax rate from 34% to 21%.

b. The amortization of the EDIT balances.

c. The over collection of income taxes from January 1, 2018, until the new rates are implemented, and whether or not a refund is appropriate.

d. The over collection of the EDIT balance from January 1, 2018, until the new rates are implemented, and whether or not a refund is appropriate.

34. The Commission required the utilities to record on their books as a deferred liability the estimated excess revenues expected to be collected by the utility caused by the reduction in the tax rate for the time period preceding the issuance of the final approved rates, as well as a calculation of the EDIT balance caused by the reduction in the FIT rate. Furthermore, the Commission required the Joint Applicants to include a proposal to extinguish the EDIT balance along with a proposal to file periodic reports updating the Commission on the deferred liability and EDIT balances. Henthorne filed supplemental testimony and, subsequently, Ralph C. Smith submitted testimony on behalf of MCC discussing the effects of the TCJA and addressing the representations made by Mr. Henthorne.

35. A reduction in Joint Applicants' corporate income tax rate reduces their revenue requirement, because income taxes are recognized as a recoverable cost. *See* Mont. Admin. R. 38.5.175. Similarly, a reduction in the tax rate results in an EDIT balance. As EWM/CBGC utilize straight-line depreciation for regulatory accounting and accelerated depreciation for tax

purposes, they pay less in federal income tax during the early years of an asset's life than is collected through rates. This tax savings is accounted for as a deferred income tax, treated as zero-cost capital, and is deducted from rate base. Thus, a lower federal income tax rate creates an excess deferred tax balance, which the TCJA requires to be returned to ratepayers. *See* TCJA of 2017 § 13001. The EDIT balances fall into two categories, "protected" which is subject to IRS normalization rules and must be amortized using the Average Rate Assumption Method (ARAM), and "unprotected" where the amortization period is set by the Commission. The Joint Applicants accepted the MCC proposal to amortize the unprotected balance over 40 years.

36. Henthorne stated that while the Joint Applicants will have lower income tax expense in 2018, based on the normalized revenue requirements developed in this case, both companies are significantly under-earning from their most recent allowed rates of return despite the decrease in taxes as a result of the TCJA, and for that reason, no regulatory liability is warranted. Supp. Test. Henthorne 14-15, *see* Ex. JDH-EWM-2-NTL (page 1) and Ex. JDH-CBG-2-NTL (which illustrate an estimated 3.52% ROR to be earned by EWM and a -1.69% loss to be realized by CBGC, after the normalizing adjustments and rate base adjustments described in the preceding section). Accordingly, the Joint Applicants did not record a deferred liability as the Commission requested. The tables below show the TCJA impact on the revenue requirements for EWM (-$353,841) and CBGC (-$24,722) as calculated by the Joint Applicants. *Id.* at Ex. JDH-EWM-6-NTL; Ex. JDH-CBG-4-NTL.

Table 1

EWM	Initial filing	normalizing adjustments	TCJA impacts	Updated for NCA
rate base	$ 20,254,802.00	$ 354,282.00	$ 38,415.00	$ 20,647,499.00
Requested Increase	$ 1,532,291.00	$ 183,367.00	$ (353,841.00)	$ 1,361,817.00

CBGC	Initial filing	normalizing adjustments	TCJA Impacts	Updated for NCA
rate base	$ 1,158,692.00	$ 72,958.00	$ 4,969.00	$ 1,236,619.00
Requested Increase	$ 183,284.00	$ 19,764.00	$ (24,722.00)	$ 178,328.00

37. EWM stated that the net EDIT Balance for EWM is $2,023,842 and $204 for CBGC. Supp. Rebut. Test. Henthorne 4-5 (Apr. 25, 2018). The Joint Applicants proposed to amortize both the protected and unprotected EDIT balances using the ARAM, and to extinguish the EDIT balance by incorporating the credits into its proposed GIRC plan. Test. Henthorne 15-17, Ex. JDH-EWM-14; Resp. Test. Smith, 19-20 (Apr. 6, 2018). The utilities argued this would reduce the GIRC-eligible capital expenditures so ratepayers would get an

immediate benefit of this credit. *Id.* at 16. However, the Joint Applicants stated that if the Commission did not approve the extinguishment of the EDIT balances through a credit to GIRC, they would support including the refund calculated at the conclusion of this docket in the distribution rates or establish a negative surcharge separate from the distribution rates. Supp. Rebut. Test. Henthorne 6-8.

38. The Joint Applicants stated that they will not attempt to pursue a retroactive ratemaking defense regarding the deferred liability from excess income tax revenues collected in 2018. They recognize that the Commission was correct in identifying the FIT rate change issue before any effect from the new tax law could occur. However, the utilities state that the Commission's requirement to calculate the liability based on the effect of a full year of the difference in tax rates for a year that has not yet fully occurred creates an accounting problem. According to the Joint Applicants, in order to record a liability, regulatory or otherwise, it has to be: 1) established that there is indeed a liability and to whom; and 2) the liability has to be measurable. A regulatory liability implies that a refund to customers is necessary and therefore a liability is recorded for the amount to be refunded, and, the utilities argue, because both utilities are under-earning, a liability and subsequent refund is not warranted because any "gain" the companies have received as a result of the decreased FIT rate has been offset by increased costs and other items not included in current rates. If the utilities were over-earning, then a liability refund would be warranted, but that is not the case here. *Id.* at 8-9.

39. Henthorne also recognizes measurement as a problem: this case will result in new rates reflecting the reduction in the FIT rate and no liability will be warranted after those new rates go into effect. Furthermore, he notes the revenues of EWM and CBGC are seasonal, with losses projected for the months of May to September 2018.

> As Mr. Smith acknowledges, "the amount of savings associated with the reduction in the FIT rate will depend on the effective date of the new rates established in this rate case." Recording a liability for the full year would almost certainly overstate the amount of the liability, if any, that may be ultimately recorded, with a corresponding increase to expense that would have to be later reversed.

Supp. Rebut. Test. Henthorne 9-10. In summary, Henthorne states that Joint Applicants are not trying to avoid recording a liability and have complied with the Commission's order. Furthermore, if the Commission ultimately determines that a liability for 2018 is warranted, that liability should be based on the Joint Applicants actual results from January 1, 2018,

through the date that new rates at issue become effective. *Id.* at 10.

40. The MCC's witness Smith agrees with the Joint Applicants that the utilities' income tax expense should be reduced to reflect impact of the lower federal income tax rate that will be in effect for 2018. Resp. Test. Smith 7. However, because of differences between the MCC and the joint applicants regarding rate base, capital structure, allowed returns on equity, cost of debt, and net operating income, the income tax allowance proposed by the MCC will differ from that proposed by the Joint Applicants. *Id.* at 12. Smith suggests that the Joint Applicants' proposal to apply the EDIT amortization to their GIRC plan should be rejected. *Id.* at 9. The MCC, while analyzing the utilities' TCJA supplemental filing, did not itself present a recalculated revenue requirement reflecting the MCC's own TCJA analysis.

41. The MCC disagrees with the Joint Applicants that regulatory liability is unwarranted since the utilities are under-earning from their most recent allowed rates of return even after the impact of the decrease in taxes as a result of the TCJA. Smith also noted the Joint Applicants had not complied with the Commission's requirement that the utilities establish a deferred liability to account for the reduction in the FIT rate to 21%, and accordingly, he suggested that the utilities should be required to book the liability. Resp. Test. Smith 32-33. The Joint Applicants calculated the deferred liability (although they have not booked it) in accordance with the Commission directive with EWM's calculated deferred liability as $263,391 and CBGC's deferred liability as $15,992. DR MCC-115 (Mar. 23, 2018). However, the actual amount of income tax savings realized by the TCJA will depend on the effective date for the new rates in this docket since the net income earned fluctuates on a monthly basis. *Id.* at 35. Depending on the effective date of the new rates, Smith maintains that the associated deferred liability should be amortized over an appropriate period such as a 3-year period. *Id.* at 36.

42. As discussed below, the Commission will require the Joint Applicants to apply the accumulated deferral that the Joint Applicants have calculated starting on January 1, 2018, to the GIRC.

43. According to the MCC, the potential cash flow impact of the TCJA could adversely affect a public utility due to increased costs of common equity for utility stocks. Hr'g Tr. 208:3-14. For utility ratemaking purposes, increased estimates of common equity costs result in greater cash flows provided to the utility. These increased cash flows serve to mitigate

the adverse cash flow affect of the TCJA. The MCC also identified that there are alternative approaches available to utilities to mitigate the cash flow impact of the TCJA such as equity thickening in the ratemaking capital structure. Hr'g Tr. 304:15-25, 305:1-20. The greater proportion of equity included in ratemaking capital structure generally provides utilities with greater cash flows due to the fact that financing in the form of equity is costlier to a utility than debt financing. In the ratemaking paradigm, increased financing costs lead to higher allowed returns for utilities and these higher returns provide the utility with increased cash flows. Smith, witness for the MCC, infers that because the Joint Applicants' capital structures are overly equity thick as is, an adjustment to their capital structures is not appropriate in this proceeding, but defers to MCC's witness Hill on this matter. Hr'g Tr. 305:21-25.

44. According to Hill, a utility's operational risk remains unchanged as a result of the TCJA, but its financial situation could change. Hr'g Tr. 465:19-25, 466:1-3. He agrees that bond rating agencies are concerned about the cash flow effects of the TCJA, but contends that the rating agencies are not as concerned about operating companies as they are about holding companies that are highly levered. *Id.* at 466:23-25. Furthermore, he argues that the TCJA serves to potentially impact a utility's cost of debt, rather than equity, and that it is unclear how the TCJA impacts equity costs. *Id.* at 466:4-23. Accordingly, the Commission notes that Hill argues that the impact of the TCJA does not warrant any adjustment, whether it be to the Joint Applicants' authorized ROEs or their ratemaking capital structures.

45. The Joint Applicants, meanwhile, show no evidence to suggest that they have moved to infuse their balance sheet with additional equity in order to protect from potential negative cash flow effects of the TCJA. The Commission concludes this remains a largely hypothetical concern for the Joint Applicants and that adjustments to capital structure should not presume to anticipate managerial decisions which may or may not be prudent.

46. Regarding the amortization of the EDIT balance, the Joint Applicants assert the cleanest option would be to implement a negative surcharge to customers which would be changed every year to track the substantial variations in the amount of EDIT amortization as shown in the table below based upon exhibits provided by the utilities. Supp. Rebut. Test. Henthorne 7-8, Ex., JDH-EWM-14-SR and JBH-CBG-10-SR.

Table 2

EWM/CBGC Annual Edit Amortization		
	EWM	CBGC
2018	($5,184)	($1,273)
2019	$59,355	$1,184
2020	$95,035	$2,241
2021	$141,021	$3,576
2022	$156,409	$3,605
2023	$168,519	$3,439
2024	$176,057	$3,353
2025	$161,379	$2,715
2026	$122,439	$920
2027	$123,898	$890

47. The Commission finds that it is appropriate to require the Joint Applicants to segregate the benefit of the lower FIT resulting from the TCJA and apply it to the benefit of customers. The Commission rejects the Joint Applicants' contention that, because they are under-earning their authorized returns, they should have to refund none of the tax benefits of the lower FIT to customers. This approach would be unreasonable. The TCJA's passage was an extraordinary and unanticipated event, outside the utilities' control, and results in a material reduction in the cost of service. See *In the Matter of NorthWestern Energy's Petition for an Accounting Order Authorizing the Deferral of the Expense-Related Portion of the Costs Associated with Phasing in its Natural Gas Transmission Integrity Verification Program,* Order 7528a, Docket D2016.11.88 (Feb. 21, 2017); *NorthWestern Energy - Request for Accounting Order Authorizing the Accumulation of the Cost of Funding Participation in Northern Tier Transmission Group*, Order 6829, Docket D2007.4.39 (May 15, 2007); *MDU-Application for an Accounting Order*, Order 6840, D2007.5.57 (July 3, 2007). The Commission provided notice of the possibility of this adjustment before Jan. 1, 2018, when the law became effective, and the Commission accepts MCC's arguments that it is reasonable that customers benefit from the tax overhaul. The Commission expects that if Congress had instead passed a significant corporate tax increase, it would have precipitated requests of the Commission to adjust rates in the other direction, including the possibility of deferrals dating to the effective date.

48. One way to estimate what consumers are paying for a utility's income tax expense is to take that portion of the last approved revenue requirement which was associated with this

expense. The total benefit of a reduction in the income tax rate could then be calculated by applying to that expense the ratio of 1) the difference between the new and old FITs, and 2) the old FIT embedded in the last-approved revenue requirement. This benefit calculation could be reasonable because it is based on the tax expense used to set existing rates. This approach was anticipated by the Commission. Not. Comm'n Act. (Jan. 22, 2018). However, the Notice also permitted the utilities to propose alternative proposals to appropriately calculate the amount of the deferral.

49. The Joint Applicants contend this methodology does not capture the utilities' actual performance and tax liability in a given year, and they also contend that their performance varies over the course of the year. Here the Commission is unpersuaded by the former contention. The Commission, however, believes the Joint Applicants raise a valid point regarding the variance in performance over the course of the year, which makes an annualized revenue requirement a poor fit for calculating a proper deferral. The Commission acknowledges that, as gas utilities make substantially all of their sales during the winter heating season, the Joint Applicants may be assumed to earn most of their taxable income during this time. Given the fact that the new rates established in this docket will be in effect for three colder months of 2018, the Commission would have to prorate the revenue requirement effect to account for weather-related sales. There is no clear way to do this based on the evidence in this proceeding. Therefore, the Commission accepts as a second-best solution the Joint Applicants' deferrals as they propose to calculate it, subject to a compliance filing due simultaneously at the time of the Joint Applicants' first GIRC Plan.

50. The Commission finds it appropriate to apply the benefits of the TCJA to the cost of GIRC, including both the deferral starting January 1, 2018, forward to the effective date of the new rates, and the EDIT. Although GIRC will not begin until 2019, the Commission finds it appropriate to apply the 2018 EDIT amortization and the partial-2018 FIT reduction benefit to the costs of the first year of the GIRC, and to use the ongoing EDIT amortization as part of the GIRC funding stream in a way that otherwise matches the year's EDIT to the year's GIRC spending. This allocation results in zero-cost capital to the GIRC because it is being paid for by the money that would otherwise go to the customer. No return on those funds will be earned by the utility, resulting in the most efficient and least harmful financial impact for ratepayers and the utility. The Commission finds these adjustments to be just and reasonable, and directs the Joint

Applicants to incorporate them into the utilities' revenue requirements accordingly.

Southern Montana Electric Pipeline

51. In 2010, SME built 19 miles of 12" high-pressure distribution main pipeline to provide fuel to SME's power plant, the Highwood Generating Station (HGS). Test. Degenstein 11; Test. Henthorne 11. In its negotiations with landowners housing the pipeline, SME agreed to provide natural-gas distribution facilities at no cost and to provide them with natural gas services. Test. Degenstein 12. EWM was hired to construct and operate the pipeline for SME. *Id.* The original cost of the pipeline was approximately $5 million, which EWM incurred and billed to SME, and SME paid a majority of the costs prior to bankruptcy. *Id.* at 13; Hr'g Tr. 81:20-82:4 (around $125,000 did not get paid through the bankruptcy). As a result of SME's bankruptcy, EWM negotiated the purchase of the SME pipeline for $75,000 in March 2016. Test. Degenstein 13; Test. Henthorne 10. Neither SME nor EWM had on file a tariff for the service of gas to consumers from this pipeline.

52. EWM contends that the original cost of the pipeline to SME should bind the Commission to accepting this value. It argues the Commission "needs to determine if it should continue its past practices of using the original cost standard or if it should depart from that practice and reduce rate base by including some or all of the negative acquisition adjustment" from the pipeline purchase. Test. Loy 42. Further, the utility argues, because it purchased the pipeline as an operating unit that had been placed in public service prior to the purchase, the FERC Uniform System of Accounts requires the plant to be recorded at the original cost to the person first devoting it to public service. Test. Henthorne 11. Accordingly, EWM requested that rate base include the original cost of the pipeline to SME, approximately $5 million, less depreciation, arguing the $75,000 purchase price does not reflect the true economic value or the original cost of constructing the pipeline. Test. Degenstein 13; Test. Henthorne 11-12. Since EWM purchased the pipeline in the middle of this rate case's test year, the rate base amount the utility proposes is an average of the beginning and ending balance of the 13 months that span the test year, equaling $2,009,102. Test. Henthorne 11, Ex. JDH-EWM-6 at 2. Nonetheless, the Commission interprets EWM's initial request, putting aside temporal accounting issues, to be a request to find as used and useful the full cost to SME of the pipeline, and not EWM's purchase price of it. Notably, EWM does not submit any of the books and records of SME to substantiate

the supposed original cost of the pipeline. Instead, EWM relies on Mr. Degenstein's recollection of what EWM invoiced SME for the work. Hr'g. Tr. 80:15-23.

53. In order to obtain approval of this asset in rates, EWM must not merely substantiate its cost, but it also must demonstrate that this asset is used and useful. To do so EWM posits two reasons. First, EWM argues SME was the first person to put the pipeline into public service by allowing others to be served by the pipeline from its inception, "because the pipeline became a necessary part of the distribution system required to serve retail customers, regardless of the actual load on the pipeline after it was placed into service." DR PSC-089(c) (Feb. 8, 2018). Since EWM bought it, EWM's use of it has grown, and the pipeline now provides the capacity necessary to serve over 250 customers. Test. Loy 43. Second, EWM also argues the SME pipeline is essential to providing safe, reliable, and uninterruptible service to the City of Great Falls by providing a redundancy that will accommodate future improvements to EWM's core system. Test. Degenstein 12; Test. Loy 42.

54. The MCC disagrees, arguing that SME did not devote the pipeline into public service, rather allowing its contractor, EWM, to provide retail gas service with the pipeline, which was incidental to the SME's primary purpose for the pipeline: to provide gas to the now-defunct HGS. Hr'g Tr. 45:18-19. According to the MCC, the original-cost standard holds that rate base should be measured on the "cost of the property to the person first devoting it to public service." Test. Schulz. 6; *see* 18 C.F.R. § 201 (2018). Accordingly, the MCC argues that since SME built the pipeline "for SME's power generation facility," although it allowed EWM to provide service to certain landowners, at no cost, it wasn't until EWM purchased the pipeline that it became devoted to public service, and therefore EWM's purchase price of $75,000 is the original cost. Test. Schulz 6-7 (quoting Test. Degenstein 11-12).

55. The MCC's witness, Paul Schulz, testified that in order for an acquisition premium to have merit, the acquisition must be the least-cost alternative, and in this case, any amount over what EWM actually paid would not be a least-cost alternative. Test. Schulz 7-8. The MCC argued that development of the SME project negated the need to consider an independent EWM project to provide similar system benefits. Test. Schulz 11. Absent the bankruptcy of SME, EWM customers would be enjoying the benefits of the SME pipeline at no additional capital cost, rather than the $75,000 paid by EWM to acquire the pipeline or the amount requested by EWM for rate base. *Id.*; Hr'g Tr. 378. Schulz argued that assessment of

positive and negative acquisition premiums is not symmetrical: the exclusion of positive acquisition premiums from rate base is not the same as allowing the creation of phantom investor capital when the price is below book. *Id.* at 7-9. According to Schulz, the FERC policy on acquisition premiums ensures that ratepayers will not incur higher rates solely because of a change in ownership of an asset or entity. In the case where price is less than original cost, FERC has limited cost recovery to the purchase price. *Id.* at 9 (citing *Ameren Corp*., 147 F.E.R.C. 61,224, 62,282 (2014)).

56. Schulz stated that rate base is intended to reflect investor-supplied capital and that reductions to rate base are commonly made for customer advances and contributions, and accumulated deferred income taxes, and in the case where a utility has acquired an asset at a cost above book value, the acquisition premium is contributed by utility investors, and this is not the same as the case where the asset is acquired at a price below book value. *Id.* at 9-10. Schulz applauded EWM for taking the opportunity to purchase the SME pipeline at a steep discount from book, but stated there is no advantage to EWM customers if that discount is wiped out and shouldered by ratepayers as a phantom amount added to rate base. *Id.* at 10.

57. MCC witness Hill testifies that placing the $5 million that the pipeline cost SME into EWM's rate base would allow EWM to earn a return that is far higher than its own cost of capital or that of comparable enterprises. Test. Hill 45 (Feb. 22, 2018). He argues that while a utility is entitled to a return similar to ventures of comparable risk, it "has no constitutional right to profits such as are realized or anticipated in highly profitable enterprises or speculative ventures." *Id.* (citing *Bluefield Water Works & Imp. Co. v. Public Service Commission*, 262 U.S. 679, 692-3 (1923)). Hill argued that if EWM earned the MCC recommended after-tax return on EWM's requested SME pipeline increase to rate base, i.e., 6.62% on $2.1 million, the $130,000 in annual income would represent a 177% return on the actual investment of $75,000. *Id.* at 45-46. He considers this return inappropriate for a utility operation, arguing the $4.9 million original cost of the pipeline is not cost justified by the addition of 200 new customers. *Id.* Further, Hill argues the additional revenues from new customers could provide the utility with an adequate return and that EWM's proposal to "rate base" the SME pipeline at a value of $2,009,102 would allow EWM to double-recover the cost of building the line. *Id.* at 47.

58. In rebuttal, EWM submitted a revised accounting proposal for the SME asset proposing to recover a return of the original cost to SME, rather than a return on the same. Such a proposal takes the form of depreciation included in the cost of service, and would cause an amortization of the negative acquisition adjustment below the line in other income, rather than to enter net original cost into rate base. Rebut. Test. Henthorne 12-13. This revised accounting entered net plant of $59,796 into rate base, which is the difference between original cost and the negative acquisition adjustment, adjusted for accumulated depreciation; this value is averaged over the test year to produce a rate base effect of $29,898. *Id.* at Ex. JDH-EWM-19. EWM also depreciated an amount of $4,830,867, or the original cost of $4,905,867 less the purchase price of $75,000, and from this function, depreciation expense of $90,579 is included in the revenue requirement. *Id.* Finally, EWM would amortize the negative acquisition adjustment of $(4,094,985), and the amortized amount of $(76,781) is not requested to be included in the revenue requirement. *Id.*

59. As more fully explained below, the Commission rejects EWM's position. The Commission has regulated service that is incidental to other nonregulated uses of natural gas transportation, distribution or gathering infrastructure. *In the Matter of Havre Pipeline Company's Service Quality and Its Response to Notice of Commission Action in N2014.11.92*, Order 7413b, Docket D2015.3.32, ¶¶ 6-9 (Feb. 23, 2016) (finding a gas gathering system is a public utility service and that system is subject to Commission regulation). However, this does not mean that whatever it cost to build the SME pipeline, which was primarily intended to serve an unregulated natural-gas fired electric power plant, must be the cost accepted as the "used and useful" value that this Commission enters in rate base when the original purpose has become defunct and it is left a stranded asset, serving only a shadow of its purpose. No regulatory commission ever accepted that the pipeline was "useful" in the economy and, indeed, SME's bankruptcy suggests it was not. The value of the property is to be determined as of the time when the inquiry is made regarding the rates and is not a matter of formulas, but must be based on fair and enlightened judgment in proper consideration of all relevant facts. *Bluefield Water Works & Improvement Co. v. Public Serv. Comm'n*, 262 U.S. 679, 690-92 (1923). The bankruptcy court, in permitting the sale or auction of SME's assets, afforded to other parties rival economic uses—other than simply salvaging it for metals—and the proper value of that use was established by EWM's winning bid. Indeed, as described by EWM's lead witness' own words, this bid reflects

the value the utility placed on it at the time it was purchased. Degenstein called this winning bid a good investment and the "right price" at the hearing: "$75,000 was all I was willing to spend because ultimately we shouldn't spend money that we don't need to spend . . . we had the right price." Hr'g Tr. 48:4-20, 49:17-21. "I would not have paid 4.9 million. . . The right decision was to get the best cost, the best price for the utility and the ratepayers of Montana." *Id.* at 49:4-12. The Commission notes a more proper lens of inquiry would be to ascertain what, within the bankruptcy, would have been the likely salvage value of the pipeline, since that appears from the record to have been, other than its attachment to EWM's pre-existing utility system, its only rival economic use. However, the Commission will not gainsay $75,000.

60. Relatedly, EWM's arguments that it faced a need that, without the SME pipeline, would have eventually caused a greater investment, are irrelevant. The Commission does not authorize rates for the cost of sub-optimal solutions to problems; it expects utilities to solve them in the most cost-effective manner possible, in this case by acquiring a pipeline from SME, after the City of Great Falls already had paid dearly for SME's bankruptcy. If the pipeline had not been purchased opportunistically by EWM, it may have been a completely pointless loss. Hr'g Tr. 83:12-85:13.

61. The Commission's decision largely moots the question of whether the asset had a public service purpose before its value, as a matter of first impression, was presented to this Commission. However, even if the Commission were not to view the situation in the light of the "used and useful" value of an asset, EWM has not met its burden of proof for establishing an original cost basis of the pipeline. It has presented none of the books and records of the entity that is said to have devoted it first to public service. It relies only on what EWM itself, as a contractor, was paid by SME for the work of constructing the pipeline. Test. Henthorne 13. EWM retained this money, applying it not just to capital costs of constructing the pipeline but also returning some portion of that money to itself as profit or to offset other operating expenses. *Id.* at 11. Thus, even if the Commission were to accept an original cost based not on public utility records but on a contractor's estimate of what it is was paid, the Commission would also have to account for what contribution in aid of construction were made to offset utility investor-contributed capital for this project. As EWM acknowledged, SME's focus for the pipeline was private use for its power plant, HGS. *See* Hr'g Tr. 45:18-19. The HGS payment to EWM should be accounted for as customer-contributed capital, offsetting the project's cost and discounting it

to a value which could then be allocated for the purposes of public utility regulation. Since the proposed cost to be included in rate base equals what EWM was paid for its work, this would properly result in a rate base of exactly $0. It seems much fairer to the Commission to pay EWM exactly what, in SME's bankruptcy, it actually paid for this asset.

62. The Commission finds that rate base should reflect the $75,000 for which EWM purchased this asset in bankruptcy, adjusting for ratemaking conventions based on average test-year balances and any accumulated depreciation.

Upstream Capacity Costs (MDDQ proposals)

63. EWM pays NorthWestern Energy ("NorthWestern") for upstream capacity and commodity transmission costs to deliver gas to all of its customers, including full service, distribution transportation, large commercial, and negotiated contract customers. In turn, upstream costs are shared by all customers. Upstream capacity costs are determined by the Maximum Daily Demand Quantity ("MDDQ") that EWM requires from NorthWestern.

64. Negotiated contract customers pay EWM for this capacity according to agreements in their respective contracts. Large commercial customers pay according to a two-tier system established in tariff. Customers with daily metering capability or purely interruptible volumes at the time of the last rate decision pay for MDDQ requirements and contribute additional payments for volumes exceeding daily MDDQ. Pasta Montana and Great Falls Sand and Gravel are the only customers using Option 1 of the tariff. A second option is currently available to Benefis Hospitals ("Benefis") since they did not have adequate daily metering when Order 7132c was issued. Under Option 2, Benefis pays a transport rate (capacity and commodity) that equals 80% of the extended general service tariff rate excluding storage costs. *See* Order 7132c, Docket D2010.9.90 (Nov. 17, 2011).

65. EWM proposes three modifications to improve the allocation of upstream capacity costs. First, EWM adds language to the Large Commercial and Negotiated Contract class tariffs to reset a customer's MDDQ to the new level if contract MDDQ is exceeded. Second, EWM adds language requiring a new customer requesting service under either of these tariffs to address its MDDQ needs, so that EWM may consult with its transportation provider–NorthWestern–regarding acquisition of new capacity before granting service. Third, because Benefis now has daily metering capability, and EWM's analysis shows that it is likely they could save money by switching to Option 1 of the Large Commercial tariff, EWM will discuss that

issue with Benefis in the near future. These issues were not contested by MCC. Test. Henthorne 31.

66. The Commission approves EWM's proposals to reset MDDQ and review the MDDQ needs of new customers on the Large Commercial tariffs. Regarding its third proposal, the Commission finds that termination of Option 2 in the Large Commercial tariff is appropriate. Benefis now has daily metering capability, so it is reasonable to track and cost daily volumes up to and in excess of contract MDDQ. Under Option 1, the rate structure passes through all transportation costs EWM incurs up to daily volumes equaling contract MDDQ. Volumes in excess of contract MDDQ are charged at a rate equal to the rate EWM pays NorthWestern for commodity transport, plus 75% of the difference between that rate, including ancillary volume charges, and the extended general service customer transport rate excluding storage costs. Order 7132c ¶ 142. The Commission finds elimination of Option 2 would simplify the tariff and implement standard treatment of comparable customers.

Modification to collection of PSC/MCC tax expense for EWM

67. EWM currently collects its PSC/MCC tax expense as part of its base charge and volumetric rate distribution rate. Hr'g Ex. JA-4, 26:5-6. EWM has proposed to collect the tax cost on a per CCF basis through a separate rate component in EWM's tariffs. Hr'g Ex. JA-4 26:6-14; Test. Henthorne, Ex. JDH-EWM-8 and Ex. JDH-EWM-10. The requested method is the same method used by CBGC. MCC did not contest the proposal. The Commission approves this method and finds in favor of adopting the EWM/CBGC proposal and directs the Joint Applicants to file compliance tariffs, accordingly. *Infra* ¶ 170.

Line Extension Tariff

68. EWM's distribution main extension allowance is $500 per residential customer and a 5-year simple payback calculation for other customers. Add. Issue Test. Henthorne 3 (Mar. 30, 2018). EWM will provide the service stub from the main to the customer's property, and is responsible for the cost and installation of meter and regulators. *Id.* The customer is responsible for all other installation costs. *Id.* Under this policy, no incremental costs are passed to existing customers when new customers are attached. *Id.* at 4. EWM recovers the costs of the free allowances in base rates from new customers. Incremental costs exceeding free allowances are recovered through Contributions in Aid of Construction ("CIAC"). *Id.* at 6. In instances where the CIAC may be so large as to discourage expansion, Rule 17 of the tariff permits an area

rate for a subdivision or group of customers, subject to approval by the Commission. *Id.* An area rate for a subdivision or large group of customers should be structured for recovery over time rather than requiring CIAC to cover all costs exceeding the allowance immediately. *Id.* at 8. CBGC doesn't have a written line extension policy, but generally follows EWM's policy. CBGC will adopt any changes the Commission orders in EWM's policy. *Id.* at 2.

69. EWM proposed to offer a new extension allowance for installation of services between the service stub and the house. *Id.* at 10. EWM currently charges residential customers $300 for the first 50 feet of service line, and $5.50/ft. thereafter. *Id.* at 10. For non-residential customers (2" line), EWM charges $400 for the first 50 feet and $6.50/ft. thereafter. *Id.* at 10-11. EWM proposed to offer a free allowance to install the first 100 feet of service line. Street cuts and excessively rocky conditions would still require customer contribution. *Id.* The allowance value to customers for a 100' service line is $575 for standard service and $725 for 2" line. *Id.* This proposal was not contested by MCC.

70. An infinite lifeline extension allowance is derived using the perpetual net present value method.[1] The allowance equals the net present value over an infinite period of the expected net margin provided by a customer, as an approximation to the marginal value of a line extension over a lifespan of 50 years or more. The infinite life assumption reduces the calculation to the ratio of annual net distribution margin to pre-tax cost of capital or rate of return. Thus, if a customer is expected to contribute margin of $300 annually, and the pre-tax cost of capital is 10%, the extension allowance would be $3,000. EWM testified that it would not support an infinite line allowance, as it ignores the incurrence of added O&M costs required to serve additional customers, and because pre-tax cost of capital is not sufficiently stable to use in an infinite life calculation. DR PSC-010(a) (Nov. 29, 2017).

71. Using an economic carrying charge rate of 7.70%, EWM calculated the incremental cost in main allowance, service stub allowance, meter, regulator, and customer service to equal $110 per year for residential customers. Add. Issue Test. Henthorne, Ex. JDH-EWM-16 at 1. The incremental cost to non-residential customers is $1,338 per year. *Id.* at 2. The

[1] *Line Extensions for Natural Gas: Regulatory Considerations*, by Ken Costello. February 2013, National Regulatory Research Institute. See page 20.

proposal for a new service allowance would increase the incremental cost to $154 per year for residential customers, and $1,394 for other customers. *Id.*

72. EWM testified that line extension and fuel switching may provide societal or public benefits such as economic development, but these benefits are hard to quantify. If existing customers do enjoy measurable system benefit from line extension, there is no reason why they should not pay a share of the costs commensurate with the benefit. Further, EWM argued that that structuring EWM's rate design so that revenue recovery is more stable and less dependent on usage would enhance EWM's opportunity to recover line extension costs; another reason to support increased customer charges. Add. Issue Test. Henthorne 5, 7.

73. According to EWM, main extensions are typically sized to accommodate growth, so the incremental capacity typically exceeds the incremental peak load of new customers. *Id.* at 7-8. The cost of the extra capacity may be recovered in a rate case before the anticipated growth occurs, so that existing customers are paying for a share of incremental capacity. *Id.* at 8. EWM does not consider this a permanent harm to existing customers, as payments today will be offset in time by the benefits of future growth. *Id.*

74. In response to discovery, EWM submitted cost studies regarding extension of service to Belt and Sand Coulee. DR PSC-146 (Apr. 17, 2018). The total cost to extend service to Belt is $1,765,738. *Id.* at DR PSC-146(b) at 7. Total allowance including the proposed service allowance is $375,203, and required CIAC is the residual $1,390,535. *Id.* EWM calculates the all-in area rate including gas costs would be $18.15/Dkt for residential customers assuming simple 5-year payback, compared to a $20/Dkt cost of propane. *Id.* If extension allowances were increased to the ratio of annual margin and a 10% pre-tax cost of capital, the all-in rate for residential customers would decrease to $16.54/Dkt. *Id.* at PSC-146(c), Attach. at 2.

75. The all-in rate includes the current distribution rate for Great Falls-Cascade customers, a surcharge to recover the shortfall (total project cost less allowances), and a surcharge to collect incremental A&G and O&M costs associated with the investment. It does not include commodity, transportation, or ancillary rates, and doesn't include fuel transition costs on the customer side of the meter. Thus the all-in rate understates the total customer cost associated with service extension and fuel switching.

76. The total cost to extend service to Sand Coulee is $214,922, with allowance of $72,147 and required CIAC of $142,775. DR PSC-146(b), Attach. at 3. EWM calculates the

all-in area rate including gas costs would be $11.53/Dkt for residential customers. *Id.* at 3. If extension allowances were increased to the ratio of annual margin and a 10% pre-tax cost of capital, the all-in rate for residential customers would decrease to $9.87/Dkt. DR PSC-146(c), Attach. at 4.

77. EWM believes that extending service to Belt is not economic, because the cost is too great and the number of customers and total volumes are too small. DR PSC-147 (Apr. 17, 2018). Even under current low natural gas prices the area rate required would make the cost about equal to propane. *Id.* EWM plans to extend service to Sand Coulee in 2018, using funds committed in Docket D2015.1.11, Order 7399a ¶ 19. *Id.* Remaining funds will not permit a similar extension to Belt. Hr'g Tr. 173:20-174:10.

78. EWM states that calculating residential customer allowance as the ratio of annual distribution margin and a 10% pre-tax cost of capital would require existing customers to cover part of the cost of extending service to a new customer. DR PSC-149(b) (Apr. 17, 2018). Calculating the allowance for non-residential customers with annual margin of $3,000 in this fashion would reduce the customer contribution to fixed cost recovery to $507 from the $1,616 contribution under the current allowance. *Id.* at PSC-149(c).

79. At hearing, EWM testified that although it "probably violates everything we talked about earlier about new customers and old customers," it might be possible to fold Belt customers in with the Great Falls customers, similar to the extension to Cascade, and perhaps the impact on the Great Falls customers would not be excessive. Hr'g Tr. 177:8-16.

80. MCC testified that the Commission should provide EWM a reasonable opportunity to recover costs associated with line extensions, but should not guarantee recovery of these costs. Add. Issue Test. Donkin 2-3 (Apr. 24, 2018). MCC does not support the use of a tracker to recover costs, arguing a tracker would be a single-issue regulatory device that violates the matching principle. *Id.* at 3. It is the MCC's position that the Commission should not approve EWM's proposed increases to customer charges in an effort to improve its ability to recover incremental line extension costs, because EWM presently has a reasonable opportunity to recover these costs. *Id.* at 6.

81. Free line-extension allowances may be used to award the customer a CIAC benefit for his contributions to net margin, that is, a calculation of customer contributions to fixed costs after deducting the incremental costs of serving the customer. These costs may

include property taxes, return of depreciated investment, debt service, and other A&G and O&M costs. Allowances may also be used to encourage the extension of service to new areas where future growth opportunities or other benefits provide value to existing customers or society. In this case, EWM is proposing to increase residential and commercial allowances to include allowance for installation of service lines, and the MCC did not contest this proposal. The Commission approves the Joint Applicants' proposal for the line extension tariff.

82. EWM also calculated infinite life allowances for customers. However, the calculations appear to use gross rather than net annual customer contributions to margin. The record is not clear why the calculations were performed this way, and how an alternate calculation of infinite life allowances using contributions to net margin may affect the utility's ability to recover prudently incurred costs. The record is sparse regarding external benefits that may be obtained through extension of service to Belt or other communities. EWM did testify that it expects little future population growth in Belt. DR PSC-148 (Apr. 17, 2018).

83. The record in this case does not support adoption of a change to Rule 17.1 that permits or directs the use of infinite life allowances. If the Commission or any party wishes to investigate the merits of alternative methods for calculating free main extensions, the investigation can be pursued in a generic non-contested docket, or in a future rate case.

Main Extension Service to Belt, Montana

84. Main extensions are regulated under Rule 17 of the tariff. Rules 17.1 and 17.3 would apply to extension of service to Belt. Rule 17.1 describes the free allowances available for main extensions. Rule 17.3 requires that applicants provide CIAC to cover the difference between the total estimated project cost and available allowances, or that applicants shall be assessed an incremental surcharge or area rate on volumes. The area rate and time period are determined by the Commission. The area rate is set to pay down the balance of utility investment, so this option essentially allows customers to provide CIAC on a term plan.

85. EWM examined three cost-recovery options for extending service to Belt, a five-year area rate with EWM proposed allowances, a five-year area rate with infinite life allowances, and traditional recovery of investment. For the area rate options, costs in excess of the initial allowance would be recovered through an area rate that would provide CIAC. After five years, the CIAC is designed to offset the shortfall so that the initial investment entered into rate base in the next rate case would be limited to any undepreciated allowances. The traditional option

isolates Belt investment to be depreciated through separate surcharge over 40 years. DR PSC-146.

86. Using Commission-ordered rates and returns, staff recalculated five-year area rates under the proposed and infinite life allowance options, and using traditional rate methods. The Commission agrees with EWM that if extension costs net of proposed allowances are imposed entirely on Belt customers, it is not certain that enough customers will find the offer attractive to make the build-out feasible. The Commission estimates the total rate will exceed $22 per dekatherm for residential customers, and since this cost does not include costs on the customer side of the meter, the savings will be significantly negative for five years under the model. After five years, assuming customer participation is consistent with expectation, the investment shortfall and allowance would be largely depreciated through the area rate, so the remaining balance could be rolled into Great Falls - Cascade rate base without significant disturbance. In that event, Belt customers would receive service at rates consistent with other Great Falls customers. However, it is not clear why EWM uses five years, instead of another period of time, as the threshold

87. If extension costs net of infinite life allowances are imposed entirely on Belt customers, the build-out is more attractive to customers, but savings remain negative over five years for all customers except for the school. For reasons described above, adoption of infinite life allowances is not well supported in the record. It is not clear that the calculation used in this case defines the present value of net contributions to margin, as it should.

88. Foremost, the traditional rate based recovery option generates positive savings for customers, excluding household upgrade costs. However, these results rely upon a propane unit cost of $20/Dkt, and a transport/supply cost for natural gas of just over $3/Dkt. This relation may not hold over 40 years. EWM believed this option would not be attractive to many customers. Since EWM does not support any of these options, and because each of these options exposes the utility to risk of under-participation with consequent cost under-recovery, the Commission will refrain from ordering any of these options until the utility establishes firm, enforceable commitments from customers.

89. The Commission analyzed rolling Belt customers into the Great Falls - Cascade tariff. This choice would provide higher certainty of cost recovery for EWM, but would require significant contributions from existing customers.

90. The incremental rate applied to all customers would be about $0.085 per dekatherm. This would result in an increase of about $6 per year to existing residential customers, and $10, $74, and $520 per year for small, large, and extended general service customers. Increased revenues from robust customer and volume growth in the Belt area could potentially reduce rates for all customers in future rate proceedings, but as noted above, EWM currently expects little future population growth in Belt. DR PSC-148 (April 17, 2018).

91. All of the above analyses assumed a 70% participation rate for Belt customers. Due to the attractive savings associated with the roll-in option, the Belt participation rate may be higher, resulting in a slight reduction in the estimated rolled incremental rate and incremental costs to existing customers.

92. The Commission approves the Joint Applicants' proposal to increase its free main extension allowance to customers to include a service line allowance. The Commission encourages EWM to continue investigating costs and benefits of a line extension to Belt, with particular emphasis on potential opportunities for economic development and expected contributions to capital cost from new customers.

Working Capital

93. EWM witness Henthorne includes $724,166 of cash working capital in rate base for EWM and $78,486 for CBGC, utilizing the 1/8 of test year average of actual annual operating and maintenance expense. Supp. Test. Henthorne 1 (Feb. 26, 2018). MCC's witness Schulz has concerns regarding working capital insomuch as not all expenses incurred by a utility to provide service are required prior to the receipt of revenues from customers, and believes two examples of this are property taxes and interest payments. Test. Schultz 24. He states that property taxes are paid in arrears, meaning the Company pays for those taxes after the time period they cover has passed. *Id.* at 24-25. Consequently, this represents a source of working cash for the utilities, not a use of working cash. *Id.*

94. Schulz states he had to determine the average time that EWM and CBGC, respectively, are in possession of that created working cash. *Id.*at 25. The Joint Applicants have slightly different intervals between meter reading and payment due date. DR MCC-063 (Jan. 31, 2018). Customers' meters are read, and customers are billed throughout the month, but this should average out overall as the meter reading periods are 25 to 35 days. *Id.* For EWM, the revenue to cover property taxes for the time January 1 to January 31 is typically received by

February 14. *Id.* For CBGC, the revenue to cover property taxes for January is typically received by February 20. *Id.* In the case of EWM, this means that EWM is in possession of the funds to pay January property taxes due to Cascade County on December 30 of the same year for 10.5 months, for February property taxes the expense lead is 9.5 months and so on. *Id.* EWM is then in possession of interest free funds in the amount of those property tax payments for an average of 8.01 months out of the year. *Id* at 26. Consequently, these funds reduce the working capital addition to rate base because they do not represent invested or borrowed capital for which the utilities should receive a return. *Id.* Schulz proposed to include in rate base for EWM $91,411 and for CBGC $57,970. Test. Schulz, Exs. PRS-6EW and PRS-6CB.

95. Henthorne states the Commission has accepted EWM's 1/8 of O&M method to calculate working capital in EWM's previous cases: D2010.9.90 and D2004.3.46. Rebut. Test. Henthorne 9. He states property taxes and interest expenses are not included in operating and maintenance expenses, therefore Schulz is making a reduction for amounts that are not included in EWM's calculation. *Id.* at 10. According to Henthorne, FERC provides guidance on the methodology for lead/lag studies, *see* CFR-2012-Title 18-vol.-sec.-154-312, and simple common sense indicate that a proper lead/lag study must consider all of the factors related to cash receipts and cash payments. *Id.* at 9. Picking two of the items delivers a result that is not complete and is inaccurate. *Id.*

96. Both EWM/CBGC and MCC provided testimony that neither is opposed to a lead lag study. Henthorne stated:

> Well, my understanding is there is basically two methods in the regulatory world of establishing a working capital allowance. One is the one-eighth of O&M method, which we use, and another one is a complete lead/lags study the taxes would be a portion of that, it ignores items on the other side so, you know, pre-paid items on the other side so, you know pre-paid items we've already put out money for that we're not collecting on. So my point is that if we're not going to doing a one-eighth of O&M, then we should do a complete lead/lag study and consider all of the sources and uses of cap.

Hr'g Tr. 154:2-16. According to Schultz:

> I certainly think it's worth consideration. The adjustment I made to working cash was an attempt to bring in significant sources of working capital to balance the ledger there without going to a full lead/lag study, recognizing there are expenses associated with that. However, I wouldn't be opposed to that. Yes, there would be costs to do it. No, I don't know exactly what the results may be. However, based on what we've seen, for example, with NorthWestern, it may very well be a

> reduction in working cash, not necessarily a - a total rate base reduction in terms of an actual deduct, but it just may be a lower amount for working cash."

Id. at 397:7-20.

97. Although the property tax and interest payments are not included in the working capital calculation itself, the two examples provided by Schultz are possible ways a firm can offset or reduce its working capital needs. The Commission finds utilizing the cash working capital amount as filed by the Joint Applicants is appropriate. The 1/8 method is a recognized methodology utilized to calculate working capital requirements.

98. In addition, the Commission notes the Joint Applicants have not provided a lead/lag study in the past 10 years. The affordability of the study and the fact that both parties agree such a study would be useful indicate that the Joint Applicants should provide such a study in any future revenue requirement filings.

Cost of Capital

Capital Structure

99. Gregory E. Scheig, Principal of ValueScope, Inc., filed testimony on behalf of the Joint Applicants regarding their proposed costs of equity ("ROE"), capital structures, and overall rates of return ("ROR"). Test. Scheig (Sept. 29, 2017); Rebut. Test. Scheig (April 9, 2018). Scheig's proposed capital structures for the Joint Applicants are based on the long-term debt and equity figures represented in their balance sheets as of December 31, 2016. Test. Henthorne 7, 33. Scheig considered the short-term debt a component of working capital to be repaid within a year and not a source of permanent financing, and therefore excluded it from his analysis. Rebut. Test. Scheig 19. He considered the proposed capital structures and calculated requested ROE for EWM of 10.75%, as reproduced in Table 3 below. Rebut. Test. Scheig 38.

Table 3

Cost of Equity Estimation Method	Indicated Cost of Equity	Weighting	Weighted Cost of Equity
CAPM	7.29%	5%	0.4%
ECAPM	7.69%	5%	0.4%
Modified CAPM	9.88%	10%	1.0%
Modified ECAPM	10.51%	10%	1.1%
Constant Growth DCF	8.96%	20%	1.8%
Non-Constant Growth DCF	10.51%	10%	1.1%
Risk Premium	9.57%	30%	2.9%
Expected Earnings	10.17%	10%	1.0%
Total Weighted Cost of Equity			9.5%
Additional Small Stock Risk Premium			1.25%
Total Requested ROE			**10.75%**

100. Scheig also calculated the Joint Applicant's requested ROR's of 8.32% (EWM) and 8.90% (CBGC), as shown in Exhibit (GES-2), Schedules I.1 and I.2, as reproduced in Table 4 below. *Id.* at 38-39, Ex. GES-2 at 80-81.

Table 4

EWM	% of total Capital Structure	Cost	Weighted Average Cost
Long-Term Debt	39.95%	4.66%	1.86%
Equity	60.05%	10.75%	6.46%
Total Requested ROR			**8.32%**

101. Stephen G. Hill, Principal of Hill Associates, filed testimony on behalf of the MCC. Hill uses his DCF analyses as his primary indicator of the cost of equity capital, indicating a range of 8.64%-8.74%. Test. Hill 42 (Feb. 22, 2018). He argues that due to uncertainty regarding the direction of the U.S. economy and interest rates, it is reasonable to utilize the upper end of this range for setting the Joint Applicants' rates in this proceeding. *Id.* at 43. Therefore, the MCC suggests an 8.75% allowed return on equity is reasonable and appropriately balances the interests of the Company and its customers, as reflected in Table 5 below. *Id.*

Table 5

Cost of Equity Estimation Method	Indicated Cost of Equity
Sustainable Growth DCF	8.74%
Mechanical DCF	8.64%
CAPM-vs. Long-Term Treasury total return	7.75%
CAPM-vs. Long-Term Treasury bond yield	8.50%
MEPR vs. 2017 Forecasted ROE	6.83%
MEPR vs. 2020-2022 Forecasted ROE	7.46%
MTB vs. 2017 estimated ROE, Retention Ratios	8.74%
MTB vs. 2020-2022 estimated ROE, Retention Ratios	8.79%
Total Requested ROE	**8.75%**

102. Hill's proposed capital structures for EWM and CBGC are based on the average capital structures of his proxy group companies. Test. Hill 19. He is critical of Scheig's decision to exclude short-term debt from his proposed capital structure and to use equity and long-term debt figures represented by the Joint Applicants, arguing they are a function of intercorporate capital allocations and not derived as a result of their relative risk interaction with the capital markets. Test. Hill 17. In contrast, the capital structures of the similar-risk sample group of gas utility holding companies which Hill relied on to estimate the cost of capital are a direct result of their relative risk and interaction with the capital markets. *Id.* Taking Hill's proposed capital structure and the requested return on equity of 8.75% (see Table 5 above), the MCC's requested rates of return (6.62% (EWM) and 6.42% (CBGC)) can be seen below in Table 6.

Table 6

CBGC	% of total Capital Structure	Cost	Weighted Average Cost
Long-Term Debt	43.25%	4.31%	1.86%
Short-Term Debt	7.32%	3.13%	0.23%
Equity	49.43%	8.75%	4.33%
Total Requested ROR			**6.42%**

EWM	% of total Capital Structure	Cost	Weighted Average Cost
Long-Term Debt	43.25%	4.66%	2.02%
Short-Term Debt	7.32%	3.77%	0.28%
Equity	49.43%	8.75%	4.33%
Total Requested ROR			**6.62%**

103. Hill contends that these returns will allow EWM an opportunity to earn 3.6 times its pre-tax interest coverage and CBGC an opportunity to earn 3.8 times its pre-tax interest

coverage, which in turn will afford the Companies an opportunity to maintain their financial position and attract capital, as required by Hope and Bluefield. *Id.* at 44.

104. The Commission did not consider whether to include short-term debt in the company's capital structure in EWM's last rate case in 2010. *See* Docket D2010.9.90, Order 7132c (Nov. 17, 2011). In that docket, EWM and the MCC both recommended capital structures that excluded short-term debt, and the Commission adopted such a capital structure (CBGC was not a party).

105. The Commission disagrees with Hill that short-term debt should necessarily be included in the capital structure. Short-term debt may finance spending that is not part of rate base. It would seem such borrowing should not be reflected in the capital structure. However, EWM has proposed, and the Commission has approved, a discrete rate base value of approximately $2.6 million for natural gas held in storage, on which it will earn a return. Rebut. Test. Henthorne, Statement E - Working Capital (Apr. 6, 2018). At hearing, the Joint Applicants conceded that the utility uses short-term debt, or a line of credit, to finance these purchases. Hr'g. Tr. 155:17-24. When the utility earns a return on an asset by including it in its rate base, as the Commission allows here, the cost of financing these purchases should be reflected in the approved capital structure. Not doing so would effectively impute a return on this asset that reflects higher-cost debt and equity financing.

106. The Commission calculates that 4.25% is the effective rate for short-term debt under the utility's line of credit, reasoning that 4.25% was the average interest rate paid on the line of credit during the test period and that, consistent with its discussion of interest rates below, the rate for the line of credit is also likely to rise. The short-term debt cost of 4.25% is less than either the cost of long-term debt or the cost of equity, either as proposed by the Joint Applicants or approved by the Commission in this Order. The inclusion of short-term debt results in a slightly lower cost of capital primarily because it results in the capital structure being less weighted toward equity.

107. In this Order, the Commission is also making two disallowances to rate base which should be considered in the capital structure. *Supra* ¶¶ 22-31 and 51-62. In rebuttal, EWM changed its position on including the SME pipeline as part of rate base and withdrew its request to earn a return on the asset's supposed value. Rebut. Test. Henthorne 12-13. The effect of this request, without a further adjustment to the capital structure, is to implicitly contend that both

equity and debt were used to "finance" the withdrawn value. Meanwhile, the approximately $1.0 million disallowance related to SAP, which the Commission makes by this order, involves an actual capital outlay that the utility would somehow have had to finance. *Supra* ¶¶ 22-31. Here, where real money is being spent, it seems reasonable to assume that the company invested in the disallowed SAP-related costs using the proceeds of long-term debt and equity in a ratio proportional to those elements' weight in the company's overall capital structure.

108. For these reasons, EWM's proposed capital structure is not reflective of the plant the utility earns an authorized return on, and the Commission finds it should be corrected. Hill proposes a hypothetical capital structure based on an average of the proxy group. Test. Hill 19. The Commission instead finds that because of the substantial amount of rate base that is financed through short-term debt, it is reasonable in the case of EWM to use a capital structure that reflects the company's actual financing scaled to rate base, net of the adjustments described above. The Commission accomplishes this calculation as follows. First, the Commission accepts the approximately $11.4 million and $7.6 million in equity and long-term debt reported by the company. Test. Scheig 29. To this, the Commission adds approximately $2.6 million, which reflects the amount of natural gas inventory in storage, as it is reflected in rate base. Test. Henthorne, Ex. JDH-EWM-9, Rule 38.5.142. This sums to approximately $21.6 million, which must be reconciled to the final submitted rate base value of $18.5 million. The Commission scales the former to the latter by reducing the shares of long-term debt and equity in a proportionate share; it does not reduce short-term debt, because this is the only part of financing that is directly tied to a discrete asset, and a scalar would therefore be inappropriate. Thus calculated, long-term debt and equity have been scaled to approximately $6.3 million and $9.5 million, respectively. Together with short-term debt, this sums to the final submitted rate base value of $18.5 million. This amount then must be reduced to reflect the Commission's disallowance of part of the SAP asset, consistent with the Commission's reasoning above. *Supra* ¶ 30. This results in a total rate base of approximately $17.5 million, with a final long-term debt and equity in the amounts of approximately $5.9 million and $8.9 million, alongside approximately $2.6 million of short-term debt.

109. Meanwhile, CBGC proposes a capital structure which reflects 71 % equity, with the remainder long-term debt. Test. Scheig, Ex. GES-2, Sch. 1.2. Approving such an equity-thick capital structure is not reasonable, as the Commission previously found with respect to EWM

when it asked the Commission to approve a capital structure with 73 % equity. Order 7132c, ¶ 93. In this proceeding, CBGC has identified no other gas utility with a comparable capital structure. Like it does for EWM, MCC recommends establishing a hypothetical capital structure based on the industry proxy group, including short-term debt. However, CBGC does not include natural gas inventory, financed by short-term debt, in its rate base; making such an imputation would be inappropriate. Instead, the Commission will establish a capital structure of 55% equity with the remainder long-term debt. This is consistent with the industry proxy group that Scheig presents when short-term debt is excluded, as it properly is with respect to CBGC. Rebut. Test. Scheig, Ex. GES-1R at 81. It also is consistent with the finding that a 55% hypothetical equity ratio falls within the range of reasonableness, pursuant to Commission precedent. Order 7132c ¶ 94.

110. Consistent with the discussion above, the Commission approves the following capital structure for EWM:

Table 7

Energy West	Dollar Amount of Rate Base	Capital Structure Percentage	Cost	Weighted Average Cost
Long-term Debt	$5,935,207	33.91%	4.66%	1.58%
Short-term Debt	$2,647,418	15.12%	4.25%	0.64%
Equity	$8,921,126	50.97%	9.20%	4.69%
Total	$17,503,751	100.00%		6.91%

As described above, the cost of EWM's short-term debt is 4.25%. Further, the cost of long-term debt is presented by Scheig and not disputed by Hill. The cost of EWM's long-term debt is 4.66%, and 4.31% for CBGC.

Cost of Debt

111. As described above, the cost of EWM's short-term debt is 4.25%. The cost of long-term debt is presented by Scheig and not disputed by Hill; it is 4.66% and 4.31% for EWM and CBGC.

Base Cost of Equity

112. The remaining 51% and 55% for EWM and CBGC's capital structures, respectively, are equity. The cost of equity is a vigorously contested issue in this proceeding, because unlike long-term debt which is priced based on transparent agreements between the

utility and a third-party issuer, the cost of equity is estimated based on expectations of what equity investors demand in return for the time-value of their money and the risk of the investment at hand. The Commission will more thoroughly examine the ROE in this Order than it has in previous orders in the hope that its resolution will indicate a starting point for the Commission's jurisprudence for parties to future rate cases.

113. The Joint Applicants present eight separate methodologies, with various permutations of data input, for a sum total of 24 different results for ROE, each of them given a different weighting by the Joint Applicants' witness, Scheig. Test. Scheig, Ex. GES-2 at 1. Hill presents a smaller set of analyses, and focuses on a variant of a methodology presented by Scheig, the sustainable growth Discounted Cash Flow ("DCF") method. Test. Hill 20, 66.

114. The evidence in this proceeding has convinced the Commission that Empirical Capital Asset Pricing Model ("ECAPM") should be the primary method for estimating the Joint Applicants' cost of equity in two different variations, as explained below. The Commission also checks the results of the ECAPM against the most straightforward form of DCF, finding the other DCF variants in this proceeding to be flawed. The Commission accords little weight to the remaining analyses, finding them at best cumulative and usually flawed in ways that the Commission's primary methods are not. The Commission discusses each of these models in turn, before presenting its calculation. The Commission also rejects an ex post small-size risk premium to its ROE calculation, because it is not supported by evidence in the record, and the Commission's most recent precedent presents an issue which the Joint Applicants have not answered.

The Capital Asset Pricing Model and the Discounted Cash Flow Methodologies

115. The Capital Asset Pricing Model ("CAPM") has several attributes which favor its use. Most importantly, it is a theoretically superior model because it attempts to anchor the firm's ROE to market-wide trends, in a way that rival methodologies do not. The Commission acknowledges that investors in utilities may choose to buy some other equity, not just other utility stocks. It is, therefore, important to sample the wider market, while considering also the less risky nature of an investment which is subject to the protections of economic regulation. This is consistent with CAPM's conceptual basis, as can be seen through its algebraic expression, $k = Rf + \beta$(Market Risk Premium ("MRP")), where the ROE is calculated by the addition of a the risk-free rate to the premium commanded by the equity market, as adjusted by

β, which in this instance is the co-variance of a proxy group of gas utilities to the wider equity market. Both Hill and Scheig present CAPM results, and Scheig also presents various ECAPM results. Test. Scheig 19-26, Ex. GES-2 2-3, 5-6; Test. Hill 33-36, Ex. SGH-8.

116. Other methods lack a basis tied to the wider equity market, and instead focus more closely on how analysts believe a proxy group of regulated firms will perform. The conventional DCF method, for example, is expressed algebraically as $k = D/P + g$, where the ROE equals the anticipated dividend yield added to analysts' expectations of the firm's growth. The reliance exclusively on the proxies' results will tend toward self-reference, as other utility commissions establish authorized returns and set expectations for capital investment, which drive the proxies' earnings and growth, and which in turn produce the ROE result which an application of the DCF method would suggest the Commission to adopt. This positive feedback loop makes the methodology unreliable, and this circularity is further aggravated by the limited size of the proxy group. In this proceeding, Scheig's proxy group is comprised of 11 firms. Test. Scheig 6, 37, Ex. GES-2 2-3, 5-10. Hill excludes four firms, citing various irregularities, and is left with only seven firms. Test. Hill 23. Either way, it is a small sample of companies from among the many hundreds that are included in the wider public equity market.

117. CAPM necessarily relies on the proxy group, but only for one of its variables, the calculation of β (beta). In this proceeding, β shows little variance between Bloomberg and Value Line, which calculate the variable for each of the proxy companies, and the value is clustered between X and Y for the highest and lowest β proxies. Test. Scheig, Ex. GES-2 2-3. Hill arrives at essentially the same value for β. Test. Hill, Ex. SGH-8. Meanwhile, the multitude of discretionary inputs in the DCF model can cause the results to vary, sometimes considerably. The Commission, were it to rely on DCF substantially, would want to very carefully parse all inputs (e.g., analysts' projections) for the limited number of proxies before accepting their validity. Such an initiative, however, would risk turning the ROE exercise into a yet more subjective undertaking. The Commission, again, is attempting to avoid a flyspeck analysis, and favors one that exists with reference to the wider market, while considering comparable risk.

118. As β shows little variability, then, the main question in relation to β is whether it has fidelity to the actual results of the firms whose return requirements are being projected. Scheig cites to a widely used textbook by Roger Morin which incorporates study results showing that the realized returns of low-β firms exceeded CAPM projections, even with the use of

adjusted betas. Test. Scheig 23, n.19. On this point, the Commission agrees with Scheig that CAPM's empirical results understate the actual returns of low-β equities. In order to remediate this issue, Scheig again borrows from Morin's textbook, which incorporates this α (alpha) effect in simplified form, as a factor x, as a modification to the basic CAPM equation, such that k = Rf + x(MRP) + (1-x) β (MRP). *Id.* In essence, x represents an adjustment which will cause the results of CAPM to regress to the MRP in proportion to the attributed value of x. Its justification, Scheig suggests, is to moderate CAPM's results so to better align to the empirical observations that CAPM forecasts understate the eventual returns of equities which have a relatively smaller value for β; thus, this methodology is known as the ECAPM. *Id.* at 21-23. Hill asserts that the use of the ECAPM with the use of adjusted betas is inappropriate as both serve to lower the slope of the Capital Market Line. Test. Hill 65. However, the Commission is persuaded by Morin's representation that "[t]he ECAPM and the use of adjusted betas comprise two separate features of asset pricing. Even if a company's beta is estimated accurately, the CAPM still understates the return for low-beta stocks." *See* Morin, Roger A. "Chapter 6: Alternative Asset Pricing Models." New Regulatory Finance Vienna: Public Utilities Reports, Inc. 2006.191. The Commission agrees with Scheig that the issue should be remedied by adopting the ECAPM, including his x factor of 0.25, which is intended to approximate the α effect identified by the academic literature reviewed in Morin's textbook.

119. In future proceedings, the Commission strongly suggests those who wish to justify a particular α within ECAPM, or who wish to use a conventional CAPM because the adjusted β already embeds α, present those arguments robustly. Additionally, much of the academic literature appears to refer to CAPM's general empirical results, and not to whether it is an accurate predictor of economically regulated firms' β. Hill does not raise this point, and the Commission invites testimony on it in future proceedings.

120. Aside from β, the main input to CAPM is the MRP. The MRP is by definition a function of the return of the wider equity market over the risk-free rate. Both the Joint Applicants and the MCC agree that the risk-free rate should be represented by long-term U.S. Treasury bonds ("T-bills"), although Hill suggests a short-term T-bill is truly the greater measure of a risk-free asset because it avoids the question of opportunity cost implicated by a longer-maturity asset, which has the effect of tying up an investor's capital over decades. Test. Hill 34. The Commission accepts that a long-term T-bill is most appropriate, especially in circumstances

where the MRP is being calculated on the basis of results perceived over a longer term; as seen below, the Commission adopts one such variant of CAPM. The Commission adopts Scheig's expected 3.19%, which represents the projection of the return of long-term T-bills in an environment where interest rates seem to be rising, after many years of stagnation at the hands of the Federal Reserve. Rebut. Test. Scheig, Ex. GES-1R 5-6, 9-10.

121. Having reasoned a risk-free rate, the value of MRP is the return of the market net of it. How the return of the wider market should be measured is thus a primary consideration of CAPM, equal to or greater than the importance of β. Within both Hill's CAPM and Scheig's CAPM and ECAPM analyses, the MRP is derived with respect to the performance of the market between 1926 and 2016, and the risk-free rate. Test. Hill 34. Scheig notes a tension in this approach, given that ROE determinations are intended to be forward-looking projects for rates not yet in effect, and thus should be grounded in the present-day market, not the past. He thus prepares modified ECAPM analyses which are grounded on the recent performance and anticipated growth of various firms from among the S&P 500.

122. Consistent with the Commission's reasoning above, it is important to calculate an ROE that represents the opportunity of investors to trade off in the wider equity market. In this vein, it is reasonable that the ROE determination should incorporate equity conditions looking forward over the next several years, when the public equity market looks volatile but somewhat robust. However, the Commission is conscious of Hill's criticism that an MRP in excess of 9%, as most of Scheig's Modified ECAPM analyses suggest, is exorbitant. Test. Hill 56-62. When asked directly, Scheig could cite to no literature that supports such an MRP. DR MCC-049 (Dec. 12, 2017). Indeed, Duff and Phelps, the source of the historic MRP data, suggests a going-forward premium of 7.0%. Test. Hill 34.

123. The Commission does two things to mitigate this concern. First, the Commission, will accept only one of Scheig's four variants of the Modified ECAPM, which limits the number S&P 500 companies sampled to only those which pay dividends and which have an analyst-projected growth rates and total equity returns between 5 and 20%. Test. Scheig 29. This analysis still includes a large sample of companies. [*Id.* at Ex. GES-2, Sched C.4. The Commission also reasons that the limitation to dividend-paying companies is important because investors, while they may trade-off utilities against the wider market, likely seek some dividend payout, and not just capital appreciation, as an attribute of their equity investment. See Test. Scheig 26. Hill

criticizes Scheig's decision to collar the sample to 5 to 20%. Test. Hill 62. He calculates that if one were to limit this sample to dividend-paying companies with between 0 and 10% results, which he expects is a more reasonable proxy for the economically regulated firm in question, that the result would be 9.88%, although he does not present work papers associated with this analysis in his testimony. *Id.*

124. The Commission believes that the 5 to 20% range is more reasonable than the 0 to 10% range. It may be reasonable in future proceedings to adopt a different range, perhaps 0 to 20%. Although the Commission does not engage in that calculation here, and upon review of the very large sample group in question, the Commission is satisfied that anomalous results are largely mitigated by this upper collar. Accordingly, the Commission adopts Scheig's Modified ECAPM MRP of 9.19%. Test. Scheig, Ex. GES-1R, Schedule C.20 at 65]. Additionally, while the Commission makes adjustments to the group of companies for the basis of measuring MRP, the main element of the CAPM or ECAPM equation which will internalize the risk adjustment for the firm in question should be β. The Commission also modifies Scheig's proxy group of companies for calculating β. WGL holdings recently merged with another holding company. Therefore, the Commission adopts a .72 which represents the arithmetic average of the proxy group used in Exhibit GES-1R, excluding WGL. *Id.*

125. Second, the Commission will moderate the effects of this application of a Modified ECAPM by equally weighting it with a more conventional analysis that relies on the historical MRP. The Commission does this in recognition of Hill's valid concerns about a potentially anomalous MRP. *Supra* ¶¶ 120-122. Local distribution companies such as the Joint Applicants and equities like them serve the rest of the economy, and their growth is likely slower than the broader economy at times of rapid growth but also more persistent than other parts of an economy when other equities slump. Investors also presumptively understand that certain firms boom-and-bust while others ride-through, and it is reasonable to consider this phenomenon in making an ROE determination. The long-duration average growth of the United States economy captures the basis on which to measure the return demands of more stable firms such as regulated gas utilities.

126. As explained above, the Commission views either of the variants of CAPM on which it relies to be superior to DCF. *Supra* ¶¶ 116-117. One additional problem of the Constant Growth DCF methodology is that it assumes that observations about the small proxy group's

near-term expected growth will endure as a constant. This is a reason why both Scheig and Hill perform variants of the DCF model, with Scheig performing a Non-Constant Growth DCF analysis and Hill performing a Sustainable Growth model, which he uses as his primary indication of the cost of equity capital. Test. Scheig 29; Test. Hill 42. Scheig's Non-Constant Growth DCF analysis relies on investors' short-term earnings projections to an extent, but relies more heavily on future stock price projections. Hill's Sustainable Growth DCF analysis substitutes sole reliance on short-term earnings expectations for an approach considering multiple factors such as dividend, earnings, and book value growth projections. The idea being that by considering various factors other than earnings estimates, one can arrive at a growth estimate that is more "sustainable." This is conceptually appealing as the Commission finds merit in Hill's representations that sell-side analysts' earnings projections are likely to offer "rosy" expectations for the stocks they follow. Test. Hill 28. However, the manner in which the witness employed this approach made its deficiencies clear.

127. As explained in Appendix B, this model is intended to derive a growth rate as an arithmetic function of internal growth (br) and external growth (sv), where g=br + vs. Test. Hill, Appendix B at 1-3. Implicit in this formula is the assumption that both "br" and "sv" result in growth. As seen in the appendix, "br" is calculated as the return on equity times the retention ratio and "sv" is the funds raised from the sale of stock as a fraction of existing equity times the fraction of new common stock sold that accrues to current shareholders. *Id.*. Hill did not employ this formula as designed. His Sustainable Growth DCF results did not use a "br" value arithmetically calculated as described in Appendix B. DR PSC-129(c) (Mar. 23, 2018) Rather, as noted above, the witness considered multiple factors and used subjective judgment to arrive at a value for "br." *Id.*; Test. Hill, Appendix C, Ex. SGH-4 at 1. Moreover, in the process of discovery, it became apparent that the manner in which the witness employed this model did not result in any growth from his "sv" input. When asked to amend his "sv" calculation to be theoretically consistent with the concept of growth and consistent with the narrative found in Appendix B, the witness concluded that his DCF results would "result in an overstatement of the cost of equity (the growth rate would be too high)," and amended the manner in which he derived "br." DR PSC-129(c). Since the witness adjusted his approach with regards to his "br" input when asked to only change his approach to the "sv" input, the degree to which subjectivity influenced the results of his Sustainable Growth DCF analysis is highlighted.

128. The Commission does not consider Hill's Sustainable Growth DCF results in this proceeding. Scheig's Non-Constant Growth DCF analysis is similarly unreliable as it places an inordinate amount of reliance on longer-term projections of the proxy companies' stock prices at intervals several years into the future. The Commission accepts Hill's criticism of this method, which replaces a shorter-term variable known with greater certainty for a much more speculative estimate of stock price, which is not only unpredictable but also may not be a sound indicator of growth. Test. Hill 66-70.

129. Ideally, DCF would incorporate a longer-term perspective on growth, but both variants presented are unreliable. Therefore, the Commission is left with the basic, constant-growth or mechanical DCF method. The Commission finds that when aberrant companies, those with DCF-indicated ROE's of >20% or <5%, are excluded from proxy group(s), the restated DCF, using the latest data available from Scheig's rebuttal testimony, results in an average indicated return on equity of the proxy companies of 9.40%. Rebut. Test. Scheig, Ex. GES-1R at 71. The Commission uses this as a check against the CAPM results, because while it suffers from the infirmities of self-reference, it can inform the Commission about whether its measures using CAPM are too radical a departure from the expectations of the regulated gas-utility sector investors. The Commission calculates the allowed ROE as follows:

(1) calculates the arithmetic mean of the three DCF results,
(2) calculates the arithmetic mean of the two ECAPM analyses,
(3) takes the results of the Commissions Modified ECAPM using a MRP of 9.19% and a β of .72 *Supra* ¶ 124.
(4) calculates both the arithmetic and geometric means of the resulting figures from steps 1-3.

Accordingly, the Commission adopts 9.2% as the cost of equity to be used in calculating the revenue requirements of the Joint Applicants, as represented in Table 8.

Table 8

DCF Analyses-Scheig (Rebuttal)		Estimated ROE
Sched D.1	Value Line	10.38%
Sched D.2	Zacks	9.02%
Sched D.3	Bloomberg	8.82%
		9.40%
ECAPM Analyses-Scheig (Rebuttal)		Estimated ROE
Sched B.8- forecasted rf rate	Value Line β	7.91%

Sched B.9-forecasted rf rate	Bloomberg β	7.77%
		7.84%
Modified ECAPM Analyses-Scheig (Rebuttal)		Estimated ROE
Sched C.20- forecasted rf rate	Value Line β	10.45%
		10.45%
GEOMETRIC AVERAGE ROE		**9.17%**
ARITHMETIC AVERAGE ROE		**9.23%**

Risk Premium - Authorized Gas Returns

130. Scheig also performed a risk premium study which compares gas utility authorized ROEs to long-term utility debt rates. Test. Scheig 30.

131. Because the risk premia used in deriving regression equation rely on historic Commission-approved natural gas ROEs, this methodology is perhaps the most susceptible to self-referential outcomes of all the methods employed by the witnesses. Widespread adoption of such a method would inherently result in a circular, positive feedback loop with no grounding in the wider equity market. *Supra* ¶ 116. The Commission is persuaded by Hill's argument that differences between allowed returns and bond yields are not necessarily reliable indicators of investor-required risk premiums, given the fact that the market prices of gas utilities over the time period studied by Scheig have been substantially above book value. Test. Hill 71-72. Therefore, the results of these analyses do not receive consideration by the Commission. It is noted that if the historical market values of natural gas utility stocks were equal to the historic book values, this method could potentially be considered a valid indicator of actual investor required returns for that historic period. However, there is no indication that current (or forecasted) market conditions mirror the conditions faced by investors during the historic time periods. Therefore, it is not reasonable to assume that current (or forecasted) market-to-book ratios would resemble the historic market-to-book ratios. This method is not grounded in the current, wider equity market(s) and is rejected.

Expected Earnings

132. Expected earnings methodology, more commonly referred to as a Comparable Earnings analysis, relies on analysts' earnings and book value projections. Test. Hill 74. The ROE is calculated as a function of forecasted earnings divided by forecasted book values. Scheig

argues that this methodology avoids the complexities of other methods and is consistent with the fair rate of return concepts set forth in Hope and Bluefield. Test. Scheig 40. Moreover, he states that the resulting ROE is an indicator of investor expectations for current and future equity returns. *Id.* The Commission is not persuaded by this statement. The average market-to-book ratio of Scheig's proxy group companies is 2.26. Test. Scheig, Ex. GES-2 at 77. It is reasonable to assume that investors' expectations are lower than what the results of these analyses would indicate as the earnings-to-(market) price ratios of the proxy group companies more accurately depict actual returns earned by investors. Moreover, because this method solely relies on proxy group projections, it is not grounded in the wider equity market(s) and suffers from the same self-referencing, circular, positive feedback loop shortcomings as the other methods which rely on the proxy group companies. *Supra* ¶ 116. Therefore, the Commission does not consider the results of these analyses.

Modified Earnings - Price Ratio

133. Hill's Modified Earnings-to-Price Ratio ("MEPR") methodology calculates an ROE as the midpoint(s) of the proxy group's average earnings-to-price ratio and its average current and projected ROEs. Test. Hill 36-37. Due to its reliance on the proxy group companies, this method suffers from the same self-referencing, circular, positive feedback loop shortcomings as the other methods which rely on the proxy group companies. *Supra* ¶ 116. Moreover, the Commission finds merit in Scheig's representation that this is not a model used by actual market participants. Rebut. Test. Scheig 11. If this were a widely-used model, Hill likely would have been able to cite specific examples of its use by market participants employing the model in the exact same manner as he proposes. Rather, Hill cites to an arithmetic equation that merely illustrates the stochastic relationship between expected returns and earnings-to-price ratios. Test. Hill 38. Therefore, the Commission does not consider the results of these analyses.

Market-to-Book Ratio

134. Hill's Market-to-Book Ratio analysis is essentially an algebraic derivative of his Sustainable Growth DCF model. Test. Hill 40. He uses the same proxy group and growth ("g") assumptions as he did in his Sustainable Growth DCF analysis, and thus, this model suffers from the same degree of subjectivity as his DCF results. Moreover, because of the widespread use of proxy groups in rate cases, the results of DCF analyses tend provide circular ROE estimates lacking any real foundation in the wider equity markets. Therefore, these results tend to reflect

commission approved ROEs as opposed to actual investor required returns. For these reasons, the Commission does not consider the results of these analyses.

Small-Size Adjustment

135. Most of the substance of the debate on an appropriate ROE turns on the formulaic calculations using market data that are discussed above. However, in terms of impacts on the allowed ROE, the Joint Applicants' advocacy to impose a "small size risk premium" ("SSRP") is no less important. An SSRP is an ex post adjustment to the ROE result calculated above; the Commission therefore considers it separately, and upon consideration of the evidentiary record, rejects it.

136. Scheig advises that a size risk adjustment is appropriate because EWM & CBGC are significantly smaller than the proxy group he relied upon for his cost of capital analyses and argues the companies are not public and, therefore, have illiquid equity interests. Test. Scheig 32. Therefore, an adjustment must be made to that ROE to account for the Joint Applicant's small size in arriving at a final ROE estimate. *Id.* He bases his suggested SSRP adjustment on Duff and Phelps' size premia studies which examine the Stock Size Premiums of the entire universe of NYSE-, AMEX-, and NASDAQ-listed securities from 1926 to the present. *Id.* at 32-34. In the studies, the risk premium required due to each firm's size is estimated by dividing the universe of securities into portfolios by capitalization and measuring the premium required beyond the risk-free rate and the security's equity risk premium estimate (beta). *Id.* at 33. The study concludes that the required SSRP increases inversely to firm size and is in addition to the required systematic (i.e., market) risk. *Id.* According to Scheig, based on this study, EWM and CBGC would fall into the 10th decile, which equates to an SSRP of 5.59%. *Id.* at 34. However, Duff & Phelps only considered unregulated companies in their survey, therefore, the regulated nature of EWM & CBGC offsets some of the risk factors reflected in the SSRP indicated above *Id.* at 33. He used data provided by Duff & Phelps' studies to calculate a weighted average SSRP for the proxy group of 1.13%. *Id.* at 36. Taking these factors into consideration, and relying on his professional experience and judgment, Scheig selected 1.25% as a minimum SSRP for EWM & CBGC. *Id.* at 36; DR PSC-034 (Feb. 8, 2018); Rebut. Test. Scheig 14-15.

137. Hill argues the market-based cost of capital for a small gas distribution utility operations such as EWM and CBGC should not be adjusted upward due to its relative size for what appears to be a long-term historical return difference between large and small firms:

- Although there is substantial evidence that a size premium does not currently exist, even if a size premium does appear in the long-term historical record for unregulated stocks, utility-specific research shows that it does not apply to utilities;
- The evidence on which the "size effect" logic is based (the long-term historical return difference between large and small unregulated companies in the broad stock market) suffers from what is termed "survivor bias"; and
- The Duff & Phelps studies relied on by Scheig are based on broad market indices such as the New York Stock Exchange (NYSE) Index. In order for a small company to be listed on a national stock index like the NYSE, it has to be extraordinarily successful.

Test. Hill 49-51. Therefore, the returns of the small companies being measured are considerably higher than the returns of the many small firms that: a) are not successful enough to be listed, or b) may have failed altogether. *Id.* at 51.

138. The Commission is not persuaded by this argument by Hill as it does not appear to be translatable to the regulated utility sector. The paradigm of utility regulation requires commissions to authorize ROEs commensurate with returns on alternative investments with similar risk. *See* Hope and Bluefield. If an investor were to supply equity to these unsuccessful (or failed) companies referred to by Hill, they would likely require higher returns due to the heightened unsystematic risk reflected in the risk profiles of those companies.

139. Hill argues the "size effect" is also called the "January effect" because virtually all (95%) of the small stock effect occurs only in the month of January. *Id.* at 54. The Commission is not persuaded by this argument as returns are "annualized." Therefore, it is unreasonable to parcel-out the month of January as it is inherently included in any calculation of annual returns.

140. The Commission previously opined on how a regulated company's size should affect its allowed return. This decision, made seven years ago, was not a model of clarity, appearing to hold that an adjustment for size was appropriate but resisting the nomenclature associated with it. First, the Commission surmised that it was "reasonable" to authorize a higher return for EWM than for a larger utility the Commission regulates, NorthWestern Energy, because "small utilities have a higher financial risk profile than large utilities." Docket D2010.9.90, Order 7132d ¶ 96-97 (Dec. 30, 2011). The MCC sought reconsideration of that finding, and the Commission went on to explain:

> The Commission did not authorize a small size risk premium in its calculation for rate of return, but did recognize that a smaller company is more sensitive to like

> dollar revenue streams than a larger company. The commission has not recently awarded small and microcap companies a significant basis point premium on their ROE compared to larger cap companies…The Commission did not establish a small size risk premium as EWM requested in this docket but only discussed how EWM is smaller than NorthWestern Energy and Montana-Dakota Utilities and should be awarded an ROE that is slightly higher.

Order 7132d ¶ 13.

141. More recently, the Commission rejected a small-size risk premium, more clearly articulating its reasoning:

> MDU contended that its small size and relatively undiversified service territory makes it more risky and therefore it should command a higher reward. However, many of the proxy companies are an amalgamation of small utilities. The proxy group's dividend and growth forecasts in the DCF results may incorporate all or some portion of those risks. The Commission finds that adding an ex post risk premium adjustment to the DCF results would result in double-counting those risks.

Order 7433f, Docket D2015.6.51, ¶ 22, (Mar. 25, 2016).

142. The Commission will continue to reject an SSRP and in doing so will articulate a number of reasons. First and foremost, the Commission's foundational concern expressed in Order 7433f has gone unanswered in this proceeding. Most of the proxy companies in Scheig's and Hill's analysis are made up of numerous operating companies. Hr'g Tr. 232:4-5. As Scheig noted at the hearing in this matter, "[m]ost of them have rate cases in each specific jurisdiction as opposed to one large one for the holding company." *Id.* at 232:11-13. Scheig conceded that he did not study whether the larger holding companies of his proxy group already contained an implied premium due to their composition of multiple, small operating companies. *Id.* at 233:15-21. Since the Joint Applicants do not answer the specific concern that led the Commission to reject the SSRP most recently, the Commission finds they have not met the burden of proof to substantiate this substantial ex post adjustment.

143. There are additional reasons on the merits of the issue which lead the Commission also to reject the SSRP. First, if a firm is more financially risky than its peers because of its size, such a trait should be reflected in its relative volatility to the peers' performance and to the market's as a whole. Yet the primary empirical measurement of the volatility of return, β, does not bear this out. *Supra* ¶ 117. The smallest members of the proxy group, Chesapeake Utilities Corporation and Northwest Natural Gas Company, have β values which are below the mean; in

other words, they are less volatile in their market performance despite being less well capitalized than their larger peer regulated gas companies. Rebut. Test. Scheig 13 (showing the relative market capitalization of proxy group members), Ex. GES-1R at 50 (showing Beta). Meanwhile, the highest-β member of the proxy group, UGI Corporation, is the third-largest of its 11 members. *Id.* The β values suggest no obvious correlation between size and risk.

144. Scheig did not study the endogenous factors that would inform the risk of the Joint Applicants in particular. Test. Scheig 18. Instead, his is an analysis which adopts ipso facto the proposition that smaller firms will require a higher return. Clearly there is empirical support that the historical market returns for small public companies are larger on average than those of larger public companies. *Id.* at 33. However, sufficient evidence has not been presented supporting the proposition that this information is translatable to the regulated utility sector.

145. The Commission, however, primarily agrees with Hill in his criticism of Scheig's premise, that the risk premia associated with the wider public equity market can be translated seamlessly to the experience of regulated utilities. Test. Hill 50-51. Both large and small utilities are insulated from the type of risk which may present for smaller firms, because they are economically regulated by public service commissions. As noted above, the only empirical evidence of size-based risk suggests no correlation. *Supra* ¶ 117. Moreover, the Commission reasons that risk has more to do with the peculiarities of the service territory and business model of a regulated utility than its size. Large utilities may serve a more sprawling service territory that exposes them to greater risk of natural disasters, like wildfires, or may serve more dense urban communities where infrastructure may be more aged and dangerous, or where gas line replacements are more difficult to undertake. Indeed, the riskiest utilities may be those which have the largest balance sheets such that in the first instance they may make big bets that fail.

146. Even were the Commission inclined to accept Scheig's advice on conceptual grounds, his calculation of his proposed SSRP leaves much to be desired. The recorded SSRP for the smallest decile of public companies is 5.59%. Test. Scheig, Ex. GES-2 at 77. He reasons that the holding companies comprising the proxy group already include an implied risk premium based on their fitting within particular deciles, which averages to 1.13%. Therefore, Scheig calculates that the "additional required SSRP" for the Joint Applicants would be 4.46%. *Id.* Then, however, he scales this down to 1.25%. *Id.* He reasons, generically, that "some of the risk factors reflected in Duff and Phelps' study above are offset by the regulated nature of their

business," but nowhere does Scheig calculate or show any detail of how, from a basis of 4.46%, he has arrived at a proposal of 1.25%. Test. Scheig 33. Given that the cost of capital witnesses in this proceeding spend cumulatively hundreds of pages of testimony and discovery debating over methodologies that result in adjustments of hundredths of percentage points, the Commission is naturally very hesitant to accept a suspiciously round number whose exact provenance cannot even be identified.

147. For all these reasons, the Commission rejects the SSRP. The Joint Applicants have not met their burden of proof. In the future, should a utility applicant seek an SSRP, they must demonstrate through clear evidence several things. First, they must demonstrate that size serves as an adequate proxy for utility-specific, unsystematic risk. Second, show that the risk premia effect that appears for small public companies relative to larger public companies is actually translatable to the regulated utility sector; the primary evidence of this should be β of proxy companies, or other direct evidence which suggests a size-based return differential associated with regulated utilities. Third, and relatedly, such an applicant must clearly answer through comprehensive analysis the problem identified in Order 7433f. *Supra* ¶¶ 141-142. Such analysis would include breaking down a public holding company into its various operating companies, and contrasting their performance and returns, which presumably would be reporting in the holding companies' financials, with market-wide risk premia.

148. The Commission also rejects Scheig's proposition that consideration should be given to the Joint Applicants' private, illiquid, equity interests. *Supra* ¶ 136. A long-standing Commission practice has been to evaluate utility ROEs on a stand-alone basis. If the Commission were to consider the upstream ownership structure and equity provided therefrom, it would also be necessary to consider other factors beyond the scope of this proceeding.

Cost Allocation and Rate Design

Cost Allocation

149. In its last rate case, Energy West relied on minimum system theory to classify investment in distribution mains 70% customer-related and 30% demand-related. Docket D2010.9.90, Order 7132c, ¶ 103 (Nov. 18, 2011). The Commission rejected the classification of mains to customer on the basis that the utility's asserted cost causality was not convincing, and that the classification appeared to violate the principle of vertical equity through assignment of

equal cost responsibility to very small and very large customers. *Id.*, ¶ 106. Additionally, the Commission faulted the utility for presenting a study for the allocation of system costs which could not be reconciled to the physical reality of the utility in question. *Id.*, ¶ 108. Here, Mr. Loy's testimony does not suffer from the same infirmities. He has conducted a Minimum System Study that estimates the cost of "a minimum size system to hook up customers," in contrast to "the cost of the actual mains, sized to meet capacity requirements at times of maximum demand." Test. Loy 18. The import of such a study is that the incremental cost of larger-diameter mains can be considered to be a function of meeting demand, and thus properly allocated on that basis; meanwhile, the hypothesized cost of the minimally-sized system is a function of the number of customers connected to the utility. The results of Loy's study suggest classifying distribution mains, and their attendant costs, as 44% customer-related and 56% demand-related in the Energy West/Cut Bank service areas. *Id.*

150. Donkin does not specifically reply to the Joint Applicants' Minimum System Study, but does offer a hypothetical example that suggests the premise behind such a study is flawed. He posits that a small manufacturing plant with a peak demand of 20 Mcf requires the same investment in mains infrastructure as do 20 residential customers, each with a coincident peak of 1 Mcf, which, he suggests, demonstrates that "a gas utility's distribution lines are sized and installed to meet customer loads and not customer counts." Test. Donkin 27. The Commission believes Donkin's example incorrectly hypothesizes that the length of mains necessary to serve less and more dense sources of demand for natural gas is similar. A minimum system study that actually identifies the mileage of the system, as Loy's does, will correctly identify the attributes of length and width, and their attendant relation to customer count and demand, that tend to drive investment in mains.

151. Previously, the Commission was "not persuaded that it would be reasonable to classify a substantial portion of mains costs [to be] customer-related, as EWM proposed." Order 7132c, ¶ 106. Loy's classification is sufficiently demand-weighted to satisfy the Commission's concerns about vertical equity. For the reasons explained above, the Commission is now persuaded to accept Loy's Minimum System Study as a reasonable basis for allocating mains and their attendant costs.

152. Loy's direct testimony contains little discussion of another major category of rate base value: the service lines, meters, and regulator equipment. He cursorily suggests a complete

allocation of these items as 100% customer-related. Test. Loy 18. Upon close review of his work papers, the Commission finds that Loy allocates these costs largely on the basis of weighted-average meter costs rather than on customer numbers. This results in a weighting that generally distinguishes between the more expensive meters installed to serve larger general service and commercial tariff customers and standard residential meter technology. The Commission surmises that this allocation generally satisfies its criterion from Docket D2010.9.90 that costs should be allocated in part on the basis of capacity, since the cost of a meter is related to its capacity, but is frustrated that Loy has left much of this to the Commission's inference. Or. 7132c, ¶ 106.

153. Donkin cites to Commission precedent which favors his classification of this plant as 50% demand-related and 50% customer related. Test. Donkin 30-31 (citing to Order 7132c, ¶ 106). In rebuttal, Loy mounts a more substantial, less cursory argument, citing to a gas utilities' trade association manual in support of the proposition that "the closer the plant item (e.g., a meter and service lines) is located to a customer, the more that particular item is related to the specific requirements of that customer." Rebut. Test. Loy 9 (Apr. 9, 2018). He suggests that while costs of meters and services for individual customers may be greater because of that individual customer's demand, it does not follow that such incremental costs should be allocated to *system-wide* demand. *Id.* at 10.

154. The Commission finds that neither witness has particularly well explained their recommendations on this point. On one hand, although Mr. Donkin has classified Accounts 380 (Services) and 381 (Meters) 50% demand-related and 50% customer-related, he classifies other significant categories associated with services and meters, such as Accounts 382 (Meter Installations), 383 (House Regulators), and 384 (House Regulator Installations), as 100% customer-related. Test. Donkin, Excel support file "GLD-2 EWM COS," tab 'Totals Functional,' lines 18-24. Such a proposal appears self-contradicting. On the other hand, although Loy classifies all service and meter plant accounts 100% to customer, he allocates these costs to customer classes on the basis of weighted average meter costs by class. *Id.*; Excel support file "Dist COS WPs," tabs 'Meters' and 'Great Falls.' Because the cost of a meter is in large part driven by its capacity, this results in allocations of service and meter plant costs that are more demand-weighted than the meter and service plant allocations of Donkin, who allocates demand-related service and meter costs on the basis of non-coincident peak monthly volumes, and

customer-related costs on customer numbers. Test. Donkin 31, 38. Thus, Donkin allocates *more costs* of services and meters to the customer-heavy residential class than Loy does, because of the difference in their allocations of customer-related costs. *Compare* "GLD-2 EWM COS," tab 'COS-Total,' line 18, in the amount of $9.6 million, to "EWM COS," tab 'COS-Total,' line 18, $8.0 million. One cannot especially blame Donkin for the oversight, because Loy's work in this regard is not transparent.

155. All in all, the Commission agrees with Loy's observation, made in rebuttal, that "the per customer level of service and meter plant in the EWM COSS are close to the MCC's level [of] per customer costs." Rebut. Test. Loy 10. The Commission, therefore, will go no further than that in trying to make sense of the confusing, rival studies in this regard, and especially in the absence of a clearly explained methodology in the first instance; it will continue its prior precedent, while noting that, like in the example of the allocation of mains, the Commission remains open to being persuaded otherwise.

156. The Commission's complete and final resolution of the allocated cost of service studies is apparently not necessary in any case, because Donkin and Loy only loosely follow their recommendations in allocating costs to classes. For Energy West, both witnesses appear to concede a rigorous adherence to their studies would mean substantial increases to the residential class, which they both propose to moderate, and with respect to Cut Bank Gas Company, it is just the opposite, which again they propose to moderate. Test. Loy 25-30; Test. Donkin 35, 40-42. The Commission, while offering the general guidance it does above, does not find it necessary to tabulate cost of service results in a precise form. Rather, the Commission sets forth the following allocation, which coheres to the commentary above:

Table 9

Final Cost Allocation of CBGC Revenues

Customer Classes	Current[1]	Ordered	Pct Chg
Residential	$ 487,393	$ 556,152	14.11%
General Service	211,192	270,671	28.16%
Total Cost of Service	$ 698,585	$ 826,823	18.36%

1: Source - Henthorne Dir. Test. Exh. JDH-CBG-6, Statement H

Rate Design

157. Rates must be designed to recover the costs that have been allocated to particular customer classes. Since some of those costs were allocated in the first instance on the basis of customer counts, the Commission finds it reasonable that there should be a corresponding fixed charge billed to each customer in a class regardless of gas consumption. Thus, the percentage of residential class revenues classified to customer should equal the percentage of revenues recovered through a fixed charge, with projected revenues scaled to authorized revenues in this case. Accepting either Mr. Donkin's or Mr. Loy's cost-allocation study for this purpose, the customer charge for EWM would be either $6.25 or $12.75, respectively, which is the function of allocating 42% or 86% of distribution revenues to this charge. Mr. Loy's and Mr. Donkin's bookends happen to be wide apart, due to the utility's predilection to classify costs as customer-related (and thus increase the fixed charge, which would be charged year-round and not be subject to the vicissitudes of weather-related gas demand), and to the countervailing tendency of the consumer advocate to classify costs as commodity- or demand-related (which has the effect of minimizing the rate impact on residential customers). The current residential customer charge is $7.25 for EWM, $13.00 for CBGC, and $7.25 for the West Yellowstone utility. The Commission maintains each of these charges at their current levels, for two reasons.

158. First, the approval of GIRC, will mean that for EWM and CBGC an additional monthly surcharge calculated on a per-customer basis will be added to monthly bills beginning in September 2020. If GIRC operates as expected, this surcharge will grow through 2024, until it is rolled into rates or lapses in 2025. Maintaining the customer charge at current levels allows for headroom so that the rate design of GIRC can be simplified and billed as a customer charge. The following table illustrates the expected rate impacts on customers regarding cost recovery of GIRC investment, with cost allocation similar to the allocation of the general revenue requirement.

Table 10

Expected Standard and GIRC-Related Monthly Customer Charges

Standard Monthly Customer Charge

Class	2018	2019	2020	2021	2022	2023
GF Res	$ 7.25	$ 7.25	$ 7.25	$ 7.25	$ 7.25	$ 7.25

1: Referencing the Direct Testimony of Charles Loy, Exhibit CEL-EWM-3, p. 1 of 2

159. Second, while the Commission desires to base its decision on the customer charge on a more analytical foundation, the Commission notes that the parties' witnesses themselves do not rigorously follow their cost allocation studies. Instead, they make largely subjective judgments about how the study-allocated costs should be moderated for the sake of actually allocating those costs to various customer classes. The lack of reliance on these studies to obtain

a result for a phase of ratemaking—cost allocation—which is the necessary predicate of rate design, raises the question of why the Commission would then rigorously adhere to these studies for the sake of calculating a precise customer charge. Accordingly, the Commission declines to do so. The existing customer charges are within the bookends of Donkin's and Loy's proposal if one accepts, as the Commission does, that the proportion of total costs allocated on the basis of customer determinants should be reflected in a customer charge. In the absence of a convincing proposition that the existing rates are unjust or unreasonable, the Commission finds that maintaining them is appropriate.

160. Since these utilities have a two-part bill for distribution cost recovery—the customer charge and the volume of gas used—the incremental revenue authorized by this Order will thus be allocated to the latter. In the absence of a demand charge, that costs allocated on the basis of demand are best approximated by a rate design that attributes these to the volumetric gas consumption component of the bill; the Commission reasons that most customers of these utilities are likely to use the most gas at the same time other customers are doing so, on very cold days.

CONCLUSIONS OF LAW

161. Energy West Montana furnishes gas service for consumers in the State of Montana, and is a "public utility" under regulatory jurisdiction of the Montana Public Service Commission. Mont. Code Ann. § 69-3-101.

162. The Montana Public Service Commission properly exercises jurisdiction over Energy West Montana's rates and operations. Mont. Code Ann. § 69-3-102, and Mont. Code Ann. Title 69, Ch. 3, Pt. 3.

163. The Montana Public Service Commission has provided adequate public notice of all proceedings, and an opportunity to be heard to all interested parties in this Docket. Mont. Code Ann. §§ 69-3-303, 69-3-104, and Mont. Code Ann. Title 2, Ch. 4.

164. The Montana Public Service Commission may prescribe classifications of the service of all public utilities. Each public utility is required to conform its schedule of rates, tolls, and charges to such classifications. Mont. Code Ann. § 69-3-306.

165. The Montana Public Service Commission may, after hearing and investigation, fix and order substituted rates, tolls, charges, or schedules as are just and reasonable if the rates are found to be unjust, unreasonable, or unjustly discriminatory or to be preferential or otherwise in

violation of the provisions of this chapter. Mont. Code Ann. § 69-3-330 (1).

166. The Montana Public Service Commission may, in its discretion, investigate and ascertain the value of the property of each public utility actually used and useful for the convenience of the public. The Commission is not bound to accept or use any particular value in determining rates. However, if any value is used, the value may not exceed the original cost of the property, except that the commission may include all or some of an acquisition adjustment for certain property purchased by a public utility in the purchasing utility's rate base if the transfer of the property to the purchasing utility is in the public interest. In making the investigation, the Commission may avail itself of all information contained in the assessment rolls of various counties or in the public records of the various branches of the state government or of any other information obtainable, and the Commission may at any time on its own initiative make a revaluation of the property. Mont. Code Ann. § 69-3-109.

167. Montana Public Service Commission is given the power to investigate and ascertain the value of the property of every public utility actually used and useful for the convenience of the public; under Mont. Code Ann. § 69-3-109, the Montana Public Service Commission is obligated to eliminate from rate base all utility costs in excess of original cost. *In re Montana Power Co.,* 180 Mont. 385, 590 P.2d 1140, 1979 Mont. LEXIS 713.

168. The rate levels approved herein are just, reasonable, and not unjustly discriminatory. Mont. Code Ann. §§ 69-3-330 and 69-3-201.

ORDER

169. For EWM, the Commission approves a total revenue requirement of $24,226,558 which results in an increase of previously approved revenue requirement of $479,461. This is based on a capital structure of 33.91% Long-Term Debt, 15.12% Short-Term Debt and 50.97% Equity. The Commission approves a 9.20% Return on Equity and a 6.91% overall return. For CBGC, the Commission approves a total revenue requirement of $1,416,130 or an increase of $128,238. This is based on a capital structure of 55.0% Equity and 45.0% Long-Term Debt. The Commission approves a 9.20% Return on Equity and a 7.45% overall return.

170. EWM is permitted to collect the PSC/MCC taxes on a per CCF basis through a separate rate component and is required to file compliance tariffs, accordingly. *Supra* ¶ 67.

171. EWM must file compliance tariffs implementing the approved rates and rate design within 30 days of the service date of this order.

172. All Findings of Fact and Conclusions of Law that can be properly considered an Order and that should be considered as such to preserve the integrity of this Order are incorporated herein as an Order.

173. These rates will be effective for services rendered on and after October 1, 2018.

DONE IN OPEN SESSION at Helena, Montana, on the 30th day of July, 2018, with Commissioner Lake dissenting as to the ROE and denial of SSRP; Commissioner Koopman dissenting as to the GIRC; Commissioners Koopman and O'Donnell dissenting as to the application of TCJA benefits; and Vice Chairman Kavulla dissenting as to keeping the monthly service charge at current rates.

BY ORDER OF THE MONTANA PUBLIC SERVICE COMMISSION

BRAD JOHNSON, Chairman

TRAVIS KAVULLA, Vice Chairman

ROGER KOOPMAN, Commissioner

BOB LAKE, Commissioner

TONY O'DONNELL, Commissioner

PUBLIC SERVICE COMMISSION OF MONTANA

Energy West Montana, Inc. Tariff No. 05, Schedule GI, Sheet 01, Release 01

GAS INFRASTRUCTURE RELIABILITY CLAUSE

GENERAL DESCRIPTION

Purpose
To provide the Utility with the resources to accelerate the replacement of aging infrastructure as identified in Energy West's general rate case filed in D2017.9.80. To accomplish these tasks, the utility is permitted to recover the costs to replace Eligible Property, as defined below, when such Eligible Property is placed into service and recorded in the individual accounts, as referenced below.

To the extent that capital investment (as measured by original cost clearings to plant less GIRC related plant clearings) in a calendar year meets or exceeds the Utility's current year annual depreciation (excluding GIRC related depreciation), all GIRC Eligible Property costs from that calendar year will be included in the recovery determination. To the extent that capital investment falls short of annual depreciation, for purposes of determining revenue recovery, the investment in Eligible Property will be reduced by the shortfall for that calendar year to determine the quantity of GIRC-Eligible Property.

All costs of Eligible Property are subject to a review for whether its costs should be permanently included in the utility's rates when Energy West next files a general rate cost. The inclusion of such costs in a rate charged under this tariff shall not be evidence that the property is used and useful, or that associated expenses were prudently incurred.

The costs of extending facilities to serve new customers are not recoverable through the GIRC.

Eligible Property
Eligible Property Identified Through DIMP

- Approximately 42 miles of pre-1984 Aldyl-A pipe
- Mechanical couplings on approximately 11,000 steel services
- Couplings on the original, approximately 4.5 miles of 12" header main
- Other capitalized costs (labor, benefits, overheads)

The Eligible GIRC Property will be booked to the following FERC plant accounts where GIRC costs will be separately identifiable. Other capitalized costs such as labor charges, related benefits, and other appropriate overheads will also be booked to the appropriate FERC account and will be separately identified.

All GIRC costs must be tracked and accounted for separately from all other costs such that for any given calendar year GIRC costs are readily identifiable and trackable and shall be subject to audit by the Commission.

- **Account 376** - Mains and related parts and fittings such as couplings, valves, excess flow valves, risers, etc. booked to this account Piping (account 376);
- **Account 378** - Measuring and regulating equipment, insulated and non-insulated fittings;
- **Account 380** - Gas services lines and related parts and fittings;
- **Account 381** - Meters;
- **Account 382** – Meter Installations, meter bars, etc.;

Commission Filings
EWM will file by November 1 of each calendar year its GIRC Plan for the following year. That plan shall detail all DIMP related projects and projected costs.

EWM will file its GIRC Cost Calculation filing by May 1 of each year to recover the GIRC costs from the previous calendar year. The GIRC Calculation filing will contain all information necessary to calculate the annual GIRC costs and a proposed rate design. The first Commission GIRC Plan filing will be due November 1, 2018 for calendar year 2019. The first GIRC Calculation filing will be made by May 1, 2020 for recovery of 2019 eligible GIRC costs. The monthly charge derived from the GIRC Calculation filing will be effective on the first billing cycle in September, beginning in 2020.

COMPUTATION OF THE GIRC

Determination of GIRC Revenue Requirement to be Recovered. The revenue requirement recovery of the costs of GIRC eligible distribution system improvements projects will consist of a pre-tax return on the GIRC Eligible Net Plant plus depreciation.

Formula:
The formula for calculation of the GIRC Revenue Requirement is as follows:

GIRC = (NP * PTRR) + DEPR

Where:

Current Year = Current Year is defined as the calendar year for which the GIRC Cost Calculation Filing is seeking recovery of GIRC costs. For example, for a filing made in May, 2020 to recover GIRC Costs for the year 2019, the Current Year is defined as 2019.

Net Plant (NP) = NP shall be calculated by subtracting AD, EDIT, and Deferred Tax Benefits (2019 only) from GP as defined below.

Gross Plant (GP) = GP is the cumulative total of all previous calendar years original cost investment in GIRC Eligible Property, plus the 13 month average GIRC original cost investment for the current year.

Accumulated Depreciation (AD) = AD is the accumulated GIRC related depreciation as booked at the end of the current year.

EDIT – EDIT is the annual total credit due to customers to reflect the annual amortization of the Excess Deferred Income Tax balance resulting from the 2017 Tax Act and Jobs Cut. The EDIT deduction from GP will be booked as zero cost customer contributed capital and is cumulative.

Deferred Tax Benefits– For the GIRC Calculation to be filed in 2020 only, the EDIT amortization associated with year 2018 and the deferred tax benefits resulting from the change in statutory tax rate accrued from Jan. 1, 2018 until Sept. 30, 2018 will be applied as an offset against the GIRC GP investment of 2019, in addition to the application of EDIT associated with year 2019. The Deferred Tax Benefit deduction from GP will be treated as zero cost customer contributed capital for the five year period 2019 through 2023.

Pre-Tax Return Rate (PTRR) = The pre-tax return shall be calculated using the statutory state and federal income tax rates, the Utility's capital structure and cost rates for long-term and short-term debt as reflected in the most recent base rate case. The cost of equity will be the equity return rate approved in the last base rate case for which a final order was entered. The pre-tax return for EWM, based on the D2017.9.80 approved capital structure and long and short term debt costs and return on equity, is 8.75%. (CBGC is 8.81%.)

Depreciation Expenses (DEPR) = DEPR related to GIRC-Eligible Property. Annual depreciation expense shall be calculated by applying the annual accrual rates employed in the Utility's most recent base rate case for the plant accounts in which each retirement unit of GIRC-Eligible Property is recorded to the original cost of GIRC-Eligible Property. DEPR equals the total amount of GIRC related depreciation expenses booked in the current year.

Rate of Return Recovery Limitation: The GIRC surcharge will be subject to a review of the utility's overall rate of return as normalized for weather and filed in the Annual Report with the Commission on or before May 1. In any year where the reported rate of exceeds the most recent authorized rate of return (defined as the overall allowed weighted cost of capital), a reduction will be made to the GIRC Revenue Requirement by the amount of incremental revenue that results in the over-earning rate of return portion. The GIRC will not be permitted to be negative, unless the surcharge would be set to zero either because of the Rate of Return Recovery Limitation or in a situation where GIRC has no incremental amount of capital spending because it is not in excess of depreciation, in which case the surcharge will be the negative value associated with the tax benefits due to be applied to GIRC's costs.

Recovery of GIRC Program Revenue Requirement

The GIRC approved revenue requirement will be recovered through a monthly customer charge. These charges will vary by customer class and will be based on the customer class allocation factors established in the current general rate case D2017.9.80. The GIRC surcharge will be

separately disclosed on customers' monthly bills.

GIRC Termination

The GIRC surcharge automatically terminates if EWM files a rate case prior to Oct. 1, 2023. The GIRC charge automatically terminates on June 1, 2025. The GIRC surcharge automatically terminates if at any time EWM files an application pursuant to Mont. Code Ann. § 69-3-308 (state and local tax tracker). Costs associated with GIRC are recoverable through a rate case filing. If EWM/CBGC desires to renew the GIRC program, it will request to do so in the general rate case filing.

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that a copy of the Final Order issued on September 26, 2018 in Docket D2017.9.80 was served upon the following,

BY THE COMMISSION: On June 8, 2022, pursuant to Rule R1-17B(c) of the Rules of Practice and Procedure of the North Carolina Utilities Commission, DEP filed its Request to Initiate Technical Conference Regarding the Projected Transmission and Distribution Projects to be Included in a Performance-Based Regulation (PBR) Application.

On September 6, 2022, pursuant to Commission Rule R1-17(a), DEP filed notice of its intent to file a general rate case application that includes a performance-based regulation application as authorized under N.C. Gen. Stat. § 62-133.16.

On October 6, 2022, DEP filed its Application to Adjust Retail Rates and for Performance-Based Regulations, and Request for an Accounting Order (the Application), supported by a Rate Case Information Report Commission Form E-1 (Form E-1), and direct testimony and exhibits. As required by N.C.G.S. § 62-133.16 and Commission Rule R1-17B, DEP's PBR Application included a residential decoupling rate-making mechanism, performance incentive mechanisms (PIMs) and tracking metrics, and a Multiyear Rate Plan (MYRP), including an earnings sharing mechanism (ESM).

PROCEDURAL HISTORY AND JURISDICTION

Procedural History

The following is a summary of the most pertinent filings by DEP, the parties, and procedural orders issued by the Commission.

Petitions to intervene were filed by CIGFUR on June 13, 2022, and CUCA on June 16, 2022. The Commission entered orders granting the petitions to CIGFUR on June 15, 2022, and CUCA on June 22, 2022.

On June 15, 2022, the Commission issued an Order Scheduling and Setting Procedures for the Technical Conference. The Commission's Order established that the Technical Conference would be held in person on July 25, 2022, that DEP should make its Transmission and Distribution (T&D) Information Filing by July 15, 2022, and that parties would be allowed to file written comments on DEP's T&D Information Filing on or before July 25, 2022.

Notice of intervention and of intent to participate in the Technical Conference was filed by the Attorney General's Office (AGO) on June 29, 2022.

Petitions to intervene and notices of intent to participate in the Technical Conference were filed by North Carolina Electric Membership Corporation (NCEMC) on June 30, 2022; NCJC, NCHC, SACE, and NCSEA on July 5, 2022; Vote Solar on July 11, 2022; and NRDC on July 11, 2022. The Commission entered orders granting the petitions of NCJC, NCHC, SACE, and NCSEA on July 7, 2022; Vote Solar on July 12, 2022; and NRDC on July 13, 2022. The Commission denied NCEMC's petition to intervene and granted NCEMC amicus curiae status on July 11, 2022.

CIGFUR also filed a notice of intent to participate in the Technical Conference on July 11, 2022. Notice of the Public Staff's intent to participate in the Technical Conference was filed by the Public Staff on July 11, 2022.

On July 15, 2022, DEP filed its T&D Information Filing. Comments in response to DEP's T&D Informational Filing were filed by the Public Staff, CIGFUR, NCSEA, and NCJC, et al. on July 25, 2022.

On July 25, 2022, a technical conference was held before the Commission with Chair Charlotte A. Mitchell, Presiding; and Commissioners ToNola D. Brown-Bland; Daniel G. Clodfelter; Kimberly W. Duffley; Jeffrey A. Hughes; Floyd B. McKissick, Jr.; and Karen M. Kemerait.

On August 3, 2022, DEP filed a letter advising that it would provide the additional information in response to Chair Mitchell's request that it identify "Red Zone" projects and associated cost-benefit analyses (CBAs) included in DEP's T&D Information Filing, as part of DEP's direct testimony to be filed on August 19, 2022, in Docket No. E-100, Sub 179.

On September 6, 2022, pursuant to Commission Rule R1-17(a), DEP filed notice of its intent to file a general rate case application that includes a performance-based regulation application as authorized under N.C.G.S. § 62-133.16.

On September 12, 2022, pursuant to N.C.G.S. § 62-69, DEP, Duke Energy Carolinas, LLC (DEC), the Public Staff, CIGFUR, and Carolina Industrial Group for Fair Utility Rates III (CIGFUR III), filed the Agreement and Stipulation of Partial Settlement regarding the cost of service study (COSS Stipulation) for consideration by the Commission in Docket Nos. E-2, Sub 1300 and E-7, Sub 1276. On September 13, 2022, a revision to the Stipulation was filed by the aforementioned parties attaching exhibits which were inadvertently omitted from the version filed the previous day.

On October 6, 2022, DEP filed its Application, Form E-1, and the direct testimony and exhibits of Stephen G. De May, North Carolina President, DEP, DEC, and Progress Energy, Inc.; Jonathan L. Byrd, Managing Director of Rate Design and Regulatory Solutions for Duke Energy Business Services, LLC (DEBS); [1] Brent C. Guyton, Director of Asset Management in Customer Delivery for DEP and DEC; Laura A. Bateman, Vice President of Carolinas Rates and Regulatory Strategy; Phillip O. Stillman, Managing Director of Load Forecasting and Corporate Strategic Regulatory Initiatives; LaWanda M. Jiggetts, Rates and Regulatory Strategy Manager for DEC; Retha Hunsicker Vice President, Customer Experience Design and Solutions for DEBS; Tim S. Hill, Vice President, Coal Combustion Products (CCP) Operations, Maintenance and Governance for DEBS; Bradley G. Harris, Rates and Regulatory Strategy Director for DEBS; Janice D. Hager, President of Janice Hager Consulting, LLC; Tom Ray, Senior

[1] DEBS provides various administrative and other services to DEP and other affiliated companies of Duke Energy Corporation (Duke Energy).

Vice President of Nuclear Operations for Duke Energy Corporation (Duke Energy); Lesley G. Quick, Vice President of Customer Technology, Advocacy, Regulatory and Business Support within Customer Services for Duke Energy; Karl W. Newlin, Senior Vice President, Corporate Development and Treasurer, DEBS; Dr. Roger A. Morin, Emeritus Professor of Finance at the Robinson College of Business and Professor of Finance for Regulated Industry at the Center for the Study of Regulated Industry, both at Georgia State University; Laurel M. Meeks, Director of Renewable Business Development for DEP; Evan W. Shearer, Principal Integrated Planning Coordinator for DEC; Daniel J. Maley, Director of Transmission Compliance Coordination for DEBS; Justin C. LaRoche, Director of Renewable Development for Duke Energy; Julie K. Turner, Vice President of Carolinas Coal Generation for Duke Energy; Kathryn S. Taylor, Rates and Regulatory Strategy Manager for DEC; Jacob J. Stewart, Director Health and Wellness for DEBS; Nicolas G. Speros, Director of Accounting for DEBS; John J. Spanos of Gannett Fleming Valuation and Rate Consultants, LLC (Gannett Fleming); and Teresa Reed, Director of Rates and Regulatory Planning for DEBS.

On October 31, 2022, the Commission issued an order which declared a general rate case, suspended the proposed new rates, established the test year period as ending December 31, 2021, and advised that an order scheduling hearings and requiring public notice would be issued at a later date.

Petitions to intervene were filed by Kroger Co. and Harris Teeter on November 4, 2022, and the Commercial Group on November 11, 2022. The Commission entered orders granting the petitions of the Commercial Group and Kroger Co. and Harris Teeter on November 15, 2022.

Petitions to intervene were filed by FPWC on November 23, 2022, and by the Sierra Club on December 14, 2022. The Commission entered orders granting the petitions of FPWC and the Sierra Club on January 10, 2023.

On December 16, 2022, the Commission issued an Order Scheduling Investigation and Hearings, Establishing Intervention and Testimony Due Dates and Discovery Guidelines, and Requiring Public Notice (Scheduling Order). The Order scheduled public witness hearings in Lumberton, Raleigh, Waynesville, Roxboro, and Snow Hill, North Carolina on February 21, February 27, March 6, March 13, and March 20, 2023, respectively. Further, the order set the relevant test period to be used by all parties as the twelve-month period ending December 31, 2021, with appropriate adjustments. The Commission directed, among other instructions, that DEP publish the Public Notice of Hearings on Rate Increase Application (Public Notice) attached to the order as Appendix A, once a week for two consecutive weeks and mail the Public Notice to its customers no later than 30 days in advance of the first set hearing. Subsequently, on December 21, 2022, the Commission issued its Order Rescheduling Public Witness Hearings, Revising Public Notice, and Revising Requirement for Mailing Public Notice (Second Scheduling Order) correcting public hearing location addresses for Lumberton and Raleigh; rescheduling the public witness hearing in Lumberton to March 21, 2023, and the public witness hearing in Raleigh to March 14, 2023; authorizing corresponding

revisions to the Public Notice; and instructing DEP to mail each of its customers a copy of the Public Notice no later than 14 days in advance of the public witness hearing scheduled for March 6, 2023.

A petition to intervene was filed by DoD-FEA on January 30, 2023. The Commission entered an order granting DoD-FEA's petition on January 31, 2023.

On December 20, 2023, DEP filed a motion requesting leave to file direct testimony of Kendal C. Bowman adopting the direct testimony of Stephen G. De May, file the direct testimony and exhibits of Graham C. Tompson adopting the direct testimony of Laurel Meeks, and to amend the direct testimony of the Battery Energy Storage Panel. On January 10, 2023, the Commission entered an order granting DEP's motion filed December 20, 2023, and accepted the testimony and exhibits filed into the record.

A joint petition to intervene was filed by ElectriCities of North Carolina, Inc. (ElectriCities) and North Carolina Eastern Municipal Power Agency (NCEMPA) on February 1, 2023. The Commission entered an order denying Electricities' and NCEMPA's joint petition on February 10, 2023.

On February 13, 2023, DEP filed the supplemental direct testimony and exhibits of witnesses Jiggetts; LaRoche; Turner; Taylor; Martin M. Strasburger, Chief Security and Information Security Officer for Duke Energy; Reed; Ray; John R. Panizza, Director, Tax Operations for DEBS; Morin; Shearer; Graham C. Tompson, Business Development Manager for Duke Energy; Maley; Guyton; and Bateman.

On March 13, 2023, Haywood EMC filed a petition to intervene. On March 15, 2023, the Commission issued an order granting Haywood EMC's petition and establishing the scope of its intervention.

On March 14, 2023, the Commission issued its Order Scheduling Virtual Public Witness Hearing and Establishing Requirements for Notice of Virtual Public Witness Hearing (March 14, 2023 Scheduling Order). The March 14, 2023 Scheduling Order scheduled an additional virtual hearing for the purpose of receiving public witness testimony on DEP's Application for April 20, 2023.

On March 15, 2023, CCEBA filed a petition to intervene. On March 17, 2023, NCLM filed a Petition to Intervene. The Commission issued orders granting the petitions filed by CCEBA and NCLM on March 27, 2023.

In March, April, and May of 2023, the Commission held seven public hearings as scheduled by the Scheduling Order, Second Scheduling Order, and March 14, 2023 Scheduling Order for the purpose of receiving the testimony of public witnesses.

NCEMC filed a petition to intervene on March 17, 2023. The Commission issued an order denying NCEMC's Petition on March 28, 2023.

On March 27, 2023, the Commercial Group filed the direct testimony and exhibits of Steve W. Chriss, Director, Energy Services, Walmart; DoD-FEA filed the direct testimony and exhibits of Maureen L. Reno, Founder and Principal Consultant of Reno Energy Consulting Services, LLC, and Larry Blank, Principal of TAHOEconomics, LLC; NCLM filed the direct testimony of Terry Mann, Mayor of the City of Whiteville, North Carolina, and Bill Saffo, Mayor of the City of Wilmington, North Carolina; The Sierra Club filed the direct testimony and exhibits of Roger D. Colton, Co-Founder, Fisher, Sheehan, and Colton, Public Finance and General Economics and Michael Goggin, Vice President, Grid Strategies, LLC; NCJC, et al. filed the direct testimony and exhibits of John Howat, Senior Policy Analyst, National Consumer Law Center, Mark E. Ellis, independent consultant and testifying expert, David B. Posner, Manger, RMI and the joint direct testimony of David G. Hill, Managing Consultant at Energy Futures Group, Inc. and Jake Duncan, a Southeast Regulatory Director for Vote Solar; FPWC filed the direct testimony and exhibits of Laurie A. Tomczyk, Senior Manager, NewGen Strategies and Solutions, LLC; CIGFUR filed the direct testimony and exhibits of Michael P. Gorman, Managing Principal, Brubaker & Associates, Inc. and Nicholas Phillips, Jr., Principal, Brubaker & Associates, Inc.; Kroger Co. and Harris Teeter filed the direct testimony and exhibits of Justin Bieber, Principal, Energy Strategies, LLC; CUCA filed the direct testimony of Charles Heilig, President, Parkdale Mills, and Kevin W. O'Donnell, President, Nova Energy Consultants, Inc.; the AGO filed the direct testimony and exhibits of Edward Burgess, Senior Director of Integrated Resource Planning, Strategen Consulting, and Ron Nelson, Senior Director, Strategen Consulting.

Also on March 27, 2023, the Public Staff filed the direct testimony and exhibits of James S. McLawhorn, Director of the Energy Division of the Public Staff; Evan D. Lawrence, Engineer with the Energy Division of the Public Staff; Roxie McCullar, Consultant, William Dunkel and Associates; John W. Chiles, Principal, GDS Transmission Services group at GDS Associates, Inc.; Thomas C. Williamson, Engineer with the Energy Division of the Public Staff; Christopher C. Walters, Associate, Brubaker & Associates, Inc.; Blaise C. Michna, Engineer with the Energy Division of the Public Staff; Jay B. Lucas, Manager of the Electric Section, Operations and Planning in the Energy Division of the Public Staff; Jordan A. Nader, Engineer with the Energy Division of the Public Staff; Jeff Thomas, Engineer with the Energy Division of the Public Staff; David M. Williamson, Engineer with the Energy Division of the Public Staff; Dustin Metz, Engineer with the Energy Division of the Public Staff, the joint testimony and exhibits of Fenge Zhang, Financial Manager, Electric Section with the Accounting Division of the Public Staff, and Michelle Boswell, Director of Accounting for the Accounting Division of the Public Staff, and the joint testimony and exhibits of David M. Williamson and Jeff T. Thomas, Engineers with the Energy Division of the Public Staff.

On April 3, 2023, DEP filed a motion seeking to substitute Melissa B. Abernathy as the sponsor of the direct testimony and exhibits prefiled by Kathryn S. Taylor. On April 20, 2023, the Commission issued its Order Granting DEP's Motion for Substitution of Witness and Adoption of Testimony.

On April 14, 2023, DEP filed the rebuttal testimony and exhibits of DEP's witnesses Maley; Kevin A. Murray, Vice President of the Project Management and Construction Organization for DEBS; Morin; Bowman, President of Duke Energy's Utility Operations in North Carolina; Donna T. Council, Senior Vice President, Corporate Real Estate, Aviation, and Business Services for DEBS; LaRoche; Ray; Turner; Guyton; Panizza; Newlin; Quick; Speros; Spanos; Jiggetts; Melissa B. Abernathy, Director of Rates and Regulatory Planning for DEC; Stewart; and joint rebuttal testimony of witnesses Bowman, Quick, Abernathy, and Speros; Bateman and Stillman; Tompson and Shearer; Conitsha B. Barnes, Director of Energy Policy Management for DEC, Harris, and Quick; and Byrd and Reed.

On April 17, 2023, DEP filed amended rebuttal testimony of witness Morin.

On April 18, 2023, DEP filed second supplemental direct testimony of witness Reed and third supplemental direct testimony of witnesses Abernathy and Jiggetts.

On April 25, 2023, the Public Staff filed a motion to withdraw portions of witness Thomas' testimony. On May 1, 2023, the Public Staff filed a motion to withdraw portions of witness T. Williamson's testimony. On May 8, 2023, the Commission issued its order granting the Public Staff's motions to withdraw portions of testimony filed by witnesses T. Williamson and Thomas.

On April 26, 2023, the Public Staff and DEP filed an Agreement and Stipulation of Partial Settlement (April 26, 2023 Partial Settlement).

On April 27, 2023, the Commission issued its Order Continuing Hearing and Modifying Dates for Additional Hearing Procedures. Pursuant to the order, the expert witness hearing was rescheduled to commence on May 4, 2023. Also on April 27, 2023, the AGO filed its motion to substitute Ron Nelson as the sponsor of the testimony and exhibits filed by AGO witness Burgess. On May 8, 2023, the Commission issued its order granting the AGO's motion.

Also on April 27, 2023, the Public Staff filed a Transmission Cost Allocation Agreement and Stipulation of Settlement between DEP, DEC, and the Public Staff (TCA Stipulation).

On April 28, 2023, DEP filed settlement testimony of witness Bateman to support the TCA Stipulation. Also on April 28, 2023, DEP filed the settlement testimony and exhibits of witnesses Abernathy, Jiggetts, and Bowman in support of the April 26, 2023 Partial Settlement.

On May 1, 2023, DEP, the Public Staff, and CIGFUR filed an Agreement and Stipulation of Settlement on Performance Incentive Mechanisms, Tracking Metrics and Decoupling Mechanism (the PIMS Stipulation). Also on May 1, 2023, DEP and CIGFUR filed a separate Agreement and Stipulation of Settlement (the Power Quality Stipulation).

Additionally, on May 1, 2023, the Public Staff filed the supplemental and settlement joint testimony and exhibits of witnesses Zhang and Boswell; the supplemental testimony of witnesses Metz and Williamson; and the settlement testimony of witnesses Metz and McLawhorn in support of April 26, 2023 Partial Settlement.

On May 2, 2023, CIGFUR filed supplemental direct testimony of witness Phillips, Jr. in support of the Power Quality Stipulation. Also on May 2, 2023, DEP, the Public Staff, and CIGFUR filed an Amended Agreement and Stipulation of Partial Settlement that amended the April 26, 2023 Partial Settlement, including through the inclusion of CIGFUR as a party (as amended, the Revenue Requirement Stipulation). Also on May 2, 2023, the Public Staff filed the joint testimony of witnesses Thomas and D. Williamson and DEP filed the joint settlement testimony of witnesses Bateman and Stillman supporting the PIMS Stipulation.

On May 4, 2023, DEP, Sierra Club, NCJC, et al., and the Public Staff filed an Agreement and Stipulation of Partial Settlement Regarding Low-Income/Affordability Performance Incentive Mechanism and Affordability Issues (the Affordability Stipulation). On May 5, 2023, DEP filed the settlement testimony of witnesses Barnes, Harris, and Quick and the Public Staff filed testimony of witness D. Williamson in support of the Affordability Stipulation.

On May 4, 2023, the expert witness hearing commenced.

From May 5, 2023, through June 6, 2023, DEP filed 18 Late-Filed Exhibits, and the Public Staff filed Late-Filed Exhibit Nos. 1 and 2.

On May 10, 2023, DEP, the Commercial Group, and Kroger and Harris Teeter filed an Agreement and Stipulation of Settlement (MGS Partial Rate Design Stipulation).

On May 16, 2023, DEP filed a Notice of Intent to Place Temporary Rates into Effect and Request for Expedited Approval of Notice of Undertaking, as well as a revised Appendix A, and on May 17, 2023, a second revised Appendix A. Also on May 17, 2023, the Commission filed an Order Approving Public Notice of Temporary Rates Subject to Refund and Financial Undertaking and Expiration of EDIT-3 Rider.

On May 23, 2023, DEP filed its Temporary Rates Compliance Filing.

On May 26, 2023, the Public Staff filed a Motion to Strike Portions of DEP's Late-Filed Exhibits 9 and 10, which DEP filed a response to on May 30, 2023. On June 2, 2023, the Commission issued an Order Denying the Public Staff's Motion to Strike Portions of DEP's Late-Filed Exhibits 9 and 10.

On June 7, 2023, DEP and CIGFUR filed an Agreement and Stipulation of Settlement (the LGS Partial Rate Design Stipulation).

On June 27, 2023, the Public Staff filed the second supplemental testimony of witnesses Zhang and Boswell, the second supplemental testimony of witness D. Williamson, and the supplemental testimony of witness Thomas. On that same date, DEP and the Public Staff filed an Agreement and Stipulation of Settlement (the Supplemental Revenue Requirement Stipulation) and the Public Staff filed the supplemental settlement testimony of Metz, Zhang, and Boswell.

On June 27, 2023, the Public Staff filed a Motion for Leave to File Testimony on the June 7, 2023 Stipulation filed between DEP and CIGFUR.

On June 28, 2023, the Public Staff filed the corrected second supplemental exhibits of witness D. Williamson.

On July 3, 2023, CIGFUR filed a motion to strike the second supplemental testimony and corrected second supplemental exhibits of Public Staff witness D. Williamson. On that same date, CIGFUR filed in opposition to the Public Staff's motion for leave to file testimony on the June 7, 2023 Stipulation.

On July 3 and 5, 2023, DEP, NCLM, and the Public Staff filed responses to the July 3, 2023 CIGFUR filings.

On July 6, 2023, the Commission issued an Order on Post-Hearing Motions and Reconvening Hearing which denied CIGFUR's motion to strike the second supplemental testimony and corrected second supplemental exhibits of Public Staff witness D. Williamson, denied the motion for leave of the Public Staff to file testimony on the June 7, 2023 Stipulation, and reconvened the expert witness hearing for limited purposes.

On July 24, 2023, the expert witness hearing was reconvened.

Jurisdiction

No party has contested the fact that DEP is a public utility subject to the Commission's jurisdiction pursuant to the Public Utilities Act (Act), Chapter 62 of the North Carolina General Statutes. The Commission concludes that it has personal jurisdiction over DEP and subject matter jurisdiction over the matters presented in DEP's Application.

Application

In summary, DEP requested in its Application and initial direct testimony and exhibits, a base rate increase of approximately $227.6 million, or 5.9%, in its annual electric sales, offset by a rate reduction of $8.5 million to refund certain tax benefits, for a net revenue increase of $219.2 million, or 5.7% from its North Carolina retail electric operations, including a rate of return on common equity of 10.2% and a capital structure consisting of 47.0% debt and 53.0% equity. DEP's Application and initial direct testimony and exhibits also sought approval of PBR and a series of rate increases based on DEP's proposed three-year MYRP, and other mechanisms required as part of PBR, with the first

rate increase effective November 5, 2022. DEP sought increases to the revenue requirement of $106.6 million, $150.8 million, and $138.3 million in Rate Year 1, Rate Year 2, and Rate Year 3, respectively.

DEP submitted evidence in this case with respect to revenue, expenses, and rate base using a test period consisting of the 12 months ending on December 31, 2021, adjusted for certain known changes in revenue, expenses, and rate base through March 31, 2023[2].

DEP, by its supplemental direct testimony and exhibits, revised its requested base revenue requirement increase to approximately $283.5 million, offset by a rate reduction of $8.5 million to refund certain tax benefits, for a net revenue increase of $275 million, including an increase to the rate of return on common equity to 10.4% and an increase to the cost of debt to 3.88% based on the average embedded cost of debt financing as of December 31, 2022. DEP also revised its series of rate increases based on DEP's proposed three-year MYRP. DEP's updated MYRP revenue requirements were $104 million, $133.4 million, and $147.5 million in Rate Year 1, Rate Year 2, and Rate Year 3, respectively.

DEP, by its second supplemental direct testimony and exhibits, revised its requested base revenue requirement increase to approximately $308.8 million, offset by a rate reduction of $8.5 million to refund certain tax benefits, for a net revenue increase of $300.3 million including an increase to the cost of debt to 3.9% based on the average embedded cost of debt financing as of February 28, 2023. DEP also revised its series of rate increases based on DEP's proposed three-year MYRP. DEP's updated MYRP revenue requirements were $104.1 million, $133.5 million, and $147.6 million in Rate Year 1, Rate Year 2, and Rate Year 3, respectively.

DEP, by its March 2023 supplemental direct testimony and exhibits, revised its requested base revenue requirement increase to approximately $314.6 million, offset by a rate reduction of $8.5 million to refund certain tax benefits, for a net revenue increase of $306.1 million, including an increase to the cost of debt to 4.03% based on the average embedded cost of debt financing as of March 31, 2023. DEP also revised its series of rate increases based on DEP's proposed three-year MYRP. DEP's updated MYRP revenue requirements were $104.5 million, $133.5 million, and $148.2 million in Rate Year 1, Rate Year 2, and Rate Year 3, respectively.

[2] DEP's Application initially proposed a capital cut-off date of April 31, 2023; however, upon further discussion and agreement with the Public Staff, the parties agreed to, and the Commission's Scheduling Order established, a capital cut-off date of March 31, 2023. The change in capital cut-off was reflected in DEP's supplemental filings.

Whole Record

The Commission held public witness hearings as noted above. The following public witnesses appeared and testified:

Waynesville: Les Cochran, Charles Guyton, Andrew Jarbeau, Porter Hughes, Gray Jernigan, Rob Denton, Mary Curry, Walker Spruill, Delisa Ensley, Ken Brame, Judy Mattox, Abby Frye, and Angelica Cote.

Raleigh: William Terry, Criss Berke, Amelia Covington, Divine Earth-Dowd, Jennifer Eison, Stacey Campbell, Paul Baer, Lisa Brewer, Peter Thomas, Agnes Foucha, Ashleigh Armstrong, Ziyad Habash, Ebony McKinnan, Cathy Buckley, Deborah Ford, Ernestine Ledbetter, Matthew Muse, Eleanor Weston, Kaitlyne Sheehan, and Brenda Jackson.

Snow Hill: Gwen Johnson, David Barnes, Phyllis Merritt-James, Brianna Howard, Jaylind Lampa, Larry James, Glenda Thomas, Vicky Bailey, Barbara Dantonio, Don Cavellini, Beatrice Jones, Syene Jasmin, Bobby Jones, and Constance Coram.

Lumberton: Debra David, Robert Macy, Jaquline Banks; Les Cochran; Sallie McLean; Lauren Martin; Samantha Sirabian; Daniel Dimaria, Hannah Jeffries, Esther Murphy, Ryua Hishikawa, Georgette Hunt, Mac Legerton, Ricky Johnson, Felicia Bethea, Carol T. Richardson, Frankie Hall, and William Fairley.

Virtual Hearing: Michael Righi, Reagan McGuinn, Ruby Bell, Kay Reibold, Steven Norris, Sean Lewis.

In summary, almost all the public witnesses stated their opposition to DEP's proposed rate increase. *See generally*, Tr. vols. 2-6. Many witnesses testified that they were on fixed incomes and about the poverty in some of the counties served by DEP. Moreover, public witnesses testified to their concern regarding DEP's use of fossil fuels, including coal and natural gas power plants, fracking, and DEP not adequately increasing the use of clean energy and renewables. Finally, some public witnesses voiced their view that DEP's executive compensation and shareholder dividends are excessive.

In addition to the public witness testimony, the Commission received a number of consumer statements of position, all of which were filed in the docket. *See generally*, Docket No. E-2, Sub 1300CS. The public witness testimony and consumer statements of position have been considered by the Commission in its deliberations on DEP's rate case Application.

The testimony and exhibits in this proceeding are voluminous. The Commission has carefully considered all the evidence and the record as a whole. However, the Commission has not attempted to recount every statement of every witness in this Order.

Rather, the Commission has summarized the evidence that is in the record. Likewise, while the Commission has read and fully considered the parties' post-hearing briefs, it has not in this Order attempted expressly to summarize or discuss every contention advanced or authority cited in the briefs.

Based upon the foregoing and the entire record in this proceeding, the Commission makes the following:

FINDINGS OF FACT

Stipulations

1. On April 26, 2023, DEP and the Public Staff filed the Revenue Requirement Stipulation, which resolved a portion of the base period and MYRP revenue requirement issues in this proceeding. On May 2, 2023, DEP and the Public Staff amended the Revenue Requirement Stipulation, adding CIGFUR as a party and resolving an additional revenue requirement issue.

2. On September 13, 2022, DEP, DEC, the Public Staff, CIGFUR, and CIGFUR III (the COSS Stipulating Parties) filed the COSS Stipulation. The COSS Stipulation provides that DEP will first allocate production and transmission demand costs to the North Carolina retail jurisdiction using the Twelve Coincident Peak (12 CP) method and will allocate production demand costs among the North Carolina retail rate classes using the modified Average and Excess (A&E) Demand Method (the Modified A&E Method).

3. On April 27, 2023, DEP, DEC, and the Public Staff filed the TCA Stipulation. The TCA Stipulation provides for a pro forma adjustment of approximately $20 million to increase the revenue requirement in DEC's pending rate case proceeding in Docket No. E-7, Sub 1276 (DEC Rate Case) and to decrease the revenue requirement in the instant proceeding.

4. On May 1, 2023, DEP, the Public Staff, and CIGFUR filed the PIMs Stipulation.

5. On May 1, 2023, DEP and CIGFUR filed the Power Quality Stipulation.

6. On May 4, 2023, DEP, DEC, Sierra Club, NCJC, et al., and the Public Staff filed the Affordability Stipulation.

7. On May 10, 2023, DEP, the Commercial Group, and Kroger Co. and Harris Teeter filed the MGS Partial Rate Design Stipulation.

8. On June 7, 2023, DEP and CIGFUR filed the LGS Partial Rate Design Stipulation.

9. On June 27, 2023, DEP and the Public Staff filed the Supplemental Revenue Requirement Stipulation.

10. The Revenue Requirement Stipulation, the COSS Stipulation, the TCA Stipulation, the PIMs Stipulation, the Power Quality Stipulation, the Affordability Stipulation, the MGS Partial Rate Design Stipulation, the LGS Partial Rate Design Stipulation, and the Supplemental Revenue Requirement Stipulation are the product of give-and-take settlement negotiations between the respective stipulating parties.

Depreciation

11. The depreciation rates proposed by DEP, which reflect the accelerated retirement of DEP's coal units, as amended by the Revenue Requirement Stipulation to reflect 20-year amortization periods for General Plant FERC accounts 391 and 397 and a 70-year life for Transmission FERC account 356, are reasonable.

12. The deferral of 75.0% of the impact of accelerating the depreciation of DEP's Mayo and Roxboro Units 3 and 4 from the current retirement dates to a regulatory asset as agreed upon in the Revenue Requirement Stipulation is reasonable.

13. Any portion of net book value upon the retirement of DEP's subcritical coal-fired plants that will not be recovered through securitization will be recovered with a return over an amortization period to be determined by the Commission in a future rate case proceeding.

Base Period Plant-Related Items

14. DEP's plant-related capital investments during the test year in its transmission, distribution, fossil/hydro, nuclear, solar, and storage assets, as adjusted by the Revenue Requirement Stipulation, were prudently and reasonably made and should be reflected in the revenue requirement.

Grid Improvement Plan Costs

15. Since DEP's last general rate case, DEP has deferred incremental operation and maintenance expense, depreciation and property taxes associated with its three-year grid improvement plan (GIP), as well as the carrying cost on the investment and the deferred costs at DEP's weighted average cost of capital.

16. DEP proposes to amortize the GIP deferral of $36.4 million, associated with the GIP investment of $196.7 million on a North Carolina retail basis, over an amortization period of three years, which results in an annual amortization expense of $12.9 million.

17. Section III, Paragraph 11 of the Revenue Requirement Stipulation provides that DEP should be permitted to recover the full balance of its GIP deferral over an amortization period of 18 years, with a debt-only return during the deferral period and rate

base treatment during the amortization period.

Coal Ash

18. DEP's request to amortize costs associated with its coal combustion residual (CCR) obligations incurred through March 31, 2023, over a five-year period and to continue the deferral of any CCR costs incurred subsequent to March 31, 2023, is reasonable.

19. The over-amortization of CCR recovery in the amount of $8.5 million should be applied against the Coal Ash CCR Asset Retirement Obligations (ARO) deferral.

Harris Land Sales

20. Section III, Paragraph 22 of the Revenue Requirement Stipulation provides for a flowback period of three years for the liability related to the gains on Harris land sales and provides that DEP will include the unamortized balance in rate base.

21. It is appropriate for DEP to continue to defer any gains on Harris land sales to be returned to customers in a future general rate case proceeding.

Roxboro Wastewater Treatment Regulatory Asset

22. DEP's request for an accounting order to establish a regulatory asset upon the retirement of the Roxboro Wastewater Treatment Plant in which to defer the unrecovered remaining net book value of the plant and costs related to obsolete inventory, net of salvage was approved in the Commission's Order in DEP's last general rate case proceeding in Docket No. E-2, Sub 1219 (the 2019 Rate Case).

23. Section III, Paragraph 24 of the Revenue Requirement Stipulation establishes an amortization period of 12 years for the recovery of the deferred balance associated with the Roxboro Wastewater Treatment Facility and that the unamortized balance will be included in rate base.

Storm Securitization Over Collections

24. Per DEP's Agreement and Stipulation of Partial Settlement with the Public Staff in Docket No. E-2, Sub 1262, DEP agreed to establish regulatory asset or regulatory liability accounts for the purpose of tracking up-front financing costs and servicing and administration fees related to storm securitization.

25. The amortization over three years of the regulatory liability for the over-recovered balance of $0.9 million for storm securitization over collections is just and reasonable.

Cost of Debt

26. The embedded cost of debt of 4.03% as set forth in Section III, Paragraph 1 of the Revenue Requirement Stipulation is reasonable and appropriate for use by DEP in this case.

Accounting Adjustments

27. The accounting adjustments set forth in the Revenue Requirement Stipulation, as further described in detail in Jiggetts Partial Settlement Exhibit 2 and the Public Staff Accounting Supplemental and Settlement Exhibit 1, Schedule 1, are the reasonable product of give-and-take negotiations among the parties.

28**.** The accounting adjustments set forth in the Supplemental Revenue Requirement Stipulation, as further described in detail in Supplemental Revenue Requirement Stipulation Exhibit 1, are the reasonable product of give-and-take negotiations between the stipulating parties.

MYRP Capital Investments

29. DEP's proposed MYRP capital investments, reflecting the projected costs associated with the transmission, distribution, fossil/hydro, nuclear, cybersecurity, solar, and storage capital investments, as adjusted in the Revenue Requirement Stipulation, are just and reasonable to all parties in light of the evidence the parties presented, consistent with statutory and regulatory requirements, and appropriate for approval as part of DEP's overall Application in this proceeding.

Reporting Requirements

30. Section IV of the Revenue Requirement Stipulation establishes several reporting obligations of DEP.

Storm Normalization

31. The adjustment to DEP's revenue requirement, calculated using the method approved by the Commission in Docket Nos. E-2, Sub 1023, E-2, Sub 1142, and E-2, Sub 1219 to account for anticipated storm expenses based upon a 10-year average of storm costs after removing costs associated with major storms, is approximately $22.243 million.

DSDR

32. DEP has requested approval to recover the future costs associated with its Distribution System Demand Response (DSDR) energy efficiency program through base rates in lieu of the Demand-Side Management/Energy Efficiency (DSM/EE) rider, beginning with the rates established in this proceeding.

Payment Navigator

33. DEP has requested approval for its Payment Navigator program, which is designed to provide support to customers in need of assistance with managing payment of their electric bills, and the request is reasonable.

Customer Connect

34. DEP has proposed to recover approximately $60 million associated with the implementation of the Customer Connect platform, which is DEP's customer engagement platform, and the Customer Information System (CIS).

COSS Stipulation

35. The COSS Stipulation between DEP, DEC, CIGFUR, and the Public Staff, requires DEP to allocate production demand and transmission demand costs by using the 12 CP allocation method for jurisdictional allocations and the Modified A&E method among North Carolina retail customer classes.

Transmission Cost Allocation Stipulation

36. The TCA Stipulation establishes a pro forma adjustment to increase the revenue requirement for DEC in the DEC Rate Case by approximately $20 million on a North Carolina retail basis as well as a corresponding decrease to the revenue requirement for DEP in the instant proceeding.

PIMs Stipulation

37. On May 1, 2023, DEP, the Public Staff, and CIGFUR filed the PIMs Stipulation.

38. The PIMs Stipulation consists of the following three PIMs: Time Differentiated and Dynamic Rate Enrollment PIM, Reliability PIM, and the Renewables Integration and Encouragement PIM (consisting of Metrics A, B, and C) (collectively, the Settled PIMs). The PIMs Stipulation also provides for three tracking metrics – customer service, beneficial electrification from incremental load of EVs, and reporting and analyzing the 10 worst performing circuits (collectively, the Settled Tracking Metrics) – and provides a process for DEP to work with the Public Staff to develop tariffs and programs to estimate and update revenue associated with EV sales.

Power Quality Stipulation

39. DEP and CIGFUR filed the Power Quality Stipulation, which has the objective of enabling DEP to analyze power quality issues.

Affordability Stipulation

40. On May 4, 2023, DEP, DEC, Sierra Club, NCJC, et al., and the Public Staff filed the Affordability Stipulation, pursuant to which DEP and DEC agreed to make shareholder financial contributions totaling $16 million over three years to benefit eligible customers.

41. The Affordability Stipulation supports the Customer Assistance Program (CAP) and the corresponding tariffs associated with the CAP.

Rate Design

42. The objective of DEP's proposed rate design is to recover the revenue requirement while aligning the cost to serve customers within the customer classes and reflecting the costs a customer causes DEP to incur. DEP's proposed rate design allocates the revenue increase between customer classes by rate base amounts.

43. DEP's rate design involves adjustments that are intended to achieve DEP's rate design objective, including a subsidy reduction, a customer migration adjustment, and customer growth and weather normalization adjustments.

44. DEP proposes changes to residential rate schedules, the small general service (SGS) rate schedules, the medium general service (MGS) rate schedules, the large general service (LGS) rate schedules, the seasonal and intermittent rate schedules, the lighting rate schedules, and the traffic signal rate schedules.

45. DEP proposes changes to its service riders, which are offered to reflect the cost of meeting unique or special customer requirements.

46. DEP proposes updated and aligned TOU periods across its rate schedules that include time-differentiated pricing for residential and non-residential customers.

47. The MGS Partial Rate Design Stipulation, entered into by DEP, the Commercial Group, and Kroger Co. and Harris Teeter, provides that 75.0% of the reduction in revenue requirement, as determined by final Commission order, applicable to rate schedule MGS-TOU should be applied to energy rates.

48. LGS Partial Rate Design Stipulation, entered into by and between DEP and CIGFUR, provides that any increase in energy charges resulting from an increase in DEP's revenue requirement, which to be recovered from the LGS, LGS-TOU, and LGS-Real Time Pricing (RTP) rate schedules, as determined by final Commission order, shall be limited to a percentage that is less than half of the approved overall increase percentage to the LGS, LGS-TOU, and LGS-RTP classes, respectively, exclusive of any decrements for the LGS, LGS-TOU, and LGS-RTP rate schedules.

Capital Structure, Cost of Equity and Overall Rate of Return

49. DEP proposed a rate of return on common equity of 10.4%, with a capital structure consisting of 53.0% common equity and 47.0% debt.

50. The overall rate of return and rate of return on common equity must be supported by competent, material, and substantial record evidence; consistent with the requirements of N.C.G.S. § 62-133 considering changing economic conditions; and must balance DEP's need to maintain the safety, adequacy, and reliability of its service with the benefits to DEP's customers to receive from safe, adequate, and reliable electric service.

51. Ultimately, the capital structure, rate of return on common equity, and overall rate of return set by this Order must result in just and reasonable rates.

COVID Deferral Recovery

52. The Commission's December 21, 2021 Order in Docket No. E-2, Sub 1253 (Deferral Order) approved DEP's request to create a regulatory asset into which to defer incremental COVID-19 pandemic-related costs.

53. In this proceeding, DEP seeks to recover the deferred balance, including accrued carrying costs, of approximately $107 million related to: (1) customer fees waived; (2) bad debt charge-offs; (3) employee stipends to cover unplanned expenses associated with the COVID pandemic; (4) costs related to employee safety; (5) costs related to remote work; and (6) miscellaneous costs, such as employee overtime.

54. DEP identified and calculated two categories of COVID-related savings in the amount of approximately $4.5 million on a North Carolina retail basis related to: (1) reduced printing and postage costs due to the moratorium on customer disconnections; and (2) reduced travel expenses. DEP benefited from certain measures taken by the federal government to assist employers during the pandemic, including federal employee retention credits (ERCs) and the delay of payment obligation of the employer portion of social security tax.

55. DEP seeks to recover the deferred balance over a three-year period.

56. DEP requests to continue the deferral of the incremental bad debt, for future recovery.

Inflation Adjustment

57. DEP's calculation of the increase in Non-Labor and Non-Fuel Operating and Maintenance (O&M) costs due to the effect of inflation relies on the same method proposed and approved by the Commission in DEP's last three general rate cases.

Rate Case Expense

58. DEP proposes to recover additional rate case expense leftover from the 2019 Rate Case in this proceeding.

59. DEP proposes to recover rate case expenses, incurred in this proceeding over a three-year period.

60. DEP proposes to include the unamortized balance of rate case expense in rate base.

Over-Amortizations

61. DEP's approach to over-amortization of Commission-approved regulatory assets is to apply the amount of over-amortization for recovery of like kind expenses.

Storm Balancing Account and Winter Storm Izzy

62. DEP requested deferral of approximately $15 million in O&M costs associated with system restoration necessitated by Winter Storm Izzy, which occurred in January 2022.

63. DEP spent $87.126 million on a North Carolina retail jurisdictional basis in 2022 on annual storm costs (inclusive of both Winter Storm Izzy and Hurricane Ian, among other storms), which is beyond the normal range of fluctuation of storm costs of $27.4 million.

64. DEP and the Public Staff agree on the amount of $15 million of O&M costs to be recovered for Winter Storm Izzy but do not agree on the method of recovery.

65. DEP proposes to recover 2022 incremental Winter Storm Izzy costs by applying a portion of the $17 million over-amortization of Hurricane Matthew costs from the DEP's general rate case proceeding from 2017 in Docket No. E-2, Sub 1142 (the 2017 Rate Case).

66. DEP proposes to create a storm balancing account that would, in essence, operate as a rider or tracker. DEP proposes to use the remaining amount of over-amortization of Hurricane Matthew costs, approximately $2 million, to establish the storm balancing account.

Other Deferrals

67. DEP requests to defer the estimated tax benefits, net of costs, associated with the Inflation Reduction Act (IRA) and Infrastructure Investment Job Act (IIJA).

68. DEP has proposed three customer programs for approval by the Commission, the CAP, the Payment Navigator Program, and the Tariffed On-Bill Program.

69. DEP expects to incur incremental O&M costs related to the implementation of the CAP the Payment Navigator Program, and the Tariffed On-Bill Program, and implementation of the PIMs, including the required PIMs dashboard, and proposes to defer its incremental O&M costs associated with the implementation of the customer programs and PIMs.

Interconnection CIAC Regulatory Liability Recommendation

70. The Public Staff has identified an issue with respect to DEP's recording of contributions in aid of construction (CIAC) in the context of interconnection agreements (IA) between DEP and third party interconnection customers and proposed that a regulatory liability be established to record any instances in which DEP incorrectly recovered costs associated with interconnection agreements (IAs) from ratepayers.

Quality of Service

71. DEP and the Public Staff presented evidence as to the adequacy of electric service provided by DEP.

Tax-Related Items

72. DEP proposes revision to its previously approved North Carolina excess deferred income taxes (EDIT) rider (EDIT-4) to reflect additional amounts due to customers.

73. The levelized return rate should reflect a capital structure consisting of 47.0% long-term debt and 53.0% equity, a 4.03% embedded cost of debt, and a rate of return on equity of 9.8%.

Base Fuel and Fuel-Related Factors and Fuel Cost Allocation

74. DEP proposes to continue its use of the equal percentage fuel adjustment allocation methodology.

75. DEP proposes to allocate purchased power capacity costs to North Carolina retail and across North Carolina retail customer classes based on production demand.

Residential Decoupling Mechanism and Earnings Sharing Mechanism

76. DEP's PBR Application includes a residential decoupling mechanism, a rate-making mechanism intended to break the link between DEP's revenue and the level of consumption of electricity on a per customer basis by its residential customers, as required by N.C.G.S. § 62-133.16(c) and Commission Rule R1-17B.

77. DEP proposes as a component of the MYRP an ESM, an annual rate-making mechanism that shares surplus earnings between DEP and its customers over

the period of time covered by a MYRP, as required by N.C.G.S. § 62-133.16(c) and Commission Rule R1-17B.

Performance-Based Regulation

78. DEP filed its first PBR Application in accord with N.C.G.S. § 62-133.16 and with Commission Rule R1-17B.

Revenue Requirement

79. After giving effect to the portions of the stipulations approved herein and the Commission's decision on contested issues, the annual revenue requirement for DEP for Rate Years 1, 2, and 3 will allow DEP a reasonable opportunity to recover its operating costs and earn the overall rate of return on its rate base that the Commission has found just and reasonable upon consideration of the findings in this Order.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 1-10

The evidence supporting these findings of fact is contained in DEP's verified Application and Form E-1; the stipulations between DEP and the other parties; the testimony and exhibits of DEP witnesses Bowman, Abernathy, Hager, Bateman, Stillman, Barnes, Harris, Quick and Jiggetts; Public Staff witnesses Zhang, Boswell, McLawhorn, D. Williamson, Thomas, and Metz; CIGFUR witness Phillips; and the entire record in this proceeding.

Revenue Requirement Stipulation

On April 26, 2023, the Public Staff and DEP filed the Revenue Requirement Stipulation resolving a portion of the revenue requirement issues between the parties. On May 2, 2023, DEP and the Public Staff amended the stipulation to include CIGFUR as a party and resolve among themselves an additional issue pertaining to vegetation management.

Witness Bowman testified that the stipulation resolves most of the revenue requirement issues between DEP and the Public Staff. She stated that the parties fully resolved the recovery of capital projects and related costs to be included in DEP's MYRP. Tr. vol. 7, 53-54. Witness Bowman also testified that the parties reached agreement on the inclusion of plant in service and depreciation rates and agreed to revenue requirement adjustments for the following items: cost of debt; executive compensation; board of directors expenses; rent expenses; lobbying; sponsorships and donations; incentive compensation; reliability assurance operations and maintenance (O&M) spend; aviation expenses; non-residential credit card fees; end of life nuclear reserve; coal inventory; salaries and wages; gain on Harris land sales; production O&M; and the treatment of various deferrals DEP is requesting to recover. *Id.* She explained that the Revenue Requirement Stipulation shows these accounting and ratemaking adjustments and the resulting effect on the revenue requirement. Witness Bowman also testified to DEP's commitment to perform a lead-lag study before its next rate case application and agreement to various reporting obligations. *Id*. Witness Bowman further testified that the stipulation represents a balanced settlement between the stipulating parties on the settled issues, is in the public interest, and should be approved by the Commission. *Id.*

Public Staff witnesses McLawhorn, Metz, Zhang, and Boswell testified that, from the Public Staff's perspective, the most important benefits the stipulation provides are: (1) an aggregated reduction in DEP's proposed revenue increase resulting from the agreed-upon adjustments; and (2) the avoidance of protracted litigation between DEP and the Public Staff before the Commission and possibly the appellate courts on the settled issues and the associated increased rate case expense recovery from customers. Tr. vol. 16, 514; Tr. vol. 19, 87. Based on these ratepayer benefits, and other provisions of the stipulation, the Public Staff believes the stipulation is in the public interest and that the Commission should approve it. *Id.*

Sections III and IV of the Revenue Requirement Stipulation outline several accounting and ratemaking adjustments, as well as reporting obligations, to which DEP,

the Public Staff, and CIGFUR agree. The Commission fully discusses these agreed-upon issues later in this Order.

COSS Stipulation

On September 13, 2022, the COSS Stipulating Parties filed the COSS Stipulation with the Commission. Tr. vol. 11, 80. The COSS Stipulation provides that DEP will first allocate production and transmission demand costs to the North Carolina retail jurisdiction using the 12 CP method and then will allocate production demand costs among North Carolina retail customer classes using the Modified A&E method. *Id.* Because transmission demand does not have average or excess energy components, the transmission demand factors at the customer class level are equivalent to the 12 CP calculation. *Id.* The COSS Stipulation also provides that, for purposes of allocating production demand costs on a jurisdictional basis as well as to North Carolina retail rate classes, DEP will make an adjustment to exclude certain curtailable/interruptible loads if they were not curtailed at the twelve system peak hours during the test year. *Id.* The COSS Stipulation only applies in the current rate case, and the COSS Stipulating Parties are free to advocate for different methodologies in future DEP cases. *Id.* DEP witness Hager testified that the stipulation is reasonable and that the Commission should approve it, noting that it was the result of give-and-take negotiations of parties with diverse views on the appropriate methodologies reaching a settlement. *Id.* at 80-81.

TCA Stipulation

On April 27, 2023, DEP, DEC, and the Public Staff filed the TCA Stipulation. The TCA Stipulation sets forth the agreement of the parties thereto to a pro forma adjustment of approximately $20 million to increase the revenue requirement in the pending DEC Rate Case and to decrease the revenue requirement in the instant proceeding.

The TCA Stipulation calculates a pro forma amount of transmission expense for DEC and transmission revenue for DEP by multiplying the net transfers from DEP to DEC which occurred in 2022 pursuant to the joint dispatch agreement (JDA)[3]by the DEP non-firm transmission rate established in the FERC-approved Joint Open Access Transmission Tariff (OATT) of DEP, DEC, and Duke Energy Florida, LLC.[4] The stipulation also provides that the adjustment is for North Carolina ratemaking purposes only and will not change the terms or conditions of the JDA or result in any accounting entries for DEP or DEC. The TCA Stipulation provides that the adjustment will become effective on

[3] The JDA is the framework by which DEC and DEP manage and utilize their electric generation assets jointly to serve their respective retail customers with the most efficient generating plants available on a daily basis and was approved by the Commission as a part of the 2012 merger of DEP and DEC. Order Approving Merger Subject to Regulatory Conditions and Code of Conduct, Docket Nos. E-7, Sub 986, and E-2, Sub 998, June 30, 2012.

[4] DEC OATT Transmission Rate Formula Template Using Form 1-Data Utilizing Cost Data for (Historic Years) with Year-End Average Balances Development of Revenue Requirement OATT, p. 3 of 7 (328 of 1170); DEP OATT Transmission Non-Levelized Rate Formula Template Using Form-1 Data Development of Revenue Requirement, p. 3 of 5 (510 of 1170).

October 31, 2023 for both DEP and DEC, and will terminate at the sooner of the effective date of rates in DEP's or DEC's next general rate case or the effective date of a full merger of DEP and DEC, unless the Commission orders otherwise.

DEP witness Bateman testified in support of the TCA Stipulation. Tr. vol 14, 146. She explained that the TCA Stipulation is the result of substantial discovery and extensive negotiation among the stipulating parties and that it reflects a constructive near-term approach to addressing rate disparity concerns arising from the increasing net transfers of energy from DEP to DEC under the JDA. *Id.* Public Staff witness Metz also testified in support of the TCA Stipulation. Tr. vol. 16, 517-18. Witness Metz testified that the TCA Stipulation addresses the growing level of net transfers and the subsequent rate disparity between DEP and DEC in North Carolina and explained that the adjustment will compensate DEP and DEC ratepayers for the use and annual maintenance of each utility's transmission system for energy transfers under the JDA. *Id.*

PIMs Stipulation

On May 1, 2023, the DEP, the Public Staff, and CIGFUR filed the PIMs Stipulation. The PIMS Stipulation reflects an agreement between the parties regarding certain of the PIMs, tracking metrics, and the electric vehicle (EV) adjustment to DEP's decoupling mechanism.

DEP's PBR Policy Panel provided testimony in support of the PIMs Stipulation. Tr. vol. 14, 131. The PBR Policy Panel testified that the resolution reached among the parties to the stipulation represents a balanced approach to achieving policy goals in DEP's first PBR Application. Tr. vol. 15, 17, 70. DEP witness Stillman testified that the settled PIMs originated from the North Carolina Energy Regulatory Process (NERP) PBR Working Group,[5] were informed by DEP's pre-filing PIM stakeholder process, and evolved over discussions among the parties in the instant proceeding. Tr. vol. 14, 132-33. DEP witness Bateman testified that the Commission must examine the PIMs in the context of the entire MYRP. Tr. vol. 15, 15. Witness Bateman testified that DEP took a conservative approach in this first PBR Application in order for DEP, customers, and the Commission to gain experience with the operation and implementation of PIMs. *Id.* at 69. DEP witness Stillman explained DEP's approach to designing the PIMs around the 1.0% cap set forth in N.C. Gen. Stat. § 62-133 and stated that DEP was deliberate in choosing to propose only a select number of PIMs that meet the maximum number of policy goals. *Id.* at 65.

Public Staff witnesses D. Williamson and Thomas provided testimony in support of the PIMs Stipulation. Tr. vol. 18, 424-25. Witnesses D. Williamson and Thomas testified that the PIMs Stipulation benefits ratepayers by providing improved compliance with N.C.G.S. § 62-133 and that each PIM in the stipulation appropriately targets a specific policy goal set forth in N.C.G.S. § 62-133. They further testified that the PIMs Stipulation

[5] The NERP was a stakeholder process to examine ways to align utility regulation with the 2019 Clean Energy Plan initiated by Governor Roy Cooper. Tr. vol. 14, 74.

will benefit ratepayers through improved operational efficiencies, cost savings, and reliability of electric service over the course of the MYRP. *Id*.

Power Quality Stipulation

On May 1, 2023, DEP and CIGFUR filed the Power Quality Stipulation. The Power Quality Stipulation provides that DEP and CIGFUR will work together to identify up to 13 industrial customer premises with DEP-owned transmission-to-distribution retail substations exclusively or primarily dedicated to the respective customer (Eligible Premises). Subject to a feasibility review, DEP will install power quality monitoring technology at each of the Eligible Premises and meet with the identified customer at least once annually to review the data from the power quality monitoring technology.

In his testimony supporting the Power Quality Stipulation, CIGFUR witness Nicholas Phillips stated that the stipulation will help ensure that DEP will satisfy the requirement to maintain or improve reliability as North Carolina implements the Carbon Plan. Tr. vol. 21, 495. He testified that the reliability risks posed by inverter-based resources are well-documented and that the Commission has recognized those risks. *Id*. at 496-97.

Witness Phillips explained in his testimony that the power quality pilot program would allow DEP to mitigate the reliability risks associated with inverter-based resources. *Id*. at 497-98. Specifically, he testified that it would allow DEP to: (1) proactively monitor power quality during implementation of the Carbon Plan; (2) gather and share data analytics with the Public Staff and the Commission; (3) determine whether power quality incidents are the result of an individual circuit or customer problem, or potentially part of a larger trend; (4) diagnose potential power quality issues and, pursuant to review, implement solutions to address any such issues; and (5) take a proactive approach to customer service and service quality. *Id.*

Regarding the cost of the pilot program, DEP witness Stillman testified on cross examination that the Power Quality Stipulation does not expressly limit the amount to be spent on the program. Tr. vol. 15, 76. He testified that the cost of installing the power quality monitoring technology would be approximately $10,000 to $25,000 per meter and that the total number of meters necessary for this pilot program is unknown. *Id.* at 75. He further testified that the cost of implementing solutions to any problems identified through the pilot program, as contemplated in the Power Quality Stipulation, will depend on the cause of the specific power quality issue for each premise. He added that the lessons learned from the pilot program will help the whole system, because the more meters that DEP installs, the more DEP will learn about the source of the power quality issues. In acknowledging that DEP intends to seek cost recovery on a cost-of-service basis, witness Stillman testified that the pilot program will help DEP better understand power quality issues, which, ultimately, will be to the benefit of all customers. Tr. vol. 21, 474-76.

Affordability Stipulation

On May 4, 2023, DEP, DEC, Sierra Club, NCJC, et al., and the Public Staff filed the Affordability Stipulation. The Affordability Stipulation obligates DEP to withdraw the affordability PIM proposed in this proceeding. In lieu of the affordability PIM, $16 million of shareholder funds will be dedicated over the next three years to address affordability concerns as follows: $10 million will be contributed to support health and safety repairs that would allow for energy efficiency and weatherization upgrades to homes; and $6 million will be contributed to the Share the Light Fund, which offers customers bill payment assistance. Tr. vol. 22, 99-100. In addition, the stipulation obligates DEP to collect and report annually, in Docket No. M-100, Sub 179, the monthly payments ratio, which is the number of residential payments remitted divided by the number of active residential accounts. Finally, the stipulation obligates DEP to establish its CAP as a three-year pilot program and convene a stakeholder engagement process to consider CAP data, metrics, and future CAP program features.

MGS Partial Rate Design Stipulation

On May 10, 2023, DEP, the Commercial Group, and Kroger Co. and Harris Teeter filed the MGS Partial Rate Design Stipulation, which resolves some of the issues in this proceeding among the parties. The MGS Partial Rate Design Stipulation provides that 75.0% of any reduction in revenue requirement, as determined by final Commission order, applicable to rate schedule MGS-time-of-use (TOU), should be applied to energy rates. The MGS Partial Rate Design Stipulation also obligates Kroger Co. and Harris Teeter to withdraw their proposal related to a multi-site aggregate commercial rate. Finally, the MGS Partial Rate Design Stipulation provides that Kroger Co. and Harris Teeter do not oppose the Revenue Requirement Stipulation or the PIMs Stipulation.

LGS Partial Rate Design

On June 7, 2023, DEP and CIGFUR filed the LGS Partial Rate Design Stipulation, which provides that any increase in energy charges resulting from any increase in DEP's revenue requirement to be recovered from the LGS, LGS-TOU, and LGS-Real Time Pricing (RTP) rate schedules, as determined by final Commission order, shall be limited to a percentage that is less than half of the approved overall increase percentage to the LGS, LGS-TOU, and LGS-RTP classes, respectively, exclusive of any decrements for the LGS, LGS-TOU, and LGS-RTP rate schedules. By its terms, the LGS Partial Rate Design Stipulation would apply to any customer currently taking service under an LGS, LGS-TOU, or LGS-RTP rate schedule who proceeds to take service under either the High Load Factor tariff or Hourly Pricing (HP) tariff, in the event the Commission approves such tariffs in this proceeding.

Supplemental Revenue Requirement Stipulation

On June 27, 2023, DEP and the Public Staff filed the Supplemental Revenue Requirement Stipulation which resolves issues related to the Public Staff audit of DEP's

third and final update. On that same date the Public Staff filed the joint supplemental testimony of witness Metz, Zhang, and Boswell in support of the stipulation. DEP also filed testimony in support of the stipulation.

Discussion and Conclusions

Because not all parties to this docket have adopted the stipulations outlined above, the standards set out by the North Carolina Supreme Court in *State ex rel. Utils. Comm'n v. Carolina Util. Customers Ass'n, Inc.,* 348 N.C. 452, 500 S.E.2d 693 (1998) (*CUCA I*), and *State ex rel. Utils. Comm'n v. Carolina Util. Customers Ass'n, Inc*., 351 N.C. 223, 524 S.E.2d 10 (200) (*CUCA II*) govern the Commission's acceptance of the stipulations. In *CUCA I,* the Supreme Court held that:

> [A] stipulation entered into by less than all of the parties as to any facts or issues in a contested case proceeding under Chapter 62 should be accorded full consideration and weighed by the Commission with all other evidence presented by any of the parties in the proceeding. The Commission must consider the nonunanimous stipulation along with all the evidence presented and any other facts the Commission finds relevant to the fair and just determination of the proceeding. The Commission may even adopt the recommendations or provisions of the nonunanimous stipulation as long as the Commission sets forth its reasoning and makes "its own independent conclusion" supported by substantial evidence on the record that the proposal is just and reasonable to all parties in light of all the evidence presented.

CUCA I, 348 N.C. at 466, 500 S.E.2d at 703.

However, as the Court made clear in *CUCA II*, the fact that not all parties have adopted a settlement does not permit the Court to subject the Commission's order adopting the provisions of a nonunanimous stipulation to a "heightened standard" of review. *CUCA II*, 351 N.C. at 231, 524 S.E.2d at 16. Rather, the Court said that Commission approval of the provisions of a nonunanimous stipulation.

> requires only that the Commission ma[k]e an independent determination supported by substantial evidence on the record [and] ... satisf[y] the requirements of chapter 62 by independently considering and analyzing all the evidence and any other facts relevant to a determination that the proposal is just and reasonable to all parties.

Id. at 231-32, 524 S.E.2d at 16.

The Commission concludes that the Revenue Requirement Stipulation, the COSS Stipulation, the TCA Stipulation, the PIMs Stipulation, the Power Quality Stipulation, the Affordability Stipulation, the MGS Partial Rate Design Stipulation, the LGS Partial Rate Design Stipulation, and the Supplemental Revenue Requirement Stipulation result from

the give-and-take negotiations between the stipulating parties and represent compromises that are fair and adequate to each party. The Commission has fully evaluated the provisions of these stipulations, the testimony proffered by parties in support of these stipulations cited above, the dearth of evidence in the record opposing any of these stipulations, and concludes, exercising its independent judgment, that it should accept in part and reject in part the provisions of the stipulations, consistent with the specific discussion and resolution of the issues set forth below.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 11-13

Depreciation

The evidence supporting these findings of fact is included in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Spanos and Jiggetts, Public Staff witnesses Zhang and Boswell, Lucas, and McCullar, FPWC witness Tomcyzk, and CIGFUR witness Gorman; and the entire record in this proceeding.

Spanos Direct Exhibit 1 to DEP witness Spanos's direct testimony is the 2021 DEP Depreciation Study prepared by Gannett Fleming (2021 Depreciation Study). Tr. Ex. vol. 10. Witness Spanos testified that the purpose of the 2021 Depreciation Study was to estimate the most current annual depreciation accruals related to electric plant in service for ratemaking purposes and to determine appropriate average service lives and net salvage percentages for each plant account. *Id.* at 352-53.

Section III, Paragraphs 2 and 3 of the Revenue Requirement Stipulation provides that DEP's depreciation rates will be set based on the rates in DEP's 2021 Depreciation Study, as adjusted in the stipulation. In conjunction with the use of DEP's proposed accelerated retirement dates for its Mayo and Roxboro Units 3 and 4, the Revenue Requirement Stipulation provides that 75.0% of the increased depreciation expense due to the accelerated retirement dates will be placed in a regulatory asset. *Id.* Section 5 of S.L. 2021-165 permits securitization for 50.0% of the remaining net book value of subcritical coal plants. The Revenue Retirement Stipulation further provides that at retirement, the net book value amounts that are not securitized will be recovered with a return over an amortization period that the Commission will determine in a future rate case. *Id.* In addition, the Revenue Requirement Stipulation sets forth the following specific adjustments to DEP's depreciation rates: (1) the amortization periods Public Staff witness McCullar proposes for General Plant FERC accounts 391 and 397 will be adopted; and (2) the 70-year life for Transmission FERC account 356 witness McCullar proposes will be adopted. *Id.*

Summary of Evidence

Retirement Dates for Coal Plants

DEP witness Spanos testified that life span estimates included in depreciation studies are based on informed judgment, incorporating factors for each facility such as facility technology, management plans and outlook for the facility, and estimates for similar facilities of other utilities. Tr. vol. 10, 358. Witness Spanos testified that he used these factors to evaluate DEP's recommended retirement dates and agreed that they were reasonable. *Id.* at 417. The 2021 Depreciation Study identified the following retirement dates for the Mayo and Roxboro units:

Unit	2021 Depreciation Study Retirement Dates
Mayo 1	December 31, 2028
Roxboro 1	December 31, 2028
Roxboro 2	December 31, 2028
Roxboro 3	December 31, 2027
Roxboro 4	December 31, 2027

As DEP witness Spanos testified, the Mayo and Roxboro lifespans are shorter than those identified in DEP's 2018 Depreciation Study, with Mayo Unit 1 having a change in retirement date from 2029 to 2028 and Roxboro Units 3 and 4 having a change in retirement date from 2029 to 2027. Tr. vol. 10, 359. The 2021 Depreciation Study indicates a life span for Mayo Unit 1 of 45 years, for Roxboro Unit 3 of 54 years, and for Roxboro Unit 4 of 47 years. *Id.* Witness Spanos testified that while the most common range of life spans for steam production facilities had been 55 to 65 years, these originally proposed life spans have been shortened in recent years due to unit efficiencies and environmental regulations. *Id.* He also testified that the industry average of similar units in recent years has been 46 years. *Id.*

In connection with these retirement dates, DEP witness Jiggetts testified that DEP was requesting permission to defer to a regulatory asset 50.0% of the impact of the accelerated depreciation of DEP's coal plants for North Carolina retail customers in order to preserve the ability to recover those costs through securitization as S.L. 2021-165 authorizes. Tr. vol. 13, 208. Jiggetts testified that because the accelerated dates reflected in the 2021 Depreciation Study would reduce the net book value of the plants at retirement and because DEP wants customers to benefit from any savings that securitization could provide, upon retirement of the facilities DEP proposes to defer to a regulatory asset 50.0% of the remaining net book value. *Id.* Witness Jiggetts testified that this approach preserves for securitization the level of net book value that would have resulted had the expected retirement dates not been updated in the 2021 Depreciation Study. *Id.* DEP also seeks permission to defer to this regulatory asset any costs related to obsolete inventory, net of salvage, at the time of retirement. *Id.* at 208-09.

Public Staff witnesses Lucas and McCullar both addressed the coal plant retirements and life spans in their testimony. In his direct testimony, witness Lucas

recommended the use of the retirement dates DEP provided in its 2014 and 2016 Integrated Resource Plans filed in Docket Nos. E-100, Sub 141 and 147, respectively. Tr. vol. 20, 38.

Witness Lucas testified that his recommended retirement dates differ solely for calculating rates in the rate case, not for planning purposes. *Id.* He does not dispute the physical retirement dates that the Commission's Carbon Plan Order established, rather, he testified that issues of reliability and cost inform his recommendations. *Id.* at 38-39; Order Adopting Initial Carbon Plan and Providing Direction for Future Planning (Carbon Plan Order), *Duke Energy Progress, LLC, and Duke Energy Carolinas, LLC, 2022 Biennial Integrated Resource Plans and Carbon Plan*, No. E-100, Sub 179 (Dec. 30, 2022). Witness Lucas testified that if DEP can accelerate depreciation before retirement, customers will not only pay more in the near-term but also that the plants will have less value to securitize in the long-term, thereby muting the benefit of securitization to ratepayers. *Id.* at 39. He testified that because Session Law 2021-165 and Commission Rule R8-74 allow securitization of remaining plant value, the financial benefit of potentially delaying the retirement of either Mayo or Roxboro should not accrue solely to DEP. *Id.*

Witness Lucas further testified that DEP has a plan to replace Roxboro's capacity with hydrogen-enabled combustion turbines and combined-cycle capacity, but it has not fully developed this plan. *Id.* He also testified that DEP has not indicated its plans for replacing general capacity for the Mayo plant. *Id.* Witness Lucas stated that if DEP retires either Mayo or Roxboro before its recommended date, DEP should securitize 50.0% or more of the remaining book value while continuing to depreciate any amount not securitized. *Id.*

Witness McCullar proposed depreciation rates based on the final retirement years provided by witness Lucas. Tr. vol. 21, 138.

FPWC witness Tomcyzk recommended final retirement dates for certain coal units that are later than dates proposed by DEP and recommended that the Commission reject DEP's request to defer 50.0% of the incremental increase in the depreciation expense because implementation of FPWC's revised retirement dates renders the deferral unnecessary. Tr. vol. 21, 729, 734. FPWC's recommended retirement dates would make DEP's request to defer 50.0% of the incremental depreciation unnecessary. *Id.* Witness Tomcyzk stated that, should the Commission approve DEP's retirement dates or otherwise accelerate retirement, then all of the resulting incremental depreciation expenses should be deferred to a regulatory asset. *Id.* at 734-35.

CIGFUR witness Gorman recommended that the Commission reject DEP's proposal to recover the 50.0% of non-deferred accelerated depreciation expenses associated with Mayo Unit 1 and Roxboro Units 3 and 4 through its base rates. Tr. vol. 21, 436. Witness Gorman testified that accelerating the retirement of these units may not be feasible and recommended that the Commission not allow DEP to include costs for such early retirement in its cost of service. *Id.* at 434.

In rebuttal, DEP witness Spanos testified that the retirement dates for the Mayo and Roxboro plants are consistent with informed judgment based on each unit and the expectation within the industry. Tr. vol. 10, 358-59. He testified that many other coal plants either have been or are planned to be retired with lifespans of around 40-45 years and that the proposed lifespans of DEP's plants are consistent with those of other utilities. Tr. vol. 10, 373. DEP witness Jiggetts testified that the retirement dates Public Staff witness Lucas proposed are from DEP's 2013 Depreciation Study and that it is inappropriate to use dates from a 2013 Depreciation Study that is almost 10 years old. Tr. vol. 23, 91. Further, in response to Public Staff witness Lucas' recommendation that DEP securitize 50.0% or more of the remaining book value while continuing to depreciate any amount not securitized, DEP witness Jiggetts responded that S.L. 2021-165 only permits securitization for 50.0% of the remaining net book value for subcritical coal plants and, therefore, that it is only appropriate to apply this proposed ratemaking treatment to 50.0% of the plant balances. *Id.*

In response to Public Staff witness Lucas' proposal to change coal plant retirement dates "for ratemaking purposes only," DEP witness Jiggetts testified that DEP is aligned with this proposal in principle, but not in methodology. *Id.* at 90. DEP witness Jiggetts testified that the depreciation rates should be set based on the actual planned retirement dates, and then deferrals and regulatory assets should be used for jurisdictionally specific ratemaking purposes. *Id.* Witness Jiggetts testified that the methodology is particularly important because securitization of the coal plant balances is only available for DEP's North Carolina retail jurisdiction and, therefore, the more appropriate way to accomplish the result that Public Staff witness Lucas supports is to use deferral and regulatory assets. *Id.* at 91.

Amortization Periods for General Plant FERC Accounts 391 and 397

Public Staff witness McCullar and FPWC witness Tomczyk both object to DEP's proposal to change the amortization period for General Plant FERC account 391, Office Furniture and Equipment, from 20 years to 15 years, and to change the amortization period for General Plant FERC account 397, Communication Equipment, from 20 years to 10 years. Tr. vol. 21, 142, 754. Both witnesses recommend the continued use of the currently approved 20-year amortization period for these accounts. *Id.* Public Staff witness McCullar noted that the Commission previously approved the continued use of 20-year amortization periods for accounts 391 and 397 in the 2019 Rate Case. Witness McCullar stated that DEP is proposing the same amortization periods for these accounts that it initially proposed in the 2019 Rate Case and others. She further stated that the 2021 Depreciation Study in this case did not provide any life data for either account. Tr. vol. 21, 142-43.

In response, DEP witness Spanos notes that the amortization period for these accounts are approved for DEC, and asserted that it is reasonable to use the same amortization periods currently approved for DEC, as those periods are more representative of the appropriate useful life. Tr. vol. 10, 397. He further testified that witness Tomczyk's rationale supporting her proposal to maintain the periods approved in

a prior case is insufficient and that an amortization period should reflect the most reasonable useful life of the actual assets in each account. *Id.*

70-year life for Transmission FERC Account 356

For Transmission FERC account 356, Overhead Conductors and Devices, DEP proposes a 65-year estimated average service life with an R2.5 survivor curve. In contrast, Public Staff witness McCullar proposes a 70-year estimated average service life. Witness McCullar argued that the Public Staff's proposal is mathematically a better fit to the actual data and that her estimate included a review of historic observed life data provided in the 2021 Depreciation Study, the relevant information DEP provided in response to discovery, and her previous experience. *Id.* at 147-48.

In response, DEP witness Spanos testified that the witnesses have taken different approaches in interpreting the relevant data, and that he disagrees with these approaches. Tr. vol. 10, 382. FPWC witness Tomczyk and Public Staff witness McCullar both stated that they considered other factors in the development of their life estimates, but they appear to support their estimates primarily with mathematical fitting results, which is one, but not the only, factor to consider when developing a life estimate. *Id.* at 386. DEP witness Spanos argued that the life estimates witnesses Tomczyk and McCullar propose omit any consideration of changes to the transmission system resulting from impacts of DEP's evolving generation fleet, produce overall life cycles that are longer than what is reflected in the historical data, and serve only to lengthen the proposed life of the assets and reduce depreciation expense. *Id.* Additionally, DEP witness Spanos testified that their estimates reflect an expectation that too high a percentage of the overhead conductors will remain reliable.

Other Depreciation Recommendations

Other Production FERC Account 343 and Transmission FERC Account 352 – Survivor Curves

FPWC witness Tomczyk recommends adjustments to the survivor curve applied to Other Production FERC account 343, Prime Movers, and Transmission FERC account 352, Structures and Improvements.

For Other Production FERC account 343 FPWC witness Tomczyk recommends the use of the L0-35 survivor curve, as opposed to the L0-30 survivor curve DEP witness Spanos proposes. Tr. vol. 21, 739. Witness Tomczyk testified that DEP did not provide a reason either in its 2021 Depreciation Study or in DEP witness Spanos' direct testimony as to why the actuarial data for this account was truncated at 39.5 years in the original and smooth survivor curve graphs in the 2021 Depreciation Study. When selecting her recommended survivor curve, witness Tomczyk testified that she considered the sum of the squared deviations (SSDs) for both truncated and full curves to be important. *Id.* at 741. Additionally, she considered the survivor curves other electric utilities use for this account and relied on her professional judgment. Based on her experience, the survivor curves other comparable utilities use typically have associated service lives that exceed

those that DEP recommends in this case. *Id.* at 741-42. FPWC witness Tomczyk noted that the only supporting information DEP provided for its survivor curve for this account is that its statistical analyses resulted in "good to excellent indications" of the survivor patterns experience for this account. *Id.* at 742.

For Transmission FERC account 352, FPWC witness Tomczyk recommends the use of an R2.5-70 survivor curve, while DEP recommends an R2.5-65 survivor curve. She testified that, in response to data requests, DEP noted that it truncated actuarial data for this account at 56.5 years in the original and smooth survivor curve graph because assets exposed to retirement above 56.5 years are less significant when compared to the total assets exposed to retirement. Additionally, the retirement activity occurring at ages in excess of 56.5 years is not typical of retirement activity for assets of those ages. Witness Tomczyk generally noted that her proposed survivor curves had lower SSDs when not truncated. Additionally, she noted that FPWC requested, but DEP did not provide, any information that explained the rationale for DEP's recommended survivor curve. As with account 343, the only information DEP provided indicated that their statistical analyses resulted in what DEP characterized as "good to excellent indications" of the survivor patterns experienced for this account.

In rebuttal, DEP witness Spanos stated that the primary reason for differences between his estimates and FPWC's estimates for survivor curves is that the parties interpreted the data differently. For Other Production FERC account 343, he argued that FPWC witness Tomczyk appears to base her proposed estimate solely on "mathematical curve matching," whereas he used a method of "visual curve matching." He also stated that FPWC witness Tomczyk's proposed survivor curve for account 343 appears to ignore the most significant portion of the historical data, and instead focuses on assets that have been in service for 35 years or more. These assets represent less than half of the assets exposed to retirement during the overall band of experience and are ones that are less indicative of asset lives into the future. Witness Spanos testified that this is inappropriate when considering an interim survivor curve and that the narrow mathematical curve matching approach is not reasonable. In regard to Transmission FERC account 352, witness Spanos testified that a review of witness Tomczyk's mathematical approach for this account shows that she was focusing her proposed, elongated survivor curve on a period reflecting nominal retirement experience and that this is not consistent with the future expectations of retirement activity in this account. Tr. vol. 10, 391. Witness Spanos explained during his cross-examination that the job of an analyst doing life estimation is not to match what has happened in the past, but rather to predict what is happening going forward. *Id.* at 462-63. Witness Spanos testified that a focus on mathematical matching can only match what has occurred in the past, which is only a part of the necessary overall analysis. *Id.* at 463.

Transmission FERC Account 353 – Net Salvage Rate

FPWC witness Tomczyk recommends that the Commission use a net salvage rate of negative 10.0%, as opposed to DEP's proposed net salvage rate of negative 15.0%. Tr. vol. 21, 750. In support of this recommendation, she noted that for the period 1979

through 2021, net salvage averaged 9.0% and that the most recent five-year average is negative 10.0%. *Id.* She also noted that, after reviewing net salvage statistics, the swings in the more recent three-year moving averages for account 353 were much less significant than for most other transmission accounts. *Id.* at 751. She testified that, based on her recent experience, net salvage rates for account 353 most often are in the negative 10.0% to negative 15.0% range. *Id.*

In rebuttal, DEP witness Spanos testified that, although the numbers FPWC witness Tomczyk cited from the 2021 Depreciation Study are correct, she ignored the fact that two of the last five years (2019 and 2021) reflect very low, anomalous cost of removal activity, which DEP should consider when developing a net salvage estimate. Tr. vol. 10, 391. During recent years, annual retirements have been increasing. *Id.* However, in 2019 and 2021, the recorded cost of removal was extremely low related to the retirements. *Id.* Given this nominal cost of removal activity in 2019 and 2021, DEP gave these years less weight than prior years. *Id.* at 391-92. Therefore, given the lag in recording cost of removal to the associated retirements and the increase in the industry for removal cost for substation equipment, witness Spanos argued that the negative 15.0% net salvage estimate is a more reasonable representation of net salvage for future retirements. *Id.* at 392.

Revenue Requirement Stipulation

Sections III, Paragraphs 2 and 3 of the Revenue Requirement Stipulation provide that DEP's depreciation rates will be set based on the rates in the 2021 Depreciation Study as adjusted in the stipulation. In conjunction with use of DEP's proposed accelerated retirement dates for its Mayo and Roxboro Units 3 and 4, the Revenue Requirement Stipulation provides that the 75.0% of the increased depreciation expense due to the accelerated retirement dates will be placed in a regulatory asset. *Id.* S.L. 2021-165 permits the securitization for 50.0% of the remaining net book value for subcritical coal plants. The Revenue Retirement Stipulation further provides that at retirement the net book value amounts that are not securitized will be recovered with a return over an amortization period that the Commission will determine in a future rate case. *Id.* The Revenue Requirement Stipulation sets forth the following specific adjustments to DEP's depreciation rates: (1) the amortization periods proposed by Public Staff witness McCullar for General Plant FERC accounts 391 and 397 will be adopted; and (2) the 70-year life for Transmission FERC account 356 proposed by witness McCullar will be adopted. *Id.*

Discussion and Conclusions

Retirement Dates for Coal Plants

Based on the Revenue Requirement Stipulation and the entire record in this proceeding, the Commission concludes that it is appropriate to depreciate Mayo Unit 1 and Roxboro Units 1-4 based on the accelerated retirement dates proposed by DEP. Section III, Paragraph 2 of the Revenue Requirement Stipulation provides that DEP's proposed retirement dates for its coal plants will be used to set depreciation rates. Witness Spanos testified that he performed a thorough analysis of the life spans for Mayo

Unit 1 and Roxboro Units 1-4 using accepted depreciation methods. His analysis specifically considered factors for each facility such as facility technology, management plans and outlook for the facility, and the estimates for similar facilities for other utilities. As witness Spanos testified on cross-examination, he made site visits, had discussions with operational personnel at each plant site, and took the necessary steps to understand the expectations for the assets and how things may change functionally for various reasons. Tr. vol. 10, 405. Witness Spanos has reviewed DEP's facilities in developing his depreciation studies over numerous years and has a great deal of experience with the specific facilities at issue in this proceeding, as well as steam plants across the country. Furthermore, the life spans DEP proposes for Mayo and Roxboro are consistent with the 45-to-50-year life spans that are occurring across the industry as more utilities transition away from coal burning generation facilities.

The Commission is not persuaded by FPWC witness Tomczyk's assertion regarding the level of uncertainty regarding the retirement dates of Mayo and Roxboro. The Commission notes that the asset retirement dates are established by the Commission in the integrated resource planning process and the retirement dates for Mayo Unit 1 and Roxboro Units 1-4 were addressed in the Carbon Plan Order. The Commission determines that the agreement encapsulated in the Revenue Requirement Stipulation, which addresses DEP's plans for Mayo Unit 1 and Roxboro Units 1-4 using the accelerated retirement dates while also accomplishing the type of rate mitigation that witness Lucas proposed strikes a reasonable balance. The Commission further determines that the provision in the Revenue Requirement Stipulation to increase the proposed deferral to a regulatory asset from 50.0% to 75.0% of the incremental depreciation expense that results from the accelerated retirement is reasonable and appropriate. As provided under the Revenue Requirement Stipulation, DEP will recover 50.0% of net book value through securitization and will recover the remaining amount, with a return, over an amortization period to be determined in a future rate case.

Amortization Periods for Plant FERC Accounts 391 and 397, and 70-year life for Transmission FERC Account 356

Based upon the evidence Public Staff witness McCullar presented, the Commission finds that the settled-upon amortization periods for General Plant FERC accounts 391 and 397 and the 70-year life for Transmission FERC account 356, as outlined in the Revenue Requirement Stipulation, are just and reasonable and appropriate for use in this case.

Other Production FERC Account 343 and Plant FERC Account 352 – Survivor Curves

Based on the entirety of the record the Commission concludes that the survivor curves proposed by DEP in this proceeding are just and reasonable and appropriate for use in this case.

Transmission FERC Account 353 – Net Salvage Rate

Based on all the evidence presented, the Commission concludes that it should not adopt FPWC witness Tomczyk's Transmission FERC account 353 proposal. In particular, the facts that annual retirements have been increasing in recent years, and that DEP reduced the weight afforded to removal activity in 2019 and 2021, weigh in favor of DEP's proposed net salvage rate. Accordingly, the Commission concludes that the proposed net salvage rate of negative 15.0% is just and reasonable and appropriate for use in this case.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 14

Base Period Plant-Related Items

The evidence supporting this finding of fact appears in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Turner, Jiggetts, Guyton, Maley, and Ray, and Public Staff witnesses Metz, Thomas, Michna, and T. Williamson, the joint settlement testimony of Public Staff witnesses Metz and McLawhorn, and the joint testimony of Public Staff witnesses Boswell and Zhang; the Revenue Requirement Stipulation; and the entire record in this proceeding.

Summary of Evidence

Generation Capital Investments

DEP witness Turner described DEP's traditional/renewable/storage generation fleet and the operational performance of those assets during the test year. Tr. vol. 12, 91. Witness Turner testified as to the major capital projects undertaken by DEP for maintenance of its fossil, renewable, and storage fleets. *Id*. at 96. In testifying on the importance of the traditional fossil fleet to customers in North Carolina, she explained that the diversity of the resource and fuel mix, and availability of coal generation during the transition away from coal, must be strategically managed to ensure the remaining coal fleet can reliably contribute to resource adequacy. She testified that as DEP makes plans to retire its remaining coal fired assets, and replace those assets with other resources, DEP must keep these remaining units in efficient working order to support the energy needs of its customers. She explained that DEP will continue to make investment in these assets to ensure that the same reliable cost effective electricity that customers have counted on for decades remains available while the replacement of those units is developed and implemented. Additionally, she testified that the combination of generation resources that replaces coal must be able to provide the same level of reliability that the coal units have provided and that because natural gas is critical to the resource mix – particularly during the winter months and while energy storage capacity is being developed and deployed – DEP will continue to rely on its natural gas fleet as part of the diverse and dispatchable resource mix to ensure the reliability of service to DEP customers. Tr. vol. 12, 91-95. Witness Turner also testified regarding DEP's hydro fleet capital maintenance projects, which were undertaken primarily for regulatory compliance. She further testified as to DEP's addition of three battery installations, including the

Asheville/ Rockhill storage project, the Hot Springs Microgrid, and the Camp Lejeune project. *Id.* at 96-97. Finally, she testified as to her opinion that DEP has reasonably and prudently operated its fossil/hydro/solar fleet during the test period. *Id.* at 99-101.

DEP witness Ray described DEP's nuclear generation assets and capital additions made to the fleet since the 2019 Rate Case to enhance safety and efficiency preserve performance and reliability of the plants throughout their extended life operations, and address regulatory requirements. Tr. vol. 16, 154. Witness Ray described how these capital additions are or would be by the capital cutoff date used and useful in safely and efficiently providing reliable electric service to DEP's customers. Tr. vol. 16, 152-62. He testified about the exceptional performance of the nuclear fleet during the test period and initiatives that DEP has undertaken to increase nuclear operational efficiency. *Id.* at 168-70. He testified that, in comparison to others in the industry, DEP's nuclear fleet has a history of top performance, including a test period capacity factor of 94.94%, which exceeds the average capacity factor for comparable units published in the most recent North American Electric Reliability Council's (NERC) Generating Unit Statistical Brochure. *Id.* at 70.

Public Staff witnesses Metz, Thomas, and Michna reviewed aspects of DEP's capital investments in its traditional/renewable/storage generation fleet. Public Staff witness Metz described his review of DEP's historic costs associated with projects placed in service for the period June 2020 through November 2022, noting that his investigation included multiple site visits to DEP's fleet of generating stations and to an operations center, as well as numerous meetings with DEP personnel. Tr. vol. 16, 412. Witness Metz did not propose any adjustments to the base case capital investment costs for the fossil/hydro or nuclear fleets. Public Staff witness Thomas reviewed DEP's capital additions to solar, storage and hydro plant since the 2019 Rate Case and recommended an adjustment regarding the Blewett Falls Fishing Pier and the Hot Springs Microgrid. Tr. vol. 19, 172. Public Staff witness Michna reviewed DEP's capital additions for steam generation since the 2019 Rate Case and recommended an adjustment to the aqueous ammonia conversion project at Mayo Station (Mayo Ammonia Conversion Project). Tr. vol. 21, 285.

Blewett Falls Fishing Pier

Public Staff witness Thomas recommended that DEP remove the Blewett Falls fishing pier from the base case and include it in the MYRP Rate Year 1 based on his conclusion that, although DEP asserted that it placed the fishing pier in service in 2021, it is not yet complete or open for public use and will remain closed for safety reasons. Tr. vol. 19, 208-09.

DEP witness Turner testified that DEP placed the pier in service pursuant to DEP's capital accounting guidelines in January 2021, but that it is not currently open for public access due to ongoing construction of a fish passage facility directly next to the pier. Witness Turner asserts that public accessibility does not determine whether an asset is in service, and that Public Staff witness Thomas did not meaningfully challenge DEP's application of the accounting guidelines, which govern the in-service determination. Tr. vol. 12, 141.

In the Revenue Requirement Stipulation, DEP accepted the Public Staff's recommendation to move the fishing pier project and its associated costs out of the base case and into the MYRP Rate Year 1. Revenue Requirement Stipulation § II.33.a, Tr. Ex. vol. 7. DEP witnesses Abernathy and Jiggetts and Public Staff witnesses McLawhorn and Metz supported this provision in their settlement supporting testimony. Tr. vol. 13, 138-40, 254-55, 262; Tr. vol. 16, 514.

Mayo Ammonia Conversion Project

Public Staff witness Michna recommended an adjustment to remove $3,230,371 in costs for the Mayo Ammonia Conversion Project. Witness Michna recommended the adjustment based on his conclusion that DEP's decision to not update the cost benefit analysis for the project after significant delays to account for significant changes in cost and the projected station retirement date was not prudent. Tr. vol. 21, 295-97.

DEP witness Turner testified that DEP's development and execution of the project has been reasonable and prudent, emphasizing that the driving factor for the project was elimination of the safety risk to plant personnel that the existing ammonia system presents. Tr. vol. 12, 139-40.

As part of the Revenue Requirement Stipulation, DEP accepted the Public Staff's proposed adjustment related to the Mayo Ammonia Conversion Project. Revenue Requirement Stipulation § III.10, Tr. Ex. vol. 7. DEP witness Jiggetts and Public Staff witnesses McLawhorn and Metz supported this provision in their settlement supporting testimony. Tr. vol. 13, 254-55, 263; Tr. vol. 16, 514.

Hot Springs Microgrid

Public Staff witness Thomas recommends that the solar costs associated with the Hot Springs Microgrid be allocated 100.0% to the "Other Production Plant" account as opposed to DEP's proposed allocation of 50.0% to "Distribution Plant" and 50.0% to "Other Production Plant." Tr. vol. 19, 192. DEP accepted this recommendation in rebuttal testimony and agreed to make the corresponding accounting adjustment. Tr. vol. 11, 47. The Revenue Requirement Stipulation reflects this adjustment.

Transmission and Distribution Base Period Investments – Non-Grid Improvement Plan (GIP)

In their direct testimonies, DEP witnesses Guyton and Maley discussed DEP's distribution and transmission investments since its last general rate case. DEP Witness Guyton testified that DEP had invested approximately $814 million in new distribution infrastructure since DEP's last rate case, which included investments in DEP's GIP. Witness Guyton testified that non-GIP distribution investments during the base period included targeted reliability and maintenance programs, and customer driven line and substation expansions. Tr. vol. 10, 38. In his direct testimony, witness Maley testified that DEP had spent

approximately $390 million in additional transmission infrastructure since its last rate case, the bulk of which was for reliability and capacity improvements. Tr. vol. 10, 169-70.

In their direct testimonies, Public Staff witnesses Metz and T. Williamson took issue with some of the transmission and distribution capital investments made by DEP since its last case, as discussed in more detail below. Specifically, witness Metz took issue with the inclusion in rate base of capital associated with a newly refurbished transmission service building project (Project Florence), as well as the timing of inclusion in rate base of investments in a new Electric Systems Operation center (Project Walter). In addition, in his direct testimony, witness T. Williamson recommended a $712,867 disallowance for costs associated with contractor damage to a Wilmington voltage regulator platform.

Project Florence and Project Walter

Public Staff witness Metz described DEP's Project Florence to support maintenance and construction for transmission service projects in Florence, South Carolina. Project Florence included demolishing facilities at DEP's existing site to build a new consolidated single building to serve DEP's Carolinas East Southern Region. Tr. vol. 16, 416-18. In his direct testimony, Public Staff witness Metz recommended removal of the costs for Project Florence due to insufficient information from DEP to justify the project. *Id.* at 420.

Witness Metz also described DEP's Project Walter, a new energy control/operations center to operate DEP's bulk electric system and manage DEP's distribution system. Tr. vol. 16, 424. Based on his review of when the project would begin to serve its intended purpose, witness Metz recommended that DEP include the project in Rate Year 1 of the MYRP rather than in the base period. *Id.*

On rebuttal, DEP witness Guyton testified that Project Florence was prudent, and that the refurbishment of facilities was necessary to efficiently meet increased and growing demand on the transmission operations center in terms of personnel and equipment and that the pre-existing buildings were no longer sufficient to meet DEP's need. Tr. vol. 10, 139-40. On rebuttal, witness Guyton also asserted that Project Florence is currently used and useful as evidenced by the fact that construction is complete, local authorities have issued certificates of occupancy, and the building is in active use for certain functionalities, with the remaining functionalities to be working out of the building before rates are in effect in this proceeding. Tr. vol. 10, 135.

Section III, Paragraph 9 of the Revenue Requirement Stipulation provides that the Project Florence costs shall be included in rate base and the costs of Project Walter shall be moved into Rate Year 1 of the MYRP as recommended by Public Staff witness Metz.

Wilmington Voltage Regulator Platform

Public Staff witness T. Williamson described the Wilmington Voltage Regulator Platform project, which DEP undertook in order to provide additional clearance below the regulator platform DEP uses in its Distribution System Demand Response (DSDR)

project. Tr. vol. 21, 203-04. Witness T. Williamson recommends an adjustment due to equipment damage a contractor caused during this project. *Id.* at 205. In his rebuttal testimony, DEP witness Guyton challenged the amount of the Public Staff's disallowance for the Wilmington voltage regulator platform incident, on the grounds that witness T. Williamson did not allege that DEP had been negligent or responsible in any way for the contractor damage. Witness Guyton also asserted that any adjustment should only be for the incremental cost of the contractor damage ($267,282), rather than the entire cost of the project. Tr. vol. 10, 140.

Section III, Paragraph 7 of the Revenue Requirement Stipulation reduces the Wilmington voltage regulator costs as Public Staff witness Williamson recommended but with the further adjustment witness Guyton suggested in his rebuttal testimony.

Discussion and Conclusions

Based on the entire record in this proceeding, the Commission concludes that the costs related to DEP's investments in its fossil, renewable, storage, and nuclear fleet assets as well as its transmission and distribution investments made during the test period, as adjusted by the Revenue Requirement Stipulation, were reasonably and prudently incurred and should be recovered. The Commission further concludes that the adjustments for the Blewett Falls Fishing Pier, the Mayo Ammonia Conversion Project, and the Hot Springs Microgrid as the Public Staff and DEP agreed in the Revenue Requirement Stipulation are reasonable. Finally, the Commission concludes that the adjustments related to Project Walter, Project Florence, and the Wilmington Voltage Regulator Platform project, as included in the Revenue Requirement Stipulation are reasonable.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 15-17

Grid Improvement Plan Cost Recovery

The evidence supporting these findings of fact is included in the testimony and exhibits of DEP witnesses Guyton, Maley, and Jiggetts, Public Staff witnesses Zhang and Boswell, the Revenue Requirement Stipulation, and the entire record in this proceeding.

Summary of Evidence

DEP witness Maley testified that DEP's GIP is enabling new grid capabilities and that the System Intelligence program has begun deployment of dynamic, smart devices with the ability to remotely locate, sectionalize, and assess damage. Tr. vol. 10, 179. Witness Maley testified that the deployment of remote monitoring and control devices with digital relays supports rapid response to system outages and disturbances to quickly restore power to the maximum number of customers and to enable better management of distributed energy resources. *Id.* DEP installed approximately 350 relays and 9 remotely capable switches over the 19 months immediately preceding the date on which DEP filed the Application. In the period starting June 1, 2020, through December 31, 2021, DEP made North Carolina GIP transmission investments totaling $9.2 million. *Id.* at 179-80. Witness Maley testified that DEP

was on track to complete North Carolina GIP work scope in its three-year plan by December 31, 2022. *Id.* at 181.

DEP witness Guyton testified that DEP developed its GIP to build grid capabilities needed to address the implications of seven megatrends. These megatrends represent key trends that drive the need to prepare the grid to safely and efficiently distribute the energy which customers depend on in their daily lives. *Id.* at 56. Witness Guyton also testified about the operational benefits associated with the GIP work that DEP had completed as of the filing of the Application. He testified that the GIP projects, which reduce the frequency and impact of outages, are contributing to the improving trends for the System Average Interruption Index (SAIFI) and the System Average Interruption Duration Index (SAIDI). *Id.* at 50. He testified that, as an example, the Self Optimizing Grid program redesigns key portions of the distribution system, transforming it into a dynamic, smart-thinking grid that can automatically reroute power around trouble areas so that power can be quickly restored to the maximum number of customers and line crews can directly and rapidly be dispatched to the source of the outage. *Id.*

He testified that the GIP distribution investments and the North Carolina retail allocated portion of general and intangible plant investments through the December 31, 2021, test period totaled $52.6 million. *Id.* at 54.

DEP witness Jiggetts testified that in the 2019 Rate Case the Commission approved deferral of certain GIP-related costs for projects placed in service through December 31, 2022, until the costs could be considered for recovery in DEP's next general rate proceeding. Tr. vol. 13, 194-95. With respect to the specific costs that have been deferred, DEP witness Maley testified that DEP has deferred incremental O&M expenses, depreciation, and property taxes associated with the GIP, as well as the carrying cost on the investments and the deferred costs at DEP's weighted average cost of capital. Tr. vol. 10, 182. In her initial direct testimony DEP witness Jiggetts testified that by of the end of 2022, DEP will have placed in service investments of approximately $236.7 million on a North Carolina retail basis. She explained that DEP proposes to amortize the GIP regulatory asset of $38.8 million over a three-year period, which results in an amortization expense of $12.9 million. Tr. vol. 13, 195. In supplemental testimony, DEP witness Jiggetts updated the GIP-related costs to replace estimated data with actual amounts incurred through December 31, 2022, and to reflect a change in the capital cutoff date to March 31, 2023. [6] *Id.* at 224. Witness Maley testified that DEP proposes to roll these costs into base rates in the current rate case. Tr. vol. 10, 182.

While the Public Staff agreed with DEP's assertion that the Commission approved deferral accounting treatment for the GIP programs, the Public Staff took issue with DEP's calculation of the GIP deferral balance. Tr. vol. 19, 59-63. Specifically, Public Staff

[6] The total GIP investment made by DEP as of December 31, 2022, on a North Carolina retail basis is approximately $197 million as shown in the December 2022 NC GIP Biannual Report filed on March 1, 2023 in Docket Nos. E-7, Sub 1214B and E-2, Sub 1219B and Jiggetts Partial Settlement Exhibit 4.

witnesses Zhang and Boswell testified that DEP's inclusion of O&M expenses are outside of the allowable expenses envisioned by the Commission's approval in the 2019 Rate Case. Tr. vol. 19, 62-63. The Public Staff argued that the GIP deferral approved in the 2019 Rate Case is restricted to incremental expenses net of operating benefits. Therefore, the deferral does not include overhead or administrative and general costs but may include a reasonable allocation of management and supervision costs. *Id.* The Public Staff asserted that some of the O&M expenses included in the deferral were not incremental, that DEP had not determined the amount of any operating benefits, and that the O&M expenses included overhead and administrative and general costs. *Id.* As explained by DEP witness Jiggetts, the Public Staff proposed the following adjustments related to DEP's proposed recovery of the deferred GIP costs: 1) removal of $6 million in system O&M costs based on the contentions that DEP did not provide support for amounts after March 2022 and that certain of the costs did not meet the criteria for deferral based on 2019 Rate Case; and 2) an amortization period of 30 years.

DEP witness Guyton testified on rebuttal that the labor expense deferred for GIP projects was incremental to base labor included in rates since DEP had already reduced the deferral by the amount of installation O&M included in current rates. He asserted that the Public Staff's adjustment to remove O&M for GIP O&M-only projects is not reasonable, on the basis that incremental installation is correctly accounted for as O&M. Tr. vol. 10, 141. He also disputed the Public Staff's position on administrative and general costs and testified that such costs were appropriately included in allocation pools that are added to capital projects in accordance with DEP's accounting practices and cost allocation manual. *Id.* at 142. DEP witness Jiggetts also testified on rebuttal as to DEP's disagreement with the Public Staff's adjustment to remove O&M expenses, with the contention that certain expenses were not appropriately allocated to the GIP projects, and with the contention that 30 years is the appropriate amortization period. Tr. vol. 23, 67-70.

Section III, Paragraph 11 of the Revenue Requirement Stipulation provides that DEP is permitted to recover the full balance of its Grid Improvement Deferral over an 18-year amortization period, with a debt-only return during the deferral period and rate base treatment during the 18-year amortization period. No intervenor took issue with this provision of the stipulation. The costs associated with the GIP deferral, as settled upon by the Public Staff and DEP, results in a deferred balance on September 30, 2023, of $22.364 million, and annual amortization expense of $1.242 million, as set forth in DEP witness Jiggetts Partial Settlement Exhibit 4. Tr. Ex. vol. 14.

Discussion and Conclusions

The Commission concludes that the evidence presented supports the treatment of the deferred GIP-related costs as agreed to by DEP and the Public Staff in the Revenue Requirement Stipulation and that the treatment strikes a just and reasonable balance between recovery of costs and mitigation of impacts to customers and, thus, should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 18-19

Coal Ash

The evidence supporting these findings of fact is included in the Coal Combustion Residuals Settlement Agreement approved in the Commission's Order in the 2019 Rate Case, Order Accepting Stipulations, Granting Partial Rate Increase, and Requiring Customer Notice, *Application by Duke Energy Progress, LLC, for Adjustment of Rates and Charges Applicable to Electric Utility Service in North Carolina*, No. E-2, Sub 1219 (Apr. 16, 2021) (CCR Settlement); DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Jiggetts and Hill, Public Staff witnesses Zhang and Boswell and Lucas, CIGFUR witness Gorman; and the entire record in this proceeding.

DEP witness Hill provided testimony as to DEP's activities to close ash basins and landfills along with other CCR management units for the period since DEP's last rate case. Tr. vol. 16, 86. Witness Hill testified that the actual and forecasted activities, as well as costs incurred, were reasonable and prudent. *Id.* Moreover, he testified that DEP implemented its plans in accordance with closure and corrective action plans that have been approved by the relevant state environmental agencies – in North Carolina, the Department of Environmental Quality, and in South Carolina, the Department of Health and Environmental Control. *Id.* He testified that DEP has also complied with its obligations under the CCR Settlement. DEP witness Jiggetts presented DEP's request to amortize deferred costs associated with the CCRs and to continue deferring costs related to compliance with coal ash regulations. Tr. vol. 13, 163. Witness Jiggetts testified as to the key components of the CCR Settlement and the associated adjustments made in this case to comply with the CCR Settlement, including the use of proceeds from insurance claims to offset CCR compliance costs. *Id.* at 191. She explained that the CCR costs sought for recovery are based upon actual costs incurred from March 1, 2020 through December 31, 2022, and updated amounts through March 31, 2023, provided in the supplemental filing made on April 18, 2023. *Id.*; Tr. vol. 23, 63. She testified that the cost, less the adjustments, totals approximately $647.8 million on a system basis and $399.3 million on a North Carolina retail basis. *Id.* She testified that DEP's adjustment amortizes the net deferred balance over a five-year period. *Id.* Witness Jiggetts also testified that DEP proposes to offset the over-amortization for the CCR costs established in the 2017 Rate Case in the amount of $8.5 million against the Coal Ash CCR ARO deferral DEP sought recovery of in this case. Witness Jiggetts testified that the balance sought for recovery in this case is being offset by North Carolina retail customer's share of insurance proceeds, calculated in accordance with the CCR Settlement terms, of $80.7 million. *Id.* at 193.

Public Staff witness Lucas investigated DEP's management of CCRs, construction and operation of DEP's CCR beneficiation projects, and proceeds from DEP's litigation of CCR insurance claims. Tr. vol. 20,15. After performing a thorough review, witness Lucas concluded that DEP's CCR management practices have been sufficient to prevent unnecessary costs to its customers, that DEP has complied with the coal ash beneficiation statute and the Commission's requirements, and that DEP's construction and operation of its two beneficiation projects since the last rate case have been sufficient to prevent unnecessary costs to customers. *Id.* at 20-25. Finally, witness Lucas found that DEP

properly credited North Carolina retail customers with proceeds from the insurance litigation. *Id.* at 26.

Public Staff witnesses Zhang and Boswell recommended that the Commission return all expiring amortizations to customers as a single rider over a period of one year with interest. Tr. vol. 19, 73.

CIGFUR witness Gorman recommended two revenue requirement adjustments to DEP's recovery of CCR compliance costs. Tr. vol. 21, 438-39.

The adjustments recommended by the Public Staff and CIGFUR regarding CCR costs were resolved in the Revenue Requirement Stipulation. While the Revenue Requirement Stipulation did not specifically address the CCR cost adjustments recommended by CIGFUR or the Public Staff, Section III of the stipulation provides that no further adjustments other than those specifically identified in the stipulation would be made to DEP's base period revenue requirement. In addition, Paragraph 7 of Section II of the Revenue Requirement Stipulation notes that the Public Staff's proposal to return expiring amortizations to customers in a single rider only applies to non-CCR over-amortizations. Tr. Ex. vol. 7.

Based on the entire record in this proceeding, including the testimony cited above as well as the relevant provisions of the Revenue Requirement Stipulation, the Commission concludes that the CCR costs sought for recovery are reasonable and prudent and consistent with the CCR Settlement. The Commission also concludes that DEP has complied with the CCR Settlement and has made the agreed-upon adjustments in this case to reflect that settlement. The Commission approves DEP's applying the over-amortization of CCR costs as established in the 2017 Rate Case in the amount of $8.5 million against the CCR deferred balance in this case, and the Commission approves the recovery of the net deferred balance over a five-year period. The Commission also approves DEP's request to continue the deferral of any CCR cost DEP incurs subsequent to March 31, 2023, for future recovery consistent with the CCR Settlement.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 20-21

Harris Land Sales

The evidence supporting these findings of fact is included in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witness Jiggetts and Public Staff witnesses Zhang and Boswell; the Revenue Requirement Stipulation; and the entire record in this proceeding.

The Commission required deferral of the gains on the sale of excess land at DEP's Harris nuclear plant in its August 13, 1992 Order in Docket Nos. E-2, Subs 537 and 333. In 2020 and 2021, DEP completed five sales transactions of excess land and deferred the North Carolina retail share of the gains on those transactions in compliance with the Commission's order. Tr. vol. 13, 195. DEP proposes to amortize those deferred gains over

a six-year period. *Id.* The Public Staff, however, proposed a four-year amortization period. Tr. vol. 19, 72. The Revenue Requirement Stipulation provides for a three-year amortization period. Revenue Requirement Stipulation § III.22, Tr. Ex. vol. 7. No intervenor took issue with this provision of the stipulation. The Commission concludes that the evidence supports the three-year amortization period the parties propose in the Revenue Requirement Stipulation, and that the three-year amortization period is just and reasonable and fair to all parties and should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 22-23

Roxboro Wastewater Treatment Regulatory Asset

The evidence supporting these findings of fact is in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witness Jiggetts and the joint testimony and exhibits of Public Staff witnesses Zhang and Boswell; the Revenue Requirement Stipulation; and the entire record in this proceeding.

In the 2019 Rate Case, the Commission allowed DEP to establish a regulatory asset for the unrecovered costs associated with the Roxboro Wastewater Treatment Plant at the time of its early retirement. The Commission allowed amortization of the regulatory asset at the existing depreciation rate to continue until it determined an appropriate amortization period in a future rate case. DEP proposed to amortize the remaining regulatory asset over a five-year period. Tr. vol. 13, 189-90. Public Staff witnesses Zhang and Boswell recommended an amortization period of 11 years, consistent with the overall remaining depreciable life of the assets if they had remained in service. Tr. vol. 19, 71. The Revenue Requirement Stipulation, Section III, Paragraph 24, provides for a 12-year amortization period for the recovery of the Roxboro Wastewater Treatment Plant regulatory asset. Tr. Ex. vol. 7. The Commission concludes that the evidence presented supports the 12-year amortization period in the Revenue Requirement Stipulation, and that the 12-year amortization period is just and reasonable and fair to all parties and should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 24-25

Revenue Requirement Stipulation – Storm Securitization Overcollections

The evidence supporting these findings of fact is in DEP's verified Application and Form E-1, the testimony and exhibits of DEP witness Jiggetts, and the entire record in this proceeding.

In the Agreement and Stipulation of Partial Settlement with the Public Staff filed in Docket No. E-2, Sub 1262, DEP agreed to establish regulatory asset or regulatory liability accounts for the purpose of tracking up-front financing costs and servicing and administration fees related to storm securitization. In the instant proceeding, DEP proposed to amortize the regulatory liability of $1.0 million for overcollections associated with storm securitizations over a three-year period. Tr. vol. 13, 202-03. The Public Staff

did not oppose this recovery timeframe. No intervenor took issue with this proposal. The Commission concludes that the evidence supports the three-year amortization period DEP proposes, and that the three-year amortization period is just and reasonable and fair to all parties and should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 26

Cost of Debt

The evidence supporting this finding of fact is in DEP's verified Application and Form E-1, the testimony and exhibits of DEP witness Newlin, the Revenue Requirement Stipulation, and the entire record in this proceeding.

DEP witness Newlin testified that DEP's long-term debt cost as of December 31, 2021, was 3.71%, which was the value DEP used to determine the revenue requirement in DEP's Application. Tr. vol. 9, 97. Section III, Paragraph 1 of the Revenue Requirement Stipulation establishes that the embedded cost of debt as of March 31, 2023 shall be used to calculate DEP's revenue requirement. Tr. Ex. vol. 7. DEP witness Jiggetts presented in her supplemental testimony that the embedded cost of debt as of March 31, 2023, is 4.03%.

No intervenor offered any evidence opposing this provision of the stipulation. The Commission therefore concludes that the use of a debt cost of 4.03% per the terms of Section III, Paragraph 1 of the Revenue Requirement Stipulation is just and reasonable to all parties considering all the evidence presented.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 27

Accounting Adjustments in Revenue Requirement Stipulation

The evidence supporting this finding of fact is included in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Council, Jiggetts, Quick, Speros, Stewart, Ray, and Turner, Public Staff witnesses Zhang and Boswell, McLawhorn, and Metz, and CIGFUR witness Gorman; the Revenue Requirement Stipulation; and the entire record in this proceeding.

Summary of Evidence

Incentive Compensation

In his direct testimony, DEP witness Stewart included as a cost of service incentive compensation at target levels that are assigned or allocated to DEP. Tr. vol. 16, 212. Public Staff witnesses Zhang and Boswell testified that incentive compensation related to the Earnings Per Share (EPS) and Total Shareholder Return (TSR) metrics for all employees should be removed from the revenue requirement because these metrics

provided a direct benefit to shareholders rather than ratepayers. Tr. vol. 19, 48-49. CIGFUR witness Gorman concurred with this assessment. Tr. vol. 21, 405.

In rebuttal, DEP witness Stewart refuted these contentions, asserting that metrics such as EPS and TSR are appropriate for recovery, as they benefit customers. Tr. vol. 23, 293-95.

The Revenue Requirement Stipulation establishes that DEP employee incentives should be adjusted to remove incentive pay related to EPS and TSR for the top levels of DEP's leadership, but not for the remainder of the employees. Revenue Requirement Stipulation § III.12, Tr. Ex. vol. 7. No intervenor took issue with this provision of the Revenue Requirement Stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Rent Expense

DEP witness Jiggetts' direct testimony included a pro forma adjustment to increase O&M expenses to reflect incremental rent expenses, net of savings, associated with the changes in the Charlotte real estate portfolio and the Duke Energy Plaza building. Tr. vol. 13, 187. Public Staff witnesses Zhang and Boswell removed the portion of rent expense related to the Duke Energy Plaza building because the building is still under construction and cannot be utilized for its intended purpose. Tr. vol. 19, 58. The Public Staff included additional amounts to bring the rent expense to a representative level by utilizing some 2021 costs and applying the updated DEBS allocation. In addition, the Public Staff expressed concerns about the real estate portfolio, considering the reduction in work force and DEP's new workforce model allowing employees to work a hybrid schedule, reducing the office facilities necessary at any given time. *Id.*

In rebuttal testimony, DEP witness Jiggetts testified that DEP does not agree with the Public Staff's adjustments to rent expense and that the rent expense as calculated by DEP reflects all known and measurable updates to the rent costs expected to be incurred by DEP. Tr. vol. 23, 76-77. In addition, she noted that DEP began incurring rent expense for the Duke Energy Plaza on January 1, 2023, and that DEP included a full year of expense for the building because, as explained in the rebuttal testimony of DEP witness Council, the detailed schedule for the building shows that all construction will be completed, and the building occupied by the effective date of the new rates in this proceeding. *Id.* at 77. Thus, she testified that the Duke Energy Plaza rent expense is a known and measurable and prudent and reasonable expense that will be incurred by DEP, which is a fact that the Public Staff had not challenged. *Id.* Further, she testified that because DEP is paying rent expense to DEC for the Duke Energy Plaza building, if the Duke Energy Plaza rent expense is removed from DEP's revenue requirement, the comparable adjustment to remove the rent income from DEC should be made to keep the revenue and costs between the affiliates aligned. *Id.* at 78. In her rebuttal testimony, DEP witness Council testified that the Duke Energy Plaza building is presently in use, with several floors currently occupied, and that the entire building is anticipated to be

completed and fully occupied by third quarter 2023, which is before the requested rates become effective in this case. *Id.* at 247.

The Revenue Requirement Stipulation, in Section III, Paragraph 13, provides for an increase in test year rent expense of $4,440,000 on a North Carolina retail basis for increased rent expense, net of depreciation savings. Tr. Ex. vol. 7. The parties further agreed to address the reasonableness and prudence of the costs of the Duke Energy Plaza in the DEC Rate Case in Docket No. E-7, Sub 1276. Tr. vol. 23, 78. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Reliability Assurance O&M Adjustment

In her direct testimony, DEP witness Turner testified regarding the importance of keeping DEP's remaining coal-fired assets in efficient working order to support customer's energy needs as DEP plans for those units' retirement and explained that DEP will continue to incur costs for these assets as appropriate and prudent to ensure that reliable cost-effective electricity remains available while DEP develops and implements replacement of the coal fleet. Witness Turner also testified that the fossil/hydro units operated efficiently and reliably during the test period. Tr. vol. 12, 94-95, 99.

In her supplemental testimony, witness Turner explained the rationale for DEP's pro forma adjustment to O&M expenses for reliability assurance. Witness Turner stated that the adjustment increased by $7.8 million the test period O&M costs related to planned reliability assurance projects. These additional projects are necessary to contribute to the reliability of plans for the Roxboro and Mayo plants and include winterization projects. Tr. vol. 12, 118.

Public Staff witness Metz testified regarding DEP's historic operations of its generating fleet since the 2019 Rate Case and other discrete performance metrics over the last decade. Part of his review considered the overall system reliability, service quality, and reasonableness of using DEP's test year O&M costs as a proxy for expected future costs. The primary purpose of the review was to determine whether and how DEP's historic operation of its generation fleet has changed. Witness Metz supported the use of the weighted equivalent availability factor (WEAF) or weighted equivalent unplanned outage factor (WEUOF), as well as other metrics, in reviewing fleet performance and noted that different conclusions are possible depending on the performance metrics one uses. He clarified that the intent of the review was not to determine reasonableness or prudence of DEP's historic operations of its fleets. Witness Metz concluded that the fossil fleet's performance has degraded over the last decade, and suggested that if that trend continues, reliability could be impacted, especially as these units must perform in a different manner than originally designed and as DEP removes other generation units from service. Witness Metz also noted DEP's reduction of fleet O&M expenses, which DEP accomplished in part by reducing staffing, in the years following its recent rate cases. Tr. vol. 16, 431-42, 447.

Witness Metz testified that there is merit to the proposed adjustment based on the coal unit availability and outage rates but also asserted that DEP reduced the level of ongoing generating plant non-fuel O&M expense the very next year after Commission approval in the last two general rate cases. Tr. vol. 16, 447. Based on the concerns he identified with O&M expenses and fleet performance, witness Metz recommended several modifications to the adjustment to coal test year O&M expenses (Form E-1, Item 10, NC-2160[7]):

- Since DEP should have already completed the Reliability Threat Analysis and Winterization O&M project work, witness Metz recommended exclusion of the costs related to Reliability Threat Analysis work from any proposed pro forma adjustment and supported the inclusion of a reduced amount for the Winterization O&M work. Tr. vol. 16, 449.

- Since the majority of the costs related to reliability improvements appeared to be capital-related rather than O&M related, witness Metz recommended inclusion of those costs in the MYRP and their exclusion from the pro forma adjustment. *Id.* at 450.

- Since there is no certainty that DEP will hire and continue to employ the proposed level of increased staff at the Roxboro and Mayo coal plants, witness Metz proposed decreasing by half DEP's 2023 staffing work request. *Id.*

- Witness Metz recommended that the Repair Hold category adjustment should be rejected because this category is an attempt to clear a backlog of a larger volume of inventory (spare parts) to be repaired. *Id.* at 449-51.

In her rebuttal testimony, DEP witness Turner described the challenge of optimizing plant investments and maintaining sufficient staffing for the coal-fired assets that DEP will retire in the near-term future. Mayo and Roxboro Stations will be the last DEP coal-fired stations DEP will retire, but DEP continues to need them to serve customers. Witness Turner explained that DEP must maintain the continued reliability of these units until replacement generation is in place. Witness Turner explained further that DEP's strategy for addressing this challenge has evolved as circumstances have changed. DEP seeks to allocate more investment to the fossil units that are the most efficient and economical, and therefore most often dispatched (as well as projected to be necessary over the long term), while still making prudent but measured investments in the coal units, balancing the need to maintain their reliability while looking forward to their eventual retirement. Tr. vol. 12, 121-22.

Witness Turner also responded to witness Metz's specific recommendations regarding the Reliability Assurance pro forma NC-2160 and provided additional details regarding this work. With respect to the major components/Reliability Threat Analysis work, she explained that DEP identified this work as necessary through the Reliability Threats

[7] Pro-forma NC-2160 was filed in DEP's February update.

Analysis that DEP conducted in late 2022 and that DEP intends the work to address large items of equipment DEP needs to maintain unit reliability. Witness Turner disagreed with witness Metz's recommendation to remove the costs for the major components/Reliability Threat Analysis work from the pro forma. She explained that the Reliability Threat Analysis is not winter storm related and that, therefore, DEP would not have done the work reflected in the pro forma item subsequent to previous winter storms. Tr. vol. 12, 124-25. Witness Turner testified that the winterization O&M project category represents work DEP identified as necessary in early 2023 following winter storm Elliott and includes the estimated cost of a study of needed repairs and installation of additional insulation, wind breaks, and updated heat trace systems to address freeze issues. Witness Turner stated that the operator workaround project category of reliability improvements represents a deeper level review of system health at the coal stations. The operator workaround project category typically addresses smaller items that can impact reliability, particularly when combined with other reliability issues. *Id.* at 127-29. Witness Turner testified that the staffing project category represents DEP's forward projection of costs, primarily salary, benefits, and overhead, to ensure that DEP has adequate resources to operate the coal units until retirement. *Id.* at 130-31. Witness Turner also testified that DEP identified the repair hold project category through the Reliability Threat Analysis and that it represents major components that do not have a readily available spare and have long lead times that supply chain challenges have exacerbated. *Id.* at 131-32.

Witness Turner also responded to witness Metz's testimony regarding fossil fleet performance and O&M investment, noting that it is important to view the entire fleet's performance and not focus solely on coal. Based on the equivalent forced outage factor (EFOF) metric, she stated that DEP's fossil fleet is performing consistent with or better than the industry average, and the natural gas units have exceeded industry average performance. Tr. vol. 12, 133-35. Witness Turner emphasized that the evaluation of fleet performance and reliability assurance needs has changed over time and will differ between coal units and natural gas units. She concluded that the Reliability Assurance pro forma represents the adjustments that DEP has identified as needed to maintain the coal units in reliable condition. *Id.* at 136-38.

The Revenue Requirement Stipulation provides for inclusion of an additional $6 million (North Carolina retail) of annual incremental spend for ongoing O&M for DEP's coal generation fleet for discrete programs and targeted categories that witness Turner lists in her supplemental and rebuttal testimony and for which she includes supporting workpapers. The parties agreed that DEP will track and report on an annual basis the actual spend and employee head count for each coal generation station over the MYRP period in a manner to be agreed upon between DEP and the Public Staff. DEP will record any cumulative underspend to a regulatory liability account accrued through the end of the MYRP period (September 2026) and return it to customers in the next general rate case. Revenue Requirement Stipulation § III.14, Tr. Ex. vol. 7. DEP witness Jiggetts and Public Staff witnesses McLawhorn and Metz supported this provision in their settlement supporting testimony. Tr. vol. 13, 254-56, 259; Tr. vol. 16, 513.

The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding. DEP has demonstrated that these funds are necessary to maintain the reliability of the coal units until their anticipated retirement. The Public Staff raised valid concerns regarding the performance of the DEP fossil fleet, specifically the coal units, and the Commission recognizes that reviews of performance can have different results depending on the metric the reviewer uses to evaluate it. DEP's tracking and annual reporting of the actual spend and employee head count for each coal generation station over the MYRP period will help to further inform this discussion as these units' retirements approach. The parties' agreement that DEP will record any cumulative underspend to a regulatory liability account accrued through the end of the MYRP period and return it to customers in the next general rate case addresses the concerns the Public Staff raised regarding O&M spending. In its first annual report, the Commission directs DEP to update the Commission on the agreed-upon specifics for the tracking and reporting of the actual spend and employee head count for each coal generation station.

Aviation Expense

In its initial filing, DEP removed 50.0% of corporate-related aviation expenses allocated to DEP in the test period that are not related to aerial patrol. DEP witness Jiggetts testified that DEP believes these costs were reasonable, prudent, and appropriate to recover from customers, but elected to remove them in this case. Tr. vol. 13, 184. Public Staff witnesses Zhang and Boswell recommended, in addition to the 50.0% already removed by DEP, removal from DEP's cost of service of additional flight costs that the Public Staff found to be unrelated to the provision of utility service, including portions of certain commercial international flights. Tr. vol. 19, 49.

The Revenue Requirement Stipulation removes aviation expenses associated with international flights, in addition to the 50.0% of aviation expenses removed in the Application. Revenue Requirement Stipulation § III.15, Tr. Ex. vol. 7. No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Executive Compensation

In its Application, DEP removed 50.0% of the compensation of the five Duke Energy executives with the highest level of compensation allocated to DEP. DEP witness Jiggetts explained that while DEP believes these costs are reasonable, prudent, and appropriate to recover from customers, DEP has, for purposes of this case, made an adjustment to this item. Tr. vol. 13, 181. Public Staff witnesses Zhang and Boswell recommended an additional adjustment to remove 50.0% of the benefits of these top five Duke Energy executives, noting that the adjustment was consistent with similar recommendations the Public Staff has made and the Commission has approved in past rate cases. Tr. vol. 19, 45-46.

Section III, Paragraph 16 of the Revenue Requirement Stipulation provides for removal of 50.0% of the benefits of the five Duke Energy executives with the highest amounts of compensation, in addition to the 50.0% of their compensation DEP removed in the Application. Tr. Ex. vol. 7. No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Charitable Contributions and Sponsorships

In his direct testimony, DEP witness Speros certified that DEP's cost of service does not include any expenditures for charitable contributions in accordance with the requirement of Commission Rule R12-13(a) as amended. Tr. vol. 13, 46. Witness Speros testified that Commission Rule R12-13(a) requires that in every application for a change in rates, a utility must certify in its prefiled testimony that its application does not include certain costs, including charitable contributions. *Id.* Witness Speros further explained that he performed additional reviews of DEP's cost of service to ensure that DEP did not include any costs that Commission Rule R12-13 prohibits in the Application. *Id.* at 47.

Public Staff witnesses Zhang and Boswell recommended an adjustment to charitable contributions of approximately $152,000 to exclude expense amounts paid to the Chambers of Commerce and other donations. Tr. vol. 19, 56; Tr. vol. 23, 59; the Public Staff Accounting Exhibit 1, Schedule 1, line 33, Tr. Ex. vol. 19. Witnesses Zhang and Boswell stated that these expenses should be disallowed because they do not represent actual costs of providing electric service to customers. Tr. vol. 19, 56.

In his rebuttal testimony, witness Speros explained that Chambers of Commerce promote business and economic development, which in turn helps to retain and attract customers to DEP's service territory. In addition, funds DEP paid to Chambers of Commerce that DEP does not specify as a donation or lobbying are in fact supporting business or economic development and DEP properly considers them utility operating expenses and includes them in DEP's cost of providing electric service to customers. Tr. vol. 13, 73.

The Revenue Requirement Stipulation establishes that no adjustment will be made to charitable contributions and sponsorships. Revenue Requirement Stipulation § III.17, Tr. Ex. vol. 7. No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Board of Directors Expense

With respect to Board of Directors expense, Public Staff witnesses Zhang and Boswell recommended an adjustment to remove 50.0% of the expenses associated with the Board of Directors of Duke Energy that had been allocated to DEP, similar to the Public Staff's recommendation regarding executive compensation and benefits of the five Duke Energy executives with the highest level of compensation allocated to DEP in the

test period. Tr. vol. 19, 47. In his response, DEP witness Stewart indicated that the law requires DEP to have a Board of Directors and that the costs of being an investor-owned utility, including Board costs, are in fact costs of service. Tr. vol. 23, 304. He argued that it is not fair or reasonable to penalize DEP for being an investor-owned utility with attendant requirements to that corporate structure. *Id.*

The Revenue Requirement Stipulation accepts the Public Staff's recommended adjustments to the Board of Directors' expenses. Revenue Requirement Stipulation § III.18, Tr. Ex. vol. 7. No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Lobbying Expense

In his direct testimony, DEP witness Speros certified that DEP's cost of service does not include any expenditures for lobbying, political or promotional advertising, political contributions, or charitable contributions in accordance with the requirement of Commission Rule R12-13(a) as amended. Tr. vol. 13, 47. Witness Speros further explained that he performed additional reviews of DEP's cost of service to ensure that DEP did not include costs that Commission Rule R12-13 prohibits in the Application. *Id.* With respect to lobbying expenses, Public Staff witnesses Zhang and Boswell adjusted O&M expenses to remove additional costs associated with Federal Government Affairs, Governmental Affairs and External Relations, and National Engagements that DEP recorded above the line in the test year. Witnesses Zhang and Boswell stated that Commission Rule R12-12 and the Commission's Order in Dominion Energy North Carolina's 2012 Rate Case (2012 DENC rate case) justify removal of these expenses. Tr. vol. 19, 50.

In rebuttal testimony, witness Speros stated that DEP disagrees that any adjustment to remove any additional cost from the cost of service under Commission Rule R12-12 or the Commission's decision in the 2012 DENC rate case is necessary. Tr. vol. 13, 63.

The Revenue Requirement Stipulation establishes that, while DEP maintains its position that its cost of service in this case did not include any lobbying expenses, for the purposes of settlement, DEP accepted the adjustments proposed by the Public Staff for lobbying expenses. Revenue Requirement Stipulation § III.19, Tr. Ex. vol. 7. No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Nuclear End-of-Life Reserve

Public Staff witness Metz recommended an $8 million disallowance of four-year Repair Hold and Quality Assurance (QA) Hold costs for nuclear inventory that has been on hold for four years or more. Tr. vol. 16, 427-28. He further recommended that a 5.0%

salvage value be applied to nuclear materials and supplies (M&S) inventory for purposes of calculating DEP's end of life nuclear reserve. *Id.* at 430.

In his rebuttal testimony, DEP witness Ray opposed witness Metz's recommendation of removal of $8 million from the end-of-life nuclear reserve, explaining that DEP holds this inventory to support plant operations and it is therefore beneficial to customers. Tr. vol. 23, 282. Witness Ray clarified that the fact that DEP maintains an item of M&S inventory in Repair Hold or QA Hold longer than four years does not mean that DEP will not ultimately use such inventory or have it available for use. *Id.* at 282-85. Regarding salvage value, witness Ray testified that if DEP receives approval of its requests for subsequent license renewal of its nuclear units, there will be few to no similar technology nuclear plants in operation at the time DEP's units retire in the next 20 years. With few to no similar vintage nuclear or coal plants in operation, the market for the more expensive inventory items such as pumps, motors, and valves will be severely limited or nonexistent. DEP does not expect markets for inventory components at or near market value to exist. Witness Ray indicated that, while DEP generally agrees that there may be some small amount of salvage value for nuclear M&S inventory at its end of life, disposal expenses will largely offset any such value. He concluded that DEP does not support maintaining a particular salvage value going forward until the retirement of the nuclear units because doing so would reduce DEP's ability to adjust the salvage value for M&S inventory as needed in the future based on changed circumstances. *Id.* at 288.

The Revenue Requirement Stipulation accepts the Public Staff's adjustment to end-of-life nuclear materials and supplies reserve expense, reduced as described in the direct testimony of Public Staff witness Metz. Revenue Requirement Stipulation § III.20, Tr. Ex. vol. 7. DEP witness Jiggetts and Public Staff witnesses McLawhorn, Metz, Zhang, and Boswell supported this provision in their settlement supporting testimony. Tr. vol. 13, 254, 60; Tr. vol. 16, 512. The Commission concludes that the adjustments to the nuclear end-of-life reserve established in the Revenue Requirement Stipulation are supported by the evidence presented, is just and reasonable and fair to all, and should be approved.

Coal Inventory

Based on DEP's historical performance, updated coal inventory analysis, and recent coal inventory holdings, Public Staff witness Michna recommended that DEP maintain its current coal inventory of 35 days of 100.0% full load burn and reduce the corresponding DEP adjustment that increased coal inventory to 40 days by $9,971,719 to account for this change. Tr. vol. 21, 292-93.

DEP witness Turner opposed witness Michna's adjustment. Witness Turner asserted that the adjustment failed to contemplate the changing market factors impacting a reliable fuel supply, namely the inability of the coal supply chain to timely respond to volatility in coal generation demand and ignored DEP's updated average inventory of 38.8 days. Witness Turner concluded that it is prudent to increase the target from 35 days to 40 days. Tr. vol. 12, 142.

The Revenue Requirement Stipulation accepts the annual 35 full load day burn average to establish the level of coal inventory for purposes of establishing a revenue requirement. Revenue Requirement Stipulation § III.21, Tr. Ex. vol. 7. DEP witness Jiggetts and Public Staff witnesses McLawhorn, Metz, Zhang, Boswell supported this provision in their settlement supporting testimony. Tr. vol. 13, 254, 261; Tr. vol. 16, 513-15. The Commission concludes that the 35-day coal inventory target proposed in the Revenue Requirement Stipulation is supported by the evidence presented, is just and reasonable and fair to all, and should be approved.

Credit Card Payment Fees

In her direct testimony, DEP witness Quick proposed to offer a Fee-Free program for small and medium nonresidential customers who make payments using debit, credit, prepaid, or electric check (Card Payments) to pay their electric bills. Tr. vol. 7, 65. In support of DEP's request, she noted that residential customers have a transaction Fee-Free program for Card Payments, which the Commission approved in DEP's last general rate case. Witness Quick recounted that nonresidential customers making a Card Payment are subject to a convenience fee of $8.50 per payment for payments up to $10,000; for payments in excess of $10,000, the convenience fee is 2.75% of the amount paid. *Id.* at 105. DEP's vendor charges the convenience fee and DEP receives no portion of it. *Id.* at 105-06. Based on customer feedback and requests, witness Quick proposed in this case to offer the Fee-Free program for Card Payments to nonresidential customers making bill payments up to $3,000. *Id.* at 106. DEP, instead of the customer, would pay the vendor the convenience fees for these Card Payments and incorporate the expense into the cost of service for recovery through its base rates. Tr. vol. 7, 104-06.

In their joint testimony, Public Staff witnesses Zhang and Boswell opposed DEP's proposal to socialize the credit card payment fees for nonresidential customers. Tr. vol. 19, 51. They noted that the current volume of customers who use this method of payment accounts for less than 1.0% of the overall bill pay transactions volume. *Id.* Additionally, witnesses Zhang and Boswell distinguished this proposal from the socialization of the residential credit card fees the Commission allowed in DEP's previous general rate case order by noting that the residential Fee-Free program had the potential to produce reductions in late payments and uncollectibles, but nonresidential customers do not experience the same level of late payments and uncollectibles as residential customers**.** *Id.* Therefore, they testified that they found no offsetting benefit of socialization of Card Payment fees for the nonresidential customers to general ratepayers. *Id.*

The Revenue Requirement Stipulation establishes that the credit card payment fees for nonresidential customers shall be removed from the revenue requirement in this case. Revenue Requirement Stipulation § III.23, Tr. Ex. vol. 7. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Payroll and Benefits

DEP and other Duke Energy affiliates continuously review operational matters including workforce staffing levels. In connection with such a review, DEP implemented planned headcount reductions beginning in 2021 through the first part of 2023, leading to a reduction in DEP's otherwise applicable revenue requirement. While DEP witness Jiggetts' schedules reflected the reduction through the March 31, 2023 cutoff date applicable to this case, Section III, Paragraph 25 of the Revenue Requirement Stipulation provides for a further reduction of the revenue requirement for the payroll costs and associated benefits for the former employees subject to the Work Reduction Initiative through the end of May 2023. *Id.* No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

Production O&M Reduction to Reflect Capitalization Policy Change

In his supplemental testimony, Public Staff witness Metz described how DEP reclassified miscellaneous line items from O&M to capital plant. Witness Metz did not take issue with this action for purposes of this proceeding but testified to his concern that test year O&M expenses used to establish an ongoing expectation of future spending may be overstated. To account for the impact of the reclassification, he recommended the removal of $463,000 on a system basis from DEP's test year expenses. Tr. vol. 16, 506-08.

The Revenue Requirement Stipulation establishes a reduction in production O&M of $463,000 on a system basis to account for the change in DEP's capitalization policy. Revenue Requirement Stipulation § III.26, Tr. Ex. vol. 7. DEP witness Jiggetts and Public Staff witnesses McLawhorn, Metz, Zhang, and Boswell supported this provision in their settlement supporting testimony. Tr. vol. 13, 254, 262; Tr. vol. 16, 512. The Commission concludes that the production O&M reduction proposed in the Revenue Requirement Stipulation is supported by the evidence presented, is just and reasonable and fair to all, and should be approved.

Vegetation Management O&M

In his direct testimony, DEP witness Maley described DEP's transmission Integrated Vegetation Management (IVM) Plan and its goal of removing and/or controlling incompatible vegetation within and along transmission rights of way. Witness Maley indicated that the IVM includes planned corridor work, reactive work, and floor management work, with DEP's prioritizing the first two categories based on threat assessments. Witness Maley also indicated that DEP had included an increase in vegetation management costs in its test period pro forma adjustments to account for increased outside labor costs and that this adjustment also covers vegetation management costs associated with the expansion of existing substation sites. Tr. vol. 10, 178-79.

In his direct testimony, DEP witness Guyton testified that DEP utilized a reliability prioritization model to drive its routine IVM program. The other important components of

DEP's vegetation management include the following programs: herbicide management, hazard trees, reactive customer requested activities, and post outage vegetation management activities. Witness Guyton also testified that DEP continues to utilize a seven-year cycle for distribution vegetation management in nonurban areas and a three-year cycle in urban areas consistent with DEP's 2015 Tree Growth Study. Tr. vol. 10, 51-52.

In his direct testimony, Public Staff witness T. Williamson described DEP's IVM Plan and provided a summary of the operation of that plan since 2015. This description included both vegetation within DEP's rights of way and vegetation that lies outside DEP's rights of way. DEP's hazard tree program manages the vegetation which lies outside DEP's rights of way. Witness T. Williamson also recommended changes to DEP's assessment activities (which would increase the frequency of its review of distribution lines), and recommended reductions in two parts of the Distribution System Vegetation Management budgets. Finally, witness T. Williamson recommended changes to the Distribution and Transmission vegetation plan reporting requirements. Tr. vol. 21, 205-18.

In his rebuttal testimony, DEP witness Guyton addressed Public Staff witness T. Williamson's vegetation plan recommendations and indicated that the significant increase in work that would be necessary to implement his recommendations for increased observation of the distribution system would increase costs and endanger DEP's ability to meet its other vegetation management plan goals. Witness Guyton further stated that reductions in Distribution Vegetation Management plan budgets were contrary to DEP's actual experience of increasing vegetation management costs. Tr. vol. 10, 143. Witness Guyton also objected to two of the additional reporting requirements witness T. Williamson suggested on the grounds that the practicalities of how the vegetation management plan operates precludes reporting on vegetative miles and hazard tree targets. *Id.*at 147.

No other party presented evidence on these matters.

The Revenue Requirement Stipulation provides for a reduction in DEP's Distribution O&M Demand Program budget to $2,721,604[8] and for adoption of the additional vegetation management reporting requirements recommended by Public Staff witness T. Williamson except for reporting on vegetative miles and hazard tree targets, as noted on page 52 of the rebuttal testimony of DEP witness Guyton. Revenue Requirement Stipulation §§ III.27 and IV.37, Tr. Ex. vol. 7. The Commission concludes that these adjustments in the Revenue Requirement Stipulation are supported by the evidence presented and are just and reasonable and fair to all and should be approved.

Lead-Lag Study

As part of its filing in this case, DEP submitted a lead-lag study that was performed by Ernst & Young, LLP, and approved in the Commission's Order in the 2019 Rate Case.

[8] The $2,721,604 is the adjusted total related to O&M Demand Program. The amount of the adjustment was $789,309 on a system basis.

Tr. vol. 13, 43; Speros Direct Ex. 2, Tr. Ex. vol. 13. The lead-lag study was used to analyze transactions throughout the year to determine the number of days between the time services are rendered and payment is received (revenue lag), and the number of days between the time expenditures are incurred and payment is made for such services (expense or payment lead). Public Staff witnesses Zhang and Boswell recommended that DEP prepare and file a fully updated lead-lag study in its next general rate case. Tr. vol. 19, 43.

In his rebuttal testimony, DEP witness Speros stated that DEP plans to pursue a merger of the DEP and DEC utilities in the next rate case and will work with the Public Staff to determine if the timing of the next lead-lag study makes more sense before or after that case. Tr. vol. 13, 73.

The Revenue Requirement Stipulation incorporates DEP's agreement to perform a lead-lag study before the next general rate case proceeding and incorporate the results of that study in DEP's next rate case application. No intervenor took issue with this provision of the stipulation. The Commission concludes that the Revenue Requirement Stipulation provides a reasonable resolution of this issue for purposes of this proceeding.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT 28.

The evidence supporting this finding of fact is included in DEP's verified Application and Form E-1; the testimony and exhibits of Public Staff witnesses Metz, Zhang, and Boswell, including Accounting Second Supplemental Ex. 1, the Supplemental Revenue Requirement Stipulation, including Ex. 1; and the entire record in this proceeding.

The Revenue Requirement Stipulation involves a comprehensive resolution between the stipulating parties of a majority of the revenue requirement issues in this case. Because the Revenue Requirement Stipulation was entered into before the Public Staff had completed its audit of DEP's third and final update of costs, the stipulation provides expressly that the stipulation does not prevent the Public Staff from completing its audit of DEP's updates or making proposed adjustments to the updated revenue requirements based on the audit. The Public Staff completed its audit of the updates in June 2023, and the Public Staff and DEP entered into the Supplemental Revenue Requirement Stipulation, filed on June 27, 2023, in which the parties agreed to certain further minor adjustments to the revenue requirement. The Supplemental Revenue Requirement Stipulation lists four areas of agreement between DEP and the Public Staff. Tr. Ex. vol. 24.

Sheds (New Hill Timpson Training Sheds)

DEP and the Public Staff agreed that DEP shall remove 50% of the costs associated with the New Hill Timpson Training Sheds from its revenue requirement for purposes of this proceeding only. The removal will result in a decrease of $186,000 in Plant in Service on a North Carolina retail basis. *Id.*

Wilson 230kV Project

DEP and the Public Staff agreed that DEP will reclassify $670,989 system amount related to the Wilson 230kV project from distribution to transmission plant. They further agreed that DEP shall offset the March 2023 plant in service amount of $1.423 million on a system basis associated with the Wilson 230kV project with an estimate of the insurance proceeds in the amount of $897 thousand on a system basis that DEP will receive. The parties acknowledged that actual proceeds received may be different than the estimates captured and agree that they will address any necessary adjustments in a future proceeding. *Id.*

Laptop Issuance

DEP and the Public Staff agreed that, for purposes of this proceeding, DEP will remove new laptop devices not issued to employees as of the capital cutoff date from the revenue requirement. The removal will result in a decrease to Plant in Service of $2,370,000 on a North Carolina retail basis. *Id.*

Capitalization Policy

DEP and the Public Staff agreed that there will be no adjustment to the capitalized costs related to the February 2023 Brunswick Unit 2 nuclear refueling outage in this proceeding. They further agreed that DEP will assist the Public Staff in reviewing DEP's capitalization procedures before DEP files its next general rate case. *Id.*

On June 27, 2023, the Public Staff filed the joint supplemental settlement testimony of witnesses Metz, Zhang, and Boswell in support of the Supplemental Revenue Requirement Stipulation. According to the Public Staff witnesses, the most important benefits that the stipulation and the agreed upon adjustments provide are: (1) an aggregate reduction in DEP's proposed revenue increase in this proceeding; and (2) the avoidance of litigation between the parties on the settled issues and the associated increased accumulation of rate case expense recovery from ratepayers. Tr. vol. 24, 47. The Public Staff further testified that the Commission should approve the Supplemental Revenue Requirement Stipulation because of these benefits to ratepayers. *Id.*

The Commission concludes that the adjustments in the Supplemental Revenue Requirement Stipulation are supported by the evidence presented and should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 29

MYRP Capital Investments

The evidence supporting this finding of fact is included in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Maley, Guyton, Ray, Turner, Strasburger, and LaRoche, Public Staff witnesses Thomas, Metz, T. Williamson, Nader,

Zhang, and Boswell, AGO witness Nelson, NCJC, et al. witnesses Hill and Duncan, , Sierra Club witness Goggin; the Revenue Requirement Stipulation; and the entire record in this proceeding.

In its Application, DEP identified capital spending projects projected to be placed in service during the MYRP period. These projects consist of transmission and distribution infrastructure, solar and battery storage, enterprise technology and security, and fossil, hydro, and nuclear investments.

DEP provided support for its MYRP projects through its Application, direct, supplemental direct, and rebuttal testimony of DEP witnesses discussed below, as well as at the July 2022 Transmission and Distribution Technical Conference. Furthermore, the Public Staff conducted substantial discovery regarding the projects DEP proposed in its MYRP. DEP's witnesses assert that DEP has provided sufficient information to justify the MYRP projects, while the Public Staff witnesses offered multiple critiques of DEP's documentation of the MYRP projects. The Revenue Requirement stipulating parties agreed to support the MYRP projects as modified in the Revenue Requirement Stipulation.

Transmission

DEP witness Maley testified in support of the MYRP transmission projects. Regarding future needs, witness Maley testified that, while DEP has worked hard to maintain the system and reliably meet customer needs, it must do more to improve the state's energy infrastructure to meet the challenges and opportunities that lie ahead. Tr. vol. 10, 170. Witness Maley testified that DEP designed its MYRP to address future challenges and opportunities and that the MYRP transmission projects include investments in the following categories: system intelligence, hardening and resiliency, transformer and breaker upgrades, and capacity and customer planning. *Id.* at 185.

Witness Maley testified that DEP selected and grouped targeted reliability improvements in the following MYRP projects, based on the areas that provide the greatest value to customers: system intelligence, vegetation management, transmission line hardening and resiliency, substation hardening and resiliency, transformer upgrades, breaker upgrades, and capacity and customer planning. *Id.* at 187. He explained that although these seven proposed MYRP investments are the same as those DEP presented in the July 25, 2022, MYRP Technical Conference, DEP has refined some of the location details and informed the Cost Benefit Analysis (CBA) with those details. *Id.*

In witness Maley's direct testimony and accompanying exhibits, he described the estimated costs of DEP's proposed MYRP transmission projects. *Id.*

In his supplemental direct testimony, witness Maley provided an update on the cost estimates applicable to transmission projects that DEP included in its MYRP based on certain criteria agreed upon with the Public Staff. *Id.* at 212-13. Witness Maley identified additional transmission MYRP project locations that DEP added to the MYRP after filing

his direct testimony, and identified those that it removed, along with the reasons behind such changes. *Id.* at 208. He provided updated project cost estimates for certain transmission MYRP projects, including explanations for the basis for such updated cost estimates. *Id.* at 212-13.

DEP witness Maley's Direct Supplemental Exhibit 1 provides the total updated costs of the proposed MYRP Transmission projects as follows:

1. Breakers - $103,434,999;

2. Capacity and Customer Planning - $624,078,511;

3. Substation Hardening and Resilience - $359,579,976;

4. System Intelligence - $72,766,544;

5. Transmission Line Hardening and Resiliency - $129,651,500;

6. Transformers - $114,269,580; and

7. Vegetation Management - $113,884,377.

Tr. Ex. vol. 10.

The modifications to proposed MYRP Transmission projects described in witness Maley's supplemental direct testimony and accompanying exhibits resulted in an updated estimated capital cost of DEP's proposed MYRP Transmission projects of $1,517,665,486.

Public Staff witness Metz testified as to multiple concerns with the MYRP projects, including outdated cost estimates, insufficient staffing levels to complete the projects on schedule, and the lack of coordination between business groups to increase project efficiencies. Tr. vol. 16, 461, 465-66, 481-83. Witness Metz recommended reducing the project contingency by half, arguing that DEP failed to justify the high contingency amount DEP budgeted for the projects. *Id.* at 491-92. He further recommended a 5.0% downward adjustment for all transmission projects in the MYRP to address potential construction efficiencies that could arise in the implementation of the MYRP. *Id.* at 494. Witness Metz also recommended the removal of certain transmission projects from the MYRP based on the analysis of Public Staff witness Chiles. *Id.* at 458.

AGO witness Nelson critiqued DEP's transmission planning and made several recommendations. AGO witness Nelson recommended that the Commission require DEP to conduct a study on the costs and benefits of grid-enhancing technologies (GETs). Tr. vol. 18, 123-30. Witness Nelson also recommended that DEP engage in regional transmission planning and asserted that regional planning could potentially displace projects in the MYRP. *Id.* at 138-41. Finally witness Nelson recommended that DEP pursue all funding options for transmission projects that are part of the IRA. *Id.* at 134.

Sierra Club witness Goggin recommended that the Commission require DEP to file a proactive transmission plan for all transmission expansion and upgrades needed to accommodate the interconnection of all new renewable resources required by 2035 under Duke's Carbon Plan. Tr. vol. 21, 789. Witness Goggin also recommended that the Commission direct DEP to use a "multi-value approach to planning transmission so that the identified upgrades meet needs related to public policy, economics, reliability, expanded interconnection with neighboring Balancing Authorities, and other categories of benefits…" Tr. vol. 21, 790.

Witness Maley addressed testimony from Public Staff witnesses Metz and Chiles. Specifically, he: (1) spoke of each MYRP project witnesses Metz and Chiles challenged and explained why the projects are necessary and appropriate for inclusion in the MYRP; (2) discussed DEP's methodology for ensuring that there is no overlap between the scope of different projects; (3) countered the argument that the Commission should reduce contingency components of the estimates for all MYRP transmission projects by 50.0%; (4) explained the basis for the contingency component of DEP's transmission projects; and (5) addressed witness Metz's recommendation that the Commission reduce all transmission project estimates by 5.0%. Tr. vol 10, 227-29, 246-47.

Witness Maley also addressed testimony of witnesses for the AGO and the Sierra Club. Witness Maley stated that he disagreed with AGO witness Nelson's recommendations. *Id.* at 259-60. Witness Maley testified that witness Nelson's recommendation to study GETs is inappropriate in this proceeding because the Commission already considered GETs in the Carbon Plan proceeding. *Id.* at 260. Also, witness Maley disputed witness Nelson's recommendations because they require activities already underway or that should be considered in the Carbon Plan or in the North Carolina Transmission Planning Collaborative (NCTPC). *Id.* Witness Maley mentioned that DEP witness Roberts explained how GETs are evaluated in his Carbon Plan testimony. Witness Maley stated that the Commission has already noted in its Carbon Plan Order that it "expects Duke to pursue all potential tax incentives or federal funding." *Id.* Witness Maley countered that new requirements imposed in this proceeding that circumvent resource planning and transmission planning are not reasonable. *Id.*

In his rebuttal testimony, witness Maley responded that Sierra Club witness Goggin's recommendations regarding transmission planning would fit better in the Carbon Plan and Integrated Resource Process (CPIRP) efforts than within the limited three-year window of the MYRP. Tr. vol. 10, 261. Witness Maley explained that Duke Energy stated in the March 15, 2023, NCTPC Transmission Advisory Group (TAG) presentation that it is pursuing the integration of a multi-value strategic transmission planning study into the local transmission planning process. Tr. vol. 10, 261. Since DEP is already pursuing this in the NCTPC, witness Maley testified that any further requirement is unnecessary. *Id.*

The Revenue Requirement Stipulation includes a 50.0% adjustment to the contingency amounts of the transmission projects as recommended by Public Staff witness Metz. The stipulation further provides that DEP will leverage project efficiencies to the extent practical in the implementation of the MYRP. The stipulation also establishes

that the transmission MYRP projects identified in DEP witness Abernathy's February 2023 MYRP update of Exhibit 4, Workpaper 5 and described in the direct and supplemental testimonies of DEP witness Maley are appropriate for inclusion in the MYRP. Based on the entire record in this proceeding, the Commission finds that DEP's proposed transmission projects are reasonable and shall be included in the MYRP for recovery. Tr. Ex. vol. 13.

The only parties that opposed portions of DEP's transmission projects included in the MYRP but not resolved through the Revenue Requirement Stipulation and other settlements are the AGO, as indicated by the testimony filed by AGO witness Nelson, and the Sierra Club, as indicated by witness Sierra Club witness Goggin.

The Commission agrees with DEP witness Maley's assertion that the recommendations of AGO witness Nelson and Sierra Club witness Goggin regarding transmission planning are designed to change DEP's decision-making regarding the types of transmission projects it undertakes. The Commission finds that the appropriate proceeding for consideration of changes to transmission planning is the CPIRP, or other proceedings.

N.C.G.S. § 62-133.16(c)(1)(a) provides that for the first year of an MYRP, the

> base rates . . . shall be fixed in a manner prescribed under G.S. 62-133 . . . plus costs associated with a known and measurable set of capital investments, net of operating benefits, associated with a set of discrete and identifiable capital spending projects to be placed in service during the first rate year.

The same provision specifies that:

> [s]ubsequent changes in base rates in the second and third rate years of the MYRP shall be based on projected incremental Commission-authorized capital investments that will be used and useful during the rate year and associated expenses, net of operating benefits, including operation and maintenance savings, and depreciation of rate base associated with the capital investments, that are incurred or realized during each rate year of the MYRP period.

N.C.G.S. § 62-133.16(c)(1)(a).

After having carefully reviewed all the evidence in the record, the Commission concludes that the evidence demonstrates that the proposed MYRP transmission projects satisfy the requirements set forth in N.C.G.S. § 62-133.16(c)(1)(a). The Commission further concludes that the evidence supports approval of the Revenue Requirement Stipulation's provisions regarding these transmission projects and that the transmission MYRP costs thereunder are just and reasonable and consistent with the public interest.

Distribution

DEP witness Guyton described the discrete and identifiable capital spending projects associated with DEP's distribution system proposed to be placed in service for each rate year of the MYRP. His testimony included the reason for, scope of, timing for (projected in-service month and year), and operating benefits of each project. Tr. vol. 10, 35-36. Witness Guyton testified that DEP's proposed MYRP distribution and other projects covered in his testimony total $2.2 billion and include the $1.8 billion in distribution MYRP projects discussed at the T&D technical conference held on July 25, 2022, as well as $0.4 billion in other non-T&D MYRP projects. *Id.* at 42. The other MYRP project categories include DEP's allocated share of the costs of enterprise communications and enterprise systems, as well as facilities and fleet electrification infrastructure. *Id.* These other projects are closely aligned with the distribution business or enabling the grid capabilities. *Id.*

While discussing the preliminary findings in the ongoing Climate Risk and Resilience Study (CRRS) of the Carolinas transmission and distribution system, witness Guyton testified that the preliminary findings of the CRRS reinforces the benefits of the proposed MYRP projects, and that the additional headroom provided by capacity upgrades and improvements accommodates customer load growth and generation, but also increases resilience to the effects of extreme heat. *Id.* at 63-64. He testified that targeted undergrounding, distribution hardening and resiliency, and hazard tree removal increase resilience to the impact of wind and storms, which are likely to increase in frequency and strength due to climate change. *Id.* at 64. Witness Guyton also testified that Duke Energy implemented Integrated Systems Operations Planning (ISOP) to leverage increasing amounts of data, such as the propensity of customers to adopt solar and purchase EVs, when planning future projects. *Id.* at 40. He testified that, when appropriate, the distribution projects will take advantage of new processes and technologies that will aid in the delivery of the energy goals and requirements of North Carolina. *Id.* at 40-41. As such, he stated that the proposed MYRP projects and the grid capabilities that are achieved through these projects will serve as a foundation to support future technologies, and will result in significant customer benefits, particularly in the areas of reliability and resiliency. *Id.* at 41.

With respect to reliability, witness Guyton stated that DEP anticipates fewer and shorter outages resulting from programs such as Self-Optimizing Grid (SOG), Targeted Underground (TUG), distribution automation, and equipment retrofitting. *Id.* Regarding resiliency, the MYRP projects will provide increased protection against physical/cyber-attacks and severe weather impacts. Increases in capacity and voltage regulation and management will accommodate increasing amounts of renewable resources and Distributed Energy Resources (DERs). *Id.* Enhanced automation and control, and situational awareness will enable DEP to operate the grid more efficiently and support new customer programs, which will provide customers more options to control their energy usage and decrease their energy costs. *Id.* Witness Guyton testified that DEP will spread its proposed distribution MYRP projects across its service territory and retail customer classes to provide equitable access to these benefits. *Id.* The programs in

DEP's MYRP projects make the grid more flexible and adaptable. Automation and control technologies will help generate and capture large volumes and types of data which was not previously available. *Id.* Witness Guyton asserted that these benefits are helpful not only for DEP's Grid Operators but also for its Planning Engineers as they analyze and model DEP's grid for future improvements and capabilities using ISOP toolsets like Morecast and Advanced Distribution Planning (ADP). *Id.* at 41-42. He indicated that grid technologies will continue to and will be integrated into new solutions to address changing customer needs. *Id.* at 42.

Witness Guyton testified that distribution projects included in the MYRP total $2,197,627,366 in estimated capital investment and fall into four investment categories: (1) Substation and Line MYRP projects which total estimated capital costs of $1.582 billion comprise most of the distribution MYRP project costs; (2) Retail and System Capacity Projects which total estimated capital costs of $0.210 billion include the traditional identification and execution of capacity projects to support traditional loads as well as DERs and EVs; (3) Hazard Tree Removal Projects which total estimated capital costs of $0.028 billion consist of the traditional identification and execution of hazard tree removal which is performed in conjunction with normal trimming cycles; and (4) non-transmission and distribution MYRP projects which total estimated capital cost of $0.4 billion include DEP's allocated share of the cost of enterprise communications and systems as well as facilities and fleet electrification infrastructure. *Id.* at 42-44, 64-65.

Witness Guyton testified that the Substation and Line MYRP projects are geographically based and include a combination of ongoing work necessary for safe and reliable service and the work necessary to deliver essential grid capabilities that DEP has identified to address the megatrends and support the clean energy transition. *Id.* at 42. DEP's Distribution MYRP consists of the following 12 programs:

1. SOG Program, also known as the smart-thinking grid, redesigns key portions of the distribution system and transforms it into a dynamic self-healing network that isolates grid issues and limits customer impacts to hundreds versus thousands of customers. The total capital cost for this program is $231.9 million.

2. Voltage Regulation and Management Program improves the grid's ability to address intermittency and fluctuations that DERs cause and improves power quality to customers. The total capital cost for this program is $204.6 million.

3. Distribution Automation Program targets the lateral segments of the grid and focuses on modernizing single-use fuses with automated devices capable of intelligently resetting themselves for reuse. The total capital cost for this program is $50.3 million.

4. Capacity Upgrades and Improvements Program consists of the same work that DEP has always performed to serve its new and existing customers. The total capital cost for this program is $461.6 million.

5. Hardening and Resiliency – Laterals Program focuses on the lateral sections or tap lines, which branch from the main feeder lines and feed neighborhoods, businesses, and commercial/industrial customers. The total capital cost for this program is $175.3 million.

6. Hardening and Resiliency – Public Interference Program improves reliability by targeting DEP's most outage prone overhead backbone power line sections most impacted by vehicle accidents and determining the proper hardening and resiliency solution to reduce the number of outages customers experience. The total capital cost for this program is $18.1 million.

7. Hardening and Resiliency – Storm Program consists of improvements to locations of the distribution grid that DEP has identified, through analysis of historical outage data, as being more vulnerable to outage impacts from extreme weather events. The total capital cost for this program is $77.2 million.

8. Equipment Retrofit Program improves reliability by targeting equipment prone to outages from animal interference, lightning, and clearance issues by upgrading the assets to modern design standards. The total capital cost for this program is $80.4 million.

9. Long Duration Interruption (LDI) Program relocates segments of main overhead feeder lines in hard-to-access areas to improve accessibility for utility trucks. The total capital cost for this program is $2.6 million.

10. TUG Program improves reliability by strategically identifying DEP's most outage prone overhead power line sections and relocating them underground to reduce the number of outages customers experience. The total capital cost for this program is $103.0 million.

11. Hazard Tree Removal Program maintains or improves reliability by identifying and removing dead, structurally unsound, dying, diseased, leaning, or otherwise defective trees that could strike electrical lines or equipment of the distribution system from outside the maintained right of way. The total capital cost for this program is $48.0 million.

12. Distribution Infrastructure Integrity Program identifies and mitigates risk factors such as end-of-service equipment, technology obsolescence, and damaged in-service distribution equipment. The total capital cost for this program is $366.1 million. *Id.* at 66-71.

.Witness Guyton testified that DEP's description of its distribution MYRP programs and associated exhibits reflect the detailed project information that Commission Rule R1-17B. *Id.* at 72. The projected annual net O&M benefits that Commission Rule R1-17B(d)(2)k requires reflect the operational O&M savings offset by the incremental cost to operate the new technology. *Id.* at 73. The O&M savings stem from fewer outages

resulting from reliability improvements and the reduction in vegetation management resulting from the undergrounding of overhead lines, for example, in the TUG program. *Id.* DEP netted these savings with the ongoing O&M costs associated with maintaining the added equipment installed under the SOG and Voltage Regulation programs. *Id.*

In his supplemental direct testimony, witness Guyton identified distribution MYRP project locations that DEP either added to or removed from the MYRP period and explained the reasons for such changes. *Id.* at 88-89. Witness Guyton provided updated project cost estimates for certain distribution MYRP projects and explained the basis of the updated cost estimates. *Id.* Witness Guyton testified that his direct testimony included 44 distribution projects (comprised of 301 distribution sub-projects at the location/task level) totaling $2.2 billion, while his supplemental direct testimony included 44 distribution projects (comprised of 297 sub-projects at the location/task level) totaling $2.0 billion representing an overall net reduction of $226.7 million across all the distribution MYRP projects. *Id.* Additionally, he testified that DEP and the Public Staff reached a consensus regarding the criteria pursuant to which DEP would update information regarding MYRP projects and their cost estimates. The updates to the distribution MYRP projects witness Guyton presented in his supplemental direct testimony meet those criteria. *Id.* at 90.

DEP removed three project locations from the MYRP period, including deferring the Franklinton 115kV location within the Substation and Line – Triangle North 262 MYRP Project totaling $0.9M to a later time outside the MYRP window, and moving both the Advanced Distribution Management System (ADMS) CVR project location, totaling $1.7M, and the ADMS Advanced Fault Location project, totaling $0.6M, outside the MYRP window. *Id.* at 91-92. Witness Guyton described cost updates to 148 total distribution MYRP projects. *Id.* at 92. Witness Guyton also explained that at the time of DEP's Application, the distribution MYRP projects were at various stages of the project management lifecycle under DEP's Project Management Center of Excellence (PMCoE) standards. *Id.* at 93. Under the PMCoE approach, as a project moves through the development cycle, DEP continues to refine the costs and project schedules based on project development, detailed design, and construction planning. *Id.* at 93.

Witness Guyton testified that the Substation and Line and Area Capacity projects comprise a significant percentage of the MYRP distribution projects. *Id.* at 94. When these projects were initially identified, a spreadsheet cost estimate was constructed based on past work scope completed for similar assets at similar locations primarily based on engineering analysis and data driven models *Id.* Planning and engineering activities that occurred after the filing of DEP's Application and engaged in as part of the PMCoE process provided the opportunity to refine the scope of work and cost estimates on 125 of the total 190 Substation and Line sub-projects at the location/task level in the MYRP based on actual circuit and equipment and site conditions. *Id.* at 94-95.

Guyton Supplemental Direct Exhibit 3 identifies the total estimated capital costs of the Distribution MYRP projects to be $1,970,915,190. Tr. Ex. vol. 10.

Public Staff witness Thomas recommended reduction of the project costs for four Area Capacity projects and one Facilities project to align with updated cost estimates. Tr. vol. 19, 218. Specifically, he recommended reduction of the cost estimates for the Wilmington 421 230kV Capacity, Wilmington Sunset Park 115kV #2 Capacity, Youngsville 115kV Capacity, Wake Tech 230kV Capacity, and Aberdeen Facilities projects. *Id.* Witness Thomas also recommended reduction of the cost estimates for the Area Capacity program by 5.0% as a financial incentive for DEP to maximize efficiencies for the Area Capacity and Substation and Line programs. *Id.* at 222-23.

Public Staff witness Metz raised multiple concerns about the MYRP projects, including outdated cost estimates, insufficient staffing levels to complete the projects on schedule, and the lack of coordination between business groups to increase project efficiencies. Tr. vol. 16, 461, 465-66, 481-83. Witness Metz recommended reducing the project contingency by half, arguing that DEP failed to justify the high contingency amount DEP budgeted for the projects. *Id.* at 491-92. Public Staff witness Lawrence recommended removal of the costs for the Electrification Charging Infrastructure (ECI) Program that would support the deployment of electric vehicles to DEP facilities and the homes of select DEP employees from the MYRP because DEP had not provided sufficient information or support for the program. Tr. vol. 21, 172-75.

NCJC, et al. witnesses Hill and Duncan made several recommendations related to DEP distribution planning. First, they recommended that the Commission initiate a working group to redesign DEP's CBA methodologies for selection of projects in the MYRP and that the Commission initiate an investigation into distribution system planning. Tr. vol. 21, 849, 874. Witnesses Hill and Duncan also recommended that the Commission require DEP to conduct non-wire (NW) pilot projects and that DEP update its MYRP cost estimates to account for federal funds available through the IRA and IIJA. *Id.* at 850-54, 879.

In his rebuttal testimony, DEP witness Guyton responded to the Public Staff's distribution related MYRP and base case testimony, and to NCJC, et al. witnesses Hill and Duncan's testimony. Tr. vol. 10, 97-98. Specifically, he: (1) described the process DEP used to select certain distribution projects for inclusion in the MYRP and provided specific, data-driven reasons why their selection was appropriate; (2) discussed the methodologies and procedures DEP used to develop cost and contingency estimates for distribution projects; (3) countered the argument that the Commission should reduce contingency components of the estimates for all distribution projects in the MYRP by 50.0%; and (4) addressed witness Thomas's recommendation that the Commission reduce certain distribution project estimates by 5.0%.

The Revenue Requirement Stipulation included certain modifications to DEP's MYRP distribution projects. Those modifications include: (1) inclusion of the 50.0% adjustment to the contingency amounts of the distribution projects as recommended by Public Staff witness Metz; (2) rejection of project efficiency adjustment to the MYRP revenue requirement but DEP agreement to leverage project efficiencies to the extent practical in the implementation of the MYRP; (3) removal of the costs of the Fleet Electrification Charge Infrastructure Project; (4) inclusion of the cost of Project Walter in

the MYRP; (5) agreement to discuss scope and content of proposed reporting on reliability O&M; (6) reduction of the Wilmington 421 230kV Capacity, Wilmington Sunset Park 115kV #2 Capacity, Youngsville 115kV Capacity, Wake Tech 230kV Capacity, and Aberdeen Facilities project cost estimates; and (7) reduction in the costs of the Substation & Line Targeted Undergrounding projects. Tr. Ex. vol. 7.

The Revenue Requirement Stipulation did not address the concerns raised by NCJC, et al. witnesses Hill and Duncan.

In response to the recommendations of NCJC, et al. witnesses Hill and Duncan, witness Guyton testified that the recommendations fail to acknowledge activities that are already underway, and for which Commission approval is therefore unnecessary. *Id.* at 105. Witness Guyton asserted that the recommendation of NCJC, et al. that the Commission initiate a working group to update DEP's CBA methodologies is unnecessary since DEP has demonstrated the current methodology, and no other intervenor disputed the current methodology or its usefulness in the current rate case. Tr. vol. 10, 149-50. He contends that witnesses Hill and Duncan also do not acknowledge specific improvements in the CBA methodology DEP used in the current rate case that DEP made in response to stakeholder feedback in DEP's last rate case. *Id.* at 150. Witness Guyton also asserted that the NW pilot projects witnesses Hill and Duncan suggest are unnecessary because DEP has already initiated other customer-solution NW approaches. Tr. vol. 21, 854-55. Witness Guyton points out that their recommendation that the Commission initiate distribution system planning is not necessary because the Commission has already initiated the ongoing ISOP stakeholder engagement efforts. *Id.* at 870. Similarly, witness Guyton asserts that their recommendation to require DEP to update MYRP cost estimates to account for federal funds available through the IRA and IIJA is unnecessary as DEP is actively pursuing grant funding opportunities for the benefit of customers. Tr. vol. 10, 151. Witness Guyton also points to DEP witness Abernathy's testimony, in which she testified that DEP requests that the Commission issue an accounting order authorizing deferral of all IRA and IIJA impacts, including benefits and costs, for addressing in a future filing. *Id.*

The Commission gives significant weight to the compromise agreements reflected in the Revenue Requirement Stipulation. The Commission is not persuaded that the recommendations of NCJC, et al. witnesses Hill and Duncan related to DEP's proposed MYRP distribution projects are necessary at this time. The majority of the recommendations of witnesses Hill and Duncan are related to distribution system planning that should be considered in other proceedings such as the CPIRP proceeding. With respect to witnesses Hill and Duncan's recommendation that the Commission require DEP to update its distribution MYRP investments to account for available federal funds, the Commission notes that the record demonstrates that DEP is pursuing such funds and re-emphasizes its direction to DEP to pursue such funds. As discussed later in this Order, impacts associated with the IIJA and IRA will be deferred, and the Commission declines to adopt Witness Hill and Duncan's recommendation related thereto.

After having carefully reviewed all the evidence in the record on DEP's distribution MYRP proposal in this docket, and based on that evidence, the Commission finds that DEP's

distribution MYRP projects satisfy the requirements set forth in N.C.G.S. § 62-133.16(c)(1)(a). The Commission further concludes that the evidence supports approval of the Revenue Requirement Stipulation's provision regarding these distribution MYRP projects.

Nuclear

DEP witness Ray testified in support of the nuclear projects DEP included in the proposed MYRP, the process DEP used to select the projects, and the method by which DEP calculated projected costs for the projects. Tr. vol. 16, 171-72. Witness Ray explained that DEP selected the projects based on their value in maintaining safe and reliable operation of the nuclear stations and on a high level of confidence in their cost estimates and schedule. Witness Ray stated that DEP based the projected costs on its long-range nuclear planning tool, which it updates regularly. *Id.* at 170. Witness Ray presented additional details regarding nuclear fleet-wide projects and the projects DEP planned for each of DEP's nuclear stations. *Id.* at 173-76; Application at 15-16, Tr. Ex. vol. 7. He concluded that DEP prudently and reasonably selected these projects as they will enable DEP to maintain the fleet in reliable and efficient condition for customers' benefit. *Id.* at 172. Witness Ray's Direct Exhibit 1 provided additional details regarding projected cost, schedule, scope, and justification for each nuclear MYRP project. Tr. Ex. vol. 16.

In his supplemental direct testimony, DEP witness Ray updated the information on the MYRP nuclear projects. Witness Ray testified that DEP did not include any new nuclear projects with its supplemental filing, but identified two nuclear projects that it was postponing until after the MYRP period and, therefore, removed from the MYRP. Tr. vol. 16, 179-80. Witness Ray explained the basis for updating MYRP project costs as agreed upon with the Public Staff and the method by which DEP developed the updated project costs. *Id.* at 181-83. Witness Ray's Supplemental Exhibits 1 and 2 provided updated in-service dates and projected costs for the nuclear MYRP projects. Tr. Ex. vol. 16

Public Staff witness Metz discussed the Public Staff's review of DEP's initial and supplemental MYRP filings and updates. Witness Metz testified that the Public Staff initiated multiple sets of discovery and participated in multiple meetings with DEP on the MYRP. Tr. vol. 16, 458. The Public Staff did not make any adjustments or raise any concerns with the need for, scope of, or projected costs for the nuclear MYRP projects. *Id.* at 478-81.

In his rebuttal testimony, DEP witness Ray noted that neither the Public Staff nor any other party recommended rejection or cost reduction for any nuclear projects DEP proposed for the MYRP. Tr. vol. 23, 289.

Based on the entire record in this proceeding, the Commission finds that DEP's projected nuclear MYRP capital investments satisfy the requirements set forth in N.C.G.S. § 62-133.16(c)(1)(a) and will be used and useful in the appropriate rate year. The Commission notes that no party offered any evidence to challenge any of the nuclear

MYRP projects. Therefore, the Commission concludes the evidence supports approval of the Revenue Requirement Stipulation's provisions regarding the nuclear MYRP projects.

Fossil/Hydro

In her direct testimony, DEP witness Turner outlined the projected natural gas, coal, and hydroelectric capital investments DEP included in the MYRP. Witness Turner described DEP's prioritization process for identification of the projects to include in the MYRP. Tr. vol. 12, 101-02. She explained that DEP applied its project management guidelines for project scope development and cost estimation. *Id.* at 102. Witness Turner presented additional details regarding the MYRP projects proposed for the natural gas, coal, and hydro generation fleets. *Id.* at 105-08; Application at 16, Tr. Ex. vol. 7. Witness Turner also testified to the importance of keeping DEP's remaining coal fired assets working efficiently to support customer's energy needs as DEP plans for those units' retirement and explained that DEP will continue to incur costs for these assets as appropriate and prudent to ensure that reliable cost-effective electricity remains available while DEP develops and implements replacement of the coal fleet. She noted that due to the continued importance of natural gas to DEP's resource mix, particularly during winter months and while DEP is developing and deploying energy storage capacity, DEP will continue to rely on its natural gas fleet as part of the diverse and dispatchable resource mix. *Id.* at 94-95. She concluded that DEP's decision to invest in these projects is prudent and reasonable as they will enable DEP to continue to provide safe, reliable, and affordable service to customers as well as comply with regulatory requirements. *Id.* at 105-06. Witness Turner's Direct Exhibit 1 provided additional details regarding projected cost, schedule, scope, and justification for each fossil/hydro MYRP project.

In her supplemental direct testimony, DEP witness Turner supported the additional fossil and hydro projects that DEP proposed to include in its MYRP. Tr. vol. 12, 112-15. She explained why certain projects that DEP removed from the MYRP were determined to be no longer necessary. *Id.* at 115-16. Witness Turner explained the basis for updated MYRP projected costs as agreed upon with the Public Staff and the method by which DEP developed the updated project costs. *Id.* at 116-17. Witness Turner's Supplemental Exhibits 1 and 2 provided updated in-service dates and projected costs for the fossil and hydro MYRP projects and cost, schedule, scope, and reasoning information for the newly added fossil and hydro projects. Tr. Ex. vol. 12.

Public Staff witness Metz testified that the Public Staff reviewed DEP's initial and supplemental MYRP filings and updates, initiated multiple sets of discovery, and participated in multiple meetings with DEP on the MYRP. Tr. vol. 16, 458, 478-81. Public Staff witness Michna testified that he did not dispute the inclusion of Steam Plant in Service projects in the MYRP, and that he agreed with DEP's philosophy of prioritizing unit reliability and resource adequacy in capital spending decisions. Tr. vol. 21, 302. Public Staff witness Thomas recommended a delay in the in-service date for the Blewett Falls fish passage project that would move the project from MYRP Rate Year 1 into MYRP Rate Year 2 due to previous and anticipated extensions of commencement of operations, and a reduction the projected cost for the project based on his review of the contractor

bid selection and internal funding approval processes, which he concluded resulted in significant excess contingency for the project. Tr. vol. 19, 208-13.

In rebuttal testimony, DEP witness Turner described how DEP's cost estimates for the Blewett Falls fish passage project, particularly the contingency allotted for the project, were based on the project's unique nature and challenges. Witness Turner disagreed with the delay of the project in service date to MYRP Rate Year 2, explaining that the timing for testing of the project is separate from the capital project construction, which according to current plans should go in service during Rate Year 1. Tr. vol. 12, 147-50.

The Revenue Requirement Stipulation accepts the Public Staff's recommended changes to the Blewett Falls fish passage project cost estimate and postponement of this project's in-service date to March 2025. Revenue Requirement Stipulation § III.33.e, Tr. Ex. vol. 7. Further, the stipulation accepts the Public Staff's recommendation for inclusion of the costs of the Blewett Falls fishing pier in the MYRP and removal from the historic test period. Revenue Requirement Stipulation § III.33.a, Tr. Ex. vol. 7. DEP witnesses Abernathy and Jiggetts and Public Staff witnesses McLawhorn and Metz supported these provisions in their settlement supporting testimony. Tr. vol. 13, 138-40, 262; Tr. vol. 16, 514.

Based on the entire record in this proceeding, the Commission finds that DEP's proposed natural gas, coal, and hydro MYRP projects satisfy the requirements set forth in N.C.G.S. § 62-133.16(c)(1)(a). DEP demonstrated that these projects are primarily in the normal course of business for maintaining the fossil and hydro fleets for reliability, safety, and regulatory compliance. In addition, DEP provided substantial evidence regarding the continued importance of the coal and natural gas fleets to its ability to continue to provide reliable service to customers and the need to continue to invest in the coal fleet until its retirement and in the natural gas fleet to reliably manage the transition away from coal. The Commission further concludes that the evidence supports approval of the Revenue Requirement Stipulation's provisions regarding these fossil/hydro projects.

Cybersecurity

In his Supplemental Direct Testimony, DEP witness Strasburger provided support for DEP's information technology (IT)/operational technology (OT) Cybersecurity project DEP will include in the MYRP. Tr. vol. 16, 184-88. Witness Strasburger explained that the purpose of the IT/OT Cybersecurity project is to assure safe and sustainable operations through proactive and effective cybersecurity design, implementation and operation of critical energy systems and their underlying technology. *Id.* at 186. He testified that the IT/OT Cybersecurity project will update OT governance and risk and compliance standards and processes, implement a new OT specific asset, patch and vulnerability management system, and deliver new OT cybersecurity threat logging and monitoring capabilities. *Id.* at 185-86. The project will also focus on expanding monitoring and threat response capabilities and will introduce proactive elements to reduce cybersecurity risks. *Id.* at 186. He noted that his Strasburger Exhibit 1 contained information regarding the IT/OT Cybersecurity project required by Commission Rule R1-17B(d)(2)j.(i)-(iii). He further testified that as DEP continues to see increased cyber threats against operational

assets, including potential geopolitical threats, cybersecurity becomes a larger component of DEP's energy transition and grid protection initiatives, and that the Commission should approve the MYRP IT/OT Cybersecurity project. *Id.* No other party offered any evidence regarding DEP's MYRP Cybersecurity project.

After having carefully reviewed the entirety of the evidence in the record on DEP's MYRP IT/OT Cybersecurity project, the Commission finds that the IT/OT Cybersecurity MYRP project satisfies the requirements set forth in N.C.G. S. § 62-133.16(c)(1)(a). DEP demonstrated that cybersecurity is becoming an increasingly critical component of its energy transition and grid protection initiatives, and that the IT/OT Cybersecurity project is reasonably necessary. Additionally, no party offered evidence to the contrary. The Commission further concludes that DEP put forth a reasonable plan to implement the IT/OT Cybersecurity project within the prescribed time period.

Battery Storage

DEP proposes a portfolio of MYRP battery energy storage projects. Tr. vol. 11, 22. The portfolio consists of six discrete and identifiable battery energy storage projects: (1) Riverside; (2) Warsaw; (3) Lake Julian; (4) Elm City; (5) Knightdale; and (6) Craggy. *Id.* DEP witnesses Tompson and Shearer (the Battery Energy Storage Panel) testified and detailed the projected cost, schedule, and scope for each MYRP project, as well as the reasoning for each project as Commission Rule R1-17B(d)(2)j requires. *Id.* at 21; *see also* Battery Energy Storage Panel Ex. 1, Tr. Ex. vol. 11. According to the Battery Energy Storage Panel, the proposed investments represent near-term investments that will play an integral role in the next phases of the energy transition. Tr. vol. 11, 21. Evidence appearing in Battery Storage Panel Exhibits 1-2 includes detailed information regarding projected cost, schedule, scope, and rationale supporting the investments. *Id.* Battery Energy Storage Panel Exhibit 2 also includes anticipated project timelines, including projected in-service month and year for each proposed project as Commission Rule R1-17B(d)(2)j requires. *Id.*

DEP's Battery Storage Panel testified as to the expected benefits associated with each proposed battery project including unique bulk power services. Tr. vol. 11, 23-25. The panel testified that battery resources are uniquely capable of serving multiple grid functions across generation, transmission, and distribution systems. *Id.* at 25. The panel testified that the Craggy, Lake Julian, and Riverside projects each comply with the Western Carolinas Modernization Project (WCMP) and support the Mountain Energy Act. *Id.* at 23-24. Additionally, the battery projects at Elm City and Warsaw both leverage and provide experience with surplus solar interconnection capacity, and they also utilize existing interconnection infrastructure thereby reducing development costs and project timelines. *Id.* at 24. Furthermore, the Knightdale battery project will be the largest battery DEP has installed and this size project provides the next phase of critical operating experience. *Id.* The Knightdale battery project will provide bulk system services including energy arbitrage and ancillary services with a grid scale battery system. *Id.* at 24-25.

Public Staff witness Thomas testified regarding DEP's proposed battery energy storage portfolio. Tr. vol. 19, 184-99. Witness Thomas recommended that DEP classify the Craggy battery project as 50.0% "Other Production Plant" and 50.0% "Transmission Plant," given that DEP sited and sized the project for a potential transmission deferral. *Id.* at 197. Witness Thomas noted that DEP has classified all battery storage projects as "Other Production Plant," with interconnection costs separated into either Transmission Plant or Distribution Plant, depending on where the facility interconnects to the grid. *Id.* at 196. For most of the projects, witness Thomas found this approach to be reasonable absent clear guidance from FERC. *Id.* For Craggy, however, witness Thomas testified that DEP identified Craggy as part of a first of a kind non-wires alternative study and sized and sited the project for a potential transmission deferral designed to alleviate a future DEP-West balancing area transmission constraint. *Id.* at 197. For those reasons, witness Thomas recommended reclassification of the Craggy battery project as 50.0% "Other Production Plant" and 50.0% "Transmission Plant." *Id.*

The Battery Energy Storage Panel rebutted witness Thomas' Craggy-related recommendation, asserting that the proposed project would not defer a transmission investment. Tr. vol. 11, 49. The panel explained that the Craggy battery would mitigate against certain delays in implementing the 230kV Craggy-Enka line project; however, it would not defer transmission investment entirely. *Id.* at 48. The panel further testified that DEP does not anticipate dispatching the Craggy battery for transmission deferral purposes – the proposed project remains cost-effective based on low interconnection costs in an area with limited generation resources. *Id.* The panel maintained that the originally proposed allocation of 100.0% Production for the project is reasonable. *Id.* at 49.

The Revenue Requirement Stipulation adopts the allocation factor by plant classification for the Craggy battery project, as proposed by DEP. Revenue Requirement Stipulation § III.33.c, Tr. Ex. vol. 7.

After careful review all the evidence in the record on DEP's MYRP proposal in this docket, and based on that evidence, the Commission finds that DEP's battery storage MYRP projects satisfy the requirements set forth in N.C.G.S. § 62-133.16(c)(1)(a). The Commission further finds that the evidence supports approval of the Revenue Requirement Stipulation's provisions regarding the battery storage MYRP projects.

Solar

DEP witness LaRoche addressed the need, rationale, and cost estimates for two solar development projects a solar project from the 2022 Solar Procurement Program DEP expects to be in service between 2025 and 2026 (2026 Solar Investment Project) and a 9.5 MW solar facility DEP proposes to place in service at the DEP Asheville Generating Plant site in Buncombe County by September 2025 (Asheville Solar Project). Application at 14; Tr. vol. 16, 113-18. Witness LaRoche stated that to identify the 2026 Solar Investment Project, DEP considered the solar investments that will result from the 2022 Carolinas Carbon Plan, the 2022 Solar Procurement Program Request for Proposals, and DEP's WCMP commitments. Tr. vol. 16, 113. Additionally, he testified that

DEP's most recent integrated resource plan (IRP) identified the need for new solar resources to reliably serve DEP's projected customer load. *Id.* at 114. Witness LaRoche also stated that N.C.G.S. 62-110.9 was a "key driver" of the 2026 Solar Investment Project, as that statute requires DEP and DEC to take all reasonable steps to achieve 70.0% carbon emission reductions by 2030 and carbon neutrality in North Carolina by 2050. *Id.* The WCMP, approved by the Commission on March 28, 2016, was also a primary regulatory driver of the program, as the Asheville Solar Project directly relates to and is a commitment stemming from the WCMP. *Id.* at 116.

Public Staff witness Thomas recommended that the Commission delay the in-service date for the Asheville Solar Project to March 2026. Tr. vol. 19, 181. Witness Thomas stated that he based this recommendation on DEP's history of delays with solar project completion as well as the potential for new challenges that may emerge during project development and construction. *Id.* at 181-82. Additionally, the Public Staff is concerned about the Asheville Solar project's costs, as the cost per kW is 50.0% higher than the cost per kW for the 2026 Solar Investment project. *Id.* at 181.

Regarding the delayed in-service date, DEP witness LaRoche testified in his rebuttal testimony that the use of historical delays is inappropriate, as blanket comparisons between past and future solar projects are not on an apples-to-apples basis. Tr. vol. 23, 262. For example, witness LaRoche noted that Public Staff witness Thomas cited DEP's delays in the Woodfin project to support his recommended delay but did not assess whether the same delays are likely to impact the Asheville Solar Project or whether DEP has taken steps to mitigate that risk. *Id.*

After having carefully reviewed the evidence in the record on DEP's Solar MYRP proposal in this docket, and based on that evidence, the Commission finds that DEP's solar MYRP projects satisfy the requirements set forth in N.C.G.S. § 62-133.16(c)(1)(a). The Commission concludes that the evidence supports approval of the Revenue Requirement Stipulation's provisions regarding the solar MYRP projects.

MYRP Implementation

Public Staff witness Metz testified to his concern regarding DEP's ability to complete the proposed MYRP projects within the three-year MYRP period. Based on his review of DEP's historic and projected 2023 staffing, Witness Metz asserted that DEP does not have a plan to increase staffing for planned MYRP projects while continuing to perform traditional work of the utility. Tr. vol. 16, 465-81.

In his rebuttal testimony, DEP witness Murray overviewed DEP's wholistic and comprehensive approach to project planning and execution while noting that neither the Public Staff nor any party recommended disallowance or rejection of any MYRP project based on generalized project execution risks or challenges. Tr. vol. 23, 313. Witness Murray discussed how Duke Energy's Project Management Center of Excellence (PMCoE) creates a common framework for managing projects across the enterprise and how DEP has successfully implemented prudent management processes historically.

While acknowledging that MYRP project execution will not be easy and that there likely will be unforeseen challenges that require DEP to, in some cases, modify planning MYRP projects to maximize benefits for customers, he explained that MYRP project execution is not a challenge that is fundamentally different than challenges inherent in DEP's historic capital project implementation and disagreed with the suggestion that DEP is not well prepared to successfully execute these projects. Tr. vol. 23, 312-18.

DEP witness Bowman also responded to the witness Metz's concerns regarding DEP's ability to execute on certain MYRP projects. Tr. vol. 21, 1211. She testified that DEP is confident in its ability to execute the MYRP projects and acknowledged DEP's obligation, as confirmed by the Commission, to continually assess the MYRP projects and ensure that customer benefits are maximized throughout the execution phase. *Id.* She explained that although DEP will encounter unforeseen challenges and circumstances, in all instances DEP will leverage its execution experience to maximize benefits for customers. *Id.*

After review of the evidence presented by DEP's various generation, transmission, and distribution witnesses, as well as the evidence presented by DEP regarding its processes, procedures, and project management experience the Commission finds that DEP has the obligation to prudently and reasonably implement the MYRP in a manner that benefits its customers. Any modification to the implementation of MYRP projects will be reported by DEP on a quarterly basis, as required under Commission Rule R1-17B(h(2)) and will be subject to audit in future base rate case proceedings. While the Commission recognizes the risk about which the Public Staff is concerned, the Commission determines, on the evidence presented, that DEP has demonstrated a reasonable plan to complete the MYRP projects within the prescribed time periods.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 30

Reporting Requirements

The evidence supporting this finding of fact is included in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Bowman, Abernathy, Jiggetts, and Guyton, and Public Staff witnesses Zhang, Boswell, McLawhorn, Metz, Nader, T. Williamson, and Thomas; the Revenue Requirement Stipulation; and the entire record in this proceeding.

Rider EC

In his testimony, Public Staff witness Nader testified that to ensure that the proposed Rider EC continues to be in the public interest, the Commission should require annual reporting on the impacts of Rider EC. Tr. vol. 21, 106. Witness Nader recommended that DEP should report the gross level of incentives DEP paid, the number of recipients, the amount of investment, load, and jobs associated with the incentives, and an overall marginal cost analysis of Rider EC to determine if the gross level of incentives DEP paid exceeds the marginal cost to serve the gross pool of participants. *Id.*

CIAC Reporting

In their joint direct testimony, Public Staff witnesses Zhang and Boswell stated that DEP was booking contributions in aid of construction (CIAC) related to interconnection agreements (IA) inconsistently. Witnesses Zhang and Boswell recommended that the Commission order DEP to review its CIAC policy to ensure that DEP properly accounts for CIAC and report the results of that review in the next general rate case. Tr. vol. 19, 39-40. In rebuttal, DEP witness Speros rebutted the notion that DEP was booking its CIAC related to IAs inconsistently but stated that DEP did not oppose in principle reporting to the Commission on its CIAC policy in the next general rate case. Tr. vol. 13, 63.

Vegetation Management Reporting

Public Staff witness T. Williamson recommended that the Commission require DEP to perform additional reporting requirements beyond the Vegetation Management Program Performance report DEP files annually. He recommended that DEP report on the additional following topics: (1) distribution vegetation management herbicide actuals, target, and variance for spending and miles; (2) distribution vegetation management number of miles of vegetated distribution lines that require trimming or herbicide treatment; (3) distribution vegetation management hazard tree program actuals, target, and variance for spending and tree counts; and (4) distribution vegetation management reactive/demand events, and the number of events worked annually. Tr. vol. 21, 217-18. In his rebuttal testimony, witness Guyton stated that DEP can provide the recommended additional distribution reporting requirements beyond the Vegetation Management Program Performance DEP files annually with two exceptions. Tr. vol. 10, 147.

Hot Springs CBA

In his testimony, Public Staff witness Thomas recommended the Commission direct DEP to perform an updated cost benefit analysis for Hot Springs. Tr. vol. 19, 194. He further recommended that DEP provide the updated cost benefit analysis with its operational report for the Hot Springs facility on October 31, 2023, in Docket No. E-2, Sub 1185. *Id.*

Discussion and Conclusions

The Revenue Requirement Stipulation establishes certain reporting obligations. Specifically, Paragraph 34 obligates DEP to report on Rider EC, subject to agreement of the Revenue Requirement stipulating parties regarding the scope and content of the report. Paragraph 35 obligates DEP to report on the CIAC issue in its next general rate case application. Paragraph 36 addresses a reporting on reliability O&M as discussed by Public Staff witness Metz, and a management reporting requirement as discussed by Public Staff witness T. Williamson, except for reporting on the two issues noted in the rebuttal testimony of DEP witness Guyton. In Paragraph 38, the Revenue Requirement stipulating parties agree to discuss the need for a report on the Hot Springs CBA as requested in the testimony of Public Staff witness Thomas. Besides the exceptions noted

in Paragraphs 34-38 of the Revenue Requirement Stipulation, Paragraph 39 indicates that DEP agrees to all reporting requirements proposed by the Public Staff.

No other party offered any evidence addressing the reporting obligations outlined in the Revenue Requirement Stipulation. The Commission concludes that the reporting obligations agreed-upon in Section IV of the Revenue Requirement Stipulation are reasonable. Based upon the record evidence and consistent with the Revenue Requirement Stipulation, the Commission finds and concludes that the reporting obligations outlined in Section IV of the Revenue Requirement Stipulation are approved.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 31

The evidence supporting this finding of fact is in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Hunsicker, Quick, and Jiggetts; the supplemental and settlement testimonies of Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

In prior DEP rate cases, including Dockets No. E-2, Sub 1023, E-2, Sub 1142, and E-2, Sub 1219, the Commission has approved a calculation of "storm normal" expenses based upon a 10-year average of storm costs, after reducing the costs associated with major storms, to include in rates. Witness Jiggetts explained the methodology for the calculation of storm normal in this case. Tr. vol. 14, 29-30. The resulting amount to include in rates per DEP's calculation is approximately $22.2 million. Jiggetts Partial Settlement Ex. 4, Tr. Ex. vol. 14.

No party disputes DEP's calculation of storm normal expenses to include in rates, and DEP witness Jiggetts testified that the Public Staff agrees with the amount as calculated by DEP. Tr. vol. 14, 58.

Accordingly, the Commission finds that the appropriate North Carolina retail normalized annual level of storm costs to include in DEP's rates in this case is $22.243 million.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 32-34

Distribution System Demand Response

The evidence supporting this finding is in the verified Application and Form E-1; the testimony and exhibits of DEP witnesses Jiggetts and Hunsicker; the testimony and exhibits of Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

In this case, DEP proposed to move the future costs associated with its DSDR energy efficiency program from the DSM/EE rider into base rates starting on the effective date for the new rates established in this proceeding as the Commission instructed in its Order from the 2019 Rate Case. Tr. vol. 13, 204. DEP witness Jiggetts explained that

DEP will continue to recover costs deferred to the regulatory asset before the effective date for new rates in this proceeding through the DSM/EE rider until they are fully amortized. *Id.* Public Staff witnesses Zhang and Boswell testified that DEP's proposal to recover the future DSDR costs in base rates is appropriate because all customers benefit from DSDR. Tr. vol. 19, 74.

No party opposed DEP's request.

Payment Navigator

The evidence supporting this finding is in the verified Application; the testimony and exhibits of DEP witnesses Jiggetts and Quick; and the entire record in this proceeding.

In her direct testimony, DEP witness Jiggetts stated that DEP proposed several new programs in this rate case to benefit customers, including the CAP, the Tariffed On-Bill program, and the Payment Navigator Program that DEP witnesses Harris and Quick also discussed in their testimony. If the Commission approves each program, DEP requests permission to establish a regulatory asset and defer to the account the incremental implementation and administration O&M costs related to the programs. Tr. vol. 13, 209.

DEP witness Quick described DEP's Affordability Ecosystem in her direct testimony. The Affordability Ecosystem is a multi-pronged approach to assist customers who have challenges in affording to pay their electric utility bills. The Affordability Ecosystem includes products and services, including bill pay assistance and weatherization programs, and DEP equips its customer service team to inform customers about opportunities to address their affordability challenges. Tr. vol. 7, 75. Consistent with DEP's Affordability Ecosystem, witness Quick requested approval of the Payment Navigator program, which DEP specifically designed to comprehensively support not only low-income customers in arrears on their bills, but all customers seeking assistance in managing their electric utility bills. *Id*. at 172. The Payment Navigator program is based on a pilot that DEP tested during the COVID-19 pandemic with customers seeking support in paying their electric bills. *Id*. at 175-77. As witness Quick described, in accordance with the Payment Navigator program, DEP proactively contacts customers who are struggling with arrearages to invite them to speak with a Payment Navigator specialist. A Payment Navigator specialist is a call center agent trained to empathetically handle more complex calls assisting customers who have fallen behind in their bills, and the specialist can take the necessary time to work with customers on obtaining the assistance they need. *Id.* at 177. Based on the customer's situation, the Payment Navigator specialist may tailor a unique set of recommendations to assist the customer in becoming current on payments and provide longer-term guidance on how to ease the customer's electric energy burdens by connecting the customer to assistance funding, referring them to energy efficiency or demand side management options, or enrolling them in programs like Budget Billing, Pick Your Own Due Date, and more. *Id.* at 78-79.

DEP witness Quick highlighted the positive feedback and insights that DEP received regarding the Payment Navigator pilot and the success that DEP had in referring customers to agencies for assistance, enrolling them in deferred payment arrangements, and recommending flexible billing programs. *Id.* at 79. During the pilot, by assisting customers to access this available funding, Payment Navigator helped customers obtain all the funding available to them from certain assistance agencies, in contrast to previous years when agencies' funds were not utilized. *Id*. at 175-76. Witness Quick also stated that during the pilot, DEP learned that about 50.0% of the customers that DEP contacted were not aware of the assistance available to them. She noted that some customers have difficulty reading and completing applications, and DEP learned during the Payment Navigator pilot that customers dropped out sometime during the application process and did not complete the applications. Witness Quick indicated that Payment Navigator specialists could benefit customers by working with them to complete the applications so that they can access all available funding. Tr. vol. 22, 132-33.

DEP witness Quick also testified that Payment Navigator would complement the CAP that DEP witness Harris described. She noted that CAP will directly benefit customers by reducing their monthly electric energy burden through a bill discount. After a customer enrolls in CAP, DEP can continue to work with the customer to understand the customer's needs and analyze what other products and services (such as Share the Light, Budget Billing, energy efficiency offerings, weatherization, and payment plans) are available to support the customer over the longer term. Tr. vol. 7, 80.

Witness Quick concluded by requesting that the Commission approve the Payment Navigator program and associated costs, which she estimated to be $3 million over the next three years. She noted that the deferral request that DEP witness Jiggetts describes in her testimony addresses the associated incremental O&M costs that the $3 million estimate includes. Witness Quick testified that DEP would not defer any capital costs associated with the program. *Id*. at 80-81

No party contested the implementation of the Payment Navigator program.

Customer Connect

In its Application, DEP requested recovery of the approximately $60 million North Carolina retail allocated capital investment associated with implementation of its Customer Connect project, the new customer engagement platform, and CIS. Tr. vol. 16, 71, 82. DEP witness Hunsicker testified that in November 2021, DEP implemented the Customer Connect platform including a CIS, which is a system that manages the billing, accounts receivable, and rates for DEP as a central repository for all customer information. *Id.* at 71-72. She explained that CIS links the consumption and metering process to payments, collections, and other downstream processes, including additional work order requests such as service connections and disconnections, outages, and trouble requests. CIS also manages customer profiles and integration of data to provide a holistic view of the customer and it should enable expected customer capabilities. *Id.* at 72-73. Witness Hunsicker explained that DEP developed its previous CIS almost 30 years

ago and the system could not efficiently support new capabilities, and thus required complex add-ons and manual performance of some complex billing functions. *Id.* at 71.

Witness Hunsicker explained that Customer Connect benefits customers by providing a modern, configurable billing system that allows DEP to keep pace more efficiently with changing customer expectations and needs. Improvements with Customer Connect include a customer-centric data model and more holistic customer data analytics capabilities, which allow DEP to better know its customers and the usage needs across the entire Duke Energy footprint and provide a more customized experience. She explained that since she first testified to the need for Customer Connect in the 2017 Rate Case, DEP has kept stakeholders informed of the status of the implementation and that, while no complex, enterprise-wide CIS implementation is without challenges, its Customer Connect implementation benchmark metrics compare favorably to industry benchmarks. *Id.* at 72.

No party contested DEP's request to recover its costs related to Customer Connect.

Discussion and Conclusions

No parties opposed DEP's requests related to DSDR, Payment Navigator, or Customer Connect. In *State ex rel. Utils. Comm'n v. Intervenor Residents*, 305 N.C. 62, 75-77, 286 S.E.2d 770, 778-79 (1982), the North Carolina Supreme Court held that the Commission can accept the uncontested evidence of a public utility regarding the reasonableness of its costs as satisfying the utility's burden of proof on the question of cost recovery. The Commission concludes that DEP has met its burden of showing that its proposals related to DSDR, Payment Navigator, and Customer Connect are just and reasonable.

More specifically, the Commission concludes that DEP's proposal to include future DSDR program costs in base rates starting with the effective date of the rates established in this proceeding to be reasonable and appropriate. Further, the Commission concludes that DEP's requested recovery of costs associated with its Customer Connect project is just and reasonable to all parties considering the evidence presented.

Finally, the Commission approves implementation of Payment Navigator and recognizes and appreciates the work of DEP to undertake this effort during the COVID-19 pandemic and to devote resources and expertise to connecting customers with assistance during the crisis. The Commission recognizes the customer benefits that arise, particularly in the context of those customers most in need, when DEP (and its affiliates) apply their specialized knowledge and resources in direct support of the customers. The Commission encourages DEP to continue to partner with assistance agencies across its service area and to proactively contact struggling customers to direct them to contact a Payment Navigator specialist for assistance in managing their electric utility bills.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 35

COSS Stipulation

The evidence supporting this finding is in DEP's verified Application and Form E-1; the COSS Stipulation; the testimony and exhibits of DEP witness Hager, Public Staff witnesses McLawhorn and D. Williamson, and CIGFUR witness Phillips; and the entire record in this proceeding.

Summary of Evidence

DEP Direct Testimony

Cost of Service Study Overview

In her testimony, DEP witness Hager described the purpose of a cost of service study (COSS) and how costs are assigned pursuant to such study. She explained that the COSS is used to align the total costs incurred by DEP in the test period with the jurisdictions and customer classes responsible for those costs. Tr. vol. 11, 82. Using the principle of cost causation, the COSS assigns or allocates DEP's revenues, expenses, and rate base to the regulatory jurisdictions and to customer classes that caused such costs to be incurred. *Id.* Costs are first grouped according to their function. *Id.* at 84. Functions include production (generation); transmission; distribution; and customer service, billing, and sales. *Id.* Functionalized costs are then classified based on the utility operation or service being provided and the related causation of the costs. *Id.* Typical classifications include demand, energy, and customer-related costs. *Id.* Finally, the functionalized and classified costs are allocated or directly assigned to the proper jurisdiction and customer class based on the way the costs are incurred (i.e., based on cost causation principles). *Id.* at 84-85. Once all costs and revenues are assigned, the COSS identifies the return on investment that DEP has earned for each customer class during the test period, and these returns can then guide rate design. *Id.* at 83.

The COSS Stipulation

On September 13, 2022, DEP, DEC, the Public Staff, CIGFUR, and CIGFUR III (the COSS Stipulating Parties) filed the COSS Stipulation with the Commission. Tr. vol. 11, 80. The COSS Stipulation provides that production and transmission demand costs are first allocated to the North Carolina retail jurisdiction using the 12 CP method, and then production demand costs are allocated within North Carolina retail rate classes using the Modified A&E method. *Id.* Because transmission demand does not have average or excess energy components, the transmission demand factors at the customer class level are equivalent to the 12 CP calculation. *Id.* The stipulation also provides that, for purposes of allocating production demand costs on a jurisdictional basis as well as to North Carolina retail rate classes, DEP will make an adjustment to exclude certain curtailable/interruptible loads if they were not curtailed at the twelve system peak hours during the test year. *Id.* By its terms, the COSS Stipulation only applies in the current rate

case, and COSS Stipulating Parties are free to advocate for different methodologies in future DEP cases. *Id.* DEP witness Hager testified that the stipulation is reasonable and that the Commission should approve it, noting that it was the result of the give-and-take inherent in coming to a settlement among parties with diverse views on the appropriate methodologies. *Id.* at 80-81. The COSS Stipulating Parties urge the adoption of the stipulation in this case as a fair and reasonable methodology for the allocation of costs. COSS Stipulation at 4-5, Tr. Ex. vol. 7.

The 12 CP Method

Under the COSS Stipulation, the 12 CP method will be used to allocate costs to the North Carolina retail jurisdiction. COSS Stipulation at 3, Tr. Ex. vol. 7. Witness Hager testified that in its previous rate case, DEP recommended, and the Commission approved, the summer coincident peak (Summer CP) method to allocate the fixed portion of production and transmission demand-related costs. *Id.* at 89. However, DEP now believes it is appropriate to move from Summer CP to 12 CP, which utilizes the average of the test year's twelve monthly peaks. *Id.* Witness Hager testified that DEP's integrated resource planning period has shifted away from an emphasis solely on summer peaks, and that by averaging the twelve monthly peaks, the 12 CP method is less volatile than a single coincident peak. She further testified that the 12 CP method is regularly used by other utilities and has been approved by state commissions and the FERC. *Id.* at 89-90.

The Modified A&E Method

The COSS Stipulation also proposes a Modified A&E method to allocate production demand costs across North Carolina retail customer classes. COSS Stipulation at 3, Tr. Ex. vol. 7. DEP witness Hager testified that the Modified A&E method adopted under the COSS Stipulation considers that generation facilities are needed to serve a utility's "average load" as well as its "excess or peak load" in assigning responsibility for the recovery of production demand-related costs. Tr. vol. 11, 81. The excess demand is the excess of a rate class' non-coincident peak (NCP) demands over its average demands. Under this method, all groups of customers are allocated some portion of the production plant investment and fixed expenses related to the generation of power. *Id.* at 96. A rate class' coincident peak demand is the class' load at the time of the system's peak demand, while a rate class' NCP is the maximum demand regardless of the time of occurrence. *Id.* Witness Hager explained that each customer class' non-coincident demand likely occurs at different times. *Id.* She noted that the A&E method is used in several jurisdictions including at least a third of the 30 utilities she examined and is a reasonable method for allocating demand-related production costs to the North Carolina retail classes in this case. *Id.* at 156, 81. However, DEP modified the method to conform the A&E allocators to the 12 CP method used at the North Carolina retail jurisdictional level. *Id.* at 97. In response to Commissioner Clodfelter's question, witness Hager testified that this method was used by Dominion in Virginia, but has never been used by Dominion in North Carolina. *Id.* at 130. Additionally, Witness Hager testified that since the sum of NCPs exceeds the coincident system peak, the excess components for each rate class were scaled down proportionally, such that the sum of their demand

matches the coincident system peak. *Id.* at 133. In response to Commission questions, DEP witness Hager stated that DEP did not use the 12 CP method for both jurisdictional and rate class allocation for this proceeding as it did in South Carolina, a difference which Witness Hager attributed to the COSS Stipulation. *Id.* at 134.

Removal of Certain Curtailable/Interruptible Loads

DEP witness Hager testified that, historically, DEP has allocated production fixed costs based on the demands served at its peak hour. *Id.* at 97. She testified that aligning firm load with firm capacity to serve that load is more consistent with the principle of cost causation than the previous method. *Id.* at 98. DEP does not plan for, and does not purchase capacity for, the curtailable load of customers. *Id.* Since DEP can curtail customers who take interruptible service so that their load does not contribute to the system peak, interruptible load does not factor in to how much the utility must invest in capacity to meet the system peak. *Id.* If the utility curtails all possible curtailable load in the test year during system peaks, there is no need for adjustments, as revenues and loads both reflect only firm load. *Id.* However, there can be a mismatch between revenues and loads if there is some non-firm load in the test year peaks. *Id.* Accordingly, DEP has removed non-curtailed non-firm load present during the test year peaks where its presence would create a mismatch with revenues. *Id.* This adjustment ensures a matching of firm load with firm load revenues. *Id.* This practice is also consistent with FERC precedent. *Id.* Witness Hager testified that this proposed method will eliminate the volatility of having load in one test year and out in the next test year. *Id.* at 100.

Adjustments were made to remove certain curtailable load at both the North Carolina retail jurisdiction level with the 12 CP method, as well as at the North Carolina retail rate class level with the modified A&E method. *Id.* at 101. The demand-related transmission costs were allocated to rate classes based on 12 CP demand, without adjustment for curtailable load. *Id.*

Distribution Costs

DEP witness Hager testified that most distribution investments are identified and then directly assigned to the state in which they are located. *Id*. Distribution costs identified as customer-related are allocated using customer allocation factors, and the remainder are designated as demand-related and allocated to customers based on NCP demand allocators. *Id.*

NCP allocators are developed to account for the different levels of the distribution system where customers may take service. *Id.* Witness Hager explained that NCP allocators are developed by taking the ratio of the non-simultaneous peak demands of the customers in each class whenever that peak occurred during the test period and comparing that to the sum of all customers' non-simultaneous peak demands. *Id.* She noted that several different NCP allocators are developed to account for the different levels of the distribution system where customers may take service (primary, secondary, etc.). *Id.* For example, only the NCP demand of customers taking service at secondary

voltage is included in the development of the NCP allocator used to allocate secondary distribution lines and poles. *Id.* at 101-02.

Further, witness Hager testified that NCP allocators are used for demand-related distribution investment because distribution facilities serve individual neighborhoods, rural areas, or commercial districts; they do not function as a single integrated system in meeting system peak demand. *Id.* at 102. The individual distribution system serving an area must be able to meet the peak demand in the area it serves, whenever the peak occurs. *Id.* Accordingly, Witness Hager testified that contribution to NCP is the appropriate measure of determining customers' responsibility for costs, because it best measures the factors that drive investment to support that part of the system. *Id.*

Energy Allocators

DEP witness Hager testified that energy-related costs, such as fuel costs and variable production costs at generating stations, reflect the variable cost of producing, transmitting, and delivering electricity. *Id.* at 102. She testified that these costs are allocated using DEP's kWh of generation and deliveries during the test period. *Id.* Witness Hager explained that kWh sales information is collected and adjusted for the level of losses attributable to each class and jurisdiction to determine the level of kWh at the generator attributable to that class or jurisdiction. *Id.*

Customer Allocators

DEP included operating expenses in FERC accounts 901-917 for allocation as customer-related costs that include meter reading, billing and collection, and customer information and services. Tr. vol. 11, 103. DEP has also included in this category a portion of distribution costs that it has identified as customer-related, such as meters and service drops (FERC accounts 369 and 370) and a portion of transformers (FERC account 368). *Id.* A portion of costs for distribution lines and poles (FERC accounts 364-367) were also identified as customer related. *Id.* The remaining distribution plant and associated costs were classified as demand-related, except for FERC account 363, Energy Storage Equipment – Distribution. *Id.*

Account 363, beginning in 2020, had a small balance of approximately $11 million related to batteries. *Id.* DEP witness Hager testified that storage battery equipment functionalized to distribution (FERC account 363) is allocated across customer classes using gross distribution plant excluding batteries. *Id.* This approach recognizes that batteries provide benefits to or support different parts of the distribution system. *Id.*

Witness Hager testified that a portion of distribution costs related to FERC accounts 364-68, including costs of poles, towers, fixtures, overhead and underground conductors, and transformers, are customer-related. *Id.* at 104. NARUC discusses using two methods for allocating these customer-related distribution costs: the Minimum System Method and the Zero-Intercept Method. *Id.* Witness Hager testified that both methods recognize that some portion of the distribution system is necessary to serve customers, regardless of whether the

customers take any energy from the system. *Id.* The Minimum System Method seeks to determine the minimum size distribution system that can be built to serve the minimum load requirements of customers. *Id.* This method develops the cost of the minimum set of distribution assets that are needed to serve customers, and allocates those costs based on the number of customers. *Id.* The Zero-Intercept Method, according to witness Hager, similarly allocates a portion of the same distribution accounts on the basis of the number of customers and seeks to identify the portion of distribution plant that is associated with no load using regression techniques. *Id.*

Witness Hager testified that DEP incorporated the Minimum System Method into its COSS and testified that this was appropriate for the allocation of customer-related distribution costs. *Id.* at 105. She explained that the Zero-Intercept Method is a more complex and time-consuming methodology. Witness Hager further explained that the Minimum System Method, which is sound and consistent with cost causation, produces results that are not materially different from the Zero-Intercept Method. *Id.* DEP's Minimum System Study allowed DEP to classify the distribution system into customer-related and demand-related portions. *Id.* She testified that because every customer requires some minimum amount of wires, poles, and other distribution infrastructure, every customer "causes" DEP to install some amount of distribution assets. *Id.* The concept used by DEP in developing its Minimum System study was to consider what distribution assets would be required if every customer had only a minimum level of usage. *Id.* This allows DEP to assess how much of its distribution system is installed simply to ensure that electricity can be delivered to each customer. *Id.* Once minimum system costs are identified, distribution costs over this amount and direct assignments of those extra costs are determined to be driven by demand. *Id.*

Witness Hager testified that the PBR Statute requires the use of the minimum system methodology to allocate distribution costs between customer classes. *Id.* at 106.

The Public Staff Testimony

Public Staff witness McLawhorn testified in support of the COSS Stipulation and discussed the stakeholder process that led to that settlement. Witness McLawhorn discussed the Commission's March 31, 2021, Order Accepting Stipulations, Granting Partial Rate Increase, and Requiring Customer Notice issued in Docket No. E-7, Sub 1214, in which the Commission adopted the Second Agreement and Stipulation of Partial Settlement (Sub 1214 Partial Settlement). Tr. vol. 16, 398-99. The Sub 1214 Partial Settlement provided for an analysis of various cost of service methodologies in which DEP and DEC agreed to consult with the Public Staff and interested parties to analyze and develop cost of service studies based upon specific criteria, including the analysis of the various strengths and weaknesses of each respective methodology, and to file the resulting COSS with the Commission before DEP filed its next rate case. *Id.* at 399. As witness McLawhorn described, the stakeholders met several times throughout 2021, holding the final meeting on November 16, 2021. *Id.* On January 25, 2022, DEP and DEC filed the results of the COSS in Docket Nos. E-2, Sub 1219 and E-7, Sub 1214, as the Commission required. *Id.* at 400. Although the stakeholder process did not result in a consensus as to the appropriate cost of service allocation methodology to

utilize, it helped certain parties arrive at the COSS Stipulation that is before the Commission in this case. *Id.*

Public Staff witness D. Williamson also testified in support of the COSS Stipulation, including the results of his investigation on how the COSS influences the way DEP's base rate charges will reflect the requested revenue requirement changes. Tr. vol. 20, 133. As witness D. Williamson explained, it is important that the utility consider all costs in the COSS to ensure that it is reasonably able to recover its full cost to serve all customers, while also ensuring that all jurisdictions and customer classes bear the appropriate responsibility for the respective costs they impose upon the system. *Id.* at 149-50. In discussing the 12 CP methodology for jurisdictional allocations and the modified A&E methodology for NC retail allocations, witness D. Williamson confirmed that the use of different cost of service allocation methodologies may be unusual for a general rate case in North Carolina, but use of two methodologies does occur in some other jurisdictions. *Id.* at 152. In sum, witness D. Williamson recommended approval of the COSS Stipulation and DEP's use of the methodologies to which the parties agreed in the COSS Stipulation. *Id.* at 180.

CIGFUR Testimony

CIGFUR witness Phillips filed testimony in support of the COSS Stipulation. Witness Phillips testified that the COSS Stipulation is reasonable and that the Commission should approve it in its entirety. Tr. vol. 21, 477. Witness Phillips also testified that both the 12 CP and modified A&E methodologies are theoretically sound, reflect principles of cost causation as required by N.C.G.S. § 62-133.16(a)(1) and (b), and should be used for ratemaking in this proceeding. *Id.* at 474, 477. Witness Phillips further testified that DEP has appropriately allocated distribution system costs to customer classes in a manner consistent with N.C.G.S. 62-133.16(b), which requires the use of minimum system methodology by an electric public utility for the purpose of allocating distribution costs. *Id.* at 473. Witness Philips additionally testified about the relation between the excess component of the A&E method as it relates to additional capacity requirements. *Id.* at 479.

CUCA Testimony

CUCA is not a party to the COSS Stipulation. CUCA witness O'Donnell acknowledged that such settlements are a product of give-and-take settlement negotiations. Tr. vol. 21, 648. Despite this, witness O'Donnell testified that the results of any model should be viewed considering the economic impact that DEP rate increases will have on the economic drivers in North Carolina. *Id.* Witness O'Donnell recommended that if the Commission were to accept the modified A&E cost allocation method, then the Commission should set rates with the recognition that North Carolina is losing manufacturing jobs more than other southern states. *Id.* at 652-53. Witness O'Donnell questioned whether the time is right for DEP to transition to full implementation of the A&E method. *Id.* at 653. Nevertheless, he testified that CUCA does not oppose the COSS Stipulation. *Id.* at 648.

The Commercial Group Testimony

The Commercial Group is not a party to the COSS Stipulation. However, Commercial Group witness Chriss testified that for the purposes of this rate case, the Commercial Group does not oppose DEP's proposed production capacity cost allocation methodology. Tr. vol. 21, 520.

North Carolina League of Municipalities (NCLM)

The NCLM was the only party to cross-examine DEP witness Hager during the expert witness hearing on May 8, 2023. Tr. vol. 11, 113-58. NCLM questioned witness Hager as to whether a 20.0% increase in lighting rates in year one of the MYRP would be considered a "gradual" change. *Id.* at 117-20. In response, witness Hager testified that, while the change in cost of service methodology did lead to DEP's allocating more cost to the Lighting class, only a portion of that increase was driven by the change in cost of service methodology. *Id.* at 119. She also testified that the point of a cost of service study is to determine allocation of costs to customer classes, but that rate design ultimately uses the cost of service study to determine rates for customers. *Id.* at 120. Witness Hager acknowledged that this COSS allocates more costs to lighting. *Id.* at 119. But she also testified that this is reasonable because the COSS determined that this increase was consistent with cost causation principles, meaning that lighting customers are causing more costs to be incurred on the system. *Id.* at 120.

Further, NCLM questioned whether all parties participated in the COSS collaborative and in settlement discussions. *Id.* at 121-22. Witness Hager testified that DEP invited all entities that were parties to the previous rate case to participate in the COSS collaborative that led to settlement discussions, which then led to the COSS DEP uses in this case. *Id.* at 122. NCLM was a party to the prior case but did not participate in the COSS collaborative and did not offer any alternative cost of service methodology in this rate case.

Discussion and Conclusions

Although the COSS Stipulation is not unanimous, no other party to this proceeding has proposed an alternative cost of service methodology. Tr. vol. 11, 125.

Based upon the evidence presented in this case, including the evidence offered in support of the stipulation as well as the evidence elicited through cross-examination as discussed hereinabove, the Commission approves the COSS Stipulation. The Commission notes that the use of the diversified non-coincident peak demand to calculate the excess allocation portion of the Modified A&E methodology is a departure from both the method approved currently for DEP as well as the A&E method applied in South Carolina. Therefore, the Commission directs DEP to provide a more detailed justification for the use of a NCP demand over a coincident peak demand for any cost allocation purpose in future rate cases.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 36

TCA Stipulation

The evidence supporting this finding of fact is contained in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Abernathy and Bateman and Public Staff witness Metz; the TCA Stipulation; and the entire record in this proceeding.

As explained by DEP witness Maley, the Red Zone Expansion Plan transmission projects (RZEP Projects) included in DEP's MYRP consist of transmission upgrades needed to enable interconnection of additional solar generation on the DEP transmission system. DEP witness Abernathy testified as to the revenue requirement sought by DEP for the RZEP Projects, which involved allocation of all RZEP costs to DEP. In light of concerns expressed by the Public Staff in the Carbon Plan proceeding regarding the imbalance of transmission costs being incurred between DEC and DEP associated with the interconnection of new generation, DEP presented (but did not propose) an alternative allocation of RZEP costs as between DEC and DEP based on respective retail transmission demand load ratio share. Tr. vol. 13, 99-101. Witness Abernathy testified that DEP did not support this allocation but included the calculation in the event the Commission determined that such an allocation was more appropriate in light of the concerns of the Public Staff. *Id.* at 102.

While the Public Staff found merit in DEP's alternative proposal, Public Staff witness Metz recommended a different proposal that focused on the net energy transfers between DEP and DEC. Tr. vol. 16, 454-55. DEP witness Metz explained that the Public Staff's alternative proposal utilizes the non-firm transmission rate from the FERC-approved OATT of DEC, Duke Energy Florida, LLC (Duke Energy Florida), and DEP, which incorporates capital and ongoing O&M costs of the DEC and DEP transmission systems. He testified that DEP's alternative allocation only considers a discrete portion of each utility's system and does not consider the O&M costs. The OATT, updated annually and listed on the OASIS website, provides an established calculation for transmission system capital and O&M costs that is transparent and easily verifiable. *Id.*

DEP and the Public Staff resolved their differences on this issue and, as set forth in the TCA Stipulation, agreed to a pro forma adjustment of approximately $20 million to increase the revenue requirement in the DEC Rate Case and a corresponding decrease the revenue requirement in the instant proceeding.

DEC, also a party to the stipulation, DEP, and the Public Staff agreed to calculate the pro forma amount of transmission expense for DEC and transmission revenue for DEP by multiplying the net transfers from DEP to DEC under the JDA in 2022 by the DEP non-firm transmission rate from the FERC-approved Joint OATT of DEP, DEC and Duke Energy Florida. The stipulation makes clear that the adjustment is for North Carolina ratemaking purposes only and will neither change the terms or conditions of the JDA nor result in any accounting entries for DEP or DEC. The TCA Stipulation provides that the

adjustment will become effective on October 31, 2023, for both DEP and DEC and will terminate at the sooner of the effective date of rates in DEP's or DEC's next general rate case or the effective date of a full merger of DEP and DEC, unless the Commission orders otherwise. TCA Stipulation § II, Tr. vol. 7, 23.

DEP witness Bateman testified in support of the TCA Stipulation. Tr. vol. 14, 146. She testified that the TCA Stipulation is the result of substantial discovery and extensive negotiation among the stipulating parties and that it reflects a constructive near-term approach to addressing rate disparity concerns arising from the increasing net energy transfers from DEP to DEC under the JDA. *Id.* Public Staff witness Metz also testified in support of the TCA Stipulation. Tr. vol. 16, 517-18. Witness Metz testified that the TCA Stipulation addresses the growing level of net energy transfers and the subsequent rate disparity between DEP and DEC in North Carolina and explained that the adjustment will compensate DEP and DEC ratepayers for the use and annual maintenance of each utility's transmission system for energy transfers under the JDA. *Id.*

The Commission concludes that the TCA Stipulation itself, along with the expert testimony discussed above, is credible evidence and is entitled to substantial weight in the Commission's ultimate determination on this issue. No party offered evidence opposing the TCA Stipulation, and the Commission concludes that the TCA Stipulation, as supported by the testimony cited above, establishes a reasonable method to align costs with cost causation principles. Utilization of this method appropriately balances DEC and DEP benefits to the least cost dispatch of their respective systems. Accordingly, the Commission concludes that the provisions of the TCA Stipulation are in the public interest and are just and reasonable to all parties in this proceeding. Therefore, the TCA Stipulation is approved for the purposes of DEP's Application in this proceeding. The Commission notes that all parties have an opportunity in the pending DEC PBR proceeding in Docket No. E-7, Sub 1276 to address the DEC impacts of the TCA Stipulation before the Commission addresses the TCA Stipulation in that proceeding.

EVIDENCE AND CONCLUSIONS FOR FINDINGS FOR FACT NOS. 37-38

PIMs Stipulation

The evidence supporting these findings and conclusions is contained in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Bateman and Stillman, Public Staff witnesses D. Williamson and Thomas, AGO witness Nelson, and CIGFUR witnesses Phillips and Gorman; the PIMs Stipulation; and the entire record in this proceeding.

PIMs

DEP initially proposed the following PIMs in its Application: (1) Peak Load Reduction, (2) Low-Income/Affordability, (3) Reliability, and (4) Renewables Integration and Encouragement. Tr. vol. 14, 91-99.

As filed, the Peak Load Reduction PIM encouraged DEP to reduce peak load, based on the estimated winter peak kilowatt reduction resulting from new customer enrollment in DEP's dynamic and time differentiated rate programs. *Id.*

The Low-Income/Affordability PIM provided incentives for DEP to encourage voluntary contributions to its existing "Share the Light" Fund, which provides financial assistance to customers who are struggling to pay their energy bills, through a structure that establishes graduated shareholder contributions and shareholder bonus matching contributions to fund health and safety repairs for low-income residences based upon target levels of contributions to the Share the Light Fund. *Id.*

The Reliability PIM held DEP accountable to maintain service reliability as measured by SAIDI (excluding Major Event Days (MEDs)). This PIM features graduated penalties DEP shall distribute to customers for failure to maintain SAIDI below tiered threshold levels that DEP will base upon historic averages adjusted for statistical confidence levels and increased outages due to additional grid work that DEP expects during the MYRP. *Id*.

The Renewables Integration and Encouragement PIM involved three metrics to incent and reward DEP. The Distributed Energy Resource (DER) Integration Metric A provided graduated rewards to DEP for exceeding targets for the number of net-metered DER customers interconnected to the DEP system. *Id.* at 104. The Large Customer Renewable Program Encouragement Metric B provided an incentive for DEP to design, obtain approval of, and subscribe customers to new renewable programs that meet these customers' desires for access to clean energy resources. *Id.* at 106. The Residential Customer Shared Solar Program Encouragement Metric C encouraged DEP to subscribe residential customers to new shared solar programs. *Id.* at 107.

In addition to the PIMs, DEP also proposed three tracking metrics in the areas of customer service, carbon dioxide (CO2) emissions, and beneficial electrification. The proposed customer service tracking metric supported maintaining adequate levels of customer service per N.C.G.S. § 62-133.16(d)(2)j. *Id*. at 113. The proposed CO2 emissions tracking metric would report progress towards compliance with the CO2 reduction requirements of S.L. 2021-165 and the Carbon Plan. *Id.* at 113-14. Finally, the third metric proposed to report on incremental load from EVs. *Id.* at 114.

Public Staff witnesses D. Williamson and Thomas expressed concerns with each PIM, beginning with the metric DEP proposed in the Peak Load Reduction PIM. Tr. vol. 18, 390. The Public Staff testified that time of use (TOU) customers have complete control over whether they act on price signals and shift their load, and enrollment in TOU rates does not directly correlate to winter peak load reductions across DEP's footprint. The Public Staff notes that DEP's TOU report suggests a modest winter peak load reduction for customers who could be presumed to be early adopters or have a greater awareness of energy usage, but there is no guarantee that this level of winter peak load reductions will occur with greater enrollment. *Id.* at 390. The Public Staff also testified that, as DEP is already receiving a performance incentive for its DSM and EE programs through its

DSM/EE rider, a winter peak load reduction PIM should have to demonstrate incrementally greater savings above those being observed through DSM and EE programs, particularly for customers who are on TOU rates and participate in DSM or EE programs. *Id.* at 391.

The Public Staff expressed concerns regarding the Low-Income/Affordability PIM, primarily based on the fact that the Share the Light Fund is not a regulated activity, and the impacts of this PIM would not be reflected in the annual PIM rider. The Public Staff testified that while customer contributions are an input in the calculation of this PIM, shareholders presently have great discretion to adjust the amount of their overall contributions to the Share the Light Fund. *Id.* at 392.

Regarding the Reliability PIM, which targets reliability by tracking DEP's SAIDI score, the Public Staff expressed concern that because benchmarking for the tiered performance structure proposed by DEP is based on five years of historical SAIDI data, consideration of any expected advancements in reliability that will occur as a result of grid investments included in the proposed MYRP is foreclosed. In addition, the Public Staff expressed the concern that the five years of historical performance data includes data that were collected before DEP's GIP investments were placed into service. *Id.* at 393.

Finally, the Public Staff testified as to concerns with the Renewables Integration and Encouragement PIM. *Id.* at 394-96. With respect to Metric A, the Public Staff testified that Net Energy Metering (NEM) adoption is largely outside of DEP's control, that NEM adoption has been steadily increasing over time as individual customers make individual financial decisions, that two recent Commission orders that have not been incorporated into the forecast or financial structure of this proposed PIM that have the potential to skew the adoption rates above what DEP has already forecast, and that the new NEM rate schedules involve customer enrollment in certain TOU rates, which links this metric to the Peak Load Reduction PIM. *Id.* at 394-96. With respect to Metrics B and C, the Public Staff expressed concerns that DEP has complete control over all renewable program capacity available to large customers and that a capacity limit that is set below anticipated enrollment requests could result in DEP easily surpassing the enrollment thresholds. Additionally, the Public Staff testified that existing large customer programs have been popular without an incentive, and the Public Staff noted that performance data on which Metric B and Metric C are based are linked to new programs and there is therefore insufficient data for determining whether a financial incentive is necessary. *Id.* at 396.

In light of the Public Staff's concerns, the Public Staff proposed three modified PIMs in response to the PIMs DEP proposed. The Public Staff proposed a Time-Of-Use Enrollment PIM, a Customer Reliability PIM, and a Renewable Interconnections PIM, which involve both modifications to DEP proposals as well as new proposals. *Id*. at 396-97.

In response to DEP's proposed Low-Income/Affordability PIM, NCJC, et al. witness Howat and Sierra Club witness Colton expressed concerns with the effectiveness of the proposed PIM as designed in advancing a policy goal of low-income energy affordability.

Id. at 205, 252. Both witnesses filed a suggestion to include a tier structure under this PIM for consideration. *Id.* at 211.

CIGFUR witness Gorman's direct testimony expressed concern regarding DEP's proposed Reliability PIM. Tr. vol. 21, 459. Witness Gorman proposed expanding the PIM to include a metric for measuring and ensuring the maintenance of adequate power quality and the avoidance of power quality incidents. *Id.* Commercial Group witness Chriss raised similar concerns about the Reliability PIM, stating that DEP should restructure the PIM to hold itself accountable for poorly performing circuits. *Id.* at 509.

AGO witness Nelson proposed a Carbon Reduction PIM as an alternative to Metrics B and C of the Renewables and Integration PIM. *Id.* at 165. Witness Nelson expressed concern that the PIMs Stipulation does not incentivize DEP to lower emissions at least cost. *Id*. at 90. DEP witness Stillman and Public Staff witness Thomas expressed concerns with a Carbon Reduction PIM's compatibility with S.L. 2021-165. *Id.* at 435, 468-69; Tr. vol. 23, 209-11.

CUCA witness O'Donnell and NCJC, et al. witness Posner proposed conceptual fuel cost PIMs. Tr. vol. 21, 671, 1104. Witness O'Donnell's proposed fuel cost PIM would attempt to manage fuel costs and volatility and encourage selection of generation resources based on fuel costs. *Id*. at 671.

DEP witnesses Bateman and Stillman explained how the carbon reduction requirement in N.C.G.S. § 62-110.9 is an aggregate requirement on DEC and DEP, meaning that the law does not require DEP to independently reduce its CO2 emissions by 70.0%. *Id.* at 211.

DEP, the Public Staff, and CIGFUR resolved their differences of opinions on PIMs proposed in this proceeding in the PIMs Stipulation. PIMS Stipulation, Tr. vol. 7, 23.

DEP's PBR Policy Panel provided testimony in support of the PIMs Stipulation. Tr. vol. 14, 131. The PBR Policy Panel testified that the resolution reached represents a balanced approach to achieving policy goals in DEP's first PBR Application. Tr. vol. 15, 17, 70. DEP witness Stillman testified as to how the settled PIMs originated from the North Carolina Energy Regulatory Process (NERP) PBR Working Group, were informed by DEP's prefiling PIM stakeholder process, and evolved over discussions with the stipulating parties. Tr. vol. 14, 132-33. DEP witness Bateman testified that the Commission must examine DEP's PIMs proposals in the context of the entire MYRP. Tr. vol. 15, 15. Witness Bateman testified that DEP took a conservative approach in its first PBR Application so that DEP, customers, and the Commission could gain experience with the operation and implementation of PIMs. *Id.* at 69. DEP witness Stillman explained DEP's approach to designing the PIMs around the 1.0% cap in N.C.G.S. § 62-133.16 and stated that DEP deliberately chose only a select number of PIMs that meet the maximum number of policy goals. *Id.* at 65.

Public Staff witnesses D. Williamson and Thomas also provided testimony in support of the PIMs Stipulation. Tr. vol. 18, 424-25. Witnesses D. Williamson and Thomas testified that the PIMs Stipulation benefits ratepayers by providing improved compliance with N.C.G.S. § 62-133.16 and that each PIM in the stipulation appropriately targets a specific policy goal from N.C.G.S. § 62-133.16. They further testified that the PIMs Stipulation will benefit ratepayers through improved operational efficiencies, cost savings, and reliability of electric service over the course of the MYRP. *Id*.

The parties to the PIMs Stipulation did not achieve an agreement on the Low Income/Affordability PIM. The PIMs Stipulation includes the three PIMs described below; the PIMs are described with specificity, including thresholds, tiers, penalty and reward amounts, and projections of costs in PBR Policy Panel Settlement Exhibits 1, 3, and 4. Tr. Ex. vol. 14.

Time Differentiated and Dynamic Rate Enrollment PIM

DEP Witness Stillman testified that the Peak Load Reduction PIM was renamed as the Time Differentiated and Dynamic Rate Enrollment PIM (TOU Enrollment PIM) and was revised to provide DEP with a $5 incentive for every new customer enrolled in an eligible program. Tr. vol. 14, 135. Witness Stillman testified that this PIM targets and advances operational efficiency and cost savings and encourages DEP to design and seek approval of dynamic and time-differentiated rate designs. *Id*. at 93. Witness Stillman further testified that this PIM is an upside only PIM, with a shared savings-like structure that would distribute 30.0% of the total peak reduction joint benefit to DEP and 70.0% to customers. *Id.* at 135.

At the expert witness hearing, witness Stillman further explained that the purpose behind this PIM is to encourage DEP to develop and expand the use of TOU rates to help address peak load growth. *Id.* at 169-71. This PIM should encourage customers to adapt to new rate designs and subsequently shift their usage from high to low usage periods. *Id.* at 169. Witness Stillman testified that current subscribership to these programs is low, in the range of about 1.5% of residential customers, so one of the purposes behind this PIM is to encourage more customers to subscribe to TOU programs. *Id.* at 171. Witness Stillman also stated that DEP had statistically significant results demonstrating that customers that have participated in these rate designs have adapted and shifted their usage from on peak periods to off peak periods. *Id.* at 170. In response to concerns about insufficient data to measure impact on load due to enrollment in TOU programs, witness Stillman testified that the PIMs Stipulation addresses this concern and explained that DEP will conduct a broader Evaluation, Measurement, and Verification study on system benefits once there is sufficient participation in DEP's TOU rate schedules to achieve statistical significance. Tr. vol. 15, 38-39.

Public Staff witnesses Thomas and D. Williamson testified that the parties designed the TOU Enrollment PIM to increase the customer base subscribing to TOU rates to continue to ascertain how TOU rates impact load reduction. Tr. vol. 18, 459. Witness D. Williamson explained that it is appropriate to reward DEP for increasing the

number of TOU customers to mitigate energy usage during peak periods when the grid is stressed, so that DEP can better operate and improve operational efficiencies of the grid. *Id.* at 460. Witness Thomas also explained that the parties based the $5 per customer reward amount on savings per customer from a previously conducted TOU Report. *Id.*

Reliability PIM

DEP witness Stillman offered direct settlement testimony in support of DEP's Reliability PIM, which is designed to facilitate maintaining or improving service reliability in compliance with N.C.G.S. § 62-110.9(3). Tr. vol. 14, 136-37. DEP's Reliability PIM would be measured by SAIDI, excluding MEDS. As originally proposed, DEP's Reliability PIM provided for graduated penalties based on DEP's failure to maintain SAIDI below certain threshold tiers based upon five-year historic averages, adjusted for statistical confidence levels, and increased outages due to expected grid work. Tr. vol. 14, 91-92.

At the expert witness hearing, witness Stillman explained that as part of the PIMs Stipulation, DEP agreed to revise the metric for this PIM to account for projected SAIDI improvement during the MYRP period due to expected grid investments. Tr. vol. 15, 41-43.

Renewables Integration and Encouragement PIM

DEP witness Stillman testified that DEP designed Metric A of the Renewables Integration and Encouragement PIM to incent rooftop solar and to provide DEP with an incentive to determine the most effective way to encourage adoption. Tr. vol. 15, 53. This metric was modified as part of the PIMs Stipulation to base the incentive tiers on the three-year rolling average of net metered interconnections. Tr. vol. 23, 194-95. Metric A would provide an incentive of up to $4 million to DEP if the number of net metered interconnections for each rate year exceeds the applicable preceding three-year rolling average by at least 25.0%. Tr. vol. 15, 50.

DEP witness Stillman testified at the expert witness hearing that the only difference between Metric B as proposed by DEP and the PIMs Stipulation is a decrease in the reward amount. Tr. vol. 15, 57. As filed, Metric B of the Renewables Integration and Encouragement PIM supports large commercial and industrial (C&I) customers, educational institutions, and local governments who have corporate goals related to electricity and are increasingly seeking access to renewable energy and programs. Tr. vol. 14, 106; Tr. vol. 23, 195-96. As witness Stillman explained, this component of the Renewables Integration and Encouragement PIM was proposed in response to feedback received from large customer representatives. Tr. vol. 14, 138; Tr. vol. 21, 460-61; *See* CIGFUR witness Gorman Direct Ex. 7; Tr. Ex. vol. 21. Public Staff witness Thomas testified that the reduction in the reward amount for Metric B, considering the PIMs Stipulation as a whole, helped to alleviate the Public Staff's concerns that DEP would be overly rewarded for the independent financial decisions of large commercial and industrial customers. Tr. vol. 18, 466-67.

Revised Metric C of the Renewables Integration and Encouragement PIM in the PIMs Stipulation is based on the recommendations of the Public Staff, addresses utility-scale interconnections, and is designed to increase operational efficiency by incentivizing interconnections above DEP's estimated annual limits. Tr. vol. 14, 139. This component includes incentive tiers and minimum MW thresholds for utility-scale interconnections in each MYRP rate year. *Id*. at 139. DEP witness Stillman testified that Metric C responds to recommendations from the Public Staff to develop a PIM to incentivize DEP to focus on utility-scale interconnections. Tr. vol. 15, 60. He further stated that the reward will not be possible until DEP exceeds the interconnections the Carbon Plan already required under the Carbon Plan. *Id*. at 63. The Public Staff also testified that the intent of Metric C is to incent DEP to be more efficient in the interconnection process. Tr. vol. 18, 472.

Tracking Metrics

DEP witness Stillman provided direct testimony stating that DEP selected the tracking metrics it proposed to quantitatively measure and monitor outcomes and/or utility performance that, although not tied to financial incentives or penalties, address DEP's progress in furthering important policy goals. He further stated that tracking metrics can provide useful information in evaluating potential future PIMs. Tr. vol. 14, 113-14.

In the PIMs Stipulation, the stipulating parties agreed to three tracking metrics. The first agreed-upon tracking metric is the proposed metric on customer service as DEP proposed in its initial testimony. DEP witness Stillman testified that under the customer service tracking metric DEP will provide a quarterly update during the rate year of the rolling 12-month call center answer rate and the average speed of answer. Tr. vol. 14, 140-41. Witness Stillman testified that this tracking metric is appropriate because customers often communicate with DEP about service and billing issues by telephone, it allows greater public access to the data, and it supports maintaining adequate levels of customer service. *Id.*

The second tracking metric is the proposed metric on beneficial electrification of EVs as DEP initially proposed. Witness Stillman explained that this metric requires DEP to report beneficial electrification from estimated incremental load from EVs and will provide data in an area of material public policy interest. *Id.*

The third tracking metric the PIMs Stipulation includes requires DEP to report the 10 worst performing circuits on an annual basis, including an analysis of the cause of each circuit's performance. DEP witness Stillman testified that the stipulating parties have agreed to confer on a definition for the metric for a worst performing circuit and file an update with the Commission on an agreed-upon metric no later than 60 days after issuance of the Commission's order in this proceeding. Tr. vol. 14, 141. Witness Stillman explained that the stipulating parties included this tracking metric in the PIMs Stipulation due to the importance of reliability and the information this reporting will provide to interested parties. Tr. vol. 15, 43.

Discussion and Conclusions

Upon review of the testimony of DEP, the Public Staff, and CIGFUR witnesses regarding the PIMs Stipulation, the Commission concludes that the PIMs Stipulation is the product of give-and-take negotiations between DEP, CIGFUR, and the Public Staff to achieve PIMs and metrics that are consistent with N.C.G.S. § 62-133.16 and strike an appropriate balance.

The Commission must give full consideration to a non-unanimous stipulation itself, along with all evidence presented by non-stipulating parties in determining whether the stipulation's provisions should be accepted. *CUCA I*, 348 N.C. at 466; *CUCA II*, 351 N.C. at 231. The Commission has considered the testimony of the parties to this proceeding on the PIMs, as cited above, and notes that some of the non-stipulating parties' recommendations and modifications are addressed by the PIMs Stipulation. For example, with the inclusion of the worst-performing-circuit tracking metric, certain intervenor recommendations on reliability PIMs are accounted for outside of an express PIM, and data on reliability and circuit performance will be gathered as a result. PIMS Stipulation § III.2, Tr. Ex. vol. 7.

As this is the first PBR application considered by the Commission and, therefore, the first set of PIMs to be adopted, the Commission concludes that it is reasonable and appropriate to take measured steps to implement PIMs and tracking metrics as allowed for under N.C.G.S. § 62-133.16. The PIMs and the tracking metrics set forth in the PIMs Stipulation achieve this measured approach and are balanced, reasonable, and consistent with the requirements of the PBR Statute, encourage behavior that is sought by customers, and could provide meaningful operational and financial benefits to customers. Therefore, the Commission concludes that the PIMs Stipulation is entitled to substantial weight. Accordingly, the Commission concludes that the PIMs and tracking metrics set forth in the PIMs Stipulation should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 39

Power Quality Stipulation

The evidence supporting this finding of fact is in the direct testimony of DEP witnesses Stillman and Guyton; the supplemental direct testimony of CIGFUR witness Phillips in support of partial settlement; the Power Quality Stipulation; and the entire record in this proceeding.

The Power Quality Stipulation provides that DEP and CIGFUR will work together to identify up to 13 industrial customer premises with DEP-owned transmission to distribution retail substations that DEP exclusively or primarily dedicates to the respective CIGFUR member (Eligible Premises). Subject to a feasibility review, DEP will install power quality monitoring technology for each Eligible Premises and meet with the identified CIGFUR members at least once annually to review the data from the power quality monitoring technology. Power Quality Stipulation at 3; Tr. Ex. vol. 7.

In support of the Power Quality Stipulation, CIGFUR witness Phillips testified that the stipulation will help satisfy the requirement of N.C.G.S. § 62-110.9 to maintain or improve reliability as utilities implement the Carbon Plan. Tr. vol. 21, 495. Witness Phillips testified that the Commission has recognized the well-documented reliability risks that inverter-based resources pose. *Id*. at 496-97.

Witness Phillips further testified that the pilot program the parties outline in the Power Quality Stipulation will allow DEP to mitigate the reliability risks associated with inverter-based resources. *Id*. at 497-98. Specifically, it would allow DEP to: (1) proactively monitor power quality as utilities implement the Carbon Plan; (2) gather and share data analytics with the Public Staff and the Commission; (3) determine whether power quality incidents are the result of an individual circuit or customer problem, or potentially part of a larger trend; (4) diagnose potential power quality issues and, pursuant to review, implement solutions to address any such issues; and (5) take a proactive approach to customer service and service quality. *Id.*

With respect to the cost of the pilot program, DEP witness Stillman stated in cross examination that the Power Quality Stipulation does not set a cost cap. Tr. vol. 15, 76. He estimated that the cost of installing the power quality monitoring technology would be approximately $10,000 to $25,000 per meter, while the total number of meters needed for this pilot was not specified. *Id.* at 75. He further stated that the cost of implementing solutions, as contemplated in the Power Quality Stipulation, will depend on the cause of the specific power quality issue for each premises. He added that the lessons learned from the pilot program will help the whole system, because the more meters that are installed, the more DEP will learn about where the power quality issues are arising. In acknowledging that DEP intends to seek cost recovery on a cost of service basis, witness Stillman stated in direct testimony that the pilot program will help DEP to understand the system and power quality issues better, and that it will ultimately be to the benefit of all customers. Tr. vol. 21, 474-76.

The Commission notes that no party introduced evidence in this docket suggesting that industrial customers are experiencing degraded power quality issues due to inverter-based resources. In addition, the Commission notes that the pilot program as the parties propose in the Power Quality Stipulation would be available for participation to only 13 CIGFUR members, and that DEP would recover the costs, with no cost cap, on a cost of service basis from all DEP ratepayers. This method would result in the cross subsidization of these industrial customers by all ratepayers, including residential customers.

The Commission acknowledges the effort required to craft a pilot program and a mutually agreeable stipulation. A well-designed pilot program focused on improving power quality for individual customers and for the entire system has merit and could provide benefits for all ratepayers. It is premature, based on the information provided in the Power Quality Stipulation, for the Commission to approve the pilot program as contemplated between the two parties absent additional details, including information regarding parameters for a feasibility review, participant eligibility, and cost, and absent an opportunity for interested parties to undertake a thorough review of the proposal and

provide comments to the Commission. Particularly with respect to pilot programs, the Commission needs sufficient information to ensure that the program is properly scoped and bounded. The Commission therefore concludes that the record evidence does not support approval of the power quality pilot program.

However, DEP may file an application for a power quality pilot program with the Commission in a new docket that addresses the concerns noted by the Commission, should it so choose.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 40-41

Affordability Stipulation/CAP

The evidence supporting these findings of fact is in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Harris, Bateman, and Stillman, Public Staff witnesses D. Williamson and Thomas, NCJC, et al. witnesses Howat and Posner, and Sierra Club witness Colton; the Affordability Stipulation; and the entire record in this proceeding.

Summary of Evidence

Low-Income/Affordability PIM

DEP's PBR Policy Panel testified in support of DEP's proposed Low-Income/Affordability PIM. Tr. vol. 14, 91. The PBR Policy Panel testified that the Low-Income/Affordability PIM would: (1) target and advance cost savings; (2) reduce low-income energy burdens; and (3) encourage carbon reductions. *Id.* at 94. The PBR Policy Panel testified that the proposed PIM would advance the identified policy goals by providing DEP with an incentive to promote voluntary contributions to the Share the Light Fund. *Id.* at 101.

Public Staff witnesses Thomas and D. Williamson recommended that the Commission deny DEP's proposed Low-Income/Affordability PIM. Tr. vol. 18, 418. The Public Staff expressed concern that the PIM fails to meet some of the Public Staff's guiding principles for the development of PIMs because the Share the Light Fund is not a regulated Company activity and DEP's annual PIM rider would not reflect the impacts of the PIM. *Id.* at 392.

Sierra Club witness Colton recommended that the Commission reject DEP's proposed Low Income/Affordability PIM and adopt Sierra Club's alternative proposal. Witness Colton expressed concerns that DEP's proposed Low-Income/Affordability PIM would insufficiently measure and promote the advancement of the PIM's stated goals and was not adequately in DEP's direct control. *Id.* at 295-300, 313. Alternatively, Sierra Club witness Colton recommended that the Commission require DEP to adopt a series of "outcome" metrics to measure DEP's performance and the accomplishment of program objectives. *Id.* at 293.

NCJC, et al. witness Howat recommended that the Commission reject DEPs Low-Income/Affordability PIM given his concerns that the originally proposed Share the Light Fund contributions would not directly advance low-income energy burden reductions and that there was no explicit commitment to measure potential low-income energy burden reductions attributable to the Low-Income/Affordability PIM. Witness Howat instead recommended that the Commission direct DEP to implement an alternative Energy Burden Reduction PIM based on a reduction in involuntary residential non-pay disconnections over a four-year period in the service territory zip codes with the highest disconnection ratios. Tr. vol. 18, 224. Additionally, he recommended that the Commission implement reporting requirements. *Id.* at 230. NCJC, et al. witness Posner echoed many of the same concerns as witness Howat and ultimately recommended that the Commission reject the Low-Income/Affordability PIM and advised the Commission to adopt NCJC, et al. witness Howat's Energy Burden Reduction PIM instead. Tr. vol. 21, 1103.

In rebuttal testimony, DEP's PBR Policy Panel reiterated DEP's position that the PIM strikes the appropriate balance between encouraging outcomes sufficiently within DEP's control and providing meaningful funding to address low-income issues. Tr. vol. 23, 186.

Customer Assistance Program

In its Application, DEP requested approval of the CAP and two new tariffs, the CAP Rider and the Customer Assistance Recovery Rider (CAR Rider). DEP witness Harris testified that the CAP proposal, initially developed in the Low-Income Affordability Collaborative (LIAC) docket, is designed to assist low-income customers who are facing affordability challenges. Witness Harris described the program structure, framework, and reasoning behind the program. Tr. vol. 12, 204-05. Under the CAP, eligible customers would automatically receive a $42 monthly bill credit for a 12-month period. Tr. vol. 12, 205.

Regarding CAP eligibility, witness Harris explained that customers who are eligible for and receive funds from either the Low Income Energy Assistance Program (LIEAP) or the Crisis Intervention Program (CIP) would qualify for assistance under the CAP. DEP would automatically enroll eligible customers into CAP using a list of customers provided by the North Carolina Department of Health and Human Services (DHHS). Tr. vol. 12, 207. Moreover, DEP could re-enroll customers in CAP for another 12 bill cycles if they are re-certified as LIEAP or CIP eligible after expiration of the initial enrollment. Tr. vol. 12, 215.

Witness Harris testified that in addition to the $42 bill credit on their next 12 monthly bills, DEP will also refer CAP customers to other income-qualified weatherization and energy efficiency services that can assist customers with reducing energy usage. Tr. vol. 12, 215. DEP would spread the costs for the $42 CAP credit among all customer classes, excluding lighting schedules, through the CAR Rider. Residential customers would pay approximately 86.0% of the CAR Rider on a per kWh basis, with non-residential customers paying the approximately 14.0% remaining on a per bill basis. Tr. vol. 12, 215. The CAR Rider would have a rolling recovery factor that DEP would true-up annually to reflect the actual amount of CAP credits paid. Tr. vol.12, 207.

Public Staff witness D. Williamson recommended that the Commission: (1) approve the CAP proposal for a three-year term; and (2) require that DEP, as part of the CAR Rider proceeding, file a report addressing several issues and metrics, including the number of CAP recipients, CAP administration costs, and observed impacts of CAP on arrearage management and disconnections for nonpayment. Tr. vol. 20, 147. Witness D. Williamson noted that the Public Staff would prefer a clear legislative requirement directing the development of a program like CAP; however, he also noted that the Commission has broad authority to determine whether programs utilities design to address affordability issues are in the public interest. Tr. vol. 20, 146. Witness D. Williamson highlighted that in the Commission's Order for the 2019 Rate Case, the Commission exercised this authority by requiring that parties collaborate on developing programs that would serve the public interest and address affordability challenges for low-income customers. Tr. vol. 20, 146-47.

Sierra Club witness Colton testified that absent a program like CAP, electric bill affordability in the DEP service territory would significantly deteriorate given the increased rates proposed in the proceeding. Tr. vol. 18, 274. Witness Colton concluded that the general policy underlying DEP's CAP proposal was reasonable. Tr. vol. 18, 275. Witness Colton proceeded to make modest recommendations to the CAP proposal to advance the achievement of affordable electric bills for low-income households. Among his recommendations, witness Colton emphasized the importance of defining an affordable bill burden as a percentage of a household's income. Tr. vol. 18, 252. Witness Colton maintained that an affordable bill burden is a range and not a point, and it is appropriate, in principle, to measure affordability by reference to bills as an affordable percentage of income – regardless of the ultimate burden target the Commission deems appropriate to adopt. Tr. vol. 18, 266. Witness Colton recommended modifying the proposed across-the-board flat bill credit to a tiered, percent of bill discount. Tr. vol. 18, 276. As proposed, witness Colton's alternative program design seeks to achieve affordable bills as a percentage of household income and reduce affordability disparities between customers at different income levels, measured by the Federal Poverty Guidelines. Tr. vol. 18, 281-84.

NCJC, et al. witness Howat provided observations and analysis regarding the variances between CAP and Consensus Proposal 24 from the LIAC, the hallmarks of effective bill payment assistance programs, low-income energy usage, and burdens. Witness Howat ultimately recommended that the Commission adopt a tiered discount affordability program. Tr. vol. 18, 203-22.

CIGFUR witness Phillips testified that the costs of the proposed CAP that DEP would recover though the CAR Rider should only be recovered from residential customers, and that the creation of a new cross-subsidy benefitting residential customers at the expense of non-residential customers contradicts the express directive of the PBR Statuteto minimize interclass cross-subsidization by the greatest practicable extent possible by the end of the MYRP period. Tr. vol. 21, 482.

The Affordability Panel of DEP witnesses Barnes, Harris, and Quick responded to the affordability-related testimony and recommendations proposed by the Public Staff and

other intervenors. Witness Barnes described DEP's Affordability Ecosystem as a multi-pronged approach resulting from the LIAC's findings. Witness Barnes explained that bill payment assistance represents one lever for addressing affordability challenges, and she pointed to energy efficiency programs as another major component in DEP's Affordability Ecosystem. Tr. vol. 22, 84. Witness Barnes further disputed witness Colton's claim of LIAC's adoption of an energy burden threshold, distinguishing LIAC's target electric energy burden from CAP from witness Colton's 5.0% definition of total home energy. Tr. vol. 22, 85. Witness Barnes testified to DEP's willingness to participate in an evaluation study of North Carolina customers that would inform findings for adopting an electric energy burden threshold for Duke Energy's North Carolina customers. Witness Barnes stated that providing the zip-code level data intervenors requested would violate DEP's Code of Conduct, which prohibits disclosing aggregated non-public customer data. Tr. vol. 22, 87. DEP witness Quick testified that while DEP tracks participants in the Winter Moratorium that Commission Rule 12-11(1) established, it does not routinely collect and track customers' income status. Tr. vol. 22, 88. Due to the complexity and costs that would be added to the work of DEP's call center representatives from collecting, validating, and tracking such sensitive information, she disagreed with recommendations that DEP should collect such data and instead endorsed DEP's continued work with state or assistance agencies with the necessary experience and expertise to assist customers. Tr. vol. 22, 89.

DEP witness Harris testified that DEP agrees with the Public Staff's testimony and recommendations related to the CAP and does not oppose the proposed annual report. Tr. vol. 22, 90-91. Harris disagreed with CIGFUR witness Phillips' conclusion regarding interclass cross subsidization and stated that the program will put downward pressure on all rates. Tr. vol. 22, 91. He further testified that DEP would be amendable to a tiering feature for future versions of the CAP. Witness Harris explained that the auto-enrollment mechanism, which is a core design feature of CAP, cannot currently support tiering. Tr. vol. 22, 92-93. Further, witness Harris disagreed with recommendations that DEP, DHHS, or other organizations provide another intake service for CAP, explaining that the estimated operating costs from a third party would increase the total cost of operating CAP by a factor of almost 11. Tr. vol. 22, 93. Witness Harris testified that using a percentage discount, rather than a dollar amount, would reduce the incentive for energy efficiency investments, reduce the financial incentives for customers to respond to dynamic rate designs, and make the program's costs less predictable. Tr. vol. 22, 94.

Affordability Stipulation

On May 4, 2023, DEP, DEC, Sierra Club, NCJC, et al., and the Public Staff filed the Affordability Stipulation. Pursuant to the terms of the Affordability Stipulation, DEP will withdraw the Low-Income/Affordability PIM and, instead, a shareholder contribution of $16 million to benefit income-eligible customers will be made as follows: $10 million in support of health and safety repairs that would allow for energy efficiency and weatherization upgrades to homes; and $6 million for the Share the Light Fund, which offers customers bill payment assistance. Tr. vol. 22, 99-100. In addition, DEP and DEC agree to collect and annually report the monthly payments ratio, which is the number of residential payments remitted divided by

the number of active residential accounts. DEP and DEC will file this data annually in Docket No. M-100, Sub 179. Furthermore, pursuant to the terms of the Affordability Stipulation, DEP would establish its CAP program as a three-year pilot. If the Commission approves CAP, DEP agrees to convene a stakeholder engagement process to consider CAP data, metrics, and future CAP program features. The Affordability Panel, the Public Staff, Sierra Club witness Colton, and NCJC, et al. witness Howat each provided testimony supporting the Affordability Stipulation. Tr. vol. 18, 326-66.

Considering all testimony and evidence along with the Affordability Stipulation, the Commission finds that the provisions of the Affordability Stipulation are reasonable and should be approved for the following reasons.

The Commission gives significant weight to the testimony of DEP witnesses Harris, Barnes, and Quick, and Public Staff witness D. Williamson regarding the Affordability Stipulation and DEP's CAP proposal. As Public Staff witness D. Williamson and DEP witness Harris highlighted in their testimony, the Commission has broad authority to set rates in the public interest. Tr. vol. 20, 146; Tr. vol. 13, 22. The question of whether the Commission should approve the CAP proposal and corresponding tariffs as outlined in the Affordability Stipulation is largely a public policy issue requiring a balancing of costs and benefits to DEP customers. The Commission established the LIAC in the 2019 Rate Case and tasked the collaborative with addressing affordability issues for low-income residential customers.

The statute authorizing performance-based regulation emphasizes reducing interclass subsidies and reducing low-income energy burdens. N.C.G.S. 62-133.16(b) requires the minimization of interclass subsidies to the greatest extent practicable by the end of the multiyear rate period. Further, N.C.G.S. § 62-133.16(d)(1) requires the Commission to consider whether the PBR application, in its entirety, "assures that no customer or class of customers is unreasonably harmed" by the proposal. N.C.G.S. § 62-133.16(d)(2) provides that the Commission may consider whether the PBR application "reduces low-income energy burdens." The Commission concludes that DEP reasonably designed the CAP proposal to meet and balance these statutory directives.

The Commission finds that the Affordability Stipulation advances the objective of reducing low-income energy burdens without causing unreasonable harm to any customer or class of customers. The Commission gives substantial weight to the DEP testimony that: (1) although the CAP causes a small interclass subsidy, residential customers primarily fund it; and (2) there is potential for the program to put downward pressure on rates for all customers, by having fewer stranded costs from disconnected accounts and arrearages, which would otherwise be passed on to the general body of ratepayers in the next general rate case.

The Commission approves the CAP as a limited-term pilot, which will allow the Commission, the Public Staff, DEP, and other parties, over time, to examine whether the CAP credit meets the public policy objectives and whether the CAP results in rates that are unreasonably discriminatory or preferential to certain customer classes. As such, the

Commission finds that it is reasonable for DEP to launch the CAP and implement the corresponding tariffs associated with the CAP proposal for a period of three years as set forth in the Affordability Stipulation.

Affordability – Next Steps

The Commission appreciates the consensus achieved by the parties in the Affordability Stipulation. Several provisions in the Affordability Stipulation provide for reporting of information. In order to examine whether the CAP meets public policy objectives, the Commission determines that it is necessary to provide guidance on these requirements.

Stakeholder Group and Report

In the Affordability Stipulation, the stipulating parties agree to convene a stakeholder engagement process to (i) consider data and reporting issues that may be necessary for the CAP, (ii) consider metrics and inputs used to assess the CAP pilot, and (iii) agree to update the Commission on the stakeholder process. The Commission directs DEP to convene this stakeholder group within 90 days of the issuance of this Order. The stakeholder group shall include the stipulating parties to the Affordability Stipulation. DEP is also directed to invite members of the LIAC to join the stakeholder group. Further, the Commission directs that the group meet at least quarterly, and that no later than 6 months after the issuance of this Order, the group must agree upon the data and information that will be provided in an annual report that will be filed each year the CAP is effective. The Commission directs that the annual report shall include, but shall not be limited to, the following information:

1. How many customers enrolled in the CAP by zip code.

2. How many dollars given in assistance by zip code.

3. Percentage of total customers enrolled in the CAP by zip code.

4. Percentage of total customers enrolled in the CAP that have had disconnections.

5. Identification of the zip codes which have the highest number of residential nonpayment disconnections.

6. Range, average, and median bill size for customers enrolled in the CAP.

7. Recommendations relating to potential changes in the CAP that would have the potential to improve the program during the pilot or as part of a subsequent program.

DEP is directed to inform the Commission if it is unable to report any of the above listed data.

The Commission notes that in Paragraph 2 of Section II the Affordability Stipulation, DEP and DEC agree to collect and report data regarding health and safety repairs that are made with shareholder funds. The Commission directs that the following information shall be provided and filed semiannually regarding these funds:

1. Dollar amount given in weatherization help to customers by zip code.

2. Dollar amount given to energy efficiency help to customers by zip code.

3. Percentage of customers that receive CAP and receive weatherization and/or EE assistance by zip code.

The report shall also identify the most frequent types of health and safety repairs that may be necessary and required to enable customers to qualify for weatherization programs.

Tiered Customer Assistance Program

The Commission further notes that the Affordability Stipulation states that parties agree to explore "a tiered customer assistance program based on income levels if that feature can be incorporated into the design of the CAP." In order to address affordability challenges in the state the Commission finds that it is necessary to direct the stakeholder group to develop a tiered program. Further, DEP is directed to file a report relating to the feasibility and proposed structure of a program the later of (i) 18 months after the entry of the order in this proceeding, or (ii) when there is one year of data from the CAP Rider. DEP shall also provide a report to the Public Staff and the Commission every six months after the entry of an order in this proceeding which summarizes the ongoing work of the stakeholder group, and which identifies any challenges as well as opportunities for improving the CAP program. DEP shall also seek from the Commission any waivers necessary or required to obtain or provide the zip code related data set forth in this Order as well as any zip code level data necessary or required to design a tiered customer assistance program.

Tracking Metrics

The Commission further finds that in order to inform future PIMs, DEP is directed to report on the following tracking metrics related to Affordability in the same manner as the tracking metrics agreed to the PIMS Stipulation:

1. The average Disconnect for Non-Payment (DNP) percentage of active residential customers over the last 12 month period.

2. The ratio of the average annual residential customer bill (1,000 kWh of usage per month) divided by the annual federal poverty income level for family of four according to the Federal Poverty Guidelines.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 42-48

Objectives of Rate Design

The evidence supporting these findings of fact is in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Reed and Byrd, Public Staff witnesses Williamson and Nader, Commercial Group witness Chriss, Kroger Co. and Harris Teeter witness Bieber, DoD-FEA witness Blank, CIGFUR witnesses Phillips and Gorman, AGO witness Nelson, and CUCA witnesses O'Donnell and Heilig; the Partial Revenue Requirement Stipulation; and the entire record in this proceeding.

DEP witness Reed testified that she used the cost-of-service information prepared by DEP and examined by DEP witness Hager to design rates. Tr. vol. 11, 176. Witness Reed testified that she also reviewed and considered the rates of return across the customer classes derived from the COSS when designing rates. *Id.* Finally, witness Reed noted that she reviewed DEP's Advanced Metering Infrastructure (AMI) data to examine customers' usage characteristics and to determine relationships between energy and demand, both on a coincident peak and non-coincident peak basis that might prove pertinent to the design of DEP's rates, including the development of new TOU periods. *Id.* at 176-77.

Witness Reed stated that one objective of DEP's proposed rate design is to achieve the necessary increase in rates to collect the total revenue requirement. *Id.* at 177. Witness Reed also stated that another DEP objective is to gradually align the cost to serve customers within its residential, general service, and lighting rate schedules. *Id.* Witness Reed also noted that DEP's goal is to design rates that reflect the costs that a customer causes DEP to incur. *Id.* With respect to the rate increases proposed in this case, witness Reed stated that the base rate increase has been allocated to the rate classes by base rate amounts. *Id.* at 180. Witness Reed claimed that this allocation methodology aims to distribute the increase equitably to the classes while maintaining each class's deficiency or surplus contribution to return. *Id.*

In his direct testimony, DEP witness Byrd testified that DEP, as ordered by the Commission, participated in a year-long Comprehensive Rate Design Study (CRDS) with external stakeholders to develop DEP's future pricing and rate design options. *Id.* at 231. Following this engagement, DEP proposed several rate design changes to incorporate stakeholder requests and input. *Id.* at 232.

DEP witness Reed testified in detail regarding changes that DEP proposes to the residential rate schedules, the SGS rate schedules, the MGS rate schedules, the LGS rate schedules, the seasonal and intermittent rate schedules, and to the lighting rate schedules. Tr. vol. 11, 183-202. DEP witness Reed also testifies in detail regarding the

proposed revisions to DEP's service riders, which are offered to reflect special customer needs and requirements. Her testimony describes how the riders have been revised to better reflect cost of service. *Id.* at 202-06.

Having considered the record evidence on the issue of rate design, the Commission concludes that the objectives of DEP's rate design – which are to: (1) achieve the necessary increase in rates to collect the total revenue requirement; (2) further align the cost to serve customers within DEP's residential, general service, and lighting rate schedules; and (3) design rates that reflect the costs a customer causes DEP to incur – are reasonable. Further, the Commission concludes that DEP's proposed allocation of the approved revenue increase to the customer classes is reasonable to all parties, considering the evidence presented and is approved for the purposes of this proceeding. Finally, for the foregoing reasons, the revisions to the rate schedules and to the service riders proposed by DEP in this proceeding are reasonable and are approved as proposed, unless otherwise specifically addressed hereinafter in this Order.

Subsidy Reduction

DEP evaluated rates of return across customer classes emanating from DEP's COSS. Tr. vol. 11, 179. DEP witness Reed testified that the historical per books rate of return indices as measured by the ratio of class rate of return to retail rate of return, shows that over a lengthy period, residential customers have been subsidized. She testified that his historical subsidy has, in the past, been beyond the range of reasonableness, which DEP defines as class rates of return within 10.0% of the total Company rate of return. *Id.* She also testified that an updated comparison through the test period now shows significant convergence of the class rate of return over all classes towards the band of reasonableness demonstrating the success of the strategy of gradually reducing the subsidy/excess by 10.0%. *Id.* at 180-81.

DEP witness Reed explained that in designing rates, the base rate increase was allocated to the rate classes by rate base amounts and that this allocation method distributes the increase equitably to the classes while maintaining each class's deficiency or surplus contribution to return. *Id.* at 18.

DEP witness Reed testified that, in this proceeding, DEP is also recommending a variance reduction of 10.0% to help reduce interclass subsidies to better align each rate class to the average rate of return. *Id.*

CIGFUR witness Phillips testified that he disagreed with DEP's proposed 10.0% subsidy reduction and instead recommended that a 25.0% subsidy reduction, consistent with DEP's last rate case proceeding, be the minimum reduction for this proceeding. Tr. vol. 21, 483. Witness Phillips testified that a subsidy reduction of 50.0% or even 100.0% would be preferable. *Id.* Witness Phillips claimed that LGS customers are subsidizing other rate classes by approximately $47.7 million under current rates, that the proposed 10.0% subsidy reduction does not adequately correct this cross-subsidization, and that LGS customers should receive a rate reduction to eliminate the subsidy. *Id.*

Witness Phillips also stated that DEP's proposed 5.8% LGS rate increase will "continu[e] the large subsidy paid by these customers". *Id.*

DoD-FEA witness Blank also took issue with DEP's proposed 10.0% subsidy reduction and stated that DEP's proposed allocation of base rate revenue increases deviates substantially from its COSS results. *Id.* at 310. Witness Blank claimed that DEP's proposed rate increases result in the LGS class subsidizing other classes, particularly the residential class. *Id.* at 326. Witness Blank argued that the use of any variance, even a higher variance than DEP's proposed 10.0%, will not alleviate the subsidization faced by the LGS class, will still lead to rate increases for LGS and LGS-TOU rate classes, and will lead to rate increases "well above a level that I would be comfortable with," for rate classes farther away from cost-based rates. *Id.* Therefore, witness Blank recommended that the Commission reject the use of a variance reduction approach, even at a higher level (e.g., 25.0%) than the 10.0% DEP proposed. *Id.*

On rebuttal, witness Reed testified that the proposed 10.0% subsidy reduction "balances the rate increases requested … so that no rate class receives a disproportionate increase [due to] the proposed changes to the cost-of-service methodology [shifting] costs among rate classes." Tr. vol. 11, 264. Specifically, witness Reed explained that if DEP had employed witness Phillips' recommended 25.0% subsidy reduction the proposed increase to the residential class would increase from 9.9% to 10.4% and the proposed increase to the Lighting class would increase from 19.9% to 24.9%. *Id.* at 265. Witness Reed stated that DEP's 10.0% subsidy reduction proposal applies the concept of gradualism to align revenues collected from each class with cost causation from DEP's class cost of service study (CCOSS) but that DEP does not intend it to signal that DEP will limit future subsidy reductions to 10.0%. *Id.*

During the expert witness hearing, in response to cross-examination by CIGFUR, CUCA, and DoD-FEA, witness Reed acknowledged that other customer classes have historically subsidized residential customers. *Id.* at 324, 360, 386-87. However, witness Reed explained that DEP intends for the 10.0% subsidy reduction to move the rate increase for each rate class toward parity with the rate of return while avoiding harm to certain classes. *Id.* at 387-88. Moreover, witness Reed reiterated that in determining the 10.0% subsidy reduction, DEP attempted to balance the change in cost-of-service with the requested rate increases so that certain rate classes would not be overly burdened with a rate increase. *Id.* at 326. Witness Reed further explained that employing a 25.0% subsidy reduction "would really harm certain [customer] classes." *Id.* at 388.

During the expert witness hearing, witness Reed also asserted that DEP's proposed 10.0% variance reduction was consistent with N.C.G.S. § 62-133.16. *Id.* at 318-21, 330. During cross-examination by CIGFUR, witness Reed acknowledged that N.C.G.S. § 62-133.16 requires DEP to minimize interclass subsidization. However, witness Reed emphasized that the statute only requires DEP to minimize interclass subsidization "to the greatest extent practicable," which is what it has done. *Id.* As witness Reed explained in response to cross-examination by the NCLM, this is particularly true given that the PBR Statute also requires the Commission to consider the possibility for

rate shock. Tr. vol. 12, 14. As such, witness Reed testified that DEP appropriately considered "competing priorities" such as cost causation, rate shock, and gradualism in proposing the 10.0% variance reduction. Tr. vol. 11, 320-21.

Based on the evidence in the record, the Commission agrees that a variance reduction of 10.0% is reasonable for application in this proceeding. In reaching this conclusion, the Commission gives significant weight to the testimony of witness Reed that a 10.0% subsidy reduction helps move towards eventual rate parity and minimize interclass subsidization, including but not limited to the historic subsidization of the residential class, while considering and incorporating other important factors. Additionally, the Commission recognizes that witness Phillips' argument in support of a greater variance reduction raises a legitimate concern, but concludes that, a variance reduction is not the only issue that a utility must consider when designing rates. The Commission also declines to accept witness Blank's recommendation to completely disallow a variance reduction. The Commission has historically approved a variance reduction for DEP and witness Blank has offered no compelling evidence warranting a departure from this prior practice. Accordingly, the Commission finds that a 10.0% subsidy reduction is just and reasonable and consistent with the PBR Statute, moves rates closer to cost for all customer classes and is less likely to lead to rate shock than a larger subsidy reduction.

Migration Adjustment

DEP witness Reed testified that during the rate design process, DEP analyzed rate migration, which occurs when customers change from their current tariff to a tariff that is more cost-effective for them. Tr. vol. 11, 181. Witness Reed claimed that, due to the introduction of new tariffs, the redesign of other tariffs to better align with system costs, and the ability of DEP's new Customer Connect billing system to perform rate comparisons and suggest the best rate for customers, DEP recommends a migration adjustment to the residential, MGS, and LGS classes. *Id.* at 181, 265-66. Specifically, DEP requests a migration adjustment to residential and MGS classes for customers who would save 10.0% or more annually and to the LGS class for customers who would save 5.0% or more annually. *Id.* at 181, 266. Witness Reed noted that this proposal would result in a $12 million migration adjustment for the residential class in Rate Year 0, an approximately $8 million migration adjustment for the MGS class each rate year, and an approximately $1.2 million migration adjustment for the LGS class each rate year. *Id.* at 181-82. Witness Reed noted that DEP is only requesting a migration adjustment for the residential class in Rate Year 0 and not Rate Years 1, 2, or 3 because under the MYRP a migration adjustment is unnecessary due to the Residential Decoupling Mechanism. *Id.* at 181-82, 370. In contrast, witness Reed testified that the proposed migration adjustment for the MGS and LGS classes will carry forward in each rate year including Rate Year 0 and Rate Years 1, 2 and 3 under the MYRP. *Id.* at 182. Witness Reed explained that the primary driver for the migration adjustment requests for the MGS and the LGS classes is the realignment of TOU windows to system costs which allows customers to respond to more economically efficient price signals. *Id.* Witness Reed's Direct Exhibits 4, 4_1, 4_2, and 4_3 provided the requested migration amounts. *Id.* Tr. Ex. vol. 11.

DoD-FEA was the only party to challenge DEP's requested migration adjustment. DoD-FEA witness Blank requested that the Commission deny DEP's proposed migration adjustment because it artificially increases DEP's base revenue recovery to account for an amount of lost future revenue that is not known or measurable. Tr. vol. 21, 314. Witness Blank argued that the migration adjustment presumes customers will switch rate schedules when they understand potential utility bill savings even though customers choose rate schedules for reasons beyond those a simple bill analysis suggests. *Id.* Witness Blank argued that the relative risk between rate designs and anticipated events that may affect future demand and usage influences actual customer choice. *Id.* Witness Blank argued that DEP's migration adjustments assume that customers will switch rate schedules and does not account for customer risk aversion, which may impact their willingness to switch even when potential utility bill savings are possible. *Id.* Witness Blank acknowledged that some migration will likely occur but argued that it is reasonable for DEP to bear such risk since it is a short-term risk that it can remedy during its next rate case when it better knows customer behavior. *Id.* at 314-15. Witness Blank also noted that future changes to customer electricity usage and billing are "an overall unknown," including potential increases that expanding EV ownership or a rise in the number of homes using electric heating could drive. *Id.*

In rebuttal testimony, DEP's Rate Design Panel, witnesses Byrd and Reed, disagreed with witness Blank's contention that the migration adjustment accounts for lost revenue that is unknown and unmeasurable. Tr. vol. 11, 266-68. The Rate Design Panel testified that in determining the migration adjustment, actual customer billing data was used to calculate actual savings on customer bills. *Id.* at 267. Specifically, the Rate Design Panel explained that for each participant in the rate class, individual customer bills were calculated on their current rate schedule at proposed rates and at other available rate schedules in their rate class at proposed rates. *Id.* at 266. The net annual savings from individual customers saving more than the threshold were then aggregated to determine the migration adjustment amount. *Id.* The Rate Design Panel further stated that DEP considers its proposed 10.0% and 5.0% savings thresholds to be conservative estimates of anticipated migration levels. *Id.* During cross-examination by the DoD-FEA, witness Reed explained that the proposed migration adjustment is a "conservative estimate" because it only considered "structural savers" – i.e., customers that would automatically save money simply by transitioning to a different rate schedule – and does not include customers below the savings threshold that may want to switch or customers that may save money through behavioral changes. *Id.* at 372, 376.

The Rate Design Panel also testified that the availability of several tools that will help customers switch to the best rate mitigates witness Blank's concerns regarding the migration adjustment. *Id.* at 267-68, 373. First, customers who have 12 months of usage history will have access to DEP's Rate Comparison Tool – an online tool (part of Customer Connect) that leverages historic interval data to determine a customer's best rate. *Id.* at 267. Second, customers may also contact DEP's Call Center Representatives to request a rate comparison. *Id.* Third, LGS class customers can also utilize their Large Account Managers. Tr. vol. 11, 267, 373. As witness Reed explained during cross-examination by

the DoD-FEA, these Large Account Managers help LGS customers both manage their complex rates and determine the best rate. *Id.* at 373.

The Commission concludes that DEP's proposed migration adjustment is just and reasonable considering the evidence of record in this proceeding. The Commission is not persuaded by DoD-FEA witness Blank that the lost revenues for which the migration adjustment is intended to compensate are unknown and unmeasurable. DEP witness Reed offered convincing testimony that the Rate Design Panel calculated the migration adjustment based on actual customer billing data and that the 10.0% and 5.0% savings thresholds are reasonable, conservative estimates of DEP's migration exposure. The Commission also considers witness Reed's testimony, describing how the Rate Comparison Tool, Call Center Representatives, and Large Account Managers will mitigate migration concerns and help customers switch to rates that may allow them to lower their bills, to be an adequate response to witness Blank's concerns. The Commission therefore accepts DEP's proposed migration adjustments and finds they should be approved as DEP proposed them for the purposes of this proceeding.

Customer Growth and Weather Normalization

DEP witness Reed testified that she provided the retail sales and number of customers to DEP witness Jiggetts for use in calculating the pro forma adjustment for growth in customers. Tr. vol. 11, 173. Witness Reed explained that to arrive at the appropriate number of customers served and the attendant annualized sales levels at the end of the test period, DEP used a combination of regression analysis and a customer-by-customer approach. *Id.* at 173-74.

In her supplemental direct testimony, witness Reed testified that DEP had agreed with the Public Staff to periodically update the Customer Growth Analysis to extend the results to the end of the pro forma period. *Id.* at 223. As such, witness Reed testified that DEP had updated the Customer Growth Analysis through December 31, 2022, for informational purposes only, as DEP witness Jiggetts' Supplemental Direct Testimony Exhibit 4 Pro forma NC1040 demonstrates. Tr. Ex. vol. 13.

CIGFUR witness Gorman testified that DEP's sales projection for residential and SGS customers in the base period is unreasonably low. Tr. vol. 21, 405, 425-26. Witness Gorman claimed that DEP bases its pro forma adjustments on weather normalized use per customer in a single year, which does not reflect how customers' usage can vary due to customer behavior, introduces uncertainty, and does not provide a reasonable projection of likely future customer electricity usage. *Id.* at 426. Witness Gorman recommended that DEP instead use a four-year average projected use per residential customers normalized sales projection. *Id.* at 428.

On rebuttal, the Rate Design Panel disagreed with witness Gorman's claim that DEP's residential weather normalized sales were too low. Tr. vol. 11, 268. The Rate Design Panel testified that DEP bases energy usage projections for the residential and SGS customer classes on historical actual weather normalized sales, which means that

DEP uses kWh sales over the test year and extended period and applies monthly factors based on 30 years of historical weather data to normalize sales for weather. *Id.* The Rate Design Panel also testified that witness Gorman was incorrect in his claim that DEP's pro forma adjustments are based on weather normalized use per customer in a single year. *Id.* The Rate Design Panel explained that the true-up of DEP's test year and extended period estimate of number of customers is based on the best fit of seven different regression models and that the analyses use four, three, two, and one-year time periods for projections. *Id.* at 268-69. The regression analysis that is best aligned with the data (highest statistical "R" value) is then selected. *Id.* at 269. Finally, the Rate Design Panel disagreed with witness Gorman's recommendation that DEP use a four-year average projected use per Residential customer normalized sales projection; the method currently used has been thoroughly vetted by the Public Staff and has been approved by the Commission in prior rate cases. *Id.* Moreover, the Rate Design Panel explained that if the Commission approves DEP's request for an MYRP, residential revenues will be decoupled. *Id.*

The Commission concludes that DEP's proposed weather normalization and customer growth adjustment are reasonable in light of the evidence presented. The Commission, therefore, rejects witness Gorman's recommendation because his proposal does not appear to provide a meaningful improvement over DEP's current methodology. Moreover, the Commission concludes that the evidence in this case does not support a departure from a customer normalized sales projection methodology that the Public Staff has scrutinized and the Commission has approved previously.

Updated Time of Use Periods

DEP witness Byrd, in his direct testimony, testified that DEP is proposing updated and aligned TOU periods across its tariffs that contain time-differentiated pricing for residential and non-residential customers. Tr. vol. 11, 233. Specifically, DEP is proposing to refresh TOU periods as follows (peak periods do not include weekends or holidays):

- On-Peak (Summer) – 6:00 p.m. – 9:00 p.m.
- On-Peak (Non-Summer) – 6:00 a.m. – 9:00 a.m.
- Discount (Summer) – 1:00 a.m. – 6:00 a.m.
- Discount (Non-Summer) – 1:00 a.m. – 3:00 a.m. and 11:00 a.m. – 4:00 p.m.
- Summer consists of the months May – September
- Non-Summer consists of the months October – April.

Id. at 234. Witness Byrd testified that the impacted rate schedules include Residential Service Time-of-Use Schedule R-TOU, Residential Service Time-of-Use Demand Schedule R-TOUD, SGS-TOUE, SGS Time-of-Use Schedule SGS-TOU

(renamed Schedule MGS-TOU), LGS-TOU, LGS-RTP, and the Large Load Curtailable Rider LLC. *Id.* at 241. Schedules R-TOU-CPP and SGS-TOU-CPP already use these proposed periods and will not be impacted. *Id.*

Witness Byrd explained that DEP's existing TOU periods, established decades ago, are no longer appropriate and increasingly do not align with DEP's current and anticipated system needs. *Id.* at 235. Witness Byrd stated that the new TOU periods will benefit customers and advance several policy goals. *Id.* at 241. Specifically, witness Byrd testified that the new TOU periods will properly align price signals to cost differences that exist across different seasons and hours, thereby encouraging peak load reduction and efficient system usage; provide the opportunity for economic use of new technologies, such as smart energy management devices, energy storage, and EVs; and encourage flexible consumption during times of low system costs, providing incentives for distributed energy resource adoption. *Id.* at 234, 241-42. Witness Byrd testified that the TOU periods proposed were taken directly from observations of the Cost Duration Model (CDM) and were discussed and evaluated at length with stakeholders during the CRDS. *Id.* at 235-36. Moreover, witness Byrd notes that the proposed TOU periods have already been approved by the Commission for two of DEP's current tariffs: R-TOU-CPP and SGS-TOU-CPP. *Id.* at 235.

The AGO was the only party that recommended any revisions to DEP's proposed TOU periods. AGO witness Nelson recommended that DEP shift its proposed Summer On-Peak period one hour earlier to 5:00 to 8:00 p.m. Tr. vol. 18, 89. Witness Nelson claimed that this Summer On-Peak period would better reflect system costs during each year of the CDM output (2021, 2026, and 2030). *Id.* at 86. Witness Nelson was particularly concerned with DEP's use of the 2030 CDM output and argued that DEP should not weight it as heavily as 2021 and 2026 output when designing current rates since it is farthest in the future and therefore the most uncertain. *Id.* at 89.

In his rebuttal testimony, DEP witness Byrd disagreed with the AGO's position that DEP should shift the Summer On-Peak period to 5:00 to 8:00 p.m. Tr. vol. 11, 269. Witness Byrd reiterated that DEP discussed and evaluated the proposed 6:00 to 9:00 p.m. Summer On-Peak period at length with stakeholders during the CRDS; DEP based the proposal on observations from the CDM; and the peak period balances several factors, including system costs through 2030 and customer experience. *Id.* at 270. In response to the AGO's concerns regarding DEP's forward-looking approach in designing the new TOU periods, witness Byrd explained that it is important that DEP revise its TOU periods now, before many residential customers are on TOU rates, to minimize disruption once more customers are on TOU rates and have established behavioral patterns. *Id.* at 304. Additionally, witness Byrd explained that TOU periods that consider expected system evolution are appropriate because they will be durable and can last for several years. *Id.* Moreover, witness Byrd testified that if the Commission adopted witness Nelson's recommendation to shift the Summer On-Peak period to 5:00 to 8:00 p.m., customers on Rate Schedules R-TOU-CPP and SGS-TOU-CPP – under which the Summer On-Peak period is 6:00 to 9:00 p.m. – would experience a change in TOU periods after having only been on these rate schedules for a short period. *Id.* at 270. As such, given the recent approval of Rate Schedules R-TOU-CPP and SGS-TOU-CPP, shifting the Summer On-

Peak period to 5:00 to 8:00 p.m. would presumably alter these customers' expectations of TOU period stability. *Id.* Finally, witness Byrd testified that the proposed 6:00 to 9:00 p.m. Summer On-Peak period better aligns with the anticipated increased levels of solar generation on the system, as contemplated in the Commission's Carbon Plan, which will shift the net peak to later in the afternoon. *Id.* at 270-71.

The Commission declines to adopt witness Nelson's recommended change to shift the Summer On-Peak period to 5:00 to 8:00 p.m. DEP witness Byrd offered convincing testimony that it would not be reasonable to shift the Summer On-Peak period to 5:00 to 8:00 p.m. given that the CRDS analyzed the 6:00 to 9:00 p.m. Summer On-Peak period,, DEP based the proposal on the CDM, and the Commission has already approved the Summer On-Peak period for DEP's Rate Schedules R-TOU-CPP and SGS-TOU-CPP. In addition to ensuring proper price signaling and encouraging customer adoption of new technologies, the evidence strongly indicates that DEP's modernized TOU periods will improve price and cost causation alignment. Accordingly, the Commission concludes that DEP's new TOU periods should be approved as proposed.

Residential

The residential rate class includes the following rate schedules: Residential Service Schedule RES, Residential Service Time-of-Use Demand Schedule R-TOUD, Residential Service Time-of-Use Schedule R-TOU, and Residential Service Time-of-Use with Critical Peak Pricing Schedule R-TOU-CPP. Tr. vol. 11, 184.

DEP witness Reed testified that DEP proposes to re-open and modify Residential Rate Schedule R-TOUD to modernize the TOU periods and to update the demand charge structure to better reflect cost causation. *Id.* Witness Reed explained that the CRDS addressed R-TOUD tariff redesign and that the modified tariff will provide customers with more choices regarding their energy consumption. *Id.* at 185. Additionally, witness Reed testified that in response to feedback from customers, DEP also proposes to expand the applicability of residential rates to include detached garages, barns, or other structures that are at the same service address as a separate, primary residential account. *Id.* at 187. Witness Reed testified that if the Commission approves the expansion, DEP will allow existing customers to move from a general service schedule to a residential schedule for detached structures at the same premises as the residential account. *Id.* at 188. Further, witness Reed testified that while DEP's unit cost study justifies an increase to the monthly Basic Customer Charge to better reflect customer-related costs and minimize customer cross-subsidization, DEP is not proposing to raise the Basic Customer Charge in this proceeding. *Id.* at 186. Specifically, witness Reed testified that DEP is proposing to maintain the monthly residential Basic Customer Charge for the R-TOUD, R-TOU, and R-TOU-CPP rate schedules at $16.85. *Id.* Reed Direct Exhibits 6, 6_1, 6_2, and 6_3 illustrate the Basic Customer Charges for the major customer classes for the proposed rate years. *Id.* at 170. Tr. Ex. vol. 11.

In his direct testimony, AGO witness Nelson recommended that the Commission explore making TOU rates default for the residential class. Tr. vol. 18, 111-12. Witness

Nelson argued that DEP's default residential rate schedule – Schedule RES – includes a non-time-varying energy rate that does not send accurate price signals to residential customers, thereby causing more costs to be incurred by customers and DEP during peak hours. *Id.* at 110-11. As such, witness Nelson argued that providing DEP with an incentive to get residential customers on a TOU rate is inappropriate and costly. *Id.* at 111. Instead, the Commission should explore other avenues for expanding residential TOU rates, such as making TOU rates default for the residential class. *Id.* at 111-12.

In his direct testimony, Public Staff witness Williamson testified that while he generally supports the proposed changes to the rate schedules, he proposed a few minor modifications. Tr. vol. 20, 172. Specifically, witness Williamson recommended that the Commission approve DEP's proposal to allow detached garages, barns, and other structures on the same residential premise to be served under a residential rate schedule. *Id.* at 173-75. However, witness Williamson recommended that DEP notify all SGS customers of this change through bill insert or separate mailing. *Id.* at 175, 180. Additionally, regarding DEP's Basic Customer Charge, witness Williamson recommended that DEP set the Basic Customer Charge for Schedules R-TOU and R-TOUD at the same $14.00 per month rate as Schedule RES. *Id.* at 173, 180.

DoD-FEA witness Blank also testified regarding DEP's proposed rate increase for the residential class. Tr. vol. 21, 322-23. Specifically, witness Blank recommended that DEP's proposed rate increase for the residential class not exceed 1.25 times the overall retail base revenue increase. *Id.*

In their rebuttal testimony, the Rate Design Panel disagreed with witness Nelson's recommendation to make TOU rates default for the residential class. Tr. vol. 11, 281. Witnesses Reed and Byrd testified that the choice to switch to a TOU rate should be with the customer because TOU rates only yield system benefits if customers respond to price signals and shift load away from peak periods. *Id.* During the expert witness hearing, witness Reed explained that forcing a residential customer to switch to a TOU rate could be harmful and result in higher bills if they cannot manage their energy usage in response to price signals. *Id.* at 312. Therefore, witness Reed testified that DEP's preferred approach to expanding TOU rate adoption is to make TOU rates more appealing and encourage voluntary adoption. *Id.* at 281, 311.

In response to the Public Staff's recommendations relating to the residential class, the Rate Design Panel accepted the Public Staff's proposal to notify all SGS customers through bill insert or a separate mailing about the expanded applicability of residential rates to include detached garages, barns, and other structures that are at the same service address as a separate, primary residential account. *Id.* at 283. DEP also accepted the Public Staff's proposal to set the Basic Customer Charge for Rate Schedules R-TOU and R-TOUD at $14.00. *Id.* at 280.

The Rate Design Panel also disagreed with witness Blank's recommendation to cap the rate increase for the Residential class. *Id.* at 282. The Rate Design Panel explained that witness Blank's rate increase proposal would shift the rate increase for the LGS class to other

customer classes which is not in line with the need to balance cost causation alignment, gradualism, and the avoidance of rate shock. *Id.* During the expert witness hearing, witness Reed explained that by shifting the rate increase from the LGS class to other customer classes, including the residential class, witness Blank's rate increase proposals benefit the LGS class at the expense of all other customer classes, including rate increases of over 100 percent for some classes. *Id.* at 385-86, 390.

In light of the parties' testimony and all the evidence presented, the Commission concludes that DEP's proposed rate design for the residential rate class, including the Public Staff modifications to which DEP agreed, is just and reasonable. The Commission agrees with witnesses Reed and Byrd that the decision to switch to a TOU rate should be with the customer. Additionally, the Commission accepts the Public Staff's testimony regarding the appropriateness of modifying the Basic Customer Charge for Schedules R-TOU and R-TOUD to be set at the same $14.00 rate as Schedule RES. This is the same Basic Customer Charge the Commission approved in DEP's last rate case, when it found that it appropriately balances the needs to offer rates that more clearly reflect actual cost causation, minimize subsidization, and provide proper price signals to customers in the rate class, while also moderating the impact of rate increases on low-usage customers. *See* 2019 DEP Rate Order 203. Accordingly, the Commission concludes that the Basic Customer Charges as set forth in Reed Exhibits 6, 6_1, 6_2, and 6_3 are just and reasonable and are therefore approved.

Medium General Service (MGS) and Large General Service (LGS)

The MGS rate class includes all nonresidential customers with demand requirements from 30 kW to 1,000 kW and consists of the following rate schedules: MGS, SGS-TOU (proposed to be renamed MGS-TOU), SGS (Thermal Energy Storage) Schedule GS-TES, Agricultural Post-Harvest Processing (Experimental Thermal Energy Storage) Schedule APH-TES, Church Time-of-Use Schedule CH-TOUE, Church and School Service Schedule CSE, and Church and School Service Schedule CSG. Tr. vol. 11, 190. The LGS class includes all nonresidential customers with demand requirements of 1,000 kW or greater and consists of the following rate schedules: LGS, LGS-TOU, and LGS (Real Time Pricing) Schedule LGS-RTP. *Id.* at 194.

In her direct testimony, DEP witness Reed described the proposed rate design for the MGS and LGS rate schedules[9]. *Id.* at 190-93. Witness Reed testified that DEP is proposing to increase the Basic Customer Charge for the MGS and LGS classes to better reflect the cost of serving these customers. *Id.* at 190. Specifically, witness Reed stated that DEP proposes to increase the Basic Customer Charge for the MGS class for all rate years from $28.50 to $30.00 per month for single-phase service, or $39.00 if the customer requests three-phase service and/or is on Schedule SGS-TOU (MGS-TOU). *Id.* at 190-91. Additionally, DEP proposes to increase the Basic Customer Charge for the LGS class for all rate years from $200.00 to $210.00 per month. *Id.* at 194.

[9] Note that DEP's proposed changes to Schedule LGS-RTP are discussed *supra*.

DEP witness Byrd testified explaining DEP's proposal to change the demand charge structure for renamed Schedule MGS-TOU and Schedule LGS-TOU. *Id.* at 243-45. Specifically, witness Byrd stated that DEP proposes a three-part demand structure consisting of the following components: a Base Demand Charge, designed to recover distribution costs, which DEP would apply to the higher of either (1) a customer's highest maximum demand across all periods over the previous 12 months, or (2) 50.0% of the Contract Demand; a Mid-Peak Demand Charge, designed to recover off-peak and discount allocation of production and transmission costs, which DEP would apply to a customer's maximum demand during off-peak or on-peak periods but excluding discount periods; and a Peak Demand Charge, designed to recover peak allocation of production and transmission costs resulting from the customer's contribution to system demand during peak hours, which DEP would apply to a customer's measured on-peak demand. *Id.* at 243-44. Witness Byrd explained that the proposed three-part demand structure will improve price transparency and better align with cost causation based on both the size and timing of customer demands and is meant to work in tandem with DEP's proposed TOU periods. *Id.* at 244.

Additionally, witness Byrd testified that, in response to stakeholder feedback during the CRDS, DEP evaluated the alignment of bills and pricing to cost causation. *Id.* at 245. Witness Byrd stated that this analysis showed that shifting a portion of fixed cost recovery from energy charges to demand charges improved alignment to cost causation across a wide spectrum of customer energy usage profiles with very little impact on customer bills. *Id.* Witness Byrd stated that as a result of this evaluation DEP witness Reed proposed that DEP institute pricing that reflects slightly higher recovery through demand charges for TOU rates. *Id.*

Kroger Co. and Harris Teeter witness Bieber testified regarding DEP's proposed MGS-TOU rate design. Tr. vol. 21, 694-702. In his direct testimony, witness Bieber acknowledged that DEP's proposed MGS-TOU rates "improve alignment between the charges and the underlying embedded costs," but noted that they are "...still substantially lower than the demand unit cost." *Id.* at 694. Witness Bieber recommended "moderate" and "revenue-neutral" changes to DEP's proposed MGS-TOU energy and demand charges that he contends will improve the alignment between the rate component and the underlying costs while employing the principle of gradualism and mitigating intra-class rate impacts. *Id.* at 697-98. Specifically, witness Bieber recommended that DEP's proposed three-part demand charges each be increased by an additional 20.0% and that the proposed off-peak energy charge be reduced by a corresponding amount. *Id.* at 698. If the Commission determines that an even more gradual approach to align rates with DEP's underlying costs is appropriate, witness Bieber provided an alternative recommendation: that MGS-TOU Base Demand Charge, Mid-Peak Demand Charge, and Peak Demand Charge each be increased by proportionally so that the sum of the three charges is no less than 60.0% of the unit cost of demand from DEP's proposed COSS for the corresponding rate year, with a corresponding adjustment to the off-peak energy charge so that the modification is revenue neutral. *Id.* at 700.

Commercial Group witness Chriss also expressed concern that DEP's proposed MGS-TOU rate design does not reflect the underlying cost to serve and as a result shifts cost

responsibility within the rate classes. *Id.* at 527-28. Witness Chriss claimed that DEP has not fully aligned the proposed MGS-TOU demand charges with the underlying demand-related costs. *Id.* at 527. Witness Chriss testified that collecting demand-related costs through an energy charge is inconsistent with cost causation principles and results in a shift in demand cost responsibility from lower load factor customers to higher load factor customers, which will overpay for demand-related costs DEP incurs through providing service to them. *Id.* at 528. Witness Chriss also claimed that DEP would benefit by recovering more demand-related costs through a demand charge instead of through the energy charge since it would be less susceptible to weather-related and other fluctuations in usage, resulting in greater revenue certainty and more stable utility earnings. *Id.* at 528-29. Witness Chriss testified that, for the purposes of this case, the Commercial Group does not oppose DEP's proposed rate levels for MGS-TOU at DEP's proposed revenue requirement, if there is a decrease from the proposed revenue requirement, the Commercial Group recommended that DEP apply such decrease proportionately to the energy charges to better align costs to the cost of service. *Id.* at 529.

In his direct testimony, AGO witness Nelson also took issue with DEP's proposal to increase the level of fixed costs it recovers through demand charges. Tr. vol. 18, 20, 93-101. Witness Nelson testified that DEP has not sufficiently demonstrated that its approach to increasing cost recovery through demand charges will improve alignment with cost causation or that it will result in superior price signals. *Id.* at 94-97. Specifically, witness Nelson claimed that the way DEP categorizes electric system costs as fixed and not fixed does not account for many power system characteristics and "reflects an oversimplification of cost classification…over-emphasizes short-term costs [and] revenue collection and de-emphasizes long-term asset avoidance and system efficiency". *Id.* at 95. Accordingly, witness Nelson recommended that DEP increase energy charges for Schedules MGS-TOU and LGS-TOU to a level that is above marginal cost while maintaining strong price ratios between On-Peak, Off-Peak, and Discount periods to send price signals to customers, and correspondingly decrease demand rates to reflect the revised energy rates. *Id.* at 93, 97, 99. Witness Nelson also recommended that DEP propose Critical Peak Pricing (CPP) rate options for MGS and LGS customers since they can contribute to lower costs and improved system reliability. *Id.* at 93, 101-06. Witness Nelson claimed that while well-designed TOU rates can improve alignment with system costs, they are not precise enough to sufficiently incentivize load shifting during critical peak events. *Id.* at 102-05. Witness Nelson testified that CPP tariffs provide utilities with the ability to flexibly identify peak load events and incentivize customers to shift load during short, but highly impactful, periods of system load. *Id.* at 102.

CUCA witness O'Donnell testified regarding DEP's proposed LGS-TOU rate design. Tr. vol. 21, 655-60. Overall, witness O'Donnell claimed that the LGS-TOU rate design is "overly complex", not beneficial to the LGS class, and would benefit DEP, not energy consumers. *Id.* at 657-59. Witness O'Donnell also testified that he did not agree with DEP's proposals to implement a Mid-Peak Demand Charge, which is "not consistent with the realities of how much manufacturing happens in North Carolina," noting that when manufacturers are "on they are on for as long as it takes," meaning they are not typically able to shutdown mid-production to avoid peak times. *Id.* at 655-56. Witness O'Donnell stated that he objected to the inclusion of a ratchet in the Base Demand Charge, which

he argued could lock customers into an overly expensive and unrepresentative demand charge if their peak demand occurs during an on-peak period. *Id.* at 658-59. As such, witness O'Donnell recommended removal of the Mid-Peak Demand Charge and the ratchet from the Base Demand Charge. *Id.* at 655-56, 659.

In their rebuttal testimony, the Rate Design Panel disagreed with the intervenors' various adjustments to DEP's proposed MGS and LGS rate design. Tr. vol. 11, 271-79. Specifically, DEP disagreed with witness Bieber's recommendation to increase the MGS-TOU three-part demand charges by an additional 20.0% and to reduce the proposed off-peak energy charge by a corresponding amount. *Id.* at 271-72. The Rate Design Panel explained that while witness Bieber's proposal is directionally aligned with DEP's approach, it does not sufficiently consider gradualism and would lead to materially adverse outcomes, such as rate shock, for lower load factor customers. *Id.* at 272. In contrast, the Rate Design Panel testified that DEP's approach to slightly increasing demand charges and correspondingly decreasing energy charges better balances gradualism with alignment to cost-of-service. *Id.*

Additionally, while DEP disagreed with witness Chriss' recommendation that DEP allocate any decreased revenue requirement proportionately to the energy charges on Schedule MGS-TOU, the Rate Design Panel noted that DEP is willing to balance lowering energy and demand, as appropriate, to meet the revenue requirement; ensure that it treats both low load factor and high load factor customers equitably; and provide that rate change shifts occur gradually. *Id.* at 271. The Rate Design Panel also testified that DEP agrees with witness Chriss that demand charges should align with demand-related costs. *Id.* at 276. However, the Rate Design Panel explained that DEP must also balance alignment to cost causation with gradualism. *Id.* at 277. As such, the Rate Design Panel testified that DEP's proposed rates, which reflect higher fixed cost recovery through demand charges, result in improved alignment to cost-of-service while also including necessary gradualism in order to avoid potential adverse impacts to lower load factor customers. *Id.*

Additionally, the Rate Design Panel rebutted witness Nelson's argument that DEP should increase cost recovery through energy charges and correspondingly decrease demand charges for Schedules MGS-TOU and LGS-TOU. *Id.* at 272. The Rate Design Panel explained that contrary to witness Nelson's recommendation, DEP proposed a modest increase in fixed cost recovery through demand charges relative to such recovery through energy charges. *Id.* The Rate Design Panel testified that DEP's proposal to increase cost recovery through demand charges both improves alignment to cost-of-service and provides meaningful price signals to encourage system beneficial behavior. *Id.* The Rate Design Panel explained that witness Nelson's suggestion would penalize higher load factor customers, who more consistently use fixed assets and require less cost to serve per unit of energy, and thus increase subsidization between customers with varying load factors. *Id.* at 273. The Rate Design Panel further explained that witness Nelson's proposed rate design would encourage more consistent consumption reduction throughout the month and weaken price signals that are meant to reduce consumption at peak times, thereby increasing the strain on the grid and subsequently increasing the

need for investments, ultimately increasing costs for all customers. *Id.* at 274. In contrast, the Rate Design panel testified that DEP's proposed rate design would encourage targeted behavioral modification to reduce demand during the times when additional demand would drive more fixed cost investments. *Id.*

Further, in response to witness Nelson's recommendation that DEP adopt a CPP rate option for MGS and LGS customers, the Rate Design Panel claimed that a CPP rate was unnecessary. *Id.* at 276. The Rate Design Panel noted that during the CRDS, stakeholders generally favored new hourly pricing options relative to CPP options. *Id.* Additionally, the Rate Design Panel stated that DEP's MGS and LGS rate design proposals offer suitable and sufficient options for customers with flexible loads. *Id.*

The Rate Design Panel also testified that it disagreed with witness O'Donnell's recommended changes to DEP's Mid-Peak Demand Charge and Base Demand Charge under Schedule LGS-TOU. *Id.* at 277-79. The Rate Design Panel explained that DEP's proposed Mid-Peak Demand Charge plays an important role in collecting significant amounts of fixed costs associated with non-peak production and transmission assets. *Id.* at 278. Similarly, the Rate Design Panel testified that the Base Demand Charge is carefully designed to reflect certain system costs under the CDM and to recover costs for distribution assets that remain constant year-round and are close to the customer, and thus appropriately utilizes a ratchet. *Id.* The Rate Design Panel explained that customers that exhibit consistent loads year-round, including some manufacturing customers, benefit from the ratchet feature because demand charges would be higher overall without such a feature. *Id.* at 278-79. Moreover, as witness Byrd testified during the hearing, the Base Demand Charge reduces bill volatility for customers by allocating and recovering costs through "very consistent charges". *Id.* at 364-65. The Rate Design Panel also disagreed with witness O'Donnell's characterization of the LGS-TOU rate as overly complex because customers taking service under Schedule LGS-TOU are generally sophisticated and capable of understanding rate design. *Id.* at 279. Moreover, as described in the CRDS, DEP's proposed tariffs appropriately balance simplicity and understandability with alignment to cost-of-service. *Id.*

DEP, the Commercial Group, and Kroger Co. and Harris Teeter entered into the MGS Partial Rate Design Stipulation resolving some of the issues in this proceeding between the parties. The MGS Partial Rate Design Stipulation provides that 75.0% of the reduction in revenue requirement, as determined by final Commission order, applicable to Rate Schedule MGS-time-of-use (TOU), should be applied to energy rates. The MGS Partial Rate Design Stipulation also provides that Kroger Co. and Harris Teeter agree to withdraw its proposal that DEP study the possibility of, and propose, a multi-site aggregate commercial rate. Finally, the MGS Partial Rate Design Stipulation provides that Kroger Co. and Harris Teeter does not oppose the Revenue Requirement Stipulation or the PIMs Stipulation.

DEP and CIGFUR entered into the LGS Partial Rate Design Stipulation, resolving some of the issues in this proceeding between the parties. The LGS Partial Rate Design Stipulation provides that any increase in energy charges resulting from an increase in

DEP's revenue requirement to be recovered from the LGS, LGS-TOU, and LGS-Real Time Pricing (RTP) rate schedules, as determined by final Commission order, shall be limited to a percentage that is less than half of the approved overall increase percentage to the LGS, LGS-TOU, and LGS-RTP classes, respectively, exclusive of any decrements for the LGS, LGS-TOU, and LGS-RTP rate schedules. The LGS Partial Rate Design Stipulation also applies to any customers currently taking service under an LGS, LGS-TOU, or LGS-RTP rate schedule that switch tariffs to either the High Load Factor tariff or Hourly Pricing (HP) tariff, in the event the Commission approves such tariffs in this proceeding.

Schedule LGS-RTP is a historical rate option that provides DEP's LGS customers with exposure to marginal pricing above a Customer Baseline Load (CBL) threshold. Tr. vol. 11, 251. Schedule LGS-RTP is currently available to customers with a load of 1,000 kW or greater and is capped at 85 nonresidential customers. *Id.* In his direct testimony, DEP witness Byrd testified that DEP proposes to freeze Schedule LGS-RTP to new applicants but grandfather current customers. *Id.* Specifically, witness Byrd testified that DEP will close Schedule LGS-RTP to new applications beginning October 1, 2023, and discard the waitlist to join schedule LGS-RTP. *Id.* at 338-39. Witness Byrd explained that DEP proposes to freeze Schedule LGS-RTP because it is administratively burdensome and does not contain ongoing CBL adjustments, creating scalability issues by allowing incremental load to remain on marginal pricing indefinitely. *Id.* at 251.

Additionally, witness Byrd testified that freezing Schedule LGS-RTP is appropriate considering the new Schedule HP proposed by DEP. *Id.* Witness Byrd explained that DEP created Schedule HP in response to stakeholder and customer requests during the CRDS for a more flexible marginal price rate with expanded availability. *Id.* at 248. Like the LGS-RTP, witness Byrd stated that Schedule HP will be available to customers with a load of 1,000 kW or greater. *Id.* at 249. Under Schedule HP, DEP will reestablish the CBL, which defines the level above which DEP will bill all kWh at the hourly energy prices, every four years based on a customer's 12-month usage history, with modifications to reflect price-responsiveness during times of grid constraints. *Id.* at 249. Witness Byrd explained that this new approach to reestablishing CBLs will restrict marginal prices to only four years for growing loads that are not consistently price-responsive, resulting in embedded cost recovery from such loads after the periodic CBL reestablishment. *Id.* Witness Byrd stated that the newly proposed CBL management is average kW and kWh by TOU period. *Id* at 250. Schedule HP will include a margin adder of $6.00 per megawatt-hour to account for day-ahead pricing uncertainty and provide some fixed cost recovery from the marginal energy purchases. *Id.* Witness Byrd testified that DEP proposes Schedule HP without a participation cap due to the durability and scalability of the new program design. *Id.*

DoD-FEA witness Blank recommended that the Commission deny DEP's request to freeze the LGS-RTP rate because DEP has not demonstrated a need to close the rate. Tr. vol. 21, 336-37, 341. Witness Blank testified that LGS-RTP is fully subscribed and that by freezing the rate DEP would prevent the possibility of a new customer replacing a departing LGS-RTP customer, which may provide a "financial windfall" to DEP. *Id.* at 336. Additionally, witness Blank argued that DEP should not close LGS-RTP because

Schedule HP is "categorically different" from Schedule LGS-RTP and therefore is not a suitable replacement for the LGS-RTP tariff. *Id.* at 336, 338. Witness Blank did not express any concerns with Schedule HP. *Id.* at 337-38.

In rebuttal, the Rate Design Panel disputed witness Blank's recommendation that the LGS-RTP rate should remain open. Tr. vol. 11, 284-88. In response to witness Blank's concerns that a departing LGS-RTP customer could provide a windfall to DEP, the Rate Design Panel testified that it does not anticipate that an existing RTP customer would switch to a non-RTP rate because under such scenario, a customer would be voluntarily switching to a higher rate. *Id.* at 285. The Rate Design Panel explained that witness Blank's imagined scenario is unrealistic because customers taking service under LGS-RTP are generally sophisticated and large and would not normally leave the rate for a less attractive option. *Id.* Rather, the Rate Design Panel testified that to the extent attrition occurs on LGS-RTP, the customer would likely be leaving DEP's service territory or otherwise switching to a lower-cost rate, thus lowering DEP's revenues. *Id.*

The Rate Design Panel also disagreed with witness Blank that Schedule HP is not a suitable substitute for LGS-RTP. *Id.* The Rate Design Panel testified that several similarities exist between Schedule LGS-RTP and Schedule HP. *Id.* Specifically, the Rate Design Panel stated that both the LGS-RTP tariff and Schedule HP: (1) are available to customers with a load of 1,000 kW or greater; (2) have energy priced at a marginal rate above a CBL threshold; and (3) contain incremental demand charges and an incentive margin. *Id.* at 285-86. Furthermore, the Rate Design Panel stated that the differences between LGS-RTP and Schedule HP demonstrate that Schedule HP is superior to LGS-RTP. *Id.* at 286. For instance, since under Schedule HP DEP will reestablish CBLs every four years and reduce them using a method that recognizes the benefits of price-responsiveness during times of grid constraints, loads DEP presently serves under the CBL could have exposure to marginal pricing after consistent price-responsive behaviors—a customer benefit that does not exist under the LGS-RTP tariff. *Id.* at 286. The Rate Design Panel explained that these adjustments are appropriate because loads that customers can reduce during times of system peak consistently over several years reduce the need for additional peaking resources and lower costs overall for the grid. *Id.* Similarly, a CBL reestablishment every four years ensures that loads that are not price responsive eventually move under the CBL and receive pricing under embedded costs, which is appropriate as such loads begin to drive investments in additional capacity assets. *Id.* at 286-87. Additionally, because of the reduced administrative burden and four-year CBL reestablishment, the Rate Design Panel testified that DEP was able to offer Schedule HP without a participation cap. *Id.* at 287. Finally, the Rate Design Panel explained that Schedule HP will more effectively serve as an economic development tool than the LGS-RTP tariff since Schedule HP is not capped and thus prospective new customers can confidently expect to be able to sign on to the rate if they wish to do so. *Id.* In summary, the Rate Design Panel stated that while several core elements in Schedule HP mirror Schedule LGS-RTP, the proposed improvements in Schedule HP relative to the LGS-RTP tariff yield a more scalable, durable, and accessible rate option for customers. *Id.* at 287-88.

During the expert witness hearing, witness Reed elaborated on the administrative burdens associated with Schedule LGS-RTP. *Id.* at 381-85. Specifically, witness Reed explained that Schedule LGS-RTP requires creation of a CBL and calendar mapping that reflect an individual customer's operations. *Id.* at 381-82. Witness Reed testified that under such processes, DEP sets a CBL for every hour of every day in Excel and must then update this data both annually and every time there is a change in scheduled shutdown days. *Id.* at 381-82. Witness Reed also described the administrative burden of manually billing and calculating the RTP bill for customers. *Id.* at 382. Witness Reed further noted that it takes two full-time personnel to manage Schedule LGS-RTP. *Id.* In contrast, witness Byrd testified that Schedule HP is much simpler and more scalable than Schedule LGS-RTP. *Id.* at 385. For example, witness Byrd explained that Schedule HP uses a CBL management approach that is already in place for DEC's hourly pricing program. *Id.* at 250, 385. This process of CBL management will eliminate the need for the administratively burdensome calendar mapping and special days process currently in use for the existing RTP rate. *Id.* at 250. Instead, after establishment of an initial CBL, DEP will automatically reestablish every four years. *Id.*

At the reconvened hearing on July 24, 2023, Public Staff witness D. Williamson testified regarding the Public Staff's concerns with the LGS Partial Rate Design Stipulation. Specifically, Public Staff witness D. Williamson testified that the Public Staff opposes the stipulation on the basis that it constricts the rate designer's ability to appropriately figure out how the revenue requirement that would get assigned to that class should be allocated between the energy and demand components of the rates. Tr. vol. 24, 89. He testified that while the stipulation might move in alignment with the cost of service, the stipulation, in the Public Staff's position, inappropriately predetermines how cost is apportioned between energy and demand components. *Id.* He explained that rate designers, not parties to the proceeding, should apportion costs among the various components of rates as rate designers have a better understanding of load shapes individual classes, specifically with respect to all customers in the class. He explained the Public Staff's position that, for this reason, the rate designer is in the best position to adequately price energy, demand, the customer charges. *Id.* at 92- 93. Ultimately, he concluded that the rate designer is in the best position to ensure that rates are designed to recover costs from customer classes most in alignment with the costs incurred by the utility to serve each class. *Id.* at 94. He also concluded that rates designed to be in alignment with cost causation are just and reasonable. *Id.* at 95. Ultimately, he testified that the Public Staff recommends that the Commission not approve the stipulation in order to allow rate designers to do their work. He testified that if the rate designer reaches the same conclusion on rate design as that set forth in the stipulation, then the Public Staff would support it. *Id.* at 97.

DEP witness Byrd testified that the LGS Partial Rate Design Stipulation would not involve any interclass subsidy and that the dynamic of allocating the revenue requirement between the energy and demand components of the rate impacts only the specific rate schedule for the customer class. *Id.* at 74. DEP witness Byrd testified that the possibility of moving capacity-related costs to the demand component of the rate was discussed during the Comprehensive Rate Design process. He testified that:

> At a high level, [DEP] looked at cost of service and determined that it would be appropriate to increase the amount of fixed costs recovered through demand charges relative to energy. We wrote about that in the roadmap, and so the Company proposed in this case -- our original proposed rates, particularly for LGS-TOU, increased the amount of fixed cost recovery through demand charges.

Id. at 75.

DEP witness Byrd testified that while the stipulation would not result in any interclass subsidization, there might be a slight bill impact to customers within the class, based on load factor but this impact is in alignment with cost of service. *Id.* at 77-78, 83-84. CIGFUR II witness Collins confirmed that the LGS Partial Rate Design Stipulation would not cause an interclass subsidy. Tr. vol. 24, 72.

Considering the parties' testimony and the evidence the parties presented, the Commission concludes that DEP's proposed rate design for the MGS and LGS rate classes, including the modifications agreed to in the MGS Partial Rate Design Stipulation and the LGS Partial Rate Design Stipulation, is just and reasonable. The Commission concludes that DEP's proposed Basic Customer Charge increases, including Basic Customer Charges of $30.00 for the MGS class and $210.00 for the LGS class, strike an appropriate balance that provide rates that accurately reflect cost causation, minimize subsidization, and provide proper price signals to customers in the MGS and LGS rate classes, while also moderating the impact of such increase on lower-load factor customers.

In addition, the Commission concludes that the MGS Partial Rate Design Stipulation and LGS Partial Rate Design Stipulation are the products of arm's-length negotiations between parties who took opposing positions on these subjects in their prefiled testimony. The Commission also finds that the MGS Partial Rate Design Stipulation and LGS Partial Rate Design Stipulation reduce the number of contested issues the parties present to the Commission for resolution regarding rate design. Both stipulations address only intra-class issues, not inter-class issues, and focus on increasing the amount of fixed cost recovery through demand charges as opposed to energy, which is consistent with DEP's COSS. The Commission acknowledges the concern of the Public Staff regarding rate design and the preference that the rate designer not be constrained by agreements between the utility and certain customers regarding the apportionment of costs between demand and energy components of the rates. Specifically, the Commission takes note of the concern that this may give rise to "winners and losers" within a particular customer class and appreciates the Public Staff's vigilance for all customers within a class. The Commission is persuaded by DEP witness Byrd that the LGS Partial Rate Design Stipulation does not result in an interclass subsidy and impacts customers within the class only slightly and in a manner that aligns with cost causation. The Commission notes that no party presented any evidence that the MGS Partial Rate Design Stipulation results in any interclass subsidization, involves inter-class allocation of revenue requirement, or is not in alignment with DEP's COSS. Therefore,

the Commission concludes that the MGS Partial Rate Design Stipulation and LGS Partial Rate Design Stipulation are reasonable and should be approved. However, in recognition of the concerns raised by the Public Staff, the Commission approval in this proceeding shall not be taken as an indication that the Commission generally looks favorably on rate design settlements, and the Commission will scrutinize rate design settlements between the utility and any customer or customer group going forward, with the objective of achieving just and reasonable rates for all customers.

Testimony from witnesses Reed, Byrd, Bieber, and Chriss indicates that the change to the MGS-TOU rate design agreed to in the MGS Partial Rate Design Stipulation is reasonable and based on cost causation. The Commission notes that the Partial Rate Design Stipulation provision relating to MGS-TOU energy rates applies only to the MGS-TOU rates proposed in this rate case. This provision does not bind DEP to any particular rate design structure in future rate cases and does not limit its ability to study alternative rate designs. Furthermore, testimony from witnesses Reed, Byrd, and Phillips indicates that the change to the LGS rate design agreed to in the LGS Partial Rate Design Stipulation is reasonable and based on cost causation. The Commission observes that the LGS Partial Rate Design Stipulation provision relating to LGS energy rates applies only to the LGS, LGS-TOU, and LGS-RTP rates proposed in this rate case, and any customers currently taking service under Rate Schedules LGS, LGS-TOU, or LGS-RTP that subsequently switch to either the HLF tariff or the HP tariff. This provision does not bind DEP to any particular rate design structure in future rate cases and does not limit DEP's ability to study alternative rate designs.

Additionally, the Commission concludes that DEP's proposal to freeze Schedule LGS-RTP to new customers effective October 1, 2023, is reasonable. The Commission further concludes that DEP's proposed Schedule HP is reasonable. The Commission declines to adopt witness Blank's recommendation to keep LGS-RTP open to new customers after DEP's proposed freeze date. Witness Reed offered convincing testimony that keeping LGS-RTP open is unduly burdensome and unnecessary given DEP's new Schedule HP. Accordingly, the Commission agrees with DEP that it is appropriate to freeze LGS-RTP. Additionally, the Commission rejects witness Blank's characterization of Schedule HP as "categorically different" than Schedule LGS-RTP. The Commission concludes that though Schedule LGS-RTP and Schedule HP contain several core similarities the differences between the two rate schedules indicate that Schedule HP will be more effective and efficient than Schedule LGS-RTP.

The Commission declines to adopt witness Nelson's recommended modifications to DEP's proposed MGS and LGS rate designs. The Rate Design Panel offered convincing testimony that it is appropriate to increase the level of fixed costs recovered through demand charges in this proceeding since doing so will improve alignment to cost causation across the range of customer load factors while also providing meaningful price signals. In contrast, the Commission finds that witness Nelson's proposal will likely result in subsidization between customers with varying load factors and weaken price signals. The Commission also rejects witness Nelson's request that the Commission adopt a CPP

rate at this time given the design of the MGS-TOU and LGS-TOU rates and the introduction of new hourly pricing options.

The Commission also declines to adopt the recommendation of witness O'Donnell to remove the Mid-Peak Demand Charge and the ratchet from the Base Demand Charge on the grounds that these charges are based on a rate design that more accurately reflects DEP's cost of service and provides customers with flexible loads the opportunity to shift consumption patterns and reduce costs.

Small General Service (SGS)

The SGS rate class includes all nonresidential customers with demand requirements below 30 kW and consists of the following rate schedules: SGS, SGS-TOUE, and SGS-TOU-CPP. Tr. vol. 11, 188.

In her direct testimony, DEP witness Reed described the proposed rate design for the SGS rate schedules. *Id.* at 188-89. Witness Reed testified that DEP is proposes to increase the Basic Customer Charge for the SGS class to better reflect the cost of serving these customers. *Id.* at 189. Specifically, witness Reed stated that DEP proposes to increase the Basic Customer Charge for the SGS class for all rate years from $21.00 to $22.00 per month for all SGS schedules to minimize the percentage increase in bills for customers with low monthly usage and to maintain a similar overall proposed increase for customers within the SGS class. *Id.* Witness Reed testified that DEP proposes to keep the Base Customer Charge at $22.00 per month for all rate years. *Id.* Witness Reed also testified that DEP proposes retaining the current kWh energy block structure, with the second block being approximately 18.0% less than the first block kWh energy rate. *Id.* Witness Reed stated that SGS energy rates are adjusted to recover the requested revenue increase. *Id.*

In his direct testimony, AGO witness Nelson recommended that DEP revise Schedule SGS-TOU-CPP. Tr. vol. 18, 105-06. Witness Nelson claimed that as currently designed, Schedule SGS-TOU-CPP does not appear to provide any tangible benefit in comparison to DEP's default TOU option under Schedule SGS-TOUE and, that in fact, Schedule SGS-TOU-CPP would be costlier for customers. *Id.* Witness Nelson claimed that Schedule SGS-TOU-CPP has higher rates across every time period, serving as a strong disincentive for customers to enroll and provide grid services during critical peak events. *Id.* at 106. He testified that DEP had previously acknowledged that "there is a pricing concern with SGS-TOU-CPP" and that as of February 2023 only a single customer had enrolled in the tariff. *Id.* As such, witness Nelson argued that DEP should redesign SGS-TOU-CPP so that customers who opt for the rate over the default TOU option have opportunities to save if they respond appropriately to critical peak events. *Id.*

DoD-FEA witness Blank also testified regarding DEP's proposed rate increase for the SGS class. Tr. vol. 21, 323. Specifically, witness Blank recommended that DEP maintain its proposed rate increase for the SGS class at $469,000 or 8.16%. *Id.*

In their rebuttal testimony, the Rate Design Panel acknowledged that there is a pricing concern with SGS-TOU-CPP. Tr. vol. 11, 282. As such, the Rate Design Panel stated that DEP will adjust the pricing on SGS-TOU-CPP to be more competitive relative to Schedule SGS-TOUE to encourage adoption of the more dynamic tariff. *Id.* Regarding witness Blank's recommendation on the proposed increase to the SGS class, the Rate Design Panel testified that witness Blank's rate increase proposal would shift the rate increase from the LGS class to other classes, contrary to DEP's goals of alignment to cost causation, gradualism and the avoidance of rate shock. *Id.*

Considering the parties' testimony and the evidence presented, the Commission concludes that DEP's proposed rate design for the SGS class, subject to modification in its compliance filing, is just and reasonable. The Commission concludes that DEP's proposed Basic Customer Charge increase to $22.00 per month for all SGS schedules strikes an appropriate balance that provides rates that accurately reflect cost causation and thus, minimizes subsidization and provides proper price signals to customers in the SGS customer class. Additionally, the Commission agrees with the Rate Design Panel that DEP should make a compliance filing to adjust the pricing on SGS-TOU-CPP to be more competitive and to encourage adoption of the tariff. Further, the Commission declines to adopt witness Blank's proposed revenue adjustments to the SGS class because his proposal would result in greater subsidization and does not align with the principles of gradualism or cost causation.

Lighting

DEP provides outdoor lighting service under the following rate schedules: Area Lighting Service Schedule ALS, Street Lighting Service Schedule SLS, and Street Lighting Service (Residential Subdivisions) Schedule SLR. Tr. vol. 11, 198. DEP also provides lighting service under Sports Field Lighting Service Schedule SFLS, Traffic Signal Service (Metered) Schedule TFS, and Traffic Signal Service Schedule TSS. *Id.* at 197.

In her direct testimony, DEP witness Reed testified in support of DEP's proposed changes to its Lighting class schedules. *Id.* at 197-202. With respect to outdoor lighting, witness Reed testified that DEP has adjusted the rates in the proposed outdoor lighting schedules to achieve a combined outdoor lighting revenue target and to reduce or eliminate the difference between the monthly rates in the Area and Street Lighting Service Schedules for similar fixtures and poles/posts. *Id.* at 198. Witness Reed explained that because the current SLS class has a significantly lower return than DEP realizes under Schedule ALS, DEP recommends a higher increase for Schedules SLS and SLR. *Id.* Witness Reed also testified that DEP proposes to freeze Schedule SLR to new applicants to align with DEC's outdoor lighting offering. *Id.* at 201. Witness Reed explained that DEP will continue to serve existing customers under Schedule SLR until such time as they move to another schedule and new customers can take service under Schedules SLS or ALS, as applicable. *Id.*

In their direct testimonies, NCLM witnesses Saffo and Mann testified that DEP's proposed increases for the Lighting class are far too high and have the potential for rate

shock. Tr. vol. 21, 761-62, 765, 777-78, 783. Witness Mann testified that the proposed increases for Lighting class customers are almost triple the average increase in the base rate, and almost double the average increase across the MYRP period. *Id.* at 762. Witness Mann also asserted that DEP's proposed Lighting class rate increases will force municipalities in North Carolina "to choose between cutting services and programs or raising property taxes on citizens," since one of the most significant costs for municipalities is street lighting. *Id.* at 766. Witness Saffo described DEP's 30.0% rate increase to the Lighting class over three years as "the opposite of gradual". *Id.* at 779. Witnesses Saffo and Mann requested that the Commission carefully review proposed rate increases for services to municipalities to be assured that DEP has taken all steps to minimize any rate increases. *Id.* at 765, 783.

In his direct testimony, Public Staff witness D. Williamson recommended approval of DEP's proposed changes to Schedule SLR, including the accompanying amendments to its Outdoor Lighting Service Regulations. Tr. vol. 20, 176-77. However, witness D. Williamson recommended that DEP notify all Schedule SLR customers of this change by bill insert or separate mailing. *Id.* at 177.

In their rebuttal testimony, the Rate Design Panel recognized that the Lighting class is facing a large rate increase but explained that a change in cost-of-service methodology primarily drives the proposed increase. Tr. vol. 11, 283-84. The Rate Design Panel testified that to mitigate some of the increase, DEP proposes to limit the reduction in the subsidy to 10.0% as opposed to the 25.0% it implemented in prior rate cases, resulting in a 19.9% increase instead of a 24.9% increase for the Lighting class. *Id.*

Regarding Public Staff witness D. Williamson's recommendation regarding Schedule SLR, the Rate Design Panel testified that DEP is willing to notify all Schedule SLR customers of its proposal to freeze the rate schedule, including the accompanying amendments to DEP's Outdoor Lighting Service Regulations, via bill insert or separate mailing. *Id.* at 284.

During the expert witness hearing, DEP witness Reed reiterated that the COSS indicated that the Lighting class should have received a substantial increase. Tr. vol. 12, 16. To mitigate this increase to the lighting class, witness Reed stated that DEP is proposing to reduce the subsidy reduction to 10.0%. *Id.* Witness Reed explained that the reduction from 25.0% to 10.0% amounts to approximately $4 million in savings to the lighting class. *Id.* While witness Reed acknowledged the substantial rate increase to the Lighting class, she explained that DEP needs to recover its revenue requirement and that DEP has limited options to shift these costs to other customer classes. *Id.* at 18. Witness Reed explained that, to the extent possible, she levelized the rate increase between the rate schedules within the lighting class. *Id.*

Considering the parties' testimony and the evidence the parties presented, the Commission finds that DEP's proposed rate design for the Lighting class, with the modification Public Staff witness D. Williamson suggested and DEP agreed to, is just and reasonable for the purposes of this proceeding. The Commission concludes that the rate

increase for the Lighting class is due to the change in cost-of-service methodology and, while substantial, reflects actual cost causation. As such, while the Commission gives some weight to the testimony of NCLM witnesses Saffo and Mann and acknowledges that the rate increase to the Lighting class may prove to be burdensome, it also recognizes the need for rates to reflect cost causation and thus approves DEP's proposed rate design for the lighting class.

Service Riders

In his direct testimony, DEP witness Byrd described DEP's proposed new service riders – Economic Development Rider (Rider EC) and Non-Residential Solar Choice Rider (Rider NSC) – that DEP intends to offer so it may expand the rate options available to customers. Tr. vol. 11, 230. Witness Byrd testified that proposed Rider EC and Rider NSC stemmed from discussions with stakeholders during the CRDS. *Id.* at 247, 253.

Witness Byrd testified that Rider EC will be available to customers: (1) with new load exceeding 1,000 kW with a minimum load factor of 40.0%; (2) that have applied for and received economic assistance from either the state or local government or another public agency; and (3) that meet certain employment and investment minimums relative to the size of the new load. *Id.* at 253. However, witness Byrd stated that new loads that are predominantly for serving EV charging are exempted from Rider EC's employment and load factor requirements and may participate for new load sizes above 500 kW, and that existing customers considering plant investments with possible relocation outside of DEP's service territory may qualify for Rider EC by meeting the investment and employment thresholds, but their new load calculation will exclude reductions associated with the removal of historic equipment or processes. *Id.* at 253-54. Witness Byrd stated that in light of new Rider EC, DEP proposes to close its existing Economic Development Rider (Rider ED) and Economic Redevelopment Rider (Rider ERD) to new applicants. *Id.* at 257. Witness Byrd explained that customers DEP currently serves under Rider ED and Rider ERD will continue to take service under these riders until completion of their existing contracts. *Id.*

Witness Byrd testified that Rider EC contains several improvements to Rider ED. *Id.* at 254-55. First, witness Byrd explained that Rider EC will provide more flexibility for customers to tailor benefits based on both electric grid and regional economic benefits associated with the participant's investment and load characteristics. *Id.* at 252-53. For example, Rider EC will consider the following criteria in developing appropriate benefit levels on an individual customer basis: peak monthly demand; average monthly load factor; DEP's incremental costs to serve; the number of new full-time employees; economic multiplier; and the total new capital investment of the customer. *Id.* at 254. Second, witness Byrd testified that in contrast to Rider ED, under which participants are required to begin taking credits 18 months after the first date service is supplied under the contract (the ramp up period), Rider EC allows participants to wait to take credits until 36 months after the first date of service, recognizing that some industries require significant start-up time for new facilities and that an 18-month ramp up period may constrain their ability to take advantage of Rider EC's benefits. *Id.* at 254-55. Third, witness Byrd testified that unlike Rider ED, which provides benefits that steadily decline

over a five-year period on a rigid schedule, Rider EC allows benefits up to 10 years, with possible differences across the years as determined by the project merits. *Id.* at 255. For example, witness Byrd stated that DEP will require projects receiving greater levels of benefits for longer periods to meet higher thresholds of investment and employment. *Id.* Finally, witness Byrd explained that Rider EC provides a reduction of up to 75.0% of the applicable demand charges on the monthly bill, while Rider ED provides a reduction in demand charges that would require modification in order to align it with DEP's proposed demand charge structure redesign. *Id.* Overall, witness Byrd explained that Rider EC will enable DEP to improve its ability to compete for, attract, and retain customers that are adding jobs and making capital investments in its service territory, ultimately reducing the prices all customers pay and promoting the prosperity of the citizens and businesses in North Carolina. *Id.* at 252-53, 255-56.

With respect to Rider NSC, witness Byrd testified that, as a result of DEP's proposed new TOU periods and the new three-part demand charge structure, DEP proposes new Rider NSC to implement several changes for non-residential customers who seek to pursue self-generation through NEM. *Id.* at 246. Witness Byrd stated that to be eligible for Rider NSC, customers must take service under a general service rate schedule that includes TOU periods. *Id.* Witness Byrd explained that because DEP's TOU periods include the proposed modified demand charge structure, this eligibility requirement ensures price alignment with system utilization and cost causation. *Id.* at 246-47. Additionally, witness Byrd stated that Rider NSC will be available to customers with NEM systems that do not exceed the lesser of 100.0% of the customer's contract demand or 5,000 kW. *Id.* at 247. Moreover, under Rider NSC, DEP proposes eliminating the standby charge for customers with a capacity factor of 60.0% or less. *Id.* Finally, unlike Rider NM, energy exported would be netted against imports during the same TOU period and excess energy exported would be credited at an average avoided cost rate calculated using the Net Energy Credit calculation proposed by DEC and DEP in Docket No. E-100, Sub 175. *Id.*

With the advent of Rider NSC, witness Byrd testified that DEP is proposing that all new non-residential NEM applications take service under Rider NSC and that current Rider NM be frozen to new customers beginning on October 1, 2023. *Id.* at 248. Accordingly, witness Byrd explained that only existing non-residential NEM customers served under Rider NM prior to the availability of Rider NSC would continue service under Rider NM. *Id.* Witness Byrd stated that existing NEM customers could continue service under Rider NM until they request service under Rider NSC or until September 30, 2033, at which point all non-residential NEM customers receiving service under Rider NM will be moved to Rider NSC or another appropriate tariff, as available at that time. *Id.*

In his direct testimony, Public Staff witness Nader testified that Rider EC is in the public interest and not unduly discriminatory, will assist in preventing job loss. and fairly balances costs and benefits. Tr. vol. 21, 104-06. Witness Nader explained that Rider EC mitigates the potential for further loss of economic activity in communities that the state has already designated as economically distressed by targeting new investment in load, employment, and economic activity. *Id.* at 104-05. Witness Nader also stated that

requiring participants to demonstrate that they have received state or local assistance conveys a sense of fairness between the costs to non-participants and the benefits to participants. *Id.* at 105. Moreover, witness Nader testified that the retention of jobs is critical given the competitive pressures manufacturing and large energy customers experience, and Rider EC should assist with keeping jobs in economically distressed communities. *Id.* Witness Nader also noted that Rider EC's longer ramp-up period and extended period of access should help ensure that system load and employment will remain in communities for some time. *Id.* Finally, witness Nader testified that the Public Staff is "reasonably satisfied" that the costs and benefits of Rider EC are balanced and fair. *Id.* at 106. However, to ensure that Rider EC continues to be in the public interest, witness Nader recommended that the Commission require annual reporting of the impacts of Rider EC. *Id.* At a minimum, witness Nader stated that DEP should report the gross level of incentives paid, the number of recipients, the amount of investment, load, and jobs associated with the incentives, and an overall marginal cost analysis of Rider EC to determine if the gross level of incentives paid exceeds the marginal cost to serve the gross pool of participants. *Id.*

With respect to Rider NSC, Public Staff witness Nader recommended that DEP's proposed 5,000 kW cap on installed capacity be eliminated. *Id.* at 108. Witness Nader testified that by requiring all non-residential NEM customers to subscribe to a TOU schedule and the proposed three-part demand structure, the full fixed cost of service should be recovered regardless of system size, thereby mitigating the risk for material cross-subsidization. *Id.* Witness Nader also argued that large non-residential customers that seek to install on-site generation will be subject to the capital funding limitations of their own businesses, serving as another limitation to prevent generation in excess of site load from being installed. *Id.* at 108-09. Although witness Nader found DEP's concerns regarding reliability if the installed capacity limit were increased to be valid, but he testified that these concerns could be addressed though customer generator controls and communication. *Id.* at 109.

Regarding Rider NSC. AGO witness Nelson recommended that: (1) customers have the option to enroll in Rider NSC for a contract term of up to five years, with the option for annual renewal thereafter; and (2) DEP permit customers enrolling in a rate that does not include a demand charge to retain their renewable energy credits (RECs). Tr. vol. 18, 108. Witness Nelson explained that providing an option for customers to enroll for a term length of up to five years balances the need to provide customers with rate certainty with the imperative to ensure that tariffs adapt to reflect evolving grid dynamics. *Id.* at 108-09. Additionally, witness Nelson argued that DEP's requirement that customers who do not enroll in rates containing a demand charge cede RECs to DEP appears arbitrary and would unduly harm or discourage the participation of SGS customers who do not currently have the option of enrolling in demand-based rates. *Id.* at 110.

Although not raised by DEP in this proceeding, Public Staff witness D. Williamson recommended that DEP analyze the standby service being offered under Riders 7 and 57 in his direct testimony. Tr. vol. 20, 178-79. Witness D. Williamson claimed that the rates and terms of service under Riders 7 and 57 likely do not cover the costs incurred to serve

customers. *Id.* at 178. Additionally, witness D. Williamson argued that keeping Riders 7 and 57 – which only serve five large industrial customers – closed to all other customers and allowing only five customers to benefit results in an unduly discriminatory rate design. *Id.* Therefore, witness D. Williamson recommended that the Commission require DEP, prior to filing its next rate case or PBR application, to analyze the impact of transferring the five customers currently taking service under Riders 7 and 57 to other standby service riders. If the analysis shows that viable options to do so exist, witness D. Williamson recommends that DEP propose a transition period in its next general rate case or PBR proceeding to temper any potential rate shock that doing so may cause the customers currently taking service under Riders 7 and 57. *Id.* at 179.

On rebuttal, the Rate Design Panel testified that it did not agree with Public Staff witness Nader's recommendation for elimination of the 5,000 kW cap on Rider NSC. *Id.* at 291. The Rate Design Panel explained that the 5,000 kW limit strikes a reasonable balance between stakeholders' requests during the CRDS for larger system sizes and DEP's concerns regarding grid operations and reliability. *Id.* The Rate Design Panel noted that DEP's proposed 5,000 kW limit for Rider NSC represents a 500.0% increase over Rider NM. *Id.* Moreover, the panel testified that DEP's proposed Schedule HP would allow customer generating systems above the 5,000 kW limit for Rider NSC. *Id.* Importantly, the Rate Design Panel explained that the larger the NEM system, the more complicated the interconnection study due to the of the unpredictability of their output to the grid. *Id.* DEP witness Byrd, during the expert witness hearing, testified that the sort of unpredictability in output (which becomes a bigger problem in the context of larger systems) has the potential to create large swings in load, which poses reliability challenges. Tr. vol. 12, 32. Accordingly, given the sizable move from 1,000 kW to 5,000 kW and operational considerations associated with going beyond 5,000 kW, witness Byrd testified that DEP believes it is inappropriate to remove the cap. *Id.* at 74.

In response to witness Nelson's recommendations with respect to Rider NSC, the Rate Design Panel testified that it did not agree with his recommendation. Tr. vol. 11, 292-93. Specifically, the Rate Design Panel explained that it did not agree with witness Nelson's recommendation that DEP permit customers to enroll in Rider NSC for a term of up to five years because DEP merely intends that the specific tariff language it proposes for Rider NSC – that "[t]he Customer shall enter into a contract for service under this Rider for a minimum original term of one (1) year, and the contract shall automatically renew thereafter . . . ." – correspond to and align with the core tariff language. *Id.* at 292. Additionally, the Rate Design Panel testified that it did not agree that DEP should permit its customers enrolling in a rate that does not include a demand charge to retain their RECs since DEP's retention of RECs from systems is a long-standing practice in North Carolina and DEP is not proposing any changes to this practice in this proceeding. *Id.* The Rate Design Panel further noted that currently effective Rider NM similarly requires DEP customers to cede RECs if they receive service under a schedule other than a TOU schedule with demand rates. *Id.* at 292-93.

Finally, in response to Public Staff witness D. Williamson's recommendation that DEP analyze the standby service DEP is offering under Riders 7 and 57, the Rate Design

Panel testified that the DEP does not oppose analyzing the effects to customers' bills of moving Riders 7 and 57 customers to another standby service rider or closing Riders 7 and 57 and moving customers to other available standby service options in a manner that lessens rate shock. *Id.* at 293.

During the expert witness hearing, DEP witness Byrd provided further support for Rider NSC. Witness Byrd testified that stakeholders discussed Rider NSC at length during the CRDS and that it captures stakeholders' proposals and feedback. Tr. vol. 11, 340-42, 347. Witness Byrd reiterated that Rider NSC better reflects cost causation. *Id.* at 351, 355. Witness Byrd, in response to questions from Commissioner Clodfelter, elaborated on DEP's justification for allowing it to retain RECs for customers who are not served under a TOU rate. Tr. vol. 12, 38-39. Witness Byrd explained that while DEP's Residential Solar Choice Rider (Rider RSC) allows customers to retain their RECs regardless of rate schedule, there are differences between Rider NSC and Rider RSC that justify the disparate treatment. *Id.* at 39. Specifically, witness Byrd stated that certain components of Rider RSC – e.g., CPP netting, non-bypassable charges, monthly grid access fee, and the monthly minimum bill – do not appear in Rider NSC and, therefore, the differences in REC retention are appropriate. *Id.*

DEP witness Byrd also provided further support for Rider EC during the expert witness hearing. In response to questions by Chair Mitchell, witness Byrd elaborated on the differences between Rider EC and Rider ED. Tr. vol. 12, 63. Witness Byrd testified that Rider EC is much more flexible than Rider EC and allows DEP to provide a more tailored incentive structure based on demand over a longer period. *Id.* Additionally, witness Byrd testified that Rider EC's 36-month ramp up period, as compared to the 18-month ramp up period under Rider ED, results in a more competitive offer to prospective customers considering sites in North Carolina. *Id.* at 63-64. Overall, witness Byrd testified that Rider EC is a more competitive and flexible offer that will put North Carolina in a better position to attract potential customers. *Id.* at 64-65.

Based on the evidence in the record, the Commission concludes that DEP's proposed new Rider EC, with the reporting obligation witness Nader suggested and DEP agreed to, is reasonable and should therefore be approved. The Commission views DEP's proposed Rider EC as an effort to attract economic development in North Carolina and concludes that implementation of the rider is in the public interest. As with other economic development tariffs this Commission has previously approved, approval of Rider EC is based in part on an evaluation of the expected economic benefits resulting from the tariff. The Commission has considered the goal of attracting new economic development in North Carolina as well as the impact of Rider EC on non-participating ratepayers and concludes that Rider EC strikes the appropriate balance between the two. The Commission agrees with witness Byrd that Rider EC will result in broad state and regional benefits by enabling DEP to assist North Carolina and local communities when competing for projects. The Commission gives substantial weight to the testimony of witness Byrd that Rider EC represents an improvement from Rider ED and that it is, therefore, appropriate for DEP to close existing Rider ED and Rider ERD.

The Commission also concludes, considering the evidence, that DEP's proposed new Rider NSC is reasonable and should therefore be approved. The Commission finds that Rider NSC is appropriate given DEP's new TOU periods and three-part demand structure and will help ensure price alignment with system utilization and cost causation. In arriving at this conclusion, the Commission gives weight to the testimony of DEP witness Byrd. The Commission is not persuaded by Public Staff witness Nader's recommendation that DEP eliminate the 5,000 kW cap on nameplate capacity. The Commission also gives weight to the operational and reliability concerns expressed by DEP. By increasing the cap from the existing 1,000 kW to 5,000 kW, DEP will gain more experience with larger systems, and this experience can be used to inform the Commission regarding the operational and reliability challenges and mitigative measures that can be adopted in future proceedings in the context of increasing the system limit. Therefore, the Commission rejects the Public Staff's recommendation to remove the 5,000 kW limit under Rider NSC. In addition, the Commission rejects the recommendations of AGO witness Nelson on the grounds that his proposals are inconsistent with past Commission practice. Finally, the Commission finds it reasonable to freeze Rider NM to new customers as of October 1, 2023, and allow existing NEM customers to continue service under Rider NM until they request service under Rider NSC or until September 30, 2033.

The Commission further requires before filing its next rate case, to DEP shall analyze the impacts of transferring customers receiving service under Riders 7 and 57 to other standby service riders and, if that analysis reveals viable options for transferring these customers, DEP shall move these customers to other standby service riders over a reasonable transition period and in a manner that lessens or avoids rate shock.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 49-51

Cost of Capital

The evidence supporting these findings is in DEP's verified Application and Form E-1; the testimony and exhibits of the public witnesses; the testimony and exhibits of DEP witnesses Morin and Newlin, Public Staff witness Walters, CUCA witness O'Donnell, DoD-FEA witness Reno, NCJC, et al. witness Ellis, Commercial Group witness Chriss, CIGFUR witness Gorman; and the entire record in this proceeding.

Cost of Equity Capital

Summary of Evidence

DEP's rate of return expert, Dr. Roger Morin, recommended a rate of return on common equity of 10.4% with a capital structure consisting of 53.0% common equity and 47.0% debt. The recommendations of intervenor expert rate of return witnesses are as follows:

Witness Walters/The Public Staff	9.45%[10]
Witness O'Donnell/CUCA	9.25%[11]
Witness Reno/ DoD-FEA	9.3%
Witness Ellis/NCJC, et. al	6.00%

Neither Commercial Group witness Chriss, nor CIGFUR witness Gorman, performed an independent expert rate of return on common equity analysis. Rather, both witnesses confined their rate of return testimony to commenting on average rates of return awarded to electric utilities over various time periods.

As is often the case with rate of return on common equity, the testimony is voluminous. Below, the Commission summarizes the prefiled testimony of the various witnesses, and addresses testimony it received at the hearings in its discussion of its findings and conclusions.

DEP Direct and Supplemental Testimony

In his direct testimony, DEP witness Morin recapped the regulatory framework under which a regulated entity's rates should be set, which is that the entity should have a fair opportunity to recover its prudently incurred costs, including taxes and depreciation, plus a fair and reasonable return on its invested capital. The allowed rate of return must necessarily reflect the cost of the funds obtained, that is, investors' return requirements. In determining a company's required rate of return, the starting point is investors' return requirements in financial markets. A rate of return can then be set at a level sufficient to permit a company the fair opportunity to earn a return commensurate with the cost of those funds. Tr. vol. 8, 31-32. Witness Morin noted that while the cost of debt is observable in the marketplace, the cost of equity – that is, investors' required rate of return on this source of financing – is more difficult to estimate. *Id.* Witness Morin concluded that the Commission's decision should allow DEP to earn a rate of return on common equity that is commensurate with returns on investments in other firms having corresponding risks; sufficient to assure confidence in DEP's financial integrity, and sufficient to maintain DEP's creditworthiness and ability to attract capital on reasonable terms. *Id.* at 32-34.

Witness Morin reiterated that the aggregate return required by investors is "the cost of capital," which he described as "the opportunity cost, expressed in percentage terms, of the total pool of capital employed by the utility." *Id.* at 34. He noted further that public utilities (or their publicly traded parent companies) must compete for capital, and that the price of capital is set in the same manner as it is set for other input factors of production – by supply and demand. *Id.* at 35.

[10] Witness Walters recommends a 20-basis point downward adjustment in rate of return on equity, to 9.25%, if DEP's MYRP is approved, and 9.45% otherwise.

[11] Witness O'Donnell recommends a 25-basis point downward adjustment in rate of return on equity, to 9.0%, if the MYRP is approved, and 9.25% otherwise.

Witness Morin testified that the focus is and must be on the investor and the investor's expectations. As witness Morin explained, "[t]he market required rate of return on common equity, or cost of equity, is the risk-adjusted return demanded by the equity investor. Investors establish the price for equity capital through their buying and selling decisions in capital markets." *Id.* at 38.

In estimating a fair rate of return on common equity for DEP, witness Morin applied three cost of capital methodologies, the Discounted Cash Flow (DCF) methodology, the Capital Asset Pricing Model (CAPM) methodology, and the Risk Premium methodology, all of which are market-based methodologies designed to estimate the return required by investors on the common equity capital committed to DEP. *Id.* at 39. Witness Morin stressed that multiple methodologies must be employed in the estimation of the cost of equity. As he noted:

> No one single method provides the necessary level of precision for determining a fair return, but each method provides useful evidence to facilitate the exercise of an informed judgment. Reliance on any single method or preset formula is inappropriate when dealing with investor expectations because of possible measurement difficulties and vagaries in individual companies' market data.
>
> * * *
>
> As a general proposition, it is extremely dangerous to rely on only one generic methodology to estimate equity costs. The difficulty is compounded when only one variant of that methodology is employed. It is compounded even further when that one methodology is applied to a single company. Hence, several methodologies applied to several comparable risk companies should be employed to estimate the cost of common equity.

Id. at 39-40.

He noted that the three methodologies he utilized, DCF, CAPM, and Risk Premium, are "broad market-based methods available to measure the cost of equity," and are all "accepted and used by the financial community and firmly supported in the financial literature." *Id.* at 40. Witness Morin utilized two sub-variants of each broad methodology, for a total of six studies.

In his direct testimony, witness Morin recommended a rate of return on common equity of 10.2%, which was the midpoint of the range of mathematical results from the six cost of capital studies he conducted. *Id.* at 26, 130. In his supplemental testimony, he updated all six of his studies, and provided the below comparison:

Method	Direct ROE	Supplemental ROE
DCF Value Line Growth*	9.9%	9.3%
DCF Analysts Growth*	9.3%	9.3%

CAPM*	10.8%	11.0%
Empirical CAPM*	11.1%	11.2%
Historical Risk Premium*	10.2%	10.8%
Allowed Risk Premium	10.2%	10.5%

* ROE estimate includes an adjustment for flotation costs.

Id. at 132. His updated rate of return on equity recommendation of 10.4% is again the midpoint of the range of these mathematical results.

For his supplemental testimony, witness Morin used the same proxy group as in his direct testimony, and the same methodologies in his studies as he had used in his direct testimony, but with updated capital markets data. The increase in his recommended rate of return on equity was largely the result of an increase in interest rates. As he noted, as of the time of his updated analysis, the level of U.S. Treasury 30-year long-term bond yield forecast is 4.3%, versus 3.7% when he prepared his direct testimony. *Id.* at 130. He noted further that the increase in forecast interest rates increases the CAPM, the empirical approximation to the CAPM (ECAPM), Historical Risk Premium, and Allowed Risk Premium results in his direct testimony. *Id.* at 33, 131. Finally, while his DCF modeling showed a slight decrease, the DCF results did not offset the increase in interest rates. *Id.* Dr. Morin concluded that the "net result of these capital market changes is a small increase in the cost of common equity." *Id.* at 131.

In his direct testimony DEP witness Morin also surveyed the current risk environment, describing a paradigm shift in the electric utility industry's risk profile. He described a "perfect storm" environment, in which "the industry is experiencing declining demand growth, rising operating costs, rising capital costs, while at the same time the industry is beset by lower allowed returns," and noted that as a result "[i]t is not surprising that investor risk perceptions have escalated" in this setting. *Id.* at 89.

Witness Morin attributed this increase in industry risk to four major challenges facing electric utilities: (1) declining growth in energy consumption due to improvements in energy science and productivity; (2) the need for record amounts of capital to replace aging infrastructure, improve reliability, and deliver renewable generation; (3) higher business risks, including the emergence of "prosumers," that is, customers (residential, commercial, industrial) who are both consumers and producers as a result of the increase in distributed generation; and (4) rising operating costs due to rising inflation and supply chain bottlenecks. *Id.* at 91-93. He concluded with the observation that "[g]iven the new paradigm shift in the industry, it is transparent that state regulatory support, including adequate returns on equity, will be instrumental to ensure ongoing capital attraction in the utility sector at reasonable costs." *Id.* at 93.

Finally, witness Morin surveyed economic conditions in North Carolina. He considered key macroeconomic factors such as GDP growth, employment data, and household income levels in North Carolina and DEP's service territory relative to the aggregate U.S. economy. *Id.* at 95. He opined that the economic conditions remain highly correlated with national conditions, such that they were reflected in the analyses used to

determine the cost of equity. *Id.* at 103. He noted that economic conditions in North Carolina continue to improve from the COVID-19 pandemic, and they continue to be strongly correlated to conditions in the broader U.S economy. *Id.* He further noted that unemployment at the state level continues to fall and remains highly correlated with national rates of unemployment, and that GDP growth also remains well correlated with U.S. GDP growth. *Id.* Median household income in North Carolina has grown at a rate consistent with the rest of the U.S. and remains strongly correlated with national levels. *Id.* Witness Morin concluded that, "the correlations between state-wide measures of economic conditions noted by the Commission in Docket No. E-22, Sub 479 remain strongly in place and, as such, they continue to be reflected in the models and data used to estimate the cost of equity capital." *Id.*

Intervenor Testimony (rate of return experts)

The intervenor rate of return on common equity expert witnesses generally criticized DEP witness Morin's analysis that resulted in his recommended 10.4% rate of return on common equity. In addition, they performed their own analyses as outlined below.

Direct Testimony of Public Staff witness Walters

Public Staff witness Walters used nearly the same proxy group of electric utilities relied on by DEP witness Morin, except that he excluded two utilities, FirstEnergy and MGE Energy. Tr. vol. 16, 248. He performed DCF, Risk Premium, and CAPM analyses for his proxy groups of electric utilities. *Id.* at 242. Witness Walters developed his DCF growth rate by relying on a consensus of professional securities analysts' earnings growth estimates, averaging the growth rate forecasts from Yahoo Finance, MI, and Zack's. *Id.* at 252-53. Public Staff witness Walters recommended a rate of return on common equity of 9.45% based on a capital structure of 52% common equity and 48% long-term debt. *Id.* at 247, 284. In the alternative, he recommended a rate of return on common equity of 9.25% if the Commission grants DEP's MYRP and PBR application. *Id.* at 288.

Public Staff witness Walters applied the DCF model, Risk Premium Model, and CAPM that yielded the following results:

Discounted Cash Flow (DCF) – 9.0% Recommended DCF Result

	Mean	Median
Constant Growth – Consensus Analyst	9.01%	9.03%
Constant Growth – Sustainable Growth Rate	8.83%	8.47%
Multi-Stage Growth	7.91%	7.89%

Risk Premium Model – 9.9% Recommended Risk Premium Result

Projected Treasury Yield (3.700%)	9.74%	
	A-rated	Baa-rated
13-week Average Utility Bond Yield	9.93%	10.22%
26-week Average Utility Bond Yield	10.04%	10.34%

Capital Asset Pricing Model (CAPM) – 9.5% Recommended CAPM Result

	Current VL Beta	Historical VL Beta	Current MI Beta
D&P Normalized Method	9.22%	8.46%	8.69%
Risk Premium Method	10.72%	9.72%	10.02%
FERC DCF	9.78%	8.92%	9.18%

Id. at 264, 71, 83-84.

In his DCF analysis, witness Walters used the average of the weekly high and low stock prices of the utilities in the proxy group over a 13-week period ending on February 10, 2023. *Id.* at 251. For his constant growth model, he used the most recently paid quarterly dividend as reported in ValueLine and an expected growth rate based on a consensus of professional securities analysts' earnings growth estimates as a proxy for investors' dividend growth rate expectations. *Id.* at 251-53. For his sustainable growth model, he estimated the long-term growth rate based on DEP's current market-to-book ratio and on Value Line's three- to five-year projections of earnings, dividends, earned returns on book equity, and stock issuances. *Id.* at 256. His Multi-Stage growth model relied on inputs from three growth periods: (1) a short-term growth period consisting of the first five years; (2) a transition period, consisting of the next five years (6 through 10); and (3) a long-term growth period starting in year 11 and extending into perpetuity. *Id.* at 258. For the short-term growth period, he relied on the consensus of analysts' growth projections described above in relationship to his constant growth DCF model. For the transition period, he reduced or increased the growth rates by an equal factor reflecting the difference between the analysts' growth rates and the long-term sustainable growth rate. For the long-term growth period, he assumed each company's growth would converge to the maximum sustainable long-term growth rate. *Id.* at 259. Lastly, while not his typical practice, he provided DCF models using historical growth inputs, which resulted in DCF estimates ranging from 7.91% to 9.89%. *Id.* at 265.

Witness Walters' risk premium model is based on two estimates of an equity risk premium: the difference between the regulatory commission-authorized returns on common equity and (1) contemporary U.S. Treasury Bonds, and (2) contemporary Moody's "A" rated utility bond yields. He evaluated these premia over the period of 1986-2021 on an overall average and rolling five- and 10-year basis. *Id.* at 266-67. In addition, he evaluated the average spread between Treasury bonds and A- and Baa-rated utility

bonds. *Id.* at 269. Finally, witness Walters added what he deems an appropriate premium in the third quartile of the rolling five-year average risk premia (6.04%) to his projected Treasury bond yields (3.7%), which produces a return on equity of 9.74%. Additionally, witness Walters applies a similar methodology to utility bond yields to estimate an equity risk premium of 4.63%.[12] He adds this to the 13- and 26-week average A- and Baa-rated utility bond yields. *Id*. at 270-71.

Witness Walters' CAPM analysis used the Blue Chip Financial Forecasts' projected 30-year U.S. Treasury bond yield of 3.7% for the risk-free interest rate. *Id.* at 274. He used the Value Line beta estimates of 0.89, the historical average Value Line beta since 2014 of 0.76, and the adjusted beta estimates provided by Market Intelligence's Beta Generator Model of 0.80 for his proxy group. *Id.* at 275. Witness Walters used two versions of the constant growth DCF model to develop his estimates of the market risk premiums. *Id.* at 278. He used the 6.85% average of his estimated market risk premiums of 6.4% and 7.3%. *Id.* at 279. He testified that his 6.85% market risk premium is a reasonable, if not a high-end estimate. *Id.* at 281.

Witness Walters concluded that the appropriate equity cost rate for DEP based on companies in his proxy group is in the 9.0% to 9.9% range, recommending the midpoint of 9.45%. *Id.* at 284. However, witness Walters testified that DEP's PBR application would shift risk from shareholders to ratepayers by reducing regulatory lag. *Id.* at 285. As such, he recommended a 9.25% rate of return on common equity, should the Commission grant DEP's MYRP and PBR application. *Id.* at 288. Witness Walters also testified as to current capital market conditions as of the date of his testimony in April 2020. He stated that the authorized rates of return on common equity for electric utilities have declined over the last several years. *Id.* at 222.

Direct Testimony of CUCA witness O'Donnell

CUCA witness O'Donnell proposed a rate of return on common equity of 9.25% (without regard to DEP's MYRP proposal), based upon DCF modeling and CAPM methodologies, as well as a comparable earnings approach. Tr. vol. 21, 627. Witness O'Donnell primarily relied upon the DCF model and testified that it is superior to the others because it has a direct and immediate link to stock prices. *Id.* at 602-03. Witness O'Donnell's DCF analysis results range from 8.7% to 9.7% with an overall result of 9.25%. *Id.* at 614. His CAPM analysis ranged from 7.25% to 8.25% with a midpoint of 7.75%. *Id.* at 626. His Comparable Earnings Analysis (CEA) ranged from 9.5% to 10.5% with a midpoint of 10.0%. *Id.*

Witness O'Donnell, like Public Staff witness Walters, made a downward adjustment to his rate of return on common equity recommendation in the event the

[12] Witness Walters states in his testimony that he adds 5.33%, but the math in his narrative indicates 4.63% was used, and 4.63% is supported by Exhibit CCW-12.

Commission approves DEP's MYRP. The downward adjustment would take his rate of return on equity recommendation from 9.25% to 9.0%. *Id.* at 627.

Direct Testimony of DoD-FEA Witness Reno

DoD-FEA witness Reno recommended that the Commission approve a rate of return on common equity of 9.3% and reject DEP's requested 10.4%. *Id.* at 349-50. She conducted her analysis by deriving average expected market returns for a proxy group of regulated electricity companies with risk comparable to DEP. *Id.* at 362. Her analysis applied two DCF models, CAPM, and ECAPM, as well as a Comparable Earnings Model. Witness Reno summarized her model results in her Table 7, reproduced below:

Table 7. ROE Estimates (%)

DCF Methodology	30-Day Stock Price	90-Day Stock Price	Average
Constant-Growth DCF (EPS Growth)	9.57	9.54	
Constant-Growth DCF (DPS, EPS and BVPS)	9.19	9.11	
Sustainable Growth DCF	8.42	8.35	
DCF Range:	**8.35**	**9.57**	**8.96**
CAPM & ECAPM Methodology	**CAPM**	**ECAPM**	
Capital Asset Pricing Model (Lg. Stock ERP, 30-yr T-Bond Rate)	10.42	10.63	
Capital Asset Pricing Model (Supply-Side ERM, 30-yr T-Bond Rate)	9.32	9.49	
Capital Asset Pricing Model (D&P Normalized Rate)	8.83	9.00	
CAPM Range:	**8.83**	**10.63**	**9.73**
Comparable Earnings Methodology			
Comparable Earnings Model (Historical ROE)	10.26		
Comparable Earnings Model (Adjusted ROE)	11.10		
Comparable Earnings Model (VL Forecasted ROE 25-27)	11.00		
CEM Range:	**10.26**	**11.10**	**10.68**
Summary			
DCF-Based ROE Average			8.96
DCF-CAPM-Based ROE Average			9.35
All-Model ROE Average			9.79
	Min	**Max**	**Midpoint**
ROE Range	8.96	9.57	9.26
Recommended ROE (%)			**9.30**

Id. at 395.

Witness Reno's recommended rate of return on equity of 9.3% represents the midpoint of her constant-growth DCF outcomes (her primary method) and is supported by the average of her DCF and CAPM methods of 9.35%. The average of all of witness Reno's models is 9.79%. *Id.* at 373.

Direct Testimony of NCJC, et al. witness Ellis

NCJC, et al. witness Ellis recommended a rate of return on common equity of 6.0%, based on the minimum required to maintain DEP's current A2 credit rating. *Id.* at 1071. Witness Ellis criticized DEP witnesses for their conflation of the rate of return on capital and the cost of capital, arguing that such confusion has led to excessive authorized returns. *Id.* at 940-42. He testified that his analysis relies on the premise that rate of return on common equity and capital structure are interrelated and cannot be determined separately. *Id.* at 1055-60.

Witness Ellis' analysis relies on the DCF and CAPM to estimate the cost of capital. *Id.* at 937. His analysis yielded the following results:

Multi-Stage Discounted Cash Flow: 6.25%

Capital Asset Pricing Model: 5.8%

Id. at 939.

He opined that the multi-stage DCF model should be used instead of the constant growth DCF model because it allows for more realistic cash flow projects, yielding more accurate results. *Id.* at 990. He testified that his CAPM analysis eliminates the upward biases seen in Witness Morin's CAPM analysis. *Id.* at 997.

Witness Ellis testified that rate of return on common equity and capital structure are interrelated and must be addressed together. *Id.* at 1056-57. He recommended along with his 6.0% rate of return on common equity that the Commission set DEP's capital structure at 58.0% equity and 42.0% debt and indicated that this combination would maintain DEP's credit rating. *Id.* at 1071.

Intervenor Testimony (other experts)

As noted above, both Commercial Group witness Chriss and CIGFUR witness Gorman provided rate of return on common equity-related testimony but did not perform any ROE analysis.

Direct Testimony of Commercial Group witness Chriss

While he did not provide a rate of return on common equity analysis in his testimony, witness Chriss for the Commercial Group testified that DEP's proposed rate of return on common equity was significantly higher than rates of return previously approved

by the Commission from 2019 to the present. *Id.* at 513-14. Likewise, witness Chriss indicated that DEP's proposed ROE is significantly higher than most reported rate of return on common equity decisions by utilities commissions from 2019 to the present. *Id.* at 515-17. He testified that according to S&P Global Market Intelligence, 141 decisions were rendered during that time frame, with results ranging from 7.36% to 10.6%, with the median authorized ROE at 9.5%. *Id.* at 515. Removing distribution-only utilities and distribution service rates from the analysis, he testified that the average rate of return on common equity for vertically integrated utilities authorized from 2019 through the time of his direct testimony filing was 9.61%. *Id.*

Direct Testimony of CIGFUR witness Gorman

CIGFUR witness Gorman proposed that the Commission adjust DEP's authorized return on equity to reflect the current industry average of 9.6%. *Id.* at 405. He testified that for vertically integrated utilities, the authorized rate of return on common equity was around 9.53% in 2021, 9.69% in 2022, and currently holds around 9.6% for 2023. *Id.* at 409. He testified further that a fair ROE and a lower-cost, more balanced ratemaking capital structure would lower DEP's cost of service and support the implementation of more competitive rates. *Id.* at 411. He further testified that the proposed 10.4% ROE significantly exceeds the authorized returns on equity for other regulated utilities companies, which have been sufficient to maintain credit and provide utilities access to capital under reasonable terms and prices. *Id.* at 450-51.

DEP Rebuttal Testimony

In his rebuttal testimony, DEP witness Morin responded to criticism by intervenor ROE witnesses and commented upon deficiencies in their analyses. While he testified that he agrees with several of the views and procedures presented by witness Walters and witness O'Donnell, he noted that their recommendations understate the appropriate ROE for DEP. Tr. vol. 8, 139, 171. Particularly, he reasoned that their recommendations lie outside of the zone of currently authorized rates of return on common equity for vertically integrated electric utilities in the United States, which have averaged 9.7% in the past and have trended upward in more recent decisions in response to the surge in interest rates and inflation. *Id.* at 139, 169. He further noted that neither witness Walters, nor witness O'Donnell, nor witness Reno explained why or how DEP's cost of equity capital has decreased since it was awarded a rate of return on common equity of 9.6% in its last rate case in 2021, given a surge in interest rates and inflation that each of them acknowledged in their testimony. *Id.* at 223.

Witness Morin further disputed the contentions of witnesses Walters, O'Donnell, and Reno that the adoption of a performance-based ratemaking statute in North Carolina, including multi-year rate plans, should result in a lower rate of return on common equity for DEP. *Id.* at 135. He noted that the peer group of electric utilities also includes other risk-mitigating mechanisms, taken account in the use of the proxy group's financial data. *Id.* As such, further adjustment on the basis that an MYRP reduces risk amounts to double counting and should be rejected. *Id.*

Witness Morin additionally challenged the findings of the intervenors individually. While he noted that they shared quite a bit of common ground in their analyses, witness Morin testified that Public Staff witness Walters' recommended rate of return on common equity lies outside of the zone of currently authorized rates of return on common equity for vertically integrated utilities and opined that if his results were amended to reflect proper data inputs to the financial models, his results would exceed 10.0%. *Id.* at 139-67. He offered the following seven points of disagreement. *Id.* at 140.

Witness Morin criticized witness Walters' reluctance to accept flotation costs, explaining that the parent-subsidiary relationship does not eliminate the cost of stock issuance. *Id.* at 142. He disagreed with witness Walters' DCF technique, explaining that his sustainable growth rate approach was illogical and inconsistent with empirical evidence. *Id.* at 143-46. He testified that witness Walters' multi-stage DCF should not be given any weight by the Commission, as it is predicated on the idea that utilities grow at the same rate as the general macro-economy. *Id.* at 148. He wholly rejected witness Walters' use of the historical Value Line beta estimates and Vasicek-adjusted betas, explaining that their use is not standard and the extent to which market participants rely on them is unclear. *Id.* at 153-54. He argued that witness Walters' CAPM underestimates the appropriate cost of capital. *Id.* at 159-60. In challenging witness Walters' risk premium analysis, witness Morin testified that it fails to recognize the inverse relationship between risk premium and interest rates. *Id.* at 160-61. Finally, witness Morin disagreed with witness Walters' criticisms of his testimony, noting that nothing presented would cause him to alter any of his recommendations or methodologies. *Id.* at 167.

At the outset, witness Morin identified two fundamental flaws in CUCA witness O'Donnell's testimony, noting that his proposed 9.25% rate of return on common equity would be one of the lowest in the industry and that it is the result of a defective DCF analysis. *Id.* at 168-71. While witness Morin agreed with parts of witness O'Donnell's analysis, he identified six specific areas of disagreement over the appropriate data inputs for the CAPM and DCF models. *Id.* at 172. He explained that witness O'Donnell's recommended rate of return on common equity is outside the zone of currently authorized rate of return on common equity for vertically integrated electric utilities in the United States and that of his own sample of companies, noting that the currently authorized returns for his peer companies average nearly 10.0%, and the expected returns for these companies from his own Value Line data shown on Exhibit KWO-4 are in the range of 10.6% – 11.1%. *Id.* at 172-73. He asserted that two of witness O'Donnell's dividend yield estimates are understated because they are based on stock prices reaching back several months in the past, thus violating the notion of market efficiency. *Id.* at 173. Witness Morin raised concern with witness O'Donnell's choice of DCF growth rates, finding his reliance on 12 different rates, including historical growth rates, sustainable growth rates, and analysts' forecasts arbitrary and inconsistent with empirical evidence. *Id.* He further questioned witness O'Donnell's reliance on historical growth rates in his DCF model, explaining that the substantial changes occurring in the electric utility industry make use of those rates questionable. *Id.* at 174.

While he agreed with parts of witness O'Donnell's CAPM analysis, witness Morin argued that witness O'Donnell's risk-free rate assumption is too low. *Id.* at 182. Witness Morin also testified that witness O'Donnell's denunciation of analysts' growth forecasts as unreasonable proxies for the DCF growth rate is without foundation and inconsistent with empirical finance literature on the subject. *Id.* at 192.

Witness Morin challenged DoD-FEA witness Reno's analysis, particularly her exclusive reliance on her Constant Growth DCF. *Id.* at 196. He reiterated his concerns about using the sustainable growth methodology due to its inherent circularity and encourages the rejection of the 90-day stock price DCF in violation of the Efficient Market Hypothesis, leaving only two DCF results from her analysis to consider. *Id.* at 198. He agreed with witness Reno's decision to give little weight to the Kroll 6.0% normalized market risk premium (MRP), as well as her comparable earnings analysis results. *Id.* at 198-99. Finally, he disputed witness Reno's criticisms of his own analyses, noting that her risk premium analysis uses a group with a nearly identical beta risk estimate and that her opposition of a flotation allowance disregards the fact that the parent-subsidiary relationship does not eliminate the costs of a new issue of stock. *Id.* at 199-200.

Witness Morin highlighted the limited analysis performed by Commercial Group witness Criss and CIGFUR witness Gorman. *Id.* at 201. He testified that witnesses Criss and Gorman determined their recommendations merely by averaging what other regulators have allowed in 2022. *Id.* He criticized the circular nature of their recommendations and noted the large deviations among the utilities included in their proposed averages. *Id.* at 202. He encouraged the Commission to disregard their testimonies as not germane and to exercise a mind of its own rather than relying on the actions of other Commissions. *Id.* at 203.

Witness Morin wholly rejected the testimony of NCJC, et al. witness Ellis, describing his approach as "non-mainstream, far-fetched, and unorthodox for both methods he uses to estimate the cost of capital." *Id.* at 204. He described witness Ellis' recommendation as draconian and described the adverse consequences to DEP's creditworthiness, financial integrity, capital raising ability, and its customers, should the Commission adopt it. *Id.* He also identified witness Ellis' inconsistencies and contradictions, such as his challenging the validity of the same consensus economic forecasts he relies on to make his recommendations. *Id.* at 205. Witness Morin challenged witness Ellis' differentiation of cost of capital and rate of return and dismissed his position on the use of Market-to-Book ratios in utility regulation. *Id.* at 206-07. In addition to challenges to witness Ellis's recommendations, witness Morin offered a myriad of criticisms to the application of his methodologies. He explained that witness Ellis' misuse of geometric averages rather than arithmetic averages produces results clearly contrary to the most basic financial theory. *Id.* at 210-12. He further identified multiple other instances where witness Ellis' methods deviate from academic state of the art practices, including his rejection of the constant growth DCF analysis and his condemnation of Value Line beta estimates. *Id.* at 205, 214, 219.

Law Governing the Commission's Decision on Rate of Return on Equity

Rate of return on equity is often one of the most contentious issues to be addressed in a rate case. The baseline for establishment of an appropriate rate of return on common equity is the constitutional constraints established by the decisions of the United States Supreme Court in *Bluefield Water Works & Improvement Co. v. Public Service Commission*, 262 U.S. 679 (1923) (Bluefield), and *Federal Power Commission v. Hope Natural Gas Co.,* 320 U.S. 591 (1944) (*Hope*), which establish:

> To fix rates that do not allow a utility to recover its costs, including the cost of equity capital, would be an unconstitutional taking. In assessing the impact of changing economic conditions on customers in setting [an ROE], the Commission must still provide the public utility with the opportunity, by sound management, to (1) produce a fair profit for its shareholders, in view of current economic conditions, (2) maintain its facilities and service, and (3) compete in the marketplace for capital.

Order Accepting Stipulation, Deciding Contested Issues, and Requiring Revenue Reduction, *Application by Duke Energy Carolinas, LLC, for Adjustment of Rates and Charges Applicable to Electric Utility Service in North Carolina*, No. E-7, Sub 1146 , at 50 (June 22, 2018); *see also State ex rel. Utils. Comm'n v. Gen. Tel. Co.,* 281 N.C. 318, 370, 189 S.E.2d 705, 738 (1972) (General Telephone). As the North Carolina Supreme Court held in *General Telephone*, these factors constitute "the test of a fair rate of return declared" in *Bluefield and Hope*. *Id.*

The rate of return on equity is, in fact, a cost – the return that equity investors require represents the cost to the utility of equity capital. In his dissenting opinion in *Missouri ex rel. Southwestern Bell Telephone Co. v. Missouri Public Service Commission*, 262 U.S. 276 (1923), Justice Brandeis remarked upon the lack of any functional distinction between the rate of return on equity (which he referred to as a "capital charge") and other items ordinarily viewed as business costs, including operating expenses, depreciation, and taxes:

> Each is a part of the current cost of supplying the service; and each should be met from current income. When the capital charges are for interest on the floating debt paid at the current rate, this is readily seen. But it is no less true of a legal obligation to pay interest on long-term bonds . . . and it is true also of the economic obligation to pay dividends on stock, preferred or common.

Id. at 306 (Brandeis, J., dissenting). Similarly, the United States Supreme Court observed in *Hope*, "[f]rom the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business . . . [which] include service on the debt and dividends on the stock." 320 U.S. at 591, 603.

The North Carolina Supreme Court has long recognized that the Commission's subjective judgment is a necessary part of determining the authorized rate of return on common equity. *See, e.g., State ex rel. Utils Comm'n v. Public Staff-N.C. Util's. Comm'n*, 323 N.C. 481, 490, 374 S.E.2d 361, 369 (1988) (*Public Staff*). Likewise, the Commission has noted that such determination is not made by application of any one simple mathematical formula:

> Throughout all of its decisions, the [United States] Supreme Court has formulated no specific rules for determining a fair rate of return, but it has enumerated a number of guidelines. The Court has made it clear that confiscation of property must be avoided, that no one rate can be considered fair at all times and that regulation does not guarantee a fair return. The Court also has consistently stated that a necessary prerequisite for profitable operations is efficient and economical management. Beyond this is a list of several factors the commissions are supposed to consider in making their decisions, but no weights have been assigned.
>
> The relevant economic criteria enunciated by the Court are three: financial integrity, capital attraction and comparable earnings. Stated another way, the rate of return allowed a public utility should be high enough: (1) to maintain the financial integrity of the enterprise, (2) to enable the utility to attract the new capital it needs to serve the public, and (3) to provide a return on common equity that is commensurate with returns on investments in other enterprises of corresponding risk. These three economic criteria are interrelated and have been used widely for many years by regulatory commissions throughout the country in determining the rate of return allowed public utilities.
>
> In reality, the concept of a fair rate of return represents a "zone of reasonableness." As explained by the Pennsylvania commission:
>
> > There is a range of reasonableness within which earnings may properly fluctuate and still be deemed just and reasonable and not excessive or extortionate. It is bounded at one level by investor interest against confiscation and the need for averting any threat to the security for the capital embarked upon the enterprise. At the other level it is bounded by consumer interest against excessive and unreasonable charges for service.
> >
> > As long as the allowed return falls within this zone, therefore, it is just and reasonable. . . . It is the task of the commissions to translate these generalizations into quantitative terms.
>
> Charles F. Phillips, Jr., The Regulation of Public Utilities, 3d ed. 1993, pp. 382 (notes omitted).

Order Granting General Rate Increase, *Application of Carolina Power & Light Co., d/b/a Progress Energy Carolinas, Inc., for Adjustment of Rates and Charges Applicable to Electric Utility Service in North Carolina*, No. E-2, Sub 1023, at 35-36 (May 30, 2013), *aff'd, State ex rel. Utils. Comm'n v. Cooper*, 367 N.C. 444, 761 S.E.2d 640 (2014) (2013 DEP Rate Order).

Moreover, in setting rates the Commission must not only adhere to both the United States and North Carolina Constitutions, but as held by the North Carolina Supreme Court, it must set rates as low as possible consistent with constitutional law. *Public Staff*, 323 N.C. at 490, 374 S.E.2d at 370. Further, the North Carolina General Assembly has provided that the Commission must also set rates employing a multi-element formula set forth in N.C.G.S. § 62-133. The formula requires consideration of elements beyond just the rate of return on common equity element, and it inherently necessitates that the Commission make many subjective determinations, in addition to the subjectivity required to determine the rate of return on common equity. The subjective decisions the Commission must make as to each of the elements of the formula can and often do have multiple and varied impacts on all of the other elements of the formula. In other words, the formula elements are intertwined and often interdependent in their impact to the setting of just and reasonable rates.

The fixing of a rate of return on the cost of property used and useful to the provision of service (as determined through the end of the historic 12-month test period prior to the proposed effective date of a requested change in rates and adjusted for proven changes occurring up to the close of the expert witness hearing or projected in accordance with the provisions of N.C.G.S. § 62-133.16(c)(1)(a)) is one of several interdependent elements of the statutory formula to be used in setting just and reasonable rates. North Carolina General Statute § 62-133(b)(4) provides, in pertinent part, that the Commission shall:

> [f]ix such rate of return on the cost of the property . . . as will enable the public utility by sound management [1] to produce a fair return for its shareholders, *considering changing economic conditions and other factors* . . . [2] to maintain its facilities and services in accordance with the reasonable requirements of its customers in the territory covered by its franchise, and [3] to compete in the market for capital funds on terms that are reasonable and that are fair to its customers and to its existing investors. [Emphasis added.]

N.C.G.S. § 62-133(b)(4).

The North Carolina Supreme Court has interpreted the above-emphasized language as requiring the Commission to make findings regarding the impact of changing economic conditions on customers when determining the proper rate of return on common equity for a public utility. *Cooper I*, 366 N.C. at 495, 739 S.E.2d at 548. The Commission must exercise its subjective judgment so as to balance two competing rate of return on common equity-related factors – the economic conditions facing DEP's

customers and DEP's need to attract equity financing on reasonable terms in order to continue providing safe and reliable service. 2013 DEP Rate Order at 35-36. The Commission's determination in setting rates pursuant to N.C.G.S. § 62-133, which includes the fixing of the rate of return on common equity, always takes into account affordability of public utility service to the using and consuming public. The impact of changing economic conditions on customers is embedded in the analyses conducted by the expert witnesses on rate of return on common equity, as the various economic models widely used and accepted in utility regulatory rate-setting proceedings take into account such economic conditions. 2013 DEP Rate Order at 38. Further,

> [t]he Commission always places primary emphasis on consumers' ability to pay where economic conditions are difficult. By the same token, it places the same emphasis on consumers' ability to pay when economic conditions are favorable as when the unemployment rate is low. Always there are customers facing difficulty in paying utility bills. The Commission does not grant higher rates of return on common equity when the general body of ratepayers is in a better position to pay than at other times . . . .

Id. at 37.

Economic conditions existing during the modified test year, at the time of the public hearings, and at the date of the issuance of the Commission's order setting rates will affect not only the ability of the utility's customers to pay rates but also the ability of the utility to earn the authorized rate of return during the period the new rates will be in effect. However, in setting the rate of return on common equity, just as the Commission must assess the impact of economic conditions on customers' ability to pay for service, it likewise must assess the effect of regulatory lag on DEP's ability to access capital on reasonable terms. The Commission sets the rate of return on common equity considering both of these impacts taken together in its ultimate decision fixing a utility's rates.

Thus, in summary and in accordance with the applicable law, the Commission's duty under N.C.G.S. § 62-133, as well as N.C.G.S. § 62-133.16, is to set rates as low as reasonably possible to the benefit of the customers without impairing DEP's ability to attract the capital needed, at reasonable rates, in order to provide safe and reliable electric service and recover its cost of providing service.

Discussion and Conclusions

Two basic issues relating to ROE are presented in this case. First, the Commission must, based upon the evidence presented, select the appropriate ROE for DEP. Second, the Commission must determine whether a downward adjustment to that ROE is appropriate in light of North Carolina's adoption of PBR, in particular, the potential for an MYRP, and the Commission's approval of DEP's PBR Application, as modified by this Order. For the reasons set forth herein, the Commission determines that: (1) the appropriate ROE to be awarded to DEP in this case is 9.8%, and (2) downward adjustment to otherwise applicable ROE is not warranted in view of (a) the widespread

acceptance of alternative regulation throughout the United States, and (b) a comparison of North Carolina's alternative regulation program as promulgated by the PBR Statute and other states' alternative regulation. The Commission is persuaded that that comparison shows, as DEP witness Bateman testified, that North Carolina is not "less risky, in terms of regulatory framework, than other states on average across the country." Tr. vol. 15, 96.

Setting the Rate of Return on Common Equity

As is the norm, the expert witnesses for DEP, the Public Staff, and other intervenors differ widely in their ROE recommendations.[13] A summary of the model outputs of the various witnesses illustrates this divergence (bold indicates a point estimate, while parenthetical figures below are the range of model outcomes provided by the witness):

	DCF (Constant Growth*)	CAPM	Risk Premium	Comparable Earnings	Overall
Morin (DEP Supp.)	9.3%	11.0%-11.2%	10.5%-10.8%	Not Performed	10.4%
Morin (DEP, Direct)	9.3%-9.9%	10.8%-11.1%	10.2%	Not Performed	10.2%
Walters (The Public Staff)	**9.0%** (8.47%-9.03%)	**9.5%** (8.46-10.72%)	**9.9%** (9.74-10.34%)	Not Performed	9.45%
O'Donnell (CUCA)	**9.25%** (8.7-9.7%)	7.25%-8.25%	Not Performed	Not relied upon 9.5%-10.5%	9.25%
Reno (DoD-FEA)	**9.3%** (9.11%-9.57%)	8.83%-10.63%	Not Performed	10.26%-11.1%	9.3%
Ellis (NCJC, et. al.)	6.25%	5.8%	Not Performed	Not Performed	6.0%
Gorman (CIGFUR)					9.6%

[13] The Commission places little weight on the rate of return on equity testimony of Commercial Group witness Chriss and CIGFUR witness Gorman as neither actually performed any rate of return on equity analysis, beyond looking to average authorized rate of return on equity awards by utility commissions, including this Commission. While looking to such industry average data can be beneficial, it does not substitute for the rigorous analysis the law and the Commission demand in setting the allowed rate of return on equity.

*Although Public Staff witness Walters and DoD-FEA witness Reno performed multi-stage and sustainable growth DCF models, they did not rely on their outputs. As such, the figures above exclude those results. NCJC, et. al. witness Ellis's 6.25% is the result of a multi-stage growth DCF analysis.

As is also typical of rate of return on equity testimony, the various expert witnesses rely on many of the same models to inform their cost of equity estimates. However, the results of these models vary due to differences of opinion on the appropriate inputs. In the following pages, the Commission will weigh and consider the inputs in order to narrow the range of reasonable outcomes. Further, while DoD-FEA witness Reno and CUCA witness O'Donnell primarily rely upon their DCF results, it has been the Commission's long-standing practice to consider and place weight on multiple models in order to protect against any one model's skewing the outcome in times when it may be less indicative of the true cost of capital. The Commission also notes that DEP witness Morin's figures above, with the exception of his Allowed Risk Premium measure, include a flotation cost adjustment of approximately 0.2%. Tr. vol. 8, 53-54, 73, 75, 78.

The Commission, for reasons discussed below, concludes that a flotation cost adjustment is not warranted in this case. As such, the following discussion excludes them from consideration in setting the allowed return on equity.

Discounted Cash Flow Model

Despite the wide range of overall recommendations provided by the expert witnesses, with the exception of NCJC, et al. witness Ellis's 6.25% result, the recommended results of the DCF models form a relatively tight band from 9.0% to 9.3%. While the remaining witnesses disagreed on the appropriate growth adjustment to apply to the dividend yield, a 30-basis point window of outcomes reflects consensus regarding an appropriate model output for the DCF model. This remains the case even after removing DEP witness Morin's 20 basis point flotation cost adjustment.

The Commission concludes that NCJC, et al witness Ellis's outcome of 6.25% is an outlier and should be ignored. Apart from being more than 300 basis points below any rate of return on equity ever approved by this Commission for DEP, it is scarcely 200 basis points above DEP's embedded cost of debt, a premium that is clearly insufficient to compensate investors for the added risks associated with equity ownership relative to a debtholder's claim on the same enterprise. Further, NCJC, et al witness Ellis is alone in his reliance on a DCF method other than the constant growth DCF model. In contrast, DoD-FEA witness Reno and Public Staff witness Walters both conducted a multi-stage DCF model, and subsequently ignored or discounted those results. Tr. vol. 16, 264; Tr. vol. 21, 395.

As a result of their relatively narrow band of 9.0% to 9.3%, the Commission concludes that the DCF analyses of DEP witness Morin, CUCA witness O'Donnell, Public Staff witness Walters, and DoD-FEA witness Reno, are credible, probative, and entitled to substantial weight.

Risk Free Rate

A key input to both the risk premium and CAPM models is the risk free rate. On cross examination, DEP witness Morin testified that, due to a decline in interest rates between the time of filing of his supplemental testimony and the hearing, his recommended rate of return on equity would have been 0.2% lower if recalculated. *Id.* at 323-324. The Commission appreciates DEP witness Morin's candor in this regard and understands that, due to the dynamic nature of financial markets, model outcomes calculated on any given day would reflect the inputs available on that day, and as such would change from day to day. With or without this correction, however, DEP witness Morin's preferred measure of the risk free rate that he used in his supplemental testimony, 4.3%, based on projections, diverges meaningfully from the actual 30-year Treasury rate both at the time of filing and during the hearing. DoD-FEA witness Reno reports the 30-day average yield on the 30-year Treasury bond was 3.79% as of February 28, 2023. Tr. vol. 21, 382. NCJC, et al. witness Ellis uses the January average of 3.66%. Tr. vol. 21, 939. DEP witness Morin himself reports the yield to be between 3.9% and 4.0% as of the date of the hearing. Tr. vol. 8, 324. CUCA witness O'Donnell uses the range of yields over the prior 12 months of 2.42% to 4.4%, and Public Staff witness Walters uses his own projected value of 3.7%. Tr. vol. 16, 274; Tr. vol. 21, 625.

In support of his use of projected interest rates, DEP witness Morin testified that,

> Cost of capital models, including both the CAPM and DCF models, are prospective (i.e., forward-looking) in nature and must take into account current market expectations for the future because investors price securities on the basis of long-term expectations, including interest rates. As a result, in order to produce a meaningful estimate of investors' required rate of return, the CAPM must be applied using data that reflects the expectations of actual investors in the market.

Tr. vol. 8, 60.

The Commission considers the single best indicator of "the expectations of actual investors in the market" to be the yield they are willing to accept on the bonds they own. Where this information is available, either in the form of current yields or forward yields based upon the same, the Commission will continue to prefer using these rates to projections offered by market commentators.

DEP Witness Morin's direct testimony relied upon a risk free rate of 3.7%, and in response to a question from Chair Mitchell, he confirms that had he relied on the same 3.7% rate in his supplemental testimony, the outputs would have largely been in-line with the model outputs from his direct testimony (i.e. 20 basis points lower than his supplemental testimony). As a result, the Commission will place somewhat more emphasis on DEP witness Morin's direct testimony than his supplemental testimony with regard to his CAPM and Risk Premium Model outcomes.

Capital Asset Pricing Model (CAPM)

The wide range of results for the CAPM from the various intervenors shed light on the importance of the underlying inputs to the model. Of primary importance are the assumed risk free rate, market risk premium and beta, as the model's output is the sum of the former and the product of the latter two. As discussed above, a risk free rate in the range of 3.7% to 3.9% reasonably aligns with prevailing 30-year Treasury yields at the time of the hearing, and with the exception of CUCA witness O'Donnell, the expert witnesses have each provided models utilizing this input. CUCA witness O'Donnell, for his part, utilized a range of yields that cover the considerable variability of the measure over the 12 months prior to his testimony (2.42% to 4.4%). Tr. vol. 21, 625. While not exactly a match, it would indicate that top half of his indicated range overlaps with the others on the basis of risk free rate.

Turning next to beta, the witnesses diverge considerably. DEP witness Morin was adamant that a beta of 0.89, reflecting the current Value Line average for the proxy group. Public Staff witness Walters also employed this figure, along with average betas going back to 2014 (0.76) and betas from Market Intelligence's Beta Generator. The Commission agrees with DEP witness Morin that using stale betas is incorrect and prefers the current Value Line average, as they better reflect current market fundamentals. The Commission also accepts DEP witness Morin's rationale for rejecting the Vasicek adjusted betas from Market Intelligence. CUCA witness O'Donnell appeared to agree with DEP witness Morin, and used a 0.88 beta for the proxy group, sourced from Value Line. Tr. vol. 21, 625. Similarly, DoD-FEA witness Reno relied upon a Value Line beta of 0.89. *Id.* at 384. NCJC, et al. witness Ellis rejected the Value Line beta because Value Line considers five years of trailing data, meaning it continues to reflect the effects of pandemic-related market turmoil and asserted that they do not reflect current investor risk perceptions. *Id.* at 1010. Instead he offers several alternatives, including from providers that allow users to modify beta calculation parameters. *Id.* at 1012. On rebuttal, DEP witness Morin testified that Value Line betas are widely used and well-known to investors, that Diana Harrington's work established them as consistently the best at predicting ensuing betas, and that NCJC, et al. witness Ellis's preferred alternatives are inferior. Tr. vol. 8, 213-14. The Commission accepts DEP witness Morin's rebuttal of NCJC, et al. witness Ellis on this point and finds reassuring the reliance of other intervening witnesses on Value Line betas in its determination of the appropriate beta.

The MRP, the last variable in the CAPM model, reveals a wider range of assumptions made by the intervening witnesses. DEP witness Morin used 8% in his initial testimony (composed of a historical MRP of 7.4% and a prospective MRP of 8.5%, averaged), and 7.3% in his supplemental testimony, each reflecting an expected market return of 12%. DEP witness Morin opined that an MRP in the range of 6.0% to 8.0% is a reasonable estimate of the cost of equity for CAPM and that the historical MRP approach is simple and difficult to improve upon. Tr. vol. 8, 71. Witness Walters utilized both a historical approach and DCF approach to estimate the MRP, yielding results of 7.9% and 6.85% respectively, and implying expected market returns of 11.6% and 10.52%. Witness Walters also utilized a method from Kroll that provides a normalized risk-free rate of 3.89% and an MRP of 6.0%. Tr. vol. 16, 278-

82. DEP witness Morin accepted witness Walters' first two estimates, but rejected the Kroll based estimate for several reasons, namely that Kroll is a highly selective source, that it lacks transparency, and falls at the bottom of a range indicated by Kroll's own analysis to be a reasonable estimate of the MRP. Tr. vol. 8, 156. Witness Reno used estimates from Kroll of 7.46% (historic arithmetic average) and 6.22% (Ibbotson-Chen supply side model). She also used a 6.0% Kroll recommended U.S. ERP paired with a normalized risk-free rate of 3.5%. Tr. vol 21, 382-83. Witnesses O'Donnell (3.5% to 4.5%) and Ellis (3.98%) offered substantially lower MRP estimates. Tr. vol. 21 939, Exhibit KWO-5; Tr. vol. 21. Witness Morin noted that these estimates are below several widely used estimates of the MRP for U.S. Stocks, that witness O'Donnell did not rely upon the CAPM, and that NCJC, et. al. witness Ellis incorrectly used geometric means in generating his MRP. Tr. vol. 8, 181-83, 210. The Commission agrees that the MRP rates of witnesses Ellis and O'Donnell are unreasonably low and should be ignored.

Witnesses Morin, Reno and Walters all seemed to agree that an estimate for the MRP within a range of 6.0% to 8.0% is reasonable. The Commission agrees.

In light of the foregoing, the Commission finds that a CAPM with inputs in the range of 3.7% to 3.9% for the risk free rate, a beta 0.89, and an MRP of 6.0% to 8.0% is a reasonable outcome. Witness Morin's use of an 8% MRP and 3.7% risk free rate from original testimony, when combined with the updated beta of 0.89 results in a CAPM rate (without flotation costs) of 10.82%. Witness Walters provided three estimates utilizing the current Value Line beta (9.22%, 9.78% and 10.72%), averaging 9.91%, while witness Reno's estimates using Value Line beta (but excluding the estimate which used a normalized risk free rate of 3.5%) were 9.32% and 10.42%, averaging 9.89%. Averaging the 9.9% results from the intervenors, with witness Morin's 10.82% modified result yields an estimated cost of equity of 10.35%. Thus, the Commission concludes that an estimate of 10.35% is a reasonable outcome for the CAPM model.

Empirical CAPM (ECAPM)

In this case, both DEP witness Morin and DoD-FEA witness Reno supported inclusion of an ECAPM result. The ECAPM, according to witness Morin, corrects for the fact that the CAPM under-predicts observed returns when beta is less than one. Public Staff witness Walters took issue with witness Morin's use of an adjusted beta as published by Value Line because the adjustments made in his ECAPM model are mathematically the same as adjusting beta. Tr. vol. 16, 306-07. In rebuttal, witness Morin testified that adjusted betas and ECAPM correct different problems, and that as a result, both are needed. NCJC, et. al. witness Ellis opposed the ECAPM on the grounds that it is not used elsewhere in finance and is not supported by updated research. Tr. vol. 21, 1038. Witness Morin contended the ECAPM is discussed in most finance textbooks, including one cited by witness Ellis. Tr. vol. 8, 217.

The Commission agrees with witness Walters's contention that mathematically, the Blume adjusted betas provided by Value Line achieve the same end. However, it finds witness Reno's support for using these same betas in the ECAPM persuasive and is

further persuaded by witness Morin's testimony that both adjustments are needed because they correct for different things.

As witness Reno and witness Morin's ECAPM calculations were both approximately 20 basis points higher than their CAPM calculations, reflecting the Commission's CAPM conclusions above, the Commission accepts an ECAPM estimate of the rate of return on equity of 10.55% as reasonable.

Together with the results of the CAPM, a combined CAPM range of 10.35% to 10.55% will be used to calculate the required rate of return on equity in this case.

Risk Premium Model

The last major method relied upon by the cost of equity expert witnesses are the Risk Premium methods. DEP witness Morin utilized two variations of this approach. The first compares actual returns of the S&P Utility Index with contemporaneous Treasury returns and applies the 4.3% risk free rate. As with his other methods, he also applied a flotation cost adjustment. His second RPM represents the historical premium of allowed ROEs to the risk free rate. This method does not employ a flotation cost adjustment, as it assumes allowed ROEs factor that in. While the Commission has previously relied upon such models, and finds them credible, as mentioned above, the Commission finds that a risk free rate of 4.3% is overstated, and will instead rely upon witness Morin's Risk Premium Models as provided in his direct testimony, which used 3.7% risk free rate. Those results, after removing the adjustment for flotation costs, averaged 10.1%. The Commission finds this result credible, probative, and entitled to substantial weight.

Public Staff witness Walters also provided a risk premium method based on authorized returns for electric utilities. Witness Walters compares 37 years of authorized returns for electric utilities against contemporaneous bond yields and uses this method to estimate a return on equity of 9.9%. The Commission has given substantial weight to this method in the past and does so in this case as well. Taken together with the 10.1% RPM result of witness Morin, the Commission finds there is credible and probative evidence supporting an RPM-based cost of equity ranging from 9.9% to 10.1%.

Comparable Earnings Method

Although no witness relied upon a comparable earnings method in formulating their recommended rate of return on equity, CUCA witness O'Donnell and DoD-FEA Reno calculated results of 9.5% to 10.5% and 10.26% to 11.1% respectively. The Commission finds these results generally support its decision regarding rate of return on equity in this case.

Indicated Range Prior to Adjustments

In light of the foregoing, the Commission has identified a zone of reasonableness of 9.75% to 10%, reflecting the average of the ranges identified above. The Commission will next examine the proposed adjustments offered by the witnesses.

Flotation Cost Adjustment

Flotation costs are the expenses of issuing equity, such as printing fees, underwriter fees, attorney fees, and other similar fees. Tr. vol. 8, 337. DEP, itself, does not issue equity; instead, equity issuances are made by its publicly traded parent, Duke Energy.

Duke Energy issued no equity during the test year. Duke Energy forecasts there will be no common equity issued from 2023 through 2027. Public Staff Cross Examination Morin – Direct and Rebuttal, Ex. 10. Tr. Ex. vol. 9. DEP witness Newlin testified that "we've said publicly that the holding company is not planning to issue common stock until 2027 at the earliest." Tr. vol. 9, 111.

Flotation costs may not be recovered under these circumstances for the following two separate and independent reasons. First, it would be "unjustified" to cause customers to overpay DEP approximately $48 million dollars towards flotation costs when, in fact, no equity was or will be issued from 2021 through 2027. See, Order Approving Partial Settlement Agreement and Stipulation, Deciding Contested Issues, Approving Water and Sewer Investment Plan, Granting Partial Rate Increases, and Requiring Customer Notice, *Application by Aqua North Carolina, Inc. for Authority to Adjust and Increase Rates for Water and Sewer Utility Service in All Its Service Areas in North Carolina and for Approval of a Water and Sewer Investment Plan*, No. W-218, Sub 573, at 62 (June 5, 2023) (2022 Aqua Rate Case).

Second, the recovery of flotation costs is not allowed under North Carolina law where there is no evidentiary support. 2022 Aqua Rate Case at 61-62. The North Carolina Supreme Court in *State ex rel. Utilities Commission v. Public Staff,* 322 N.C. 689, 370 S.E.2d 567 (1988), reversed and remanded the ROE portion of the Commission's Order dated October 31, 1986, Docket No. E-7, Sub 408 for Duke Power Company. The Supreme Court directed the Commission on remand to reconsider the proper rate of return on Duke Power's common equity and also support its conclusion on flotation costs with specific findings. There was no evidence in that case that Duke Power intended to issue new stock for the next three or four years. On remand, the Commission issued its second E-7, Sub 408 Order, reassessed the evidence, and issued new findings of fact and conclusions. The Commission concluded that 13.2% was a fair rate of return on Duke Power's equity and there was a 0.1% increment in the approved 13.2% ROE to cover future stock issuance costs. On the second appeal, the Supreme Court held that the Commission's inclusion of the "stock" issuance increment is not supported by substantial evidence in view of the whole record. *State ex rel. Utils. Comm'n. v. Public Staff*, 331 N.C. 215, 218 (1992). The Supreme Court concluded the Commission's inclusion of a 0.1% ROE increment for purported future financing costs in the approved ROE was not based upon substantial evidence in view of the whole record. The Supreme Court stated:

> As we noted on the first appeal, an 0.1% upward increment in Duke's rate of return on common equity costs ratepayers $ 4.2 million annually in additional rates. Historically, Duke's average costs per issuance of stack

> was $ 3.2 million. In light of the whole record on this issue, particularly in the absence of any evidence that Duke intended to issue stock in the immediate future, there is simply no substantial evidentiary support for the Commission's addition of a 0.1% increment to Duke's rate of return on common equity to cover future stock issuance costs.

State ex rel. Utils. Comm;'n v. Public Staff, 331 N.C. 215 at 221-22.

The Supreme Court further stated and ruled:

> On the first appeal of this case, we questioned whether the record supported *any* adjustment whatever in the rate of return for purported future stock issuance, or financing, costs. We said:
>
> > Since *no* evidence was introduced that Duke intends to issue new stock for the next three or four years, and because there was no evidence regarding the probable cost of a prospective issuance, we question whether the record supports *any* financing cost adjustment. *State ex. rel. Utilities Commission v. Public Staff*, 322 N.C. at 700, 370 S.E.2d at 574 (emphasis added). We are not satisfied, for the reasons alluded to in our first opinion, that the record supports no such adjustment in the common equity rate of return.

Id. at 221.

As in that case, there was and is no plan to issue equity in the present case. Accordingly, there is no evidence to support DEP's request to increase its ROE by 20 basis points for flotation costs. Therefore, the Commission rejects DEP's inclusion of 20 basis points in its ROE request to cover flotation costs.

Downward Adjustment Due to MYRP

N.C.G.S. § 62-133.16(c)(1)(a) requires the Commission to consider any increased or decreased risk to either the electric public utility or its ratepayers that may result from having an approved MYRP.

Public Staff witness Walters and CUCA witness O'Donnell both made specific mathematical downward adjustments in their ROE recommendations to account for what they perceive as the less risky environment DEP now operates in as a result of the passage of the PBR Statute. Witness Walters's downward adjustment was 20 basis points, taking his ROE recommendation from 9.45% to 9.25%. Tr. vol. 16, 288. Witness O'Donnell's downward adjustment was 25 basis points, taking his ROE recommendation

from 9.25% to 9.0%[14]. Tr. vol. 21, 627. Inasmuch as the Public Staff's recommendation is more fully explained in witness Walters's testimony, the Commission will address it, but the same factors described in this discussion apply with equal force to the recommendations of witnesses O'Donnell and Reno.

While asserting that there were other reasons to support a downward adjustment, witness Walters conceded that "the only stated adjustment for [DEP's] ROE is based on the MYRP." Tr. vol. 16, 336. Further, the actual quantification of the recommended downward adjustment was not performed by witness Walters at all. Instead, he simply adopted the Public Staff's methodology applied in the recent water utility cases, the 2022 Aqua Rate Case., and the general rate case proceeding for Carolina Water Service North Carolina in Docket No. W-354, Sub 400 (the 2022 CWSNC Rate Case). See Order Approving Partial Settlement Agreement and Stipulation, Deciding Contested Issues, Granting Partial Rate Increase, Approving Water and Sewer Investment Plan, and Requiring Customer Notice, *Application by Carolina Water Service, Inc. of North Carolina for Authority to Adjust and Increase Rates and Charges for Water and Sewer Utility Service in All Service Areas of North Carolina and Approval of a Three-Year Water and Sewer Investment Plan*, No. W-354, Sub 400 (Apr. 26, 2023); *See also* Order Approving Partial Settlement Agreement and Stipulation, Deciding Contested Issues, Approving Water and Sewer Investment Plan, Granting Partial Rate Increases, and Requiring Customer Notice, *Application by Aqua North Carolina, Inc., for Authority to Adjust and Increase Rates for Water and Sewer Utility Service in All Its Service Areas in North Carolina and for Approval of a Water and Sewer Investment Plan*, No. W-218, Sub 573 (June 6, 2023). In footnote 29 of his direct testimony, witness Walters linked to the Public Staff testimony filed in those two water utility cases to support quantification, noting that the "Public Staff has previously argued that approval of multi-year mechanisms that reduce the risk borne by water and wastewater utilities should result in a 20-basis point reduction in the allowed ROE." *Id.* at 287. The Commission did not accept the Public Staff position in either of the proceedings cited by witness Walters, and this downward adjustment is contrary to Commission's reasoning in the Orders in the 2022 Aqua Rate Case and the CWSNC Rate Case. Further, there is substantial evidence introduced in this case supporting DEP's position that no downward adjustment is warranted. Accordingly, the Commission rejects the downward adjustment theory.

In the Commission's Order in the 2022 CWSNC Rate Case, the Commission addressed and rejected the Public Staff's requested 20 basis point downward adjustment in otherwise applicable ROE and its holding was read into the record by Dr Morin:

> [T]he Commission is persuaded that this type of mechanism is prevalent across the country and within the proxy group. Although a WSIP is intended to reduce regulatory lag, the existence of similar mechanisms across the country and in the states where the proxy group utilities operate indicates

[14] DoD-FEA witness Reno did not make a specific downward adjustment to her rate of return on equity recommendation due to DEP's MYRP proposal but indicated that she had taken the MYRP proposal into account in setting rate of return on equity.

> that the comparative risk reduction associated with a WSIP[15] for CWSNC, in this case, is zero.

Tr. vol. 9, 20-21 (emphasis added)[16].

The Commission's conclusion is in line with witness Morin's academic work on this subject, which is summarized in his most recent book, Modern Regulatory Finance, published in late 2021. *See* DEP Redirect Morin Direct and Rebuttal Ex. 1. Tr. Ex. vol. 9. At the hearing in this proceeding Witness Morin summarized the three reasons why he asserts the presence of risk-mitigating mechanisms should not result in a reduction in the cost of equity as presented on pages 58-59 of his Direct and Rebuttal Exhibit 1. *Id.*

First, witness Morin asserts that the ROE in a rate case is being set based upon a proxy group of comparable companies, and the use of a proxy group takes into account similar risk mitigating mechanisms that are pervasive in the industry, so "the addition of any discreet adjustment would be unwarranted double counting of the effect of these mechanisms." DEP Redirect Morin Direct and Rebuttal Ex. 1 at 58, Tr. Ex. vol. 9. In sum he states that the "current market data reflects or embeds the presence of risk mitigators." Tr. vol. 9, 17. Second, he states that empirical studies in peer-reviewed academic journals have examined the impact of risk mitigators on the cost of equity, and the results show that there is no impact. *Id.* at 17-18. Third, risks that are diversifiable are not considered relevant in cost of capital estimates for investors, because by definition they can be eliminated through diversification, and risk mitigators are in fact diversifiable. *Id.* at 18.

DEP witness Morin, quoting from his book, summarized that a downward adjustment would be "double counting" as the "market-derived returns are estimated for market information on the cost of common equity for other comparable companies, which already incorporates the impacts of these mechanisms." Tr. vol. 9, 17-18 (quoting DEP Redirect Morin Direct and Rebuttal Ex. 1 at 59), Tr. Ex. vol. 9.

The Commission is persuaded that DEP has proven, by the greater weight of the evidence, that the impact of alternative ratemaking mechanisms like the PBR Statute is already incorporated into the analysis and a downward adjustment in otherwise applicable ROE would be inappropriate "double counting."

DEP Late-Filed Exhibit (LFE) No. 11 and LFE No. 14 illustrate the prevalence of alternative ratemaking mechanisms. DEP LFE No. 11 is a map demonstrating that alternative ratemaking mechanisms are widespread throughout the United States. In fact, of the 51 jurisdictions depicted (the 50 states plus the District of Columbia), only five have no alternative ratemaking mechanism in place. By contrast, 36 (over 70%), have two or more such mechanisms, including North Carolina, which has two (MYRP and

[15] A "WSIP" (Water and Sewer Investment Plan) is the water utility analog to an MYRP for electric utilities.

[16] The Commission reiterated this holding, in identical language, in its recent Order in the 2022 Aqua Rate Case. See Order at 62.

decoupling). The other eleven states have a single mechanism, either a future test year or specific capital trackers. The exhibit validates DEP witness Bateman's observation that in the United States:

> [A]lternative ratemaking regulation is the norm and, therefore, contrary to Witness Walters's assertion, implementation of a MYRP does not warrant a reduction to the Company's ROE since this change simply makes North Carolina's ratemaking practices more aligned with the rest of the country. Notably, every single company in Witness Walters's proxy group operates either entirely or partially in states that have adopted alternative regulation.

Tr. vol. 23, 159-60.

LFE No. 14 shows the 23 electric utility holding companies in witness Morin's peer group used in connection with his ROE recommendation and the alternative ratemaking mechanisms in the applicable jurisdiction. Tr. vol. 8, 349. The LFE illustrates witness Morin assertion that "the proxy group companies all operate in … states [that have alternative ratemaking mechanisms], and more than one state in many cases." *Id.*

DEP witness Bateman compared the alternative ratemaking mechanisms available in North Carolina under the PBR Statute with similar mechanisms available in other jurisdictions. DEP witness Bateman stated that "the focus should not be on whether DEP has a Multiyear rate plan, but rather, how the North Carolina PBR framework compares to alternative regulation in other states in terms of risk to the utility." Tr. vol. 23, 160. Witness Bateman asserted that "North Carolina's framework places more risk with the utility than the frameworks in some other states." *Id.* She provided numerous examples of how North Carolina's framework places risk on the utility. As an example, she compared states with formula rates and riders for significant capital investments that allow for true-ups of costs increases to North Carolina's PBR mechanism under which she contends electric utilities bear "all the risk of and financial impact associated with cost increases on projects in between rate cases." *Id.* Witness Bateman also stated that unlike the PBR Statute many other states' MYRP mechanisms provide for fully forecasted growth of both capital and associated O&M expense. Tr. vol. 15, 91-92. Finally, she noted that ESM in North Carolina's PBR Statute is asymmetrical in that it assures that customers receive 100% of earnings once the utility's earnings exceed 50 basis points of its allowed ROE, but the utility does not receive an earnings boost if it underearns. *Id.* at 92-93; Tr. vol. 23, 160-61; *See also* DEP Redirect Bateman Stillman Direct and Settlement Ex. No. 1, Tr. Ex. vol. 16.

Witness Bateman concluded her review with the observation that she saw nothing that makes North Carolina "less risky, in terms of the regulatory framework than other states on average across the country." Tr. vol. 15, 96.

The Commission agrees with DEP witnesses Bateman and Morin and concludes that substantial evidence supports the reasonableness of a rate of return on equity ranging from 9.75% to 10.0%, without a downward adjustment due to the MYRP. The

Commission is persuaded by the evidence that similar types of mechanisms are prevalent across the industry as well as within the proxy group. The Commission is also persuaded that elements of the North Carolina statute are distinguishable as compared to other jurisdictions, as pointed out by witness Bateman, in terms of allocation of risk between utility and customers. The Commission is mindful that one of the objectives of the MYRP is to reduce the lag in recovery experienced by the utilities, which, in theory, benefits the utility. However, the Commission concludes that given the utility has entered a capital intensive period of time as it manages the transition of its system, it is critical that the utility be in a position to access capital on reasonable terms and the Commission concludes that the availability of the MYRP makes DEP competitive in terms of its ability to access capital on reasonable terms.

Regarding the obligation in accord with the holding in *Cooper I* to inform its selection of a rate of return on equity within that range, the Commission will next address the impact of changing economic conditions on customers.

In this case, all parties had the opportunity to present the Commission with evidence concerning changing economic conditions as they affect customers. The testimony of DEP witness Morin and Public Staff witness Walters addresses changing economic conditions at some length. Witness Morin provided detailed data concerning changing economic conditions in North Carolina, as well as nationally, and concluded that the North Carolina-specific conditions are “highly correlated” with conditions in the broader national economy. As such, witness Morin testified that changing economic conditions, both nationally and specific to North Carolina, are reflected in his rate of return on common equity estimates.

Public Staff witness Walters generally agreed with DEP witness Morin that as of the time of the filing of his testimony, economic conditions had improved in North Carolina. As the Commission has noted, customer impact due to changing economic conditions is embedded in ROE expert witness analyses. Witness Morin’s analysis, which the Commission credits and to which the Commission gives weight, also indicates that even though the North Carolina and U.S. economies have contracted, economic conditions in North Carolina continue to be highly correlated to conditions nationally, and, therefore, continue to be reflected in the analyses used to determine the rate of return on equity.

The point is to see whether the econometric data relied upon by ROE expert witnesses captures the effects and impacts of changing economic conditions upon customers and the Commission concludes that, based on the evidence presented in this case, it does.

Based upon the general state of the economy and the need for the continuing affordability of electric utility service, and after weighing and balancing factors affected by the changing economic conditions in making the subjective decisions required, the Commission concludes that the rate of return on common equity of 9.8% will not cause undue hardship to customers even though some will struggle to pay the increased rates.

Indeed, affordability, especially for low-income customers, was a special focus of DEP and the intervening parties to this proceeding. As noted above, the Commission established the LIAC in its April 16, 2021, Order in the 2019 Rate Case and tasked the LIAC with addressing affordability issues for low-income residential customers. The efforts of the LIAC are apparent in this case and include the Affordability Stipulation as previously discussed in this Order. The provisions in the Affordability Stipulation, which includes the development of the CAP pilot, directly benefit customers with the least ability to pay in the current economic environment. In addition, as previously discussed in this Order, through the Payment Navigator program proposed in this proceeding, DEP will work closely with customers in need of assistance with managing bills and will connect those customers with sources of support and funding, based on the unique situation of the customer. While these programs will not ease the burden that electricity rates will place on certain of DEP's customers, the Commission expects these programs to provide a meaningful level of support to eligible customers. The Commission takes these facts into account in approving the 9.8% return on equity. However, the Commission also concludes, based on the evidence of record, that efforts to address energy burden and support for customers need assistance with their bills are but nascent. The LIAC allowed DEP and its stakeholders to generate data that illustrates the depth and breadth of the challenge in North Carolina. Work must continue to reach these customers and provide meaningful support both in terms of assisting customers use energy more efficiently so that bills are reduce and in terms of providing support to those customers when they are in need of bill assistance. The Commission recognizes the difficulties attendant to solving for these issues but emphasizes that the utility must continue this work. As has been previously expressed by this Commission, the electric utilities must pursue every opportunity presented by federal funding made available by the IRA and other federal legislation to support customers in need. The Commission has confidence that DEP, the Public Staff and stakeholders will identify such opportunities for customers and will develop programs that take advantage of every federal dollar that is available for customer support.

Considering the changing economic conditions and their effects on DEP's customers, the Commission recognizes the financial difficulty that an increase in DEP's rates may create for some of DEP's customers, especially low-income customers. The Commission is mindful that, as shown by the evidence, relatively small changes in the rate of return on common equity have a substantial impact on a utility's base rates. Therefore, the Commission has carefully considered changing economic conditions and their effects on DEP's customers in reaching its decision regarding DEP's approved rate of return on common equity.

The Commission also recognizes that provisions in S.L. 2021-165 may intensify the risks facing DEP as it continues to navigate the challenges associated with the change in the mix of electric generating resources and with new load patterns, including ensuing the continued reliable operation of the electric system, and to work toward the requirements of N.C.G.S. § 62-110.9. As DEP witness Bowman asserted,

> [I]t is simply indisputable that the tasks currently before the Company—implementing the energy transition within the construct of the Carbon Plan while simultaneously evolving nearly every aspect of its business and pursuing a complex merger—are unprecedented, imposing new and unique execution risks on the Company across all phases and aspects of its business that are inarguably more far-reaching and complex than anything the Company has ever pursued in the past.

Tr. vol. 21, 1200-01.

The need to invest significant sums to serve its customers requires DEP to maintain its creditworthiness in order to compete for large sums of capital on reasonable terms. And, in addition, as recent years have demonstrated, macroeconomic, geopolitical, extreme weather, public health, and other exogenous events beyond DEP's control may necessitate – and indeed have necessitated – the need for DEP to access and invest significant sums during atypical and volatile market conditions. The Commission takes note of DEP witness Newlin's testimony that, particularly in light of DEP's present credit metrics, ROE is one predicate (capital structure being another predicate, discussed in detail below) to the level of creditworthiness necessary to efficiently access the capital markets on reasonable terms during all market cycles, including periods of high volatility, which access ultimately lowers borrowing costs passed through to customers during such time. Tr. vol. 9, 112-13; Tr. vol. 22, 206-07.

The Commission must weigh the impact of changing economic conditions on DEP's customers against the benefits that those customers derive from DEP's ability to provide safe, adequate, and reliable electric service 24/7/365, regardless of macroeconomic, geopolitical, environmental, and public health events. Safe, adequate, and reliable electric service is essential to the well-being of the people, businesses, institutions, and economy of North Carolina. The Commission is mindful of the burden that electricity rates will place on many of DEP's customers and the contribution of the ROE to those rates, but the Commission must balance the burden against DEP's being in a position to access capital: (1) on reasonable terms; and (2) in moments when DEP most needs capital in order to provide reliable service.

The Commission concludes in the exercise of its independent judgment and discretion that a 9.8% rate of return on common equity is supported by the evidence and should be adopted. The hereby approved rate of return on common equity appropriately balances the benefits received by DEP's customers from DEP's provision of safe, adequate, and reliable electric service in support of the well-being of the people, businesses, institutions, and economy of North Carolina (which benefits are symbiotically linked to DEP's ability to compete in the capital markets to access capital on reasonable terms that will be fair to ratepayers) with the difficulties that some of DEP's customers will experience in paying DEP's adjusted rates. The Commission further concludes that a 9.8% rate of return on common equity will allow DEP to compete in the market for equity capital, providing a fair return on investment to its investor-owners. Accordingly, the Commission concludes, taking into account changing economic conditions and their

impact on customers, that the approved rate of return on common equity will result in the lowest rates constitutionally permissible in this proceeding.

Capital Structure

Summary of Evidence

In his direct testimony, DEP witness Newlin proposed using a capital structure of 53% members' equity and 47% long-term debt. Tr. vol. 9, 94. Witness Newlin testified that DEP's "specific debt/equity ratio will vary over time, depending on a variety of factors, including among other things, the timing and size of capital investments and payments of large invoices, debt issuances, seasonality of earnings, and dividend payments to the parent company." *Id.* As of December 31, 2021, DEP's capital structure was 53.9% common equity and 46.1% long-term debt. *Id.* at 95.

Witness Newlin discussed the current credit ratings and forecasted capital needs of DEP and emphasized the importance of DEP's continued ability to meet its financial objectives. *Id.* at 87. He noted that DEP faces substantial capital needs over the next several years so as to provide cost-effective, safe, reliable, and increasingly cleaner electric service to its customers well into the future, so DEP must therefore appeal to debt and Duke Energy's equity investors to attract the capital it needs. *Id.* at 98-99. He explained that investors – both debt and equity – have a variety of investment opportunities available to them and require a return commensurate with the risk they incur, warning that they will invest elsewhere if they feel the expected return provided by a company for a given amount of risk is inadequate. *Id.* at 86. He further explained that lower credit quality weakens a company's attractiveness as an investment opportunity relative to companies with higher credit quality and similar return profiles. *Id.* at 86-87. As such, witness Newlin testified it is critically important that DEP maintain strong, investment-grade ratings to assure its financial strength and flexibility and ensure access to capital on reasonable terms. *Id.* at 96.

Discussing DEP's financial objectives, witness Newlin addressed specific objectives that support financial strength and flexibility, including maintaining 53% common equity for DEP on a financial capitalization basis; ensuring timely recovery of prudently incurred costs; maintaining sufficient cash flows to meet obligations; and maintaining a sufficient return on equity to fairly compensate shareholders for their invested capital. *Id.* at 97-98. He further testified that the ability to attract capital (both debt and equity) on reasonable terms is vitally important to DEP and its customers, and each of these specific objectives helps DEP both to maintain its investment-grade credit ratings and to meet its overall financial objectives. *Id.* at 87-88.

Intervenor witnesses disputed witness Newlin's recommendation. Public Staff witness Walters, CUCA witness O'Donnell, and DoD-FEA witness Reno all testified that DEP's proposed 53/47 capital structure exceeded the equity ratio for all proxy group companies. Tr. vol. 16, 245 (Walters); Tr. vol. 21, 592 (O'Donnell); Tr. vol. 21, 360 (Reno). The testimony of witnesses Walters and Reno also noted that the 53/47 recommendation

was inconsistent with DEP's observed capital structure at various points in time. Tr. vol. 16, 246 (Walters); Tr. vol. 21, 360 (Reno). Witnesses O'Donnell, Reno, and Gorman testified that the 53/47 proposal exceeded the average capital structure authorized by other utility commissions. Tr. vol. 21, 360 (Reno); Tr. vol. 21, 593-94 (O'Donnell); Tr. vol. 21, 405, 408 (Gorman).

These witnesses' capital structure recommendations were as follows: Walters — 52/48 (Tr. vol. 16, 247); O'Donnell — 50/50 (Tr. vol. 21, 568); Reno — 52/48 (Tr. vol. 21, 360); and Gorman — 52/48 (Tr. vol. 21, 405).

NCJC, et al. witness Ellis took a different tack, recommending a capital structure of 58% equity and 42% debt. Tr. vol. 21, 1071. As noted above in connection with the Commission's discussion of ROE evidence, witness Ellis testified that ROE and capital structure are interrelated and must be addressed together. *Id.* at 1056-57. Accordingly, his 58/42 capital structure recommendation goes hand-in-hand with his 6.0% ROE recommendation. *Id.* at 1071. He indicated that this combination would minimize customer costs while meeting investor return expectations. *Id.*

In his rebuttal testimony, DEP witness Newlin took issue with the intervenor witness recommendations. He observed that the reliance of witnesses Walters, O'Donnell, and Reno on capital ratios of proxy group companies was misplaced, because the proxy companies are all publicly traded holding companies, not utility operating companies. Tr. vol. 22, 169. He testified that it is inappropriate to compare DEP's capital structure to the holding company capital structures, because the risk profiles are very different. *Id.* at 170. The appropriate comparison is to other utility operating companies. Witness Newlin performed that comparison for witness Morin's proxy group, which was essentially the same for the other rate of return on equity expert witnesses and presented the results in Newlin Rebuttal Exhibit 1. Tr. Ex. vol. 22. The results show that the average capital structure for operating utilities is 53.3% equity/46.7% debt – consistent with DEP's proposal. Tr. vol. 22, 172. He pointed to the Commission's previous rejection of the use of parent company structures as opposed to operating company structures in determining the operating utility's appropriate equity/debt ratio. *Id.* at 172-73.

Witness Newlin further testified that witnesses Walters's and Reno's comparisons of DEP's proposed capital structure with DEP's actual capital structure at a specific point in time are inappropriate. *Id.* at 173. He explained that it is reasonable to expect DEP's capital structure to fluctuate above and below the target equity ratio, and that merely selecting a point in time is not representative of how DEP intends to capitalize its business in the long-term. *Id.* at 174. Moreover, the specific points in time utilized by witness Walters rely on a surveillance report which includes current maturities of long-term debt which are excluded for ratemaking purposes. *Id.*

Witness Newlin disputed the manner in which witnesses O'Donnell, Reno, and Gorman compare DEP's proposed capital structure with allowed common equity ratios granted by other state regulators, noting that their presentations are overly simplistic and

misleading. *Id.* at 175. He explained that their considerations fail to give proper weight to trends of rising equity components not reflected in their historical observations. *Id.* at 176.

Witness Newlin also presented an analysis of the intervenor capital structure recommendation with the lowest equity ratio component, proposed by witness O'Donnell. He noted that selection of an optimal capital ratio requires balance between affordability and access to the capital markets. He noted that a strong capital structure and adequate ROE provide the balance sheet protection and cash flow generation to support high credit quality. This in turn creates financial flexibility to efficiently access the capital markets on reasonable terms during all market cycles, including periods of high volatility, which ultimately lowers borrowing costs passed through to customers. *Id.* at 180. He testified that witness O'Donnell fails to consider the impact his 50/50 capital structure recommendation would have on DEP's credit metrics and potentially its credit ratings. *Id.* Witness Newlin then presented an analysis showing the negative impact upon DEP's credit ratings of the 50/50 recommendation, concluding the recommendation along with witness O'Donnell's ROE estimate would further stress DEP's already distressed credit metrics and cash flows, with negative consequences to DEP's credit ratings and cost of debt. *Id.* at 181-88.

Witness Newlin also criticized witness Ellis' 6.0% rate of return on equity/58% equity layer recommendation, noting that with an ROE that low DEP would not be able to effectively compete for capital. *Id.* at 193. Witness Newlin presented a table showing alternate ROE comparisons of southeastern utilities, as follows:

Table 4: Authorized ROE Comparison of Peer Utilites in the Southeast since 2020

Regulated Utility	State	Docket/Case No.	Year of Order	Current Authorized ROE
Virginia Electric and Power	NC	E-22, Sub 562	2020	9.75%
Alabama Power Company	AL	reported by S&P, under RSE mechanism	2021	11.88%(1)
Dominion South Carolina	SC	2020-125-E	2021	9.50%
Duke Energy Carolinas	NC	E-7, Sub 1214	2021	9.60%
Georgia Power	GA	44280	2022	10.50%(2)
Florida Power & Light	FL	20210015 - ROE Trigger	2022	10.80%(3)
Duke Energy Florida	FL	20220143-EI	2022	10.10%(4)
Tampa Electric Co.	FL	20220122-EI	2022	10.20%(5)
Duke Energy Progress	SC	2022-254-E	2023	9.60%
Average				**10.21%**

Source: S&P Capital IQ, Past Rate Cases pulled on April 4, 2023.

(1) Alabama Power has a formula rate mechanism that allows for annual adjustments, and they have a variety of mechanisms to allow for the inclusion of new plant. Under this mechanism, they are allowed a relatively high ROE (S&P reported 11.88% in year 2021) that is balanced against limited annual rate adjustments with certain caps.

(2) Authorized retail ROE set under the 2022 Alternative Rate Plan approved by the Georgia Public Service Commission and evaluated against a range of 9.50% to 11.90%. Any retail earnings above 11.90% will be shared with Georgia Power retaining 20%, 40% applied to reduce regulatory assets, and 40% directly refunded to customers.

(3) ROE Trigger increased authroized ROE to a midpoint of 10.80% from 10.60%

(4) Originally approved ROE band was 8.85% to 10.85%. The ROE band will increase by 25 basis points beginning in 2023 as a result of the average 30-year U.S. Treasury rate increasing by more than 50 basis over a six-month period.

(5) Originally approved ROE band was 9.00% to 11.00%. The ROE band will increase by 25 basis points beginning in 2023 as a result of the average 30-year U.S. Treasury rate increasing by more than 50 basis over a six-month period.

Id. at 195.

Finally, witness Newlin provided an overview of market dynamics since DEP's last rate case, noting the dramatic changes in economic conditions, including persistently high inflation, geopolitical issues like the war in Ukraine, and bank failures. *Id.* at 196. The Federal Reserve has responded to inflation by dramatically raising short term interest rates, and long term rates have also spiked and remain volatile. He noted that this heightened level of market volatility and uncertainty has led to an unprecedented number of zero issuance days in the primary debt capital markets. Witness Newlin stressed the value during these times of high credit quality and strong investment-grade credit ratings, which allow Companies to not only access the market, if needed, but also provide flexibility to wait for more optimal market conditions. *Id.* at 196-97. In his testimony summary witness Newlin noted that DEP's existing strong investment grade credit ratings constitute a form of insurance against downgrades that will be the likely consequence of weakening DEP's financials and noted further that downgrades only work to the detriment of DEP and its customers. *Id.* at 201.

Discussion and Conclusions

For the reasons set forth herein, the Commission approves DEP's proposed capital structure of 53.0% equity and 47.0% long term debt.

The Commission is not persuaded by witness Ellis' recommendation. In the Commission's view, his testimony on capital structure is far outside the mainstream, just as it was for ROE. While the Commission appreciates – and no party disputes – witness Ellis's point that capital structure and rate of return on equity are related, the Commission is concerned that an ROE so low, even if connected to a high equity ratio, will render DEP at a severe disadvantage when competing for capital. The Commission is concerned that DEP will not find many equity investors willing to invest in an electric utility that runs nuclear plants and faces significant challenges and capital needs with respect to spearheading S.L. 2021-165's energy transition with a 6.0% rate of return on equity, no matter what the equity ratio – especially when, as indicated by DEP Redirect Newlin Rebuttal Exhibit 2, those same investors can invest in much less risky utility bonds yielding 5.24%. Tr. vol. 23, 47; Tr. Ex. vol. 22.

Turning next to the recommendations of the other witnesses, the Commission notes while witnesses Gorman, Reno, and Walters support use of the stipulated equity later from DEP's prior rate case, much of their testimony in support of lowering the equity layer from DEPs request is premised upon comparisons to the capital structures of publicly traded holding companies. The Commission has repeatedly rejected the use of holding company capital structures in the past. *See, e.g.,* Order Granting General Rate Increase and Approving Amended Stipulation, issued on December 7, 2009 in Docket No. E-7, Sub 909, 27-28. Moreover, witness Newlin persuasively establishes that DEP's proposed 53/47 capital structure is right in line with the capital structures of the utility operating companies that are subsidiaries of the holding companies in Dr. Morin's proxy group, which is essentially the same as all of these witnesses' proxy groups. *See* Newlin Rebuttal Ex. 1, Tr. Ex. vol. 22.

The seemingly slight difference between DEP's 53/47 proposal and the Public Staff's 52/48 proposal masks consequential impacts. Those impacts persuade the Commission that 53/47 is the optimal structure that appropriately balances affordability and DEP's access to capital on reasonable terms. With DEP's credit metrics as stressed as they are, further downward pressure in the form of a reduced equity layer and increased debt is decidedly not in the best interests of either DEP or its customers.

The credit stressors experienced by DEP are in some respects being felt industry wide. In his direct testimony, witness Morin referenced the "perfect storm" facing electric utilities like DEP: (1) slowing or even declining electricity growth in energy consumption; (2) at a time in which record amounts of new capital must be raised to replace aging infrastructure, improve reliability, and deliver renewable generation; (3) coupled with the need to implement a transition away from fossil fuel (particularly coal) and toward renewables, including electrification of the transportation sector; and (4) and layering on further the need to build new transmission infrastructure to strengthen the grid against

weather events increasing in frequency and ferocity, as well as new renewable generation resources. Tr. vol. 8, 91-92.

As witness Bateman testified, DEP faces multiple risks on multiple fronts including risks associated with investment and new technologies; risks associated with operating a system that must be "on" 24/7/365 with new types of generation, including increasing amounts of solar; and risks associated with getting the retirement of existing coal generation "just right." Tr. vol. 15, 97-98. These risks all highlight the execution and operational risks facing DEP in connection with the mandates of S.L. 2021-165. Witness Bowman addressed this issue as well, as noted in the return on equity discussion above. Moving forward, these risks impose upon DEP the obligation to navigate a fast-changing landscape to secure ready access to capital upon reasonable terms, to ensure that it can make the necessary capital investments to ensure reliable and affordable service to its customers.

Credit rating agencies have noted these stressors, both on a national and a DEP-specific basis. On the national front, Moody's published in November 2022 an industry-wide report highlighting the agency's revision of the entire regulated utility sector outlook from stable to negative. *See* DEP Redirect Newlin Direct Ex. 3, Tr. Ex. vol. 10. The report highlights that the industry as a whole is confronting numerous financial pressures at a time when Moody's expects "the sector to maintain elevated capital spending focused on reducing carbon emissions to make progress toward net zero goals and overall system reliability" – precisely the execution risks DEP faces in connection with the mandates of S.L. 2021-165.

Specifically regarding DEP, Moody's has taken two very recent actions, both of which highlight the immediate credit metric challenges DEP faces. First, in April 2023 Moody's published a "Ratings Action" report (DEP Redirect Newlin Direct Exhibit 1) affirming DEP's A-level rating but at the same time issuing an explicit warning with regard to the principal credit metric utilized by Moody's, the ratio of Funds From Operations (FFO) to debt (FFO/Debt)[17]. Tr. Ex. vol. 10. In its April 2023 Ratings Action Moody's indicated that it was raising its FFO/Debt downgrade threshold for DEP from 20.0% to 21.0%, meaning that while it had in the past forecast a potential downgrade in DEP's credit rating if the FFO/Debt metric stayed below 20.0% on a sustained basis, it was now forecasting a potential downgrade if the metric stayed below 21.0% on a sustained basis. This is a particularly worrisome development because, as Company witness Newlin pointed out during his direct testimony, DEP's FFO/Debt ratio has been below 21.0% for a number of years. Tr. vol. 9, 17-18. In other words, DEP is already operating below the Moody's raised downgrade threshold and has already been doing so on a sustained basis. *Id.* at 18-19.

Between witness Newlin's appearance on direct on May 5 and his appearance on rebuttal on May 16, Moody's issued its May 2023 updated Credit Opinion regarding DEP, replacing its Credit Opinion issued in March 2022 (introduced into evidence as both Public

[17] In Moody's parlance FFO/Debt is called "preworking capital cash flow to debt" (Tr. vol. 9, 115), or "CFO pre-WC to debt." Both FFO and CFO pre-WC mean the same thing and are a measure of cash flow. *Id.*

Staff Cross-Examination Morin Direct and Rebuttal Exhibit No. 15 and DEP Redirect Newlin Direct Exhibit 2). Tr. Ex. vol. 10. In the updated Credit Opinion, Moody's explicitly referenced as factor that could lead to a downgrade the FFO/Debt ratio "remaining below 21% in 2023." DEP Redirect Newlin Rebuttal Ex. 1, 2; *see also* Tr. vol. 23, 36-37. Accordingly, Moody's not only alluded to its raised download threshold, but pointedly referenced 2023 – this very year.

The potential for downgrade is not a theoretical issue. The actions by Moody's beginning with its sector outlook publication in November 2022, running through its April 2023 raising of DEP's downgrade threshold, and culminating with its May 2023 updated DEP Credit Opinion are a series of escalating warnings.

Witness Newlin noted in his testimony that to ensure reliable and cost-effective service, and to fulfill its obligations to serve customers, DEP must continuously plan and execute major capital projects, and must be able to operate and maintain its business without interruption and refinance maturing debt on time, regardless of financial market conditions, even (and perhaps especially) in times of market volatility. Tr. vol. 9, 102. Customers benefit from DEP's financial strength, because its strong investment-grade credit ratings provide DEP with greater access to the capital markets on reasonable terms during such periods of volatility. *Id.* Responding to questions from Chair Mitchell, witness Newlin recounted a recent example of market dislocation, resulting from the collapse of Silicon Valley Bank, in which other Duke Energy subsidiaries were able to time entry into the market for the benefit of their customers, and he noted that only a "utility with good strong credit quality is able to do that." Tr. vol. 22, 207. He similarly alluded to market dislocation at the initial stages of the COVID-19 pandemic when Duke utilities were able to flexibly maintain market access when other utilities were unable to access the credit markets. *Id.* at 208. And widening credit spreads between higher- and lower-rated utilities mean that downgrade will have cost consequences for customers even if DEP were able to achieve access to the capital markets. *Id.* at 205; tr. vol. 23, 45-48.

Witness Newlin likened the flexibility derived from DEP's existing strong investment grade credit ratings as "a form of insurance against downgrades that will be the likely consequence of weakening the Company's financials," and noted that "downgrades only work to the detriment of DEP and its customers." Tr. vol. 22, 201 (emphasis in original). He cautioned against the Commission's taking action to weaken this insurance policy, "perhaps with unintended consequences." *Id.* The Commission heeds this warning, and the escalating series of warnings from Moody's, and finds that now is decidedly not the time to weaken DEP's credit profile and invite a credit downgrade. DEP must attract capital on reasonable terms in order to finance investment needed for the continued reliability of the system. Weakening DEP's capital structure or awarding too-low an ROE will make attraction of necessary capital that much more difficult – and certainly more expensive.

Accordingly, the Commission accepts witness Newlin's recommendation that DEP's capital structure be composed of 53.0% equity and 47.0% long term debt.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 52-56

COVID Deferral

The evidence supporting these findings of fact is contained in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Bowman, Quick, Abernathy, Speros (together as a panel), and Jiggetts, Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

Deferral Docket

In August of 2020, DEP and DEC (together, Duke) jointly petitioned the Commission for approval of orders for regulatory accounting purposes authorizing both Companies to establish a regulatory asset to account for incremental costs resulting from the unprecedented COVID-19 Pandemic and declared State of Emergency, so that such costs can be deferred pending further action by the Commission in the next general rate case filed by DEP and DEC. Joint Petition of Duke Energy Carolinas, LLC and Duke Energy Progress, LLC for Approval of Accounting Orders to Defer Incremental COVID-19 Expenses, Docket Nos. E-2, Sub 1258 and E-7, Sub 1241 (August 7, 2020) (Covid Deferral Docket). DEC and DEP each requested permission to create a regulatory asset to defer costs associated with customer fees waived, bad debt expenses, employee stipends and safety-related costs, remote work costs, and other costs, including overtime and related call center costs.

The Public Staff filed comments the Covid Deferral Docket opposing Duke's request, arguing among other things that Duke had not substantiated a need for a deferral of the costs enumerated and recommending the Commission deny the request. Further, the Public Staff stated that if the Commission allowed Duke to defer costs, Duke should offset such costs with COVID-related savings such as federal tax credits and reductions in operating expenses.

The Commission granted the request to defer incremental costs and waived customer fees associated with the COVID-19 Pandemic for recovery in a future proceeding in its December 21, 2021 Order Approving Deferral Request (Deferral Order), in Docket Nos. E-2, Sub 1258, E-7, Sub 1241. The Commission noted the unique nature of the request, the severity of the ongoing pandemic, and the fact that many of the actions taken by the Companies were in part due to government mandates imposed upon Duke intended to ease both the financial and public health impacts of the pandemic on North Carolina and its citizens who might likely have been displaced from their homes. Deferral Order at 13.

The Commission determined that it would be patently unfair to penalize Duke by not allowing an opportunity to justify recovery of these costs in a future rate case and the Commission concluded that the costs allowed to be recovered may be amortized over a period of time determined in the future rate cases.

Although the Commission allowed Duke to include carrying costs on the deferred amounts for accounting purposes, the Commission concluded that the rate of that return, if any, and the amount to which that return is applied will be subject to determination in that future rate case.

Summary of Evidence

DEP Direct and Supplemental Testimony

In the present proceeding, DEP now seeks recovery of its deferred incremental COVID-related costs. In her direct testimony, DEP witness Jiggetts presented DEP's request. Witness Jiggetts explained that DEP deferred and requests to recover: (1) customer fees waived, (2) bad debt charge-offs, (3) employee stipends to cover unplanned expenses associated with the COVID pandemic, (4) costs related to employee safety, (5) costs related to remote work, and (6) miscellaneous costs, such as employee overtime. Tr. vol. 13, 197-99. Witness Jiggetts maintained that the costs included in the deferral are reasonable and prudent costs that were incurred as DEP provided its essential public service during the pandemic. *Id.* at 199.

In her direct testimony, DEP witness Quick explained the efforts DEP undertook to support its customers throughout the pandemic and the return to normal billing practices. Tr. vol. 7, 81-83. Witness Quick explained that DEP suspended service disconnections and waived fees for card payments, walk-in pay location payments, late payment charges, and insufficient funds. *Id.* at 81. Witness Quick also detailed how DEP worked with assistance agencies and customers on an individual basis to connect qualifying customers with assistance funding where possible. *Id.* Witness Quick described DEP's expanded outreach campaign efforts and, in particular, detailed the ways in which DEP adapted its customer operations resources to provide a more tailored experience for customers and utility assistance agencies. *Id.* at 82.

DEP witness Speros testified in support of DEP's bad debt calculation. Tr. vol. 13, 51-52. Witness Speros explained that the moratorium on disconnections and late payment fees led to an increase in the number and amounts of past due accounts outstanding, which in turn lead to increased bad debt expense. *Id.* Witness Speros testified that the deferred bad debt expense was calculated as the total amount of incremental bad debt expense exceeding the amount already being recovered in base rates from the period starting in March 2020 through the capital cut-off date in this case. *Id.* at 52. Witness Speros also explained that DEP is continuing to incur impacts to business operations from the pandemic, namely that charge-offs related to COVID delinquencies are ongoing and will continue to be. *Id.* at 53.

Witness Jiggetts explained that DEP's additional deferred expenses include employee safety-related costs, costs for remote work, employee stipends, and other miscellaneous costs. Tr. vol. 13, 197. She explained that because DEP is an essential service provider, it was not an option for some of DEP's employees to remote work. Witness Jiggetts further explained that DEP provided, and will continue to provide,

employees with the appropriate personal protective equipment, and incurred additional incremental costs for increased cleaning and sanitation supplies, health care, as well as for testing and temperature checks. *Id.* at 198. For those employees who could work from home, witness Jiggetts testified that DEP incurred additional costs for remote work, including costs for expanded conference line capacity, increased network bandwidth, other required information technology improvements, expanded video conferencing licenses, and increased company cellular telephone and data usage. *Id.* at 198-99. Lastly, for certain eligible employees, witness Jiggetts stated that DEP provided a one-time cash payment of $1,500 to help with unplanned expenses associated with COVID-19. Witness Jiggetts also clarified that DEP seeks to recover other expenses related to overtime costs needed to implement COVID-19 guidelines to ensure employee safety and increased costs due to expected increased call volume at call centers when normal billing practices resume. *Id.* at 199.

Witness Jiggetts testified that the proposed new rates requested in this proceeding include recovery of costs deferred from March 2020 through April 2023, and that the adjustment normalizes revenues for waived late fees that will be collected going forward, amortizes the deferred costs over a three-year period, adjusts test year expenses to include certain incremental employee costs that were previously deferred and includes the deferral balance, net of one year of amortization and deferred taxes, in rate base. *Id.* In her third supplemental direct testimony, witness Jiggetts updated DEP's amortization amount for the COVID deferral to include actual amounts realized through March 31, 2023.[18] Tr. vol. 13, 247.

The Public Staff Direct and Supplemental Testimony

In their direct testimony, Public Staff witnesses Zhang and Boswell recommended that the Commission adjust DEP's revenue requirement to remove DEP's proposed COVID deferral due to significant questions regarding the eligibility, accuracy, and reasonable quantification of the costs included in the deferral and the savings and cost offsets DEP chose not to net against the COVID expenses. Tr. vol. 19, 65. Witnesses Zhang and Boswell commented that during their review of several major O&M expenses they found COVID-related cost savings in employee expenses and printing which were not netted again the deferred COVID costs. They stated that DEP was offsetting these savings against reduction in customer load, unfavorable weather, and excess storm costs, none of which were the causation of the savings. *Id.* at 66.

Witnesses Zhang and Boswell noted that DEP received the following credits and delayed payments as a result of the pandemic: (1) Employee Retention Credit (ERC); (2) delayed payment of employer portion of social security tax; and (3) Accelerated Alternative Minimum Tax (AMT). *Id.* at 67. The witnesses explained that Section 2301 of the federal CARES Act created a refundable ERC of up to $5,000 per eligible employee taken against the employer's share of the Social Security Tax on Qualified Wages paid from March 13, 2020, through December 31, 2020. *Id.* Witnesses Zhang and Boswell

[18] See fn. 2.

further stated that the CARES Act amended Title 26 of the Internal Revenue Code to allow the entire AMT credit carryforwards to be refundable to taxpayers in either the 2018 or 2019 tax year. Witnesses Zhang and Boswell noted that DEP reported that the AMT credits were generated by non-regulated operations of Duke Energy and, as such, were not attributable to DEP. *Id.* at 68.

Witnesses Zhang and Boswell testified that DEP is unable to provide any and all costs savings associated with the pandemic; thus, the Public Staff cannot calculate an appropriate amount for deferral. Additionally, the witnesses expressed concerns regarding the types of charges deferred reiterating the same concerns the Public Staff expressed in its comments filed in the Deferral Docket. *Id.* at 69. With regard to the employee stipends, witnesses Zhang and Boswell testified that this one-time payment, does not appear to include a verification by DEP as to the expenses paid, and constitutes goodwill to some employees on the part of DEP, not a cost that should be borne by ratepayers. *Id.*

Witnesses Zhang and Boswell rebutted DEP's assertion that its call center costs have increased, instead testifying that based on the Public Staff's review of the call center volumes and labor costs, including overtime, over the last five years, the volume and costs has been steady, with costs and volume declining in 2021 and 2022. *Id.* at 69. They testified, concerning costs for remote work, that while DEP incurred some additional costs with the initial rollout, remote work is now part of DEP's regular work offerings, and DEP has not offset any of these increased costs with associated decreases in office expenses. The witnesses removed the costs associated with safety personal protection equipment because DEP indicated that the amount included in the original filing will not be an ongoing amount. *Id.* at 71. Witnesses Zhang and Boswell also removed the overtime for the call center as their review indicated the level sought by DEP was not above the amounts already included in DEP's cost of service. *Id.* They also expressed concern regarding the reserve percentage DEP is utilizing to estimate its bad debt expense because DEP is still collecting a portion of the uncollectible amount through various collection agencies. *Id.* at 70.

In their supplemental and settlement testimony, Public Staff witnesses Zhang and Boswell again recommended removal of DEP's COVID deferral from the revenue requirement and updated their recommended removal amount to account for amounts included by DEP through February 28, 2023. *Id.* at 89. The witnesses again reiterated that the Public Staff opposes DEP's recovery of its deferred expenses because it did not net its COVID-related cost savings against the actual costs incurred. *Id.* at 93.

DEP Rebuttal Testimony

On rebuttal, DEP's COVID Panel, consisting of witnesses Bowman, Quick, Abernathy, and Speros, all testified to provide further detail and context for DEP's pandemic response and COVID-related costs incurred. Tr. vol. 21, 1263-64. The Panel stated that the vast majority of the deferred costs DEP seeks to recover result directly from customer inability to pay and the governmental response to that inability to pay. They

explained that non-payment ordinarily would have been met by discontinuance of service, but actions both of the Governor of North Carolina and the Commission removed service disconnection as an option for DEP. *Id.* at 1264.

Witness Bowman detailed DEP's initial and ongoing response as an essential service provider. Witness Bowman explained DEP's actions in response to federal, State, and Commission direction, including Governor Cooper's executive orders and the Commission's moratorium on disconnections. *Id.* at 1266-67. Witness Bowman also provided a brief background on the Deferral Docket and the Commission's Deferral Order, which approved DEP and DEC's request to establish a regulatory asset for the purposes of deferring the incremental costs associated with the COVID-19 pandemic for final determination in a future rate case. *Id.* at 1268. She stated that the Deferral Order also required DEP to periodically file reports to update the Commission concerning the actual amounts deferred. *Id.* DEP witness Quick details the ways in which DEP adapted its customer support operations to serve the unique needs of customers associated with the pandemic. *Id.* at 1272-76.

DEP witness Abernathy included in her portion of the prefiled COVID Panel rebuttal testimony a chart detailing the deferred costs as of March 17, 2023, the date DEP's second supplemental testimony was filed:

Deferred Incremental COVID-19 Costs	**$ in Millions**	**% of total**
Customer fees waived	$27.1	29.1%
Bad debt expense	$57.3	61.6%
Employee safety related costs	$4.0	4.3%
Costs for remote work	$0.6	0.7%
Employee stipends	$0.7	0.8%
Other (primarily call center costs)	$3.3	3.5%
Total Incremental COVID-19 Costs deferred	$93.0	100.0%
Accrued carrying costs	$12.0	
COVID Deferral projected balance as of rates effective	$105.0	

Id. at 1280.

According to DEP, the requested $105.0 million in deferred incremental COVID-related costs translates to approximately 124 basis points, excluding any impacts from lost revenues. *Id.* Witness Abernathy testified that as of the filing of the third supplemental testimony (April 18, 2023) the projected balance as of the date rates would go in effect had grown to approximately $107 million, mainly because of an increase in the amount of bad debt expense. *Id.* at 1307. She commented that the spike in bad debt expense occurred in connection with the expiration in March 2023 of 12-month repayment plans DEP automatically enrolled customers into as of the time (March 2022) when the extended winter moratorium on disconnection finally ended. *Id.* at 1353.

Witness Abernathy explained that over 90% of the deferred costs are attributable to waived customer fees and bad debt expenses. She notes that these incremental costs were primarily the result of government-issued moratoriums imposed on DEP. *Id.* at 1282. Witness Quick explained that DEP waived approximately $27 million in customer fees, launched extensive outreach campaigns to bring awareness to the available customer assistance, expanded the eligibility for the Winter Moratorium and extended its length. *Id.* at 1272-73. The COVID Panel testified that the remaining categories of expense are also clearly pandemic-related, in that they were incurred in order for DEP, as a provider of an essential service, to fulfill its obligation to continue operation 24 hours a day, seven days a week despite the pandemic. Witness Bowman stated that more than 40% of DEP's workforce had to show up, in person, at work, at power plants and other facilities, or to repair damage following storms. *Id.* at 1319. She noted that in doing so those employees had to be furnished with protective gear, cleaning supplies, sanitizing supplies, and COVID testing services and nursing case management. Further, witness Bowman testified that DEP installed barriers at the workstations located at various operating plants so employees would not transmit the coronavirus. *Id.* at 1321. Witness Abernathy stated that these costs are captured in the category "employee safety related costs." *Id.* at 1281.

The COVID Panel testified regarding the challenges faced by DEP's customer service representatives, who ordinarily would work in call centers but had to transform themselves essentially overnight into a virtual workforce working from their homes – homes that in large measure were not set up with home-office facilities – while simultaneously dealing with childcare and other family-related issues exacerbated by the pandemic. They noted that costs associated with these challenges are captured in the employee stipends, which were distributed to hourly-paid call center employees costs related to the pandemic such as increased childcare, home-office equipment, and home internet access.[19] *Id.* at 1282, 1325-26. They explained that the stipends served as an inexpensive means of retaining essential employees, as witness Quick noted, "to try to keep them and help them through this unprecedented time that we were all going through … just a way of really supporting our hourly employees at the call center." *Id.* at 1326. The COVID Panel testified that DEP also incurred costs related to remote work generally, such as expanded conference line capacity, increased network bandwidth, other required information technology improvements, expanded video conferencing licenses, and increased company cellular telephone and data usage. *Id.* at 1281-82.

Regarding regulatory treatment of COVID-19 costs in other jurisdictions, the COVID Panel testified that as of the time the reply comments were filed in the Deferral Docket (November 30, 2020) commissions in 32 states and the District of Columbia had permitted cost deferral in response to requests from regulated utilities subject to their jurisdiction. They stated that since then, several state commissions have begun to allow recovery of deferred costs. They noted that the Georgia Public Service Commission

[19] Call center-related costs are also captured in the "call center" category, which relates to incremental increases in workload and the need to retain outside vendors as the centers began to "return to normal" following the easing of the shutdown moratoriums. Tr. vol. 21, 1277-79.

recently permitted recovery of approximately $25 million in deferred COVID-related costs over a three-year amortization period.[20] *Id.* at 1270.

In response to the Public Staff's testimony that DEP's request for cost recovery of incremental deferred COVID-related costs should be denied because DEP has not offset these costs with COVID savings, the COVID Panel testified that the Deferral Order requires only that DEP track the costs being deferred. The Panel did note that in South Carolina DEP was required to track and report quarterly both COVID-19 related savings and net lost revenues (NLRs) on a South Carolina retail basis in 2020. *Id.* at 1288. The Panel stated that because of this South Carolina requirement, DEP has tracked incremental savings due to COVID and provided these amounts to the Public Staff. They explained that DEP's estimates included two categories of expenses that resulted in financial savings attributable to the COVID-19 pandemic. First, DEP experienced reduced employee expenses as compared to budget, primarily related to reductions or elimination of travel and expenses associated with normal operations while DEP's employees were required to work remotely and adhere to travel restrictions, etc. Second, DEP experienced reduced printing and postage costs while the various government-imposed moratoriums were in place and DEP was not disconnecting customers and thus not mailing required notifications. *Id.* at 1289.

The COVID Panel stated that in 2020, DEP estimated approximately $4.5 million, on a North Carolina retail basis, in O&M expense savings attributable to COVID-19. DEP estimated NLRs in 2020 to be approximately $28 million, on a North Carolina retail basis, compared to budget, more than offsetting the savings reductions that the Public Staff suggests. *Id.* The COVID Panel maintained that the negative impact of NLRs was ignored by the Public Staff in its testimony.

The Covid Panel also addressed the assistance provided by the federal CARES Act. With respect to the accelerated AMT, the COVID Panel maintain that the Public Staff's argument that this credit should impact the COVID-19 deferral is simply incorrect as "not a single dollar of the AMT refunds is attributable to DEP; rather, the refunds all relate to other subsidiaries of Duke Energy Corporation". *Id.* at 1291. Regarding the delay in payment of the social security tax for the period April through December 2020, the COVID Panel noted that this was only a temporary deferral from the government and was fully paid by December 31, 2022. *Id.* They stated that although the Public Staff believes that DEP should have offset the COVID deferral for the working capital impacts of the delay in payment, witnesses Boswell and Zhang did not provide a quantification of their estimate of that amount. The COVID Panel estimates that the carrying cost benefit between April 2020 and December 2022 was approximately $2 million on a North Carolina Retail basis. *Id.* Related to the ERC, the COVID Panel stated that DEP filed for ERCs under the CARES Act and that all claims have been filed attributable to its operations from March 13, 2020, through September 30, 2021. The COVID Panel contended that even if these

[20] See Order Adopting Settlement Agreement as Modified, Docket No. 44280 (December 20, 2022); see also Direct Testimony of Aaron P. Abramovitz, Sarah P. Adams, Adam D. Houston, and Michael B. Robinson, Docket No. 44280, at 46-47 (June 24, 2022).

benefits to DEP (excluding the AMT which is not a benefit attributable to DEP) should be netted against costs, they should in that case also be netted against NLRs. The Panel maintained that these benefits do not overcome NLRs even when added to the $4.5 million DEP estimates is COVID-related savings. *Id.* at 1292.

Witness Abernathy maintained that the Public Staff's recommendation is one-sided and asymmetrical in its focus on DEP's apparent savings but omits any discussion of NLRs. *Id.* at 1271. Witness Abernathy explained that in 2020, DEP faced challenges in addition to the pandemic, such as mild weather that also resulted in substantially lower than projected revenues. She also testified concerning increased expense due to higher-than-normal storm restoration costs. Witness Abernathy testified that when faced with the prospect of revenue loss and in keeping with its focus on managing O&M expenses for the benefit of customers, DEP, as a routine part of its business, identifies and implements a suite of cost mitigation measures. *Id.* at 1271.

Witness Abernathy testified that total O&M cost reductions for 2020 amounted to $62 million on a North Carolina retail basis. *Id.* at 1295. She further testified that revenue impacts from COVID and mild weather amounted to $71 million on a North Carolina retail basis, and when added to an additional impact ($14 million) related to storm costs, the total is $85 million, an amount that was not contested by any party. *Id.* at 1294-95. Witness Abernathy then observed that "revenue impacts plus storm costs on the one hand, and the cost savings on the other, are opposite sides of the same coin – but, as shown by my illustration, the reduced revenues and storm impacts ($85 million) outstrip cost savings ($62 million) by a significant amount – approximately $23 million." *Id.* at 1295.

In response to the Public Staff's testimony regarding incremental call center costs, the DEP COVID Panel explained that, although average workload hours decreased during the Commission-ordered disconnection (Q2 and Q3 2020), DEP could not capture the potential savings associated with reduced workload during this timeframe in light of the uncertainty of when DEP would return to normal, making it such that reducing staffing would not have been prudent; and its view that reducing staffing in the short term, only to have to restaff a few months later, would not have been cost-effective. DEP witness Quick clarified that while overall call volume declined in 2021 and 2022, the average handling time per call increased as DEP's customers experienced changing needs following the return to normal. *Id.* at 1276.

Witness Abernathy also testified regarding the various invoices and ledgers DEP provided the Public Staff of its COVID-related expenses and savings. *Id.* at 1284-86. She described in detail the data DEP provided in response to the Public Staff data requests and in support of its COVID cost recovery request. *Id.* Witness Abernathy stated that the Public Staff did not dispute the actual amounts of the costs deferred and requested for recovery. *Id.* at 1286-87. She noted that for bad debt expense, the Public Staff only expressed concerns with DEP's calculation and the reserve percentages used.

Witness Speros provided additional testimony in support of DEP's bad debt expense and calculation. Witness Speros testified to the process that DEP undertook to

develop the reserve percentages, explaining that the reserve percentages are calculated by taking the net charge-off amounts divided by the aged receivable balance utilizing the historical data from 2018 and 2019. *Id.* at 1297. Witness Speros explained that DEP reviews the aging schedules and works with various internal teams to determine if there are any unusual changes or fluctuations in collections and write-offs that could impact the reserve calculation, and that based on these reviews, DEP determines if the balance in the loss reserve is reasonable as stated or if an adjustment is required. Witness Speros also testified that DEP compiles quarterly data on aged receivables, the balance of the loss reserve, and the current write-offs compared to forecast are then summarized and discussed with management. *Id.* at 1298. Witness Speros also clarified how customers on payment plans are treated for purposes of charge-off accounting. *Id.* He stated that customers on payment plans are actively working with DEP and are therefore viewed as having less risk of charging off than the typical delinquent customer. He noted that consistent data is available related to payment plans and a more accurate assessment can be taken by looking at the trends of customer defaults on their payment plans. Witness Speros explained that the percentage is calculated using the dollars defaulted on payment plans divided by total dollars of payment plans. *Id.*

Witness Abernathy testified that DEP has proposed to continue the deferral of bad debt expense until the next rate case. She stated that if the reserve percentages used to calculate bad debt expense do not result in actual charge offs, this will be reflected in future bad debt expense. *Id.* at 1286. Therefore, the continuation of the deferral should resolve any Public Staff concerns about the correct percentages to use. She noted that if the Commission does not approve continuation of the bad debt expense deferral, then test year bad debt expense should be increased by approximately $42 million to reflect a current level of bad debt expense using 2022 actual expense. *Id.* at 1286-87.

Testimony Presented at the Expert Witness Hearing

At the expert witness hearing, Public Staff witnesses Zhang and Boswell responded to questions on cross-examination and from Commissioners about their recommendation to disallow all COVID-related expenses included in DEP's deferral. Witness Boswell testified that part of the reason why the Public Staff removed the expense was because it could not determine what level should be included. Tr. vol. 19, 139. Public Staff witness Boswell stated that the Public Staff struggled to receive information from DEP and that underlying the difference of opinion between the Public Staff and DEP is the respective views on COVID savings. *Id.* Witness Boswell further stated that it is unreasonable to offset COVID-related savings against other costs, such as storm and weather costs, as DEP has proposed. *Id.* at 140. In response to a hypothetical question on deferral approval from Commissioner Duffley, witness Boswell testified that an appropriate amortization period would be around ten or fifteen years, akin to storm recovery, instead of the three years proposed by DEP. *Id.* at 141.

The COVID Panel also responded to questions from Commissioners related to DEP's deferral request. Witness Abernathy began by providing the final amount of the requested deferral in this proceeding – $107 million through DEP's third supplemental

update. Tr. vol. 21, 1307. Witness Speros explained that DEP has a structured and well-documented approach for tracking its COVID-related impacts, and further clarified that DEP's bad debt expense consists of two components: actual charge-offs, and a reserve adjustment based on the level of accounts receivable. *Id.* at 1310-11. Witness Abernathy explained DEP's methodology for the quantification of net lost revenues but reiterates that DEP has not requested recovery for lost revenues, *Id.* at 1316, 1343, and witness Bowman provided testimony related to the costs incurred in order for DEP to continue to operate as an essential service provider. *Id.* at 1319. Witness Bowman explained that 40% of DEP's workforce had to continue work as before, even in light of potential nonpayment due to the disconnection moratorium in place at the time, and that in no instance did DEP stop providing its services. *Id.* at 1319-20. Witness Bowman further testified that this period extended from March of 2020 until August of 2022. *Id.* at 1321. Witness Bowman explained that this continuation of service came at a cost to DEP as it ensured safety protocols were in place and followed and procured adequate protective gear for DEP's employees. *Id.*

Concerning the amortization period of the deferred costs, witness Bowman indicated its preference for a shorter amortization period stating DEP's preference for a three-year amortization but stated that DEP would likely be willing to slightly extend the recovery period. She testified that, if extended, DEP would prefer the amortization period be in a three-year increment, such as six years, to keep in sync with the MYRP. *Id.* at 1327.

Public Staff witness Boswell testified that "the Company meticulously … [accounted for] the costs associated with COVID." Tr., vol. 19, 161. Witness Boswell further testified that, while the Public Staff would have liked to provide the Commission with a recommendation on recovery of COVID costs, "[t]ruthfully … we couldn't determine what level should be put in there." *Id.* at 138. Witness Boswell noted that the Public Staff had issued numerous data requests and participated in several teleconferences with DEP seeking to formulate a recommendation. *Id.* She stated that "…since we couldn't come to a number, we thought it was just wiser to remove [the deferred COVID costs] altogether than to put a range for which that we didn't fully have support for." *Id.*

Witnesses Abernathy and Speros addressed the "savings" issue directly. Witness Speros noted that while costs can be (and were) directly tracked, the negative is not true – "savings" are not directly trackable; rather, they must be discerned through data analysis, namely by comparing actual expenditures with budgeted expenditures to get a sense of what DEP did not spend versus what it thought it would spend. Tr. vol. 21, 1345. He stated that at that point, the analyst can make a judgment based upon the type of expense and whether it is COVID-related. *Id.* Witness Abernathy confirmed that is precisely what DEP did to determine that the employee expense and printing/postage reductions discussed in her testimony, in fact, directly related to the pandemic. *Id.* at 1346. The witnesses maintained there is no reason that the Public Staff could not go through the same exercise, had it chosen to do so. They noted that the Public Staff had the data including "[a]nalysis of comprehensive actuals vs. budget information by O&M for function for 2020 (PS DR 138)" and that data was even supplemented outside of the formal discovery process. DEP Redirect COVID Panel Rebuttal Ex. 1, Tr. Ex. vol. 21. When

asked by Chair Mitchell if the Public Staff used any of this data provided by DEP to estimate COVID savings, witness Abernathy responded, "[n]o, they have not." *Id.* at 1350.

Concerning DEP's request to continue the COVID deferral for bad debt expenses, witness Abernathy testified (and her testimony is uncontradicted) that were the Commission to side with the Public Staff and refuse cost recovery and continued deferral, test year bad debt expense in this case would increase by approximately $42 million, increasing the revenue requirement in this case by that amount, an amount which no party to this proceeding has challenged. *Id.* at 1354-55; Tr. vol. 22, 13. Witness Abernathy testified that the revenue requirement associated with recovery of the deferred costs in this case is $41 million. Tr. vol. 21, 1307. She maintained that, not only is DEP's proposed approach the most reasonable and equitable, it is also the approach that results in the lower revenue requirement in this proceeding.

Further, as it relates to DEP's request for continuation of the COVID deferral, witness Quick explained that part of this request results from the payment plans that DEP offered at the expiration of the disconnection moratorium and the expansion of the Winter Moratorium. Tr. vol. 21, 1328-29. Witness Quick testified that this provided customers with flexibility and support to make disconnection a last resort. *Id.* at 1330. Witness Abernathy explained that this process has resulted in higher arrearages and testifies that DEP accordingly has not seen the completion or lack of completion of all the authorized payment plans, and therefore is unable to calculate an appropriate level of bad debt expense. *Id.*

Discussion and Conclusions

In the Deferral Order, the Commission expressly granted DEP's request that "estimated incremental costs of utility service that are proximately caused by the pandemic may be deferred pending a final determination on cost recovery in a future rate case," and also held that its decision was "without prejudice to the right of any party to take issue with the amount, if any, of the deferred costs to be allowed for ratemaking purposes, if such costs are included in future rate filings." Deferral Order at 13. Typically, the Commission's customary two-prong deferral test is applied in the context of a deferral request such that the nature of the costs and magnitude thereof need not be litigated in the subsequent cost recovery docket. The COVID deferral request was unique in the sense that the costs were unusually speculative, the length of time totally unknown, and the magnitude indefinite, leaving the Commission unable to evaluate the second prong in a meaningful manner in the COVID Deferral Docket. In its discretion, the Commission may in this proceeding undertake an analysis of the magnitude of the deferred COVID expenses that are now known and measurable, if the Commission determines such analysis is necessary in reaching its conclusion regarding cost recovery of COVID-related costs. The three main factors that the Commission generally finds relevant in its analysis of the second prong are: (1) the amount of the deferred costs; (2) DEP's earnings during the analogous timeframe; and (3) fairness and equity.

In prior deferral orders, the Commission has noted that it does not apply the two-prong test in a vacuum. Rather, the Commission considers all of the pertinent factors involved on a case-by-case basis and weighs the equities to arrive at a decision that is fair to the utility and its ratepayers, and that serves the public interest. The Commission may analyze the merits of deferral using not only the well-established two-prong test but also considering the totality of the underlying facts, circumstances, and equities of this case. In the case of the incremental COVID-related costs, the Commission determines that the two-prong test was met in that these costs are extraordinary in nature and, absent deferral, would have a material impact on the utility's financial condition. The Commission gives significant weight to DEP's calculation in this proceeding that the $105.0 million in deferred costs amount as of DEP's second supplemental filing would have a 124 basis point impact on earnings, excluding any impacts on lost revenues.

In this proceeding, the Public Staff noted that DEP has consistently achieved earnings in excess of its authorized ROE since before the COVID pandemic and maintained that DEP's earnings are a relevant factor for consideration in the Commission's decision concerning cost recovery. The Commission acknowledges that historically in assessing the appropriateness of cost-deferral requests, the Commission has based its decision, in large measure, on the impact that the costs would have on the level of earnings currently being achieved by DEP. The impact on earnings, typically, has been measured and assessed in terms of ROE, considered in conjunction with: 1) the ROEs realized and reported to the Commission in DEP's recent quarterly ES-1 reports, particularly the ROE reflected in DEP's most recent report; and 2) DEP's currently authorized ROE. In this proceeding, the Commission finds that the COVID pandemic was an unprecedented event – truly exceptional – much more so than unusually severe weather and other events for which costs have been allowed to be deferred in the past. In determining fairness and equity between customers and shareholders in this circumstance, the Commission must evaluate the totality of the situation.

The Commission recalls that during the state of emergency government officials were taking all necessary steps to slow the spread of the coronavirus by requiring people to social distance and stay at home to the greatest extent possible. The health and safety of North Carolina communities were affected by the efforts of all residents to stay home and socially distance to slow the spread of the coronavirus. Governmental actions were also implemented to help prevent hospitals from being overwhelmed with patients and to preserve human life. The seriousness of the circumstance was unprecedented. The Commission recognizes that it was crucial for DEP, as a provider of an essential service, to fulfill its obligation to its customers to continue operations 24 hours a day, seven days a week despite the pandemic. This vital requirement for DEP to continue to provide its customers essential electric utility service during this unprecedented event cannot be overemphasized. The Commission recognizes that DEP met its obligation to the Commission and the citizens of North Carolina. The Commission recognizes that for DEP to provide electric utility service to the citizens of North Carolina during the pandemic necessitated certain DEP employees to perform their job duties in the same manner as prior to the declaration of the state of emergency. As a result, many of DEP's employees

were not allowed the option to work from home to protect the health and safety of themselves and their families.

Government officials, including this Commission, sought to aid North Carolina citizens amidst a turbulent and challenging economic environment by issuing a state of emergency and various mandates and moratoriums. During the height of the turmoil caused by the pandemic, customers benefitted from the governmental mandates to waive customer fees and discontinue disconnections for non-payment. The pandemic lasted much longer than anyone anticipated. Businesses, families, and individuals benefitted from these mandates, particularly households that were struggling with financial issues resulting from the pandemic. Further, DEP, at this Commission's direction, provided customers with new, more favorable payment options and worked to connect eligible customers with available financial assistance from new and existing federal and state programs.

In reaching its decision concerning cost recovery of the incremental COVID-related expenses, the Commission sought to balance fairness and equity between customers and shareholders when: 1) determining the appropriate size or amount of the deferral for cost recovery in this proceeding; 2) applying the COVID-related savings; 3) determining whether a return should be allowed on the deferred costs during the deferral period and on the unamortized balance during the amortization period; 4) selecting the amortization period for cost recovery; and 5) deciding the timing of when amortization should begin.

In its examination of the deferred COVID-related costs for which to allow cost recovery, the Commission gives significant weight to the fact that the Public Staff, which extensively audited the deferred costs, did not find any of the costs to be unreasonable in amount and did not find that any of the costs were unrelated to the COVID-19 pandemic. As it did in the Deferral Docket, the Public Staff argues that COVID costs should be offset with COVID savings, and that, in its view, DEP has not adequately accounted for savings.

After careful consideration, the Commission concludes based upon the evidence presented that recovery in rates of DEP's deferred COVID-related costs pertaining to customer fees waived, bad debt expense, and employee safety related costs, are just and reasonable and should be approved. The Commission determines that it is appropriate to reduce these allowed costs by certain COVID-related expense savings for employee travel expenses, printing and postage costs, DEP's filed ERCs, and the carrying cost benefit of the delayed payment of the employer portion of social security tax. The Commission concludes that it is not appropriate to recover the carrying costs accrued during the deferral period or a return on the unamortized balance during the amortization period. Further, the Commission determines a six-year amortization beginning when rates become effective for this proceeding is appropriate. The Commission sets forth its reasons for these conclusions below.

Regarding the amount of costs deferred, DEP witness Abernathy testified that as of the filing of the Third Supplemental Testimony filed on April 18, 2023, the projected balance of deferred incremental COVID-19 costs as of the date rates would go in effect increased to

approximately $107 million, mainly because of an increase in the amount of bad debt expense that occurred in connection with the expiration in March 2023 of 12-month repayment plans DEP automatically enrolled customers into as of the time (March 2022) when the extended winter moratorium on disconnection finally ended. The Commission acknowledges that no party has challenged the expenses for which DEP now seeks recovery pursuant to the Deferral Order were COVID-related expenses. Instead, the fundamental disagreements between DEP and the Public Staff are: (1) whether certain deferred COVID expenses are appropriate for recovery from ratepayers; (2) whether the deferred COVID expenses should be offset by certain savings, benefits, credits, and overearnings; and (3) whether a return on the deferred costs during the deferral period and on the unamortized balance during the amortization period should be allowed.

The Commission notes that as indicated in the chart above provided by witness Abernathy, over 90% of the deferred costs were incurred from waived customer fees and bad debt expense. The Commission concludes that these two costs resulted directly from governmental action, including mandates from the Commission, and are appropriate for recovery from customers. Specifically, at the onset of the COVID-19 pandemic the Governor issued a proclamation of a state of emergency (Executive Order No. 116), and subsequent orders of the Governor and of the Commission imposed a moratorium upon DEP's ability to disconnect customers for nonpayment and required waiver of customer fees ordinarily imposed in connection with nonpayment, such as late fees, reconnection fees, and return check charges. As a consequence of these governmental actions, DEP was unable to use its customary tools to timely collect payments from customers. DEP's ability to charge certain customer fees such as late fees, reconnection fees, and returned check charges encourage customers to pay their monthly bills. Disconnection of electric service is a strong incentive for the customers to pay their bills timely. The DEP COVID Panel testified that the moratorium on disconnections and the suspension of late fees had an adverse impact on the level of bad debt expense in that DEP realized an increase in the number of past due accounts that ultimately caused a significant increase in bad debt expense.

In this proceeding DEP seeks to recover only the difference between the level of bad debt expense currently in rates and the amount of bad debt expense above that level resulting from actions taken during the pandemic. The Commission acknowledges that denial of the recovery of deferred waived customer fees and bad debt expense would deny DEP recovery of costs incurred for complying with Executive and Commission Orders. DEP was expected to continue to provide normal, uninterrupted electric service 24 hours per day, seven days a week, to all customers during this unprecedented event. Moreover, DEP was expected to continue to provide service to its customers who were not paying for such service for an extended period of time. The Commission concludes that these costs are reasonable for recovery from customers.

With respect to employee safety related costs, the Commission acknowledges that DEP incurred costs to provide its employees with the appropriate personal protective equipment to facilitate the continuation of work for customers in a safe manner. Additionally, DEP incurred incremental costs associated with cleaning supplies, health

care, as well as testing and temperature checks. As previously noted, to provide essential electric service, many of DEP's employees were not allowed the option to work from home. DEP witnesses testified that more than 40% of DEP's workforce had to show up, in person, at work, at power plants and other facilities, or to repair damage following storms. The Commission concludes that those employees had to be furnished with protective gear, cleaning/sanitizing supplies, and COVID testing services and nursing case management. Thus, the Commission concludes that these costs are reasonable and prudent costs to recover from customers.

Regarding the costs of remote work, in order to facilitate employees working remotely to protect their health and safety during the pandemic, DEP incurred incremental costs associated with expanded conference line capacity, increased network bandwidth, other required information technology improvements, expanded video conferencing licenses, and increased company cellular telephone and data usage. The Commission recognizes that many other businesses and state agencies in North Carolina were able to shift to fully or nearly full remote work to respond to the Governor's state of emergency and also incurred similar incremental costs to accommodate employees working remotely. The Commission notes that in the post-state of emergency work environment, remote work offerings continue either fully or on a hybrid basis for many businesses, state agencies, and utilities, including DEP. The Commission determines that although the pandemic may have initiated this category of costs, these costs are now largely ongoing in nature and not specific to the pandemic. Moreover, DEP has not offset the deferred costs of remote work with the associated decreases in office expenses such as utilities, office supplies, and other miscellaneous expenses related to employees working from the office. Thus, the Commission concludes that it would not be appropriate to recover the deferred costs of remote work from customers.

DEP provided certain eligible employees a one-time cash payment of $1,500 to help with unplanned expenses associated with COVID-19. DEP testified that the stipends were appropriate to support employees in providing service to customers and to avoid turnover and should be allowed as reasonable and prudent costs. The COVID Panel contended that DEP did not require expense verification associated with the employee stipends to avoid the extra administrative cost of reviewing receipts and validating usage by the employees that received the stipend. The Commission concludes that the one-time $1,500 stipends provided voluntarily by DEP to certain hourly employees should be considered voluntary goodwill and should not be recovered from customers. Usage of the stipends was not verified by DEP and that employees were free to spend the funds as they pleased, without oversight, and thus the Commission determines they should be excluded from cost recovery of deferred COVID expenses.

DEP witness Jiggetts testified that the other category of deferred costs includes overtime to implement COVID-19 guidelines to ensure employee safety and increased costs due to expected increased call volume at call centers when normal billing practices resume. Public Staff witnesses Boswell and Zhang contended that expenses associated with call center overtime should not be included in the ongoing COVID deferral given that the amount sought by DEP for call center overtime was not above the amounts already

included in DEP's cost of service. The Commission is persuaded that, because the amount sought by DEP for call center overtime was not above the amount already included in DEP's cost of service, these costs should not be recovered from customers.

Regarding COVID-related cost savings, the COVID Panel contends that the Deferral Order required only that DEP track the costs being deferred, but that nonetheless DEP was required to track and report COVID savings (specifically, reduced employee expenses such as reductions or elimination of travel and expenses associated with normal operations while employees were required to work remotely and adhere to travel restrictions, and reduced printing and postage costs) and NLRs on a South Carolina retail basis for 2020 and therefore did, and provided to the Public Staff, the incremental COVID savings and NLRs at a system level to which it applied allocation factors to derive the South Carolina retail amounts. According to the COVID Panel, DEP's COVID savings were largely realized in 2020 in the amount of approximately $4.5 million on a North Carolina retail basis, while DEP estimated the NLRs related to reduced load and demand in 2020 to have been approximately $28 million on a North Carolina retail basis, thereby more than offsetting the savings reductions that the Public Staff suggests.

Although not presented in filed testimony, in its proposed order the Public Staff maintained that a portion of the O&M savings DEP experienced in 2020 and 2021 – which includes any savings experienced by DEP related to remote work, and reduced expenses in employee travel, printing, and postage – should offset the deferred COVID costs DEP is now seeking to recover. The Public Staff contended that, with few exceptions, DEP stated it did not track how the O&M savings were derived, thus, there is no amount that the Public Staff could definitively identify as strictly COVID-related savings. In light of this, the Public Staff recommended that 50% of DEP's total non-fuel O&M savings in 2020 and 2021 should be offset against the deferred COVID costs sought for recovery. The Commission notes that in its proposed order, the Public Staff also recommended disallowance of the employee stipends and the increased call center costs but did not specifically object to cost recovery of any other category of DEP's deferred COVID-related costs.

The Commission acknowledges that DEP is not requesting rate recovery of the NLRs related to the COVID pandemic. Witness Bateman testified that DEP made a conscious decision not to request deferral of NLRs in the COVID Docket. Witness Bateman further testified that DEP did what it always does when faced with the prospect of lower than budget revenues, DEP absorbs revenue impacts through O&M savings. Witness Bowman explained that when faced with the prospect of revenue loss, DEP as a routine part of its business and in keeping with its focus on managing O&M cost for the benefit of customers, identifies and implements a suite of cost mitigation measures. Witness Abernathy testified that further complicating the picture in 2020, the prospect of revenue loss arose not only from the pandemic but also from mild weather. She noted that DEP responded to twin threats to its revenue stream, both the pandemic and mild weather, by instituting cost efficiency measures, which she described in detail. She testified that none of these "belt tightening measures" were included in the deferred costs. Witness Abernathy maintained that DEP did everything that it could to reduce costs and,

as a result, avoided the need to request a deferral of the NLRs. However, DEP was not able to offset both the incremental costs due to COVID-19, and the other unfavorable impacts in 2020, including the NLRs due to COVID. The end result is that deferral of incremental COVID-19 costs was required and requested, and the Commission gave its approval to that deferral. Witness Abernathy contends that none of the cost savings measures discussed above have been – or should be – used to offset the COVID-19 related incremental costs.

When asked by the Public Staff to identify the COVID-related savings, witness Abernathy testified that two categories of savings were identified: 1) reduced employee expense related to reduction in or elimination of travel, and 2) reduced printing and postage costs as a result of the disconnect moratoriums ordered by the Commission. The Commission concludes that these cost savings identified by DEP which were directly attributable to the pandemic should offset the amount of deferred COVID-related expenses. DEP witness Speros noted that while COVID-related costs can be and were directly tracked, the negative is not true – "savings" are not directly trackable; rather, they must be discerned through data analysis, namely by comparing actual expenditures with budgeted expenditures to get a sense of what DEP did not spend versus what it thought it would spend. He stated that the analyst can make a judgment based upon the type of expense as whether it COVID-related. Witness Abernathy confirmed that is precisely what DEP did to determine that the employee expense and printing/postage reductions were, in fact, directly related to the pandemic.

The Commission determines that the issue of COVID-related cost savings is intertwined with the issue cost savings resulting from the mitigation measures taken by DEP to address NLR. Furthermore, various events occurring in 2020 are entwined in the analysis - COVID, mild weather, and storm restoration costs. On the one hand, in its proposed order the Public Staff indicated there was no amount that the Public Staff could definitively identify as strictly COVID-related savings; thus, the Public Staff recommended that 50% of DEP's total non-fuel O&M savings in 2020 and 2021 should be offset against the deferred COVID costs sought for recovery. On the other hand, DEP, through witness Abernathy's testimony, maintained that none of DEP's cost saving measures to mitigate NLRs should be used to offset the incremental COVID-related costs. Witness Abernathy also maintained that savings related to the federal government assistance for which DEP filed ERCs and was granted a carrying cost benefit related to the delayed payment of the employer portion of social security tax. The Commission concludes that these measures taken by the federal government to assist companies and employers in weathering the impacts of the pandemic should inure to the benefit of customers. To balance the fairness and equity between customers and shareholders related to the COVID-19 pandemic and, in part, because the amount of COVID-related savings cannot be definitively identified, the Commission did not approve all deferred COVID-related expenses for cost recovery from customers. The Commission notes DEP's position on savings and the difficulties associated with calculating savings that are directly attributable to the pandemic. However, the Commission determines that the two types of savings identified by witness Abernathy are directly related to the pandemic and that the measures taken by the federal government to assist companies and employers during the pandemic which provided

benefits to DEP, directly relate to the pandemic. For these reasons, the Commission concludes that these costs should be netted against deferred COVID-related costs. In reaching this conclusion, the Commission gives weight to the testimony of witness Abernathy that expense savings resulting from DEP's normal cost mitigation measures to offset revenue shortfalls related to mild weather and in this case, the pandemic, should not be used to offset COVID-related expenses.

The Commission declines to approve DEP's request to recover approximately $12 million in accrued carrying costs on the deferred costs or to authorize a return on the unamortized balance of the COVID costs during the amortization period. In reaching this decision, the Commission is conscious of the fairness and equity factors inherently at play in considering how to appropriately balance the difficulties experienced by both the utility and ratepayers throughout the pandemic. DEP contends that inasmuch as the deferred costs are by definition not already in rates and were fronted by DEP's investors, the costs properly bear a return at DEP's weighted average cost of capital so as to ensure that DEP and its investors are made whole. The Public Staff recommends denial of any return on the allowed deferred expenses stating that interest has already been accounted for in the $27 million late payment fees of the deferred expenses at issue in this proceeding, and to allow an additional return would unfairly allow DEP to collect interest upon interest.

Taking into consideration the hardships caused by the pandemic on the residents and businesses in North Carolina, DEP's earnings reported in its E.S.-1 Report during the deferral period which were at or above the utility's authorized rate of return, and the totality of the hardships suffered by customers during the pandemic, the Commission concludes that the approximately $12 million included in DEP's request related to accrued carrying costs on the deferred costs or a return on the unamortized balance during the amortization period should not be recovered from customers through rates.

The Commission concludes that it is appropriate that cost recovery for the approved deferred COVID-related costs occur over a six-year amortization period. Due to the material amount of COVID-related costs approved for recovery, the Commission finds that the three-year amortization period requested by DEP would be burdensome for customers. The 12-year amortization period advocated by the Public Staff in its proposed order is unreasonably long in light of the Commission's decision herein to not allow carrying charges on the deferred costs. The Commission has customarily used a five-year amortization period for recovery of costs from customers for extraordinary events like storms. However, at the expert witness hearing, the COVID Panel stated DEP's preference that the amortization period be in a three-year increment, such as six years, to keep in sync with the MYRP. Thus, the Commission determines that a six-year amortization period reasonably balances the impacts to both DEP's customers and its shareholders.

The Commission determines that amortization of the deferred COVID-related costs should begin upon the effective date of new rates in this proceeding.

Regarding DEP's request to continue its deferral for incremental bad debt expense, the Commission determines that since DEP is still incurring incremental bad debt expense, it is appropriate for DEP to continue to defer those costs incurred after March 31, 2023. The Commission concludes that DEP's request to continue the deferral of the incremental bad debt, for future recovery, is just and reasonable, and should be approved. The Commission acknowledges the positions taken by the Public Staff in its proposed order related to this issue and agrees with the Public Staff's recommendation that any payments associated with the deferred bad debts should be credited on a monthly basis through the next general rate case but declines to accept the Public Staff's other recommendations related to call center overtime costs or an ongoing overearnings analysis during the deferral period. Thus, the Commission concludes that DEP should credit on a monthly basis through the next general rate case any payments associated with the deferred bad debts.

Finally, the Commission notes that its decision on deferral of the COVID-related costs is based on the particular facts of this case, and in particular, the unprecedented circumstances related to the pandemic, and should not be cited or relied on as precedent for future cost deferral decisions. The Commission evaluated the totality of the pandemic, taking into consideration the governmental mandates which removed DEP's tools to control bad debt expense, the necessity for DEP to provide uninterrupted electric service during the duration of the pandemic – even when many customers were not paying their bills, the benefit to customers and North Carolina as a whole of the governmental mandates, and DEP's financial standing as reported in its quarterly E.S.-1 Reports to the Commission for the duration of the deferral period. Considering all these factors and the entire evidence of record, the Commission concludes that its decision set forth herein is the most reasonable, fair, and equitable outcome for both customers and shareholders with respect to the COVID-19 pandemic.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 57

Inflation Adjustment

The evidence supporting this finding of fact is found in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witness Jiggetts and Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

Summary of Evidence

DEP Direct and Supplemental Testimony

DEP, through witness Jiggetts' direct testimony and exhibits, adjusted its annual non-labor and non-fuel O&M costs to reflect the increase in costs during the test period that occurred due to inflation. *See* Tr. vol. 13, 185. In supplemental direct testimony, witness Jiggetts testified that this inflation adjustment was updated to reflect inflation factors through December 31, 2022, and to remove the impact of the gains/losses on the sale of by-products. *Id.* at 222-23. This inflation adjustment factor was subsequently

updated in Jiggetts' second and third supplemental direct testimony, *Id.* at 232, 243, and finally in Settlement Testimony to arrive at a rate of 12.13%. Jiggetts Partial Settlement Ex. 4 at 109, Tr. Ex. vol. 14.

The Public Staff Testimony

Public Staff witnesses Zhang and Boswell recommend that the Commission adjust DEP's inflation factor to reflect a five-year average inflation rate through December 31, 2022. Tr. vol. 19, 44. Witnesses Zhang and Boswell further recommend that the inflation adjustment be modified to reflect the Public Staff's recommended adjustments removing aviation expenses, Board of Directors expenses, uncollectibles, and sponsorships and donations. *Id*. In supplemental testimony, witnesses Zhang and Boswell applied their recommended inflation adjustment to actuals through February 2023 to reflect the 61-month average recommended by the Public Staff. *Id.* at 90. Witnesses Zhang and Boswell testified that the increasing inflation rates seen in 2021 and early 2022 have already begun to decrease and that DEP's 2021 expenses already reflect some portions of the increase in costs due to inflation. *Id.* at 44-45. They further testified that the Public Staff does not find it appropriate to calculate ongoing rates for a minimum of the next three years based on years in which inflation was abnormally high. *Id.* at 45.

DEP Rebuttal Testimony

In rebuttal, DEP witness Jiggetts opposed the Public Staff's recommended adjustment. Tr. vol. 23, 93-97. Jiggetts testified that DEP's proposal does not project inflation of O&M expenses, but instead accounts for the impacts of inflation that have already been incurred from the test period to the end of the update period. *Id.* at 94. Witness Jiggetts further testified to DEP's methodology for calculating an inflation factor, stating that it has not changed from previous rate cases. *Id.* Witness Jiggetts testified that the Public Staff's assertion that any non-payroll O&M expenses updated beyond December 2021 would include impacts related to inflation is incorrect, and she explained that any O&M expenses that are updated through pro forma adjustments are excluded from the inflation adjustment. *Id.* at 94-95. Witness Jiggetts cited data from the U.S. Bureau of Labor Statistics that shows a continual upward trend for all inflation metrics. *Id.* at 96. Further, witness Jiggetts testified that while DEP disagrees with the Public Staff's adjustments removing certain expenses related to aviation, sponsorships, donations, lobbying, and Board of Directors expenses, DEP agrees that it would be appropriate to adjust the total O&M subject to inflation for that amount, to the extent that there are adjustments made to those expenses. *Id.* at 97.

Testimony Presented at the Expert Witness Hearing

At the hearing, witness Jiggetts testified to DEP's recommended inflation rate factor of 12.13%. Tr. vol. 13, 302. Witness Jiggetts explained that DEP uses a 13-month average to calculate its inflation factor, consistent with its methodology in the previous rate case. *Id.* at 302-03. She further explained that, in calculating the inflation factor, DEP is looking at the actual level of inflation, as reported by the U.S. Bureau of Labor Statistics,

through the March 31, 2023 cutoff date. *Id.* at 302. She testified that DEP compares that level of inflation to the costs actually incurred during the test year by looking at the 13-month average of the Bureau of Labor Statistics' data. *Id.* at 302-03. Using this approach, witness Jiggetts explained that inflation has increased to 12.13% through the March 31, 2023, cutoff period. *Id.*

Witness Jiggetts clarified that the test year used in the adjustment is historical, rather than prospective, and that the purpose of the adjustment is to adjust test year expenses to account for inflation as of the March 31 cutoff period. *Id.* at 304. Witness Jiggetts explained that DEP does not project inflation rates or factors. *Id.* at 304. Instead, the test year expenses are adjusted for known and measurable changes through the March 31 cutoff period. *Id.* at 303.

Public Staff witness Zhang testified that the Public Staff calculated its recommended inflation adjustment by averaging the inflation rate over the 61-month period from January 2018 through January 2023. Tr. vol. 19, 116-17. Witness Zhang further testified that averaging the inflation rate over that 61-month period with the average inflation of the consumer producer price index's published inflation resulted in a 61-month average inflation factor of 4.31%. *Id.* at 117. In response to cross examination by DEP, witness Boswell testified that she could not state for certain if the Public Staff's methodology had previously been used in any electric utility rate case. *Id.* at 128.

Discussion and Conclusions

The Commission concludes, based upon the evidence presented, that the rate factor adjustment proposed by DEP is just and reasonable. The Commission declines to adopt the 61-month average method advocated by the Public Staff and notes that per DEP's Late-Filed Exhibit No. 13, the Public Staff has previously proposed the same method that DEP employed in this proceeding. The Commission determines that the adjustment proposed by DEP, at 12.13%, captures actual inflation during the test period updated through March 31, 2023, in substantially the same manner that DEP has historically employed.

Specifically, the inflation adjustment (Adjustment No. NC2110 in witness Jiggetts' schedules) annualizes test period O&M expenses, excluding fuel, purchased power, and labor and benefit costs to reflect the change in test period costs through the March 31, 2023 cutoff date by an actually-experienced inflation factor. The adjustment captures actual inflation during this period in the same manner used in at least DEP's last seven general rate cases. DEP Late-Filed Ex. No. 13. As witness Jiggetts testified, DEP has proposed and the Commission has approved rates that were calculated using the method of determining the inflation adjustment used by DEP in this proceeding for many years, in all kinds of inflationary environments. While the Commission recognizes that, as the Public Staff points out, the period of time during which the updated test year occurred was coincident with unprecedented times, including the pandemic, the Commission is concerned that a departure from historical practice on this issue is not warranted, as adjusting for "known and measurable changes" is consistent with N.C.G.S. § 62-133(c)

and produces the just and reasonable result of putting DEP in a position of recovering its costs, and is fair to DEP and to customers regardless of the inflationary environment.

Upon consideration of all the evidence in this proceeding, the Commission concludes that DEP's proposed inflation adjustment to test year non-fuel and non-labor O&M costs is consistent with past practice, consistent with statutory law, derived using a method that is fair to customers and to the utility regardless of the inflationary environment, and is approved.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 58-60

Rate Case Expense

The evidence supporting these findings of fact is found in the verified Application and Form E-1; the testimony and exhibits of DEP witnesses Jiggetts and Bateman; Public Staff witnesses Zhang and Boswell, and the Public Staff's cross exhibits of witness Jiggetts; and the entire record in this proceeding.

Witness Jiggetts testified that, in the current proceeding, DEP has included adjustment NC5020 related to rate case costs, amortizes over a three-year period the incremental rate case costs incurred and projected to be incurred for this docket, as well as costs incurred after the cut-off in the last rate case which have not yet been brought forth for recovery. Her testimony explained that over amortizations associated with rate case costs approved in Docket Nos. E-2, Subs 1023 and 1142 and severance costs approved in the 2019 Rate Case were used to offset the amount requested for recovery in this case. Tr. vol. 13, 176, 194.

With respect to costs associated with the 2019 Rate Case, witness Jiggetts explained that in the first partial settlement in the 2019 Rate Case (2019 First Partial Settlement), entered into by DEP and the Public Staff on June 20, 2020, DEP and the Public Staff settled on an agreed amount of rate case expense that would be recovered from customers. Tr. vol. 13, 332. She explained that the amount of rate case expense was estimated, at that time, to be $3.5 million, which represented the sum of actual expense incurred through February 2020 and estimated to be incurred through August 2020. Tr. vol. 13, 312. Witness Jiggetts testified that the projection of costs through August 2020 was based upon past, normal experience that DEP would have had with a rate case proceeding.

In response to a question from Commissioner Duffley, witness Jiggetts testified that DEP seeks to recover rate case costs in this case which exceed those agreed to in the 2019 First Partial Settlement with respect to rate case expense related to the instant proceeding, Witness Jiggetts updated adjustment NC5020 in her supplemental direct testimony and third supplemental direct testimony to reflect actual rate case expense amounts incurred by DEP. *Id.* at 224, 247.

Witness Jiggetts testified that over-amortizations associated with rate case expenses approved in Subs 1023 and 1142 and severance costs approved in the 2019 Rate Case were used to offset the amount requested for recovery in this case. Tr. vol. 13, 194. She testified that DEP requests that the remaining balance to be amortized over the three-year period. Tr. vol. 23, 78.

Public Staff witnesses Zhang and Boswell explained that they removed: 1) DEP's adjustment to include additional rate case expenses from the 2019 Rate Case that exceed the amount agreed to in the 2019 First Partial Settlement 2) the adjustment to include the unamortized portion of rate case expense in rate base; and 3) DEP's inclusion of over-amortized regulatory assets to offset rate case expense. Regarding the additional costs from the 2019 Rate Case, witnesses Zhang and Boswell testified that the 2019 First Partial Settlement reflected an agreed-upon amount for 2019 Rate Case expenses, and that this amount was ultimately incorporated into the revenue requirement approved by the 2019 Rate Case. As such, the Public Staff asserted that it is inappropriate to include 2019 Rate Case costs beyond those included in the Commission-approved revenue requirement from a general rate case that has been closed, and in which DEP did not request that additional costs be considered before the Commission issued its final order. Tr. vol. 19, 56-57.

Regarding DEP's adjustment to include the unamortized balance of rate case expense in rate base, witnesses Zhang and Boswell testified that the amortization of rate case expense should reflect a normalization of the costs associated with the filing of a rate case, based on an average of the number of years between rate case filings. In this case, witnesses Zhang and Boswell stated that rate case expense does not rise to the level of being extraordinary in nature and, as such, does not require rate base treatment. As with other over-amortizations in this proceeding, witnesses Zhang and Boswell asserted that the over-amortized amounts from the rate case expense and severance costs should be flowed back to ratepayers as a one-year rider and not used to offset other amounts. Tr. vol. 19, 57-58.

In her rebuttal testimony, witness Jiggetts asserted that DEP is not precluded from collecting additional amounts incurred from the 2019 Rate Case based on the 2019 First Partial Settlement. In her view, the 2019 First Partial Settlement does not contain any language capping rate case costs at a maximum amount or prohibiting DEP from asking for additional reasonably and prudently incurred actual expenses in a future rate case. While the amounts agreed to in the 2019 First Partial Settlement were based upon information available at the time the agreement was reached, witness Jiggetts stated that DEP's costs were ultimately higher as the proceedings for that case were delayed and extended, for reasons which could not have been foreseen, and that the Public Staff has made no assertion or forecasted any evidence showing that the additional 2019 Rate Case expenses were not reasonably and prudently incurred. Tr. vol. 23, 79-81.

Rejecting the Public Staff's recommendation that the unamortized rate case costs for this proceeding be removed from rate base, witness Jiggetts explained that DEP's investors have advanced the funds to cover these reasonably and prudently incurred

utility costs and, as such, DEP should be allowed to earn a return on this asset to reflect the earnings expected from its investors during the amortization period. Tr. vol. 23, 81-82.

At the expert witness hearing, witness Jiggetts testified that, to the best of her knowledge, DEP did not provide updates of its 2019 Rate Case expenses through May 2020 as the second settlement would have allowed, and that she was not aware of DEP's having requested to recover these amounts during the 2019 Rate Case expert witness hearing or at any point prior to the filing of this proceeding. Tr. vol. 13, 311-18.

Although not presented in prefiled testimony, in is proposed order, the Public Staff provided additional context concerning various events that occurred during the 2019 Rate Case related to the issue of rate case expense. On June 2, 2020, DEP and the Public Staff filed the First Settlement, in which DEP and the Public Staff agreed that certain rate case expenses as set forth in DEP's rebuttal testimony could be recovered (not in rate base) and that these expenses would be amortized over a five-year period. In DEP witness Kim Smith's testimony supporting the 2019 First Partial Settlement, she describes the settled issues (including rate case expense) as "resolve[d] . . . without the necessity of contentious litigation." 2019 Rate Case, Tr. vol. 14, 260. On July 31, 2020, DEP and the Public Staff filed the second partial settlement, in which the two parties agreed that DEP's updates covering expenses through May 31, 2020 (filed on July 2, 2020), could be included for recovery (pending and subject to the Public Staff's audit thereof), up to 75% of the difference (should the difference result in an increase in the revenue requirement) between DEP's February 2020 costs and May 2020 updates in recognition of the uncertainty regarding the effects of COVID. However, in its July 2, 2020 filing, which updated expenses through May 2020, DEP did not seek recovery of any additional rate case expenses. In addition, the Public Staff notes that the expert witness hearing for the 2019 Rate Case took place in August 2020, but the issue of recovery of 2019 Rate Case expense beyond that provided for in DEP's rebuttal testimony does not appear to have been raised to the Commission during the hearing, in DEP's proposed order, or in any other form during the pendency of the 2019 Rate Case.

According to the Public Staff, DEP had a reasonable opportunity in the 2019 Rate Case to come forth with additional rate case expenses, and it failed to do so. If DEP believed there were 2019 Rate Case expenses outside the confines of the 2019 Settlement Agreements, DEP should have raised this issue at the 2019 Rate Case expert witness hearing and sought the Commission's guidance on how to preserve the issue, but it failed to do so. The Public Staff asserts that just because DEP's 2019 Rate Case expenses were ultimately higher than expected due to COVID does not mean that the entire category of 2019 Rate Case expenses were not encompassed in the settlement agreements. Instead, this was an aspect of settlement that DEP did not foresee. However, the Public Staff asserts that the fact that DEP did not foresee the impact of its agreements is not justification to depart from the terms therein or deprive customers of the benefit of the Public Staff's bargain.

In their second supplemental testimony filed on June 27, 2023, Public Staff witnesses Zhang and Boswell updated rate case expenses to reflect the actual rate case expense incurred through March 31, 2023, as reflected in DEP's third supplemental filing.

Discussion and Conclusions

The Commission must decide on three issues relating to rate case expense: (1) recovery of rate case expense from DEP's 2019 Rate Case, as well as the recovery of rate case expense from the current proceeding; (2) whether rate case expense should be reflected in the rate base; and (3) the amortization period over which the expense should be recovered. As discussed below the Commission concludes that (1) DEP's request to recover costs incurred from the 2019 Rate Case which are above and beyond those provided for in the 2019 Settlement Agreements is approved; (2) the unamortized balance of rate case expense should not be reflected in the rate base; and (3) the amortization period over which the rate case expense should be recovered is three years. The issue regarding whether over-amortizations associated with rate case costs approved in Sub 1023 and severance costs approved in the 2019 Rate Case should be used to offset the rate case expense in this proceeding is discussed in other portions of this Order.

The Commission notes that 2019 First Partial Settlement reflected a settlement on the sum of actual rate case expense incurred through February 2020 plus expenses estimated to be incurred through August 2020. The Commission also notes, as DEP witness Jiggetts testified, that DEP did not update its rate case expenses through May 2020, as the second partial settlement in the 2019 Rate Case allowed. However, the Commission also notes the unusual, perhaps unprecedented, trajectory of the 2019 Rate Case. Specifically, the first partial settlement was entered into on June 2, 2020, and the second settlement was entered into on July 31, 2020. The consolidated hearing for DEC and DEP was held in late August 2020. The separate hearing for DEP was held in late September to early October 2020. Between the consolidated hearing and the individual hearing, DEP worked to put interim rates into effect and notified customers of same. On December 11, 2020, the Supreme Court issued its order in *State ex rel. Utils. Comm'n v. Stein*, 375 N.C. 870, 851 S.E.2d 237 (Dec. 11, 2020), effectively remanding the issue of cost recovery for coal combustion residuals (CCRs) back to the Commission. Subsequent to issuance of that decision, DEP engaged in settlement discussions related to CCR cost recovery. On January 25, 2021, the Coal Combustion Residuals Settlement Agreement (CCR Agreement), to which DEP and the Public Staff were parties, was filed in the 2019 Rate Case docket. On February 12, 2021, the Commission issued an order in the 2019 Rate Case docket re-opening the record to accept into evidence supporting testimony filed by DEP and the Public Staff. On February 17, 2021, the Commission issued an order requiring DEP to respond to certain questions from the Commission regarding the CCR Agreement. The final order in the 2019 Rate Case was issued by the Commission on April 16, 2021. Subsequent to the issuance of the order, DEP worked to establish rates in compliance with the Commission's order, provide notice to its customers of new rates and put those rates into effect on June 1, 2021. The 2019 Rate Case, initiated by application

filed in August 2019 made by DEP, culminated with rates' taking effect on June 1, 2021. This timing was impacted by events outside of DEP's control, namely the pandemic and the issuance of the Stein order by the North Carolina Supreme Court. As summarized by DEP witness Jiggetts:

> The actual hearings, the consolidated hearings, I believe, happened at the end of August of 2020. We had interim rates that went into effect in September of 2020. The individual hearing for DEP happened, I believe, late September, early October of 2020. The CCR settlement was essentially reached in January of 2021. The Order in that case came out in April of 2021. And then new rates went into effect in June of 2021.
>
> During that time frame, obviously, we had additional discovery that required, you know, questions and responses. We had the prep and the times for the hearings. So all of that, kind of, bled into the costs being more than what we initially estimated at the time of settlement in June of 2020.

Tr. vol. 23, 118.

The Commission understands and respects the Public Staff's strongly held position that the settlement agreements entered into during the rate case should govern and that DEP should be held to the terms of these agreements in order for customers to receive the benefit of the Public Staff's bargain. In general, the Commission agrees with the Public Staff that parties must be held to their agreements made in settlement, particularly in the interest of encouraging future settlements. Nevertheless, the Commission concludes that it would be unreasonable to deny DEP recovery of expenses incurred in the context of the 2019 Rate Case that were not reflected in the 2019 First Partial Settlement The Public Staff asserts that DEP could have raised the issue rate case expense during the August 2020 expert witness hearing, but it is not clear to the Commission that DEP could have reasonably anticipated, at that time, the additional work that would be required in the 2019 Rate Case. Thus, DEP's request to recover costs incurred related to the 2019 Rate Case which are above and beyond those provided for in the 2019 First Partial Settlement is approved. Further, the Commission concludes that these additional rate case costs in the amount of $5.384 million as shown on Public Staff Accounting Second Supplemental Exhibit I, Schedule 3-1(t), Line 4, should be amortized over a three-year period.

Regarding rate case expense for this proceeding, the Commission concludes that it is reasonable and appropriate to allow DEP to recover total costs of $6.551 million as shown on Public Staff Accounting Second Supplemental Exhibit I, Schedule 3-1(t), Line 1. Tr. Ex. vol. 24. As previously stated, the issue regarding whether over-amortizations associated with rate case costs approved in Sub 1023 and severance costs approved in the 2019 Rate Case should be used to offset the rate case expense in this proceeding is discussed in other portions of this Order.

The Commission notes that DEP has projected additional rate case expense to be incurred through the date rates will be effective for this proceeding in the amount of $2.526

million as shown on Public Staff Accounting Second Supplemental Exhibit I, Schedule 3-1(t), Line 6, and has requested that the Commission allow DEP to track these costs for possible recovery in a future general rate case proceeding. Tr. Ex. vol. 24. The Commission determines that, in the ordinary course of ratemaking, the rate case expense amount to be recovered from customers should be established in the current general rate case proceeding and not re-evaluated in a future rate case for recovery from customers. Generally, it has been past practice for the Public Staff and the utility to work together to estimate an appropriate amount of rate case expense for approval by the Commission to reflect the activities occurring after the agreed-upon update cutoff date to the conclusion of the hearing or through the preparation of proposed orders. The Commission finds that this practice has been an efficient and reasonable process with respect to determining the appropriate amount of rate case expense to recover from customers. As previously discussed, the Commission's decision in this case to re-evaluate in this proceeding the 2019 Rate Case costs to be recovered in rates is an exception to the Commission's historic practice due to the unusual circumstances occurring during the 2019 Rate Case. Therefore, the Commission denies DEP's request to track and seek future recovery of rate case costs for the present proceeding above the amounts approved herein.

Concerning DEP's adjustment to include the unamortized portion of rate case expense in rate base, the Commission gives significant weight to the Public Staff's testimony stating that the amortization of rate case expense should reflect a normalization of the costs associated with the filing of a rate case, based on an average of the number of years between rate case filings. The Commission notes that the 2019 First Partial Settlement expressly provided that the unamortized balance of rate case expense would not be included in rate base. The Commission concludes that DEP's request to include the unamortized balance of rate case expense in rate base is denied.

Regarding the amortization period over which the current rate case expense of $6.551 million, as netted against a portion of the over-amortization of rate case expenses approved in Sub 1023, should be recovered, the Commission determines that the amortization period over which the rate case expense should be recovered is three years, as this aligns with the MYRP timeframe. Accordingly, the Commission finds and concludes that the three-year amortization period is just and reasonable and should be approved.

EVIDENCE AND CONCLUSIONS FOR FINDING OF FACT NO. 61

Over-Amortizations

The evidence supporting this finding of fact is contained in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witness Jiggetts, Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

Summary of Evidence

In its Application, DEP requested permission to apply expiring over-amortizations as an offset to the deferral balances of costs that DEP believed were similar in nature, but which may not yet have been approved by the Commission. The requested offsets include: (1) the

coal combustion residuals (CCR) asset retirement obligation; (2) rate case expenses; (3) application of the over-amortization of severance costs to rate case expenses; (4) application of the over-amortization of early retired coal plants to the Asheville early retired coal plant; (5) application of the over-amortization of Hurricane Matthew to the Winter Storm Izzy proposed deferral; and (6) regulatory fees. Tr. Ex. vol. 7.

DEP Direct Testimony

In direct testimony, DEP witness Jiggetts supported adjustment NC5010, which removes from Test Period costs the amortization of various regulatory assets or liabilities that have been approved by the Commission in previous general rate case proceedings. Tr. vol. 13, 194. Witness Jiggetts testified that the amortization period for the items removed will expire before proposed new rates are effective, and thus should not be included in Test Period expenses on which new rates are based. *Id.* Witness Jiggetts explained that over-amortizations of the regulatory assets and liabilities have been applied to like kind expense recovery in this case. *Id.* Witness Jiggetts testified that DEP intends to apply the over-amortization of the early retired plant regulatory assets against the Asheville Coal plant regulatory asset allowed in the 2019 Rate Case, as an example, and she also testified that over-amortization associated with rate case costs as approved in Docket Nos. E-2, Subs 1023 and 1142 and severance costs approved in the 2019 Rate Case were used to offset the amount requested for recovery in this case. *Id.*

The Public Staff Testimony

Public Staff witnesses Zhang and Boswell recommended that the Commission remove DEP's proposed over-amortization offsets and return the expiring amortizations to customers as single rider over a period of one year with interest. Tr. vol. 19, 73. Witnesses Zhang and Boswell stated that, due to the complexities involved with the associated adjustments, the Public Staff will work with DEP to verify appropriate accounting for the removal of the regulatory assets from the calculation of rate base and propose their inclusion in a rider in their supplemental filing. *Id.* Witnesses Zhang and Boswell explained that currently, regulatory assets are handled on a case-by-case basis, with the recovery period determined by the Commission based on the specifics of the item to be recovered. *Id.* They testified that by offsetting the expiring amortizations against continuing amortizations, DEP is overriding the Commission's approved terms for recovery of the individual regulatory assets. Thus, witnesses Zhang and Boswell testified that the Public Staff recommends returning the over-amortizations to ratepayers through a one-year rider with interest to allow for the refund to customers while maintaining the terms of the Commission's previous approvals of the remaining regulatory assets. *Id.*

DEP Rebuttal Testimony

In rebuttal, DEP witness Jiggetts described each of the expired amortizations that DEP is proposing to offset against like costs: (1) coal ash;[21] (2) rate case costs;

[21] The over-amortization of coal ash costs is separately addressed earlier in this Order.

(3) severance; (4) early retirement of coal plants; (5) Hurricane Matthew; and (6) regulatory fees. Tr. vol. 23, 101-04. Witness Jiggetts explained how DEP's proposed treatment of the expiring amortizations is consistent with the Commission's 2018 Order in the 2017 Rate Case. *Id.* at 100-01; Order Accepting Stipulation, Deciding Contested Issues and Granting Partial Rate Increase, Docket No. E-2, Sub 1142 (February 23, 2018) at 224. She stated that in that order the Commission previously addressed continuing amortizations of expired regulatory assets and liabilities in the context of coal ash costs. Tr. vol 23, 100. She further stated that in that order the Commission concluded:

> With regard to DEP's CCR costs from 2018 forward, DEP witness Bateman testified that DEP is requesting to establish a regulatory asset/liability account and defer to this account the portion in annual rates that is more than DEP's actual costs, or the amount in annual rates that is less than DEP's actual costs. In essence, the asset/liability account would be a tool used to true-up the difference in DEP's next general rate case. The Commission agrees with DEP's recommended approach, not only for CCR costs, but also for all cost deferral accounts…. [T]he Company should continue to record all amounts recovered as deferred costs in the specific regulatory asset account established for those deferred costs until the Company's next general rate case.

Id. at 100-101.

Witness Jiggetts also disagreed with the Public Staff's assertion that by offsetting the expiring amortizations against continuing amortizations, DEP is overriding the Commission's approved terms for recovery of the individual assets. *Id.* at 100. Witness Jiggetts maintained that DEP has complied with the 2018 DEP Order and has continued the amortization of the expired regulatory assets and liabilities and, in the context of this rate case, is applying those over-amortizations to the deferral balances of costs that are similar in nature, in compliance with the Commission's order. *Id.* at 101.

Witness Jiggetts' also explained the impact upon rates should the Commission adopt DEP's proposed treatment. *Id.* at 104. Witness Jiggetts testified that DEP's approach reduces deferred balances being addressed in the current case, and thereby reduces the base rate revenue requirement, all the while protecting the customers from the rate volatility created by a significant one-year rider. *Id.*

Testimony Presented at the Expert Witness Hearing

At the expert witness hearing, DEP witness Jiggetts answered questions from the Commission regarding the process by which DEP analyzed the rate impact of its proposed treatment of over-amortizations. Tr. vol. 14, 22. Witness Jiggetts walked through DEP's proposal with regard to both coal ash and Winter Storm Izzy. *Id.* at 22-23. Witness Jiggetts explained how applying DEP's proposed treatment to coal ash over-amortizations provides customers a benefit of approximately $3 million. *Id.* at 23. Witness

Jiggetts testified that for - Hurricane Matthew, the over-amortization completely covers what DEP is requesting to defer for Winter Storm Izzy, which means customers would never have to pay for that balance. *Id.* at 23-24.

Discussion and Conclusions

Over-amortization occurs when amortization expense collected in rates (as established in a prior rate case) exceeds the associated regulatory asset or liability. DEP defers such over-amortizations, and the issue in this proceeding is how to utilize such over-amortizations to benefit customers. DEP proposes to apply the over-amortizations to recovery of like kind expenses. The Public Staff proposes to flow the over-amortizations back to customers through a one-year Regulatory Asset/Liability Rider (Rider RAL). The Commission has reviewed the evidence and considered the testimony of the witnesses and determines that, for purposes of this proceeding, it is reasonable and appropriate to offset some, but not all, of DEP's previously approved regulatory assets that have been over-amortized against other regulatory assets.

DEP witness Jiggetts testified that the Commission previously addressed continuing amortizations of expired regulatory assets and liabilities in the context of coal ash costs in the 2018 DEP Order and that DEP's proposal in this proceeding to apply over-amortizations to like kind expenses is consistent with that order. DEP contends that the Commission's conclusion in the 2018 DEP Order that the asset/liability account would be a tool used to account for and subsequently true-up in the next general rate case the difference between the actual amount in annual rates for regulatory assets/liabilities and DEP's actual costs is consistent with its proposal that over-amortizations should be used as a true-up tool with respect to like costs, to be ruled on by the Commission in DEP's next rate case. The Commission disagrees with DEP's interpretation that the 2018 DEP Order approved any sort of offsetting of amortizations between one set of costs that had been approved by the Commission and another set of costs which had not been approved by the Commission for deferral.

The Commission notes that in the 2018 DEP Order cited to by DEP, the Commission allowed DEP to record a specific amount of revenue for its CCR costs as of September 1, 2017, and onward in a deferral account until its next general rate case, with a five-year amortization period. The Commission also stated in the 2018 DEP Order that, if DEP receives revenue for any deferred cost authorized in the 2017 Rate Case proceeding for a longer period of time than the amortization period approved by the Commission for that deferred cost, DEP should continue to record all revenue received for that deferred cost in the specific regulatory asset account established for that deferred cost until DEP's next general rate case. In other words, the Commission directed in its 2018 DEP Order that the asset/liability account utilized for CCR costs be used as a tool to true-up the difference between the portion in annual rates that is more than DEP's actual costs, or the amount in annual rates that is less than DEP's actual costs, in DEP's next general rate case.

The Commission has addressed over-amortizations directly in another docket. In its February 21, 2019 Order Approving Joint Partial Settlement Agreement and Stipulation, Granting Partial Rate Increase, and Requiring Customer Notice, *Application by Carolina Water Service, Inc., of North Carolina for Authority to Adjust and Increase Rates for Water and Sewer Utility Service in All of its Service Areas in North Carolina, Except Corolla Light and Monteray Shores Service Area*, No. W-354, Sub 360 (2019 CWSNC Order), the Commission ordered that federal unprotected EDIT funds (a regulatory liability) should be returned to ratepayers through a levelized rider and not be offset through the remaining unamortized portion of a regulatory asset (in this instance, the overcollection in rates of federal income taxes related to the decrease in the federal corporate income tax rate), as the utility suggested. In ordering as such, the Commission explained that:

> [O]ffsetting [a] known and measurable [liability] against either unknown future regulatory assets, or regulatory assets previously approved by the Commission for recovery over a specified period, presents significant intergenerational issues and constitutes inappropriate ratemaking. . . . [T]he amortization period for each regulatory asset is approved by the Commission based upon its determination of what is fair and reasonable for the ratepayers with regard to the costs associated with that specific regulatory asset, or other specific factors taken into consideration by the Commission at the time of that approval. The Commission finds that choosing to simply offset the new . . . liability with the remaining unamortized portion of any regulatory asset would effectively override the Commission's prior decision as to the appropriate amortization period for the regulatory asset, by equalizing the remaining amortization period and the amortization period for the new . . . regulatory liability. And as CWSNC witness DeStefano testified, he is not aware of a situation wherein the Commission has approved such offsetting treatment. . . .
>
> [D]eparting from this transparent process in the course of a general rate case simply to offset flowing through the benefit of reductions in an entirely separate category of costs (income taxes) is neither fair nor reasonable. Further, the Commission notes that for customers, a rider will be separately identified on their bills so they can see in dollars and cents the impact of the federal unprotected EDIT flow through. This transparency would not occur with the offsetting proposed by DEP.

2019 CWSNC Order at 55-56. The Commission considered the two costs to be in "entirely separate categor[ies] of costs" such that offsetting one with the other was not justified.

In the proceeding now before us, the Commission examines whether offsetting expiring over-amortizations with new or existing regulatory assets or expenses is justified or in the best interests of ratepayers, when the nature of the two events is similar or the same. The Commission notes that the Public Staff did not present any Commission

precedent, statutory, or rule that over-amortizations must be flowed back to customers via a one-year rider. DEP argues that its proposed approach reduces deferred balances and thereby reduces the base rate revenue requirement which provides a longer-term benefit to customers than the Public Staff's proposed one-year rider. Further, the Commission gives significant weight to the potential implications of the Public Staff's one-year rider proposal upon DEP's credit metrics. As indicated in DEP LFE No. 10, "[g]iven the magnitude of the reduction in cash flow resulting from the Public Staff's proposed $37 million one-year rider, the accelerated flowback puts additional downward pressure upon DEP's already-stressed credit metrics – specifically, the ratio of Funds from Operations (which is essentially a measure of cash flow) to Debt (FFO/Debt). The downward pressure is all the more acute in light of Moody's very recent decision to increase the FFO/Debt downgrade threshold to 21% (up from 20%)."

The Commission finds that DEP's proposal makes intuitive sense in some specific instances because it applies the over-amortization to an actual, Commission-approved cost of the same nature as identified in the course of a general rate case rather than "returning" the over-amortization only to turn around and collect revenue from customers for costs of the same type. However, the Commission determines that similar to the approval of deferral requests, the manner in which to address the true-ups related to over-amortizations in the utility's next general rate case should be determined on a case-by-case basis based on the specific circumstances existing at the time. The Commission finds that, in this specific rate case, DEP's simpler approach to reduce regulatory assets approved by the Commission in this rate case with over-amortizations related to previously Commission-approved regulatory assets is reasonable and appropriate as follows:

a. The over-amortization of rate case expense from Docket No. E-2, Sub 1023 of $1,112,000 should be applied to the balance of rate case expense in the Commission's Order in the 2017 Rate Case $530,000, which will eliminate that balance. The remaining $582,000 of over-amortization should be applied against rate case costs being requested in this proceeding.

b. The over-amortization of early retired plant in the amount of $13.8 million should be applied against the outstanding rate base balance for the Asheville early retired coal plant authorized in the 2019 Rate Case.

c. The over-amortization of Hurricane Matthew costs from the 2017 Rate Case in the amount of $17 million should be treated as follows: First, to recover 2022 incremental Winter Storm Izzy costs of approximately $15 million, and second, the remaining $2 million credit should be refunded to customers through a one-year rider with interest.

Based on the circumstances in this proceeding, the Commission concludes this treatment is reasonable and appropriate because the Commission has carefully reviewed and selected specific "same type" regulatory assets for which the over-amortizations are being applied. The Commission is very clear that same type Commission-approved costs

are being offset by over-amortizations related to same type previously approved regulatory assets. The specific information related to the same type of regulatory assets/liabilities is set forth herein in a manner that is transparent both to the parties and to customers. The Commission concludes that the approved offsetting of over-amortizations reduces deferred balances being addressed in the current case, and thereby reduces the base rate revenue requirement, provides a longer-term impact on rates to customers, protects customers from the rate volatility created by a significant one-year rider, and addresses the potential unfavorable implications of the Public Staff's significant one-year rider proposal upon DEP's credit metrics.

The Commission denies DEP's proposal to apply the over-amortization of severance costs from the 2019 Rate Case in the amount of $907,000 against the rate case costs being requested in this proceeding because these are two entirely separate categories of costs and as such, offsetting one with the other is not justified. The Commission rejects DEP's argument that the offset should be approved because severance costs are labor related, and the rate case costs primarily consist of labor related dollars. The Commission also rejects DEP's proposal that the over-amortization of regulatory fees in the amount of $68,000 should be addressed in a future proceeding but instead finds the over-amortization should be addressed in the present rate case. Thus, the Commission concludes that the over-amortizations related to the regulatory fees, the severance costs, and the remaining $2 million credit from the Hurricane Matthew amortization that DEP proposed to be used to fund the initial balance in the Storm Balancing Account, should be returned to customers through a levelized rider over a one-year period with a return at the weighted average cost of capital.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 62-66

Winter Storm Izzy and Storm Balancing Account

The evidence supporting these findings of fact is contained in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witness Jiggetts and Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

Summary of Evidence

DEP Direct Testimony

DEP witness Jiggetts testified as to the incremental O&M costs incurred as a result of Winter Storm Izzy. Tr. vol. 13, 210. She testified that DEP experienced extraordinary storm costs in response to Winter Storm Izzy in January 2022, incurring approximately $23.8 million on a North Carolina retail jurisdictional basis. *Id.* at 211. Witness Jiggetts testified that these amounts are not finalized and that invoices would continue to be received, validated, and paid over the next several months. *Id.* DEP requested to defer the incremental O&M expenses related to Winter Storm Izzy, less approximately $11 million of "normal storm range expense" as that term was defined in the 2017 Rate Case for a total deferral in this proceeding of approximately $12.8 million. *Id.* Witness Jiggetts

testified that, without approval of this deferral request, DEP would face earnings degradation of approximately 35 basis points. *Id.* According to witness Jiggetts, approval of this request would benefit DEP and its customers by helping to ensure investors' confidence in DEP and to assure access to needed capital on reasonable terms and equitable treatment as to deferred costs and revenues. *Id.*

DEP witness Jiggetts also testified as to DEP's request for approval of a new methodology for tracking storm costs incurred. Tr. vol. 13, 212. Witness Jiggetts testified that the regulatory asset approved for Hurricane Matthew storm costs in the 2017 Rate Case was fully amortized as of September 2021, and per the Commission's order in that case, DEP has continued to record the amortization and has a regulatory liability on its books. *Id.* Witness Jiggetts testified that DEP is seeking to use this existing regulatory liability to create a "balancing account" for storm costs going forward, starting with DEP's request to apply the excess amortization from Hurricane Matthew to the deferred costs for Winter Storm Izzy. *Id.* Witness Jiggetts explained that, to this end, Adjustment NC7010 establishes an average amount of incremental storm costs included in customer rates. *Id.* Witness Jiggetts testified that under DEP's proposal, each year, if the incremental storm expenses are over the average amount in rates, the difference would be deferred to the account; if the incremental storm expenses are under the average amount in rates, the difference would be contributed to the account. She testified that if the average amount included in customer rates approximates the average amount of storm expense going forward, the balancing account balance should fluctuate around zero and not require additional funding. *Id.* She further stated that if the account does require additional funding, this could be evaluated in a future rate case or storm securitization proceeding. *Id.* at 212-13. Witness Jiggetts testified that the Storm Balancing Account would allow DEP to recover its actual costs for storm restoration efforts and ensure that DEP does not make or lose money related to its storm restoration efforts. *Id.* at 213.

DEP witness Jiggetts also testified as to how she calculated a storm normal expense amount of $17.8 million based upon a ten-year average of storm costs, after removing costs associated with major storms, to be included in rates consistent with prior Commission orders. Jiggetts Supplemental Ex. 4, Tr. Ex. vol. 14.

The Public Staff Direct Testimony

Public Staff witnesses Zhang and Boswell did not make an adjustment to DEP's storm normalization calculation. Public Staff Accounting Ex. 1, Tr. Ex. vol. 19.

Witnesses Zhang and Boswell disagreed that DEP should be permitted to defer costs associated with Winter Storm Izzy, stating that the Public Staff maintains its position as articulated in its initial comments filed on March 15, 2017, in the 2017 Rate Case and Docket No. E-2, Sub 1131, that it is appropriate and reasonable that DEP only be allowed to defer the difference between its actual incremental O&M expense related to Winter Storm Izzy and a normal amount of $27.4 million on a North Carolina retail jurisdictional basis. Tr. vol. 19, 54. In light of the fact that DEP had, at the time it filed its Application in this proceeding, estimated the costs of Winter Storm Izzy to be approximately $23.8

million on a North Carolina retail jurisdictional basis, the Public Staff stated that the costs associated with this storm would not qualify for a deferral. *Id.* The Public Staff explained that, merely because the storm costs incurred in a given year are greater than $11 million (the normalized level from a prior rate case), it cannot simply be assumed that the larger expense is extraordinary in magnitude and therefore suitable for deferral. *Id.* Witnesses Zhang and Boswell stated that actual storm expenses included in the ten-year average spanned a wide range of annual amounts, from a storm amount as low as $4,901 to as high as $461.974 million, and, as such, at least $27.4 million should be considered an appropriate level of normal storm expense for purposes of consideration of DEP's $23.8 million in deferral costs. *Id.* at 54-55. In the event that the costs associated with Winter Storm Izzy exceed the $27.4 million North Carolina retail amount, the Public Staff suggested that DEP may file for a deferral or securitization, whichever is most beneficial to ratepayers. *Id.*

Additionally, the Public Staff did not agree with DEP's proposal to create a storm balancing account and stated that creating such an account would only serve to transfer all risk from DEP to ratepayers, including placing unaudited costs into a deferral for recovery. *Id.* at 53. The Public Staff stated that DEP already has ample opportunities to recover storm costs, whether that be through storm normalization, securitization, or deferrals, all of which may allow DEP to reasonably and appropriately recover actual audited storm costs. *Id.*

DEP Rebuttal Testimony

DEP witness Jiggetts testified on rebuttal that the Public Staff accurately summarizes DEP's intent in proposing the storm balancing account. Tr. vol. 23, 83. Witness Jiggetts explained that the Commission should implement a mechanism that results in DEP's neither making nor losing money because of storm restoration efforts. *Id.* Witness Jiggetts responded to the Public Staff's assertion that the storm balancing account would transfer risks from the utility to ratepayers and would include unaudited costs for recovery. *Id.* at 83-84. Witness Jiggetts testified that the base level of storm expense that must be exceeded before DEP can request deferral, as established in the 2017 Rate Case, has in practice been inequitable to DEP as the base level of storm expense is greater than the amount of storm normal expense included in base rates, which results in that difference being borne by shareholders. *Id.* at 84. Witness Jiggetts explained that when DEP's linemen repair and replace damaged lines and equipment after a storm event, the outcome is the restoration of utility service for DEP's customers. *Id.* Witness Jiggetts stated that it is DEP's position that these storm restoration expenses are a cost of service of the regulated utility that are reasonably and prudently incurred and should be recovered from customers. *Id.*

Witness Jiggetts also responded to the Public Staff's second assertion and explained that the deferral of the amounts to the balancing account does not preclude those amounts from being subject to audit or review by the Public Staff or the Commission. *Id.* at 86. Witness Jiggetts testified that deferrals, by their nature, are unaudited amounts when initially recorded, but that when the amounts in the balancing account are put forth for recovery or

return to customers in a future case or securitization, the activity and related balance will be subject to audit for reasonableness and prudency. *Id.*

In her third and final supplemental testimony, witness Jiggetts updated the storm normalization calculation to $22.2 million. Jiggetts Supplemental Ex. 4, Tr. Ex. vol. 14. In its exhibits to settlement testimony, the Public Staff similarly utilized $22.2 million for DEP's storm normalization calculation. Public Staff Accounting Ex. 1, Tr. Ex. vol. 19.

The Public Staff Supplemental and Settlement Testimony

In its supplemental and settlement testimony, the Public Staff testified that, based upon the updated numbers provided in witness Jiggetts' supplemental filings with regard to the costs of Winter Storm Izzy and other 2022 storms, it recommends that the costs incurred for Winter Storm Izzy be recovered through securitization. Tr. vol. 19, 91.

Testimony Presented at the Expert Witness Hearing

At the expert witness hearing, DEP witness Jiggetts explained the methodology for the calculation of storm normalization of $22.2 million in this case and testified that the Public Staff agreed with her storm normalization calculation. Tr. vol. 14, 29-30; 57-58.

Public Staff witnesses Zhang and Boswell explained at the expert witness hearing that, while the costs contained in DEP's initial filing did not rise to the level of warranting deferral, DEP's inclusion in a supplemental filing of costs associated with Hurricane Ian – when viewed together with Winter Storm Izzy costs – met the threshold warranting deferral or securitization of the costs. Tr. vol. 19, 150-51.

At the expert witness hearing, DEP witness Jiggetts described the mechanics of DEP's proposal for a storm balancing account and how it is accomplished using a visual aid. DEP Redirect Jiggetts Direct and Settlement Ex. 2, Tr. Ex. vol. 14. Witness Jiggetts explained how the exhibit shows that in Year 1 DEP experienced $25.65 million in storm restoration costs (apart from major storms where costs would ordinarily be deferred or securitized). Subtracting that amount from "storm normal" ($22.2 million) leaves an under-recovery of $3.45 million, which is deferred to the Storm Balancing Account, meaning that at its inception in this example, the account is a Regulatory Asset. In Year 2, however, DEP experiences only $10.15 million in storm restoration costs. After accounting for the existing balance in the account ($3.45 million) and Year 2's "storm normal" (again, $22.2 million), the balance in the account has now shifted to a Regulatory Liability of $8.6 million – that is, over the two year period in the example, DEP collected "storm normal" costs in rates amounting to $44.4 million, and experienced restoration costs associated with "normal" storms of $35.8 million, leaving a balance in the account of $8.6 million in favor of customers.

Witness Jiggetts clarified that the initial building block for the storm balancing account is the calculation of the storm normal expense, which is the amount already in rates. Tr. vol. 14, 27-31. Witness Jiggetts testified that, as originally approved by the

Commission in DEP's 2012 Rate Case, Docket No. E-2, Sub 1023, "storm normal" embeds average storm restoration costs in rates over a 10-year period, after excluding costs which would ordinarily be deferred or securitized. She explained that deferral or securitization applies to major storms, so the "storm normal" calculation is designed to have a baseline level of storm restoration cost in rates derived from a 10-year average. *Id.* at 28-30. In this case, the "storm normal" cost to be embedded in rates is $22.2 million, a figure with which the Public Staff agrees. *Id.* at 30.

Witness Jiggetts testified that, as proposed, the account would have a regulatory liability of approximately $2 million (in favor of customers), which would extinguish costs associated with Winter Storm Izzy but also lower returns, since the funds would be in rate base. Tr. vol. 14, 62-63. Witness Jiggetts stated that this regulatory liability position would continue until the next general rate case and, even though the balance in the account would change from year to year based upon storm costs actually experienced from a rates charged to customer perspective that the initial $2.27 million credit, would stay reflected in rates until DEP returns for a rate case proceeding. *Id.* at 63.

Discussion and Conclusions

As noted above, the Commission has approved DEP's calculation in this proceeding for the storm normalization expense to be included in rates.

The Commission stated in its Order in the 2017 Rate Case that both DEP and the Public Staff cite in support of their positions in this case with regard to the issues concerning the recovery of storm costs:

> The Commission's precedents do not require that ratepayers bear the entire cost of repairing the damage to a utility's system resulting from a major storm. Instead, deferrals of storm costs are limited to those costs that are beyond the normal range of fluctuation of storm costs from year (in this case, costs in excess of $27.4 million). In recent general rate cases, the Commission has also included in the utility's rates a storm cost allowance based on the average amount the company has incurred over a period of years (the storm cost allowance approved in Sub 1023 was $12.7 million per year). Costs may exceed an average, or normal, amount used to set rates in a general rate case; however, as long as those excess costs are within a normal range of variation, they should be presumed to be recovered through the utility's rates in effect at that time (given the fact that many expenses fluctuate from year to year).

Order Accepting Stipulation, Deciding Contested Issues and Granting Partial Rate Increase, *Application by Duke Energy Progress, LLC, For Adjustment of Rates and Charges Applicable to Electric Utility Service in North Carolina*, No. E-2, Sub 1142, at 127 (Feb. 23, 2018) (2017 Rate Case Order).

Based upon DEP's spending of $87.126 million on a North Carolina retail jurisdictional basis in 2022 on annual storm costs, which is above the annual threshold of $27.4 million on a North Carolina retail jurisdictional basis in annual storm costs that the Public Staff agreed is proper for seeking deferral or securitization, the Commission is satisfied that DEP has met the threshold warranting a deferral or securitization for Winter Storm Izzy and Hurricane Ian. As discussed herein, the Commission concludes that DEP should be allowed to recover the 2022 incremental Winter Storm Izzy costs of approximately $15 million, which amount was agreed to by the Public Staff, by applying a portion of the over-amortization of Hurricane Matthew costs in the amount of $17 million from the 2017 Rate Case. As stated elsewhere in this Order, the remaining amount of over-amortization of Hurricane Matthew costs, approximately $2.0 million, should be returned to customers through a levelized rider over a period of one year.

With regard to the proposed storm balancing account, the Commission described the position taken by DEP in the 2017 Rate Case proceeding (that all costs in excess of a normalized annual amount should be considered extraordinary and recovered on a deferred basis) as potentially "set[ting] a dangerous precedent for other categories of costs in the future." 2017 Rate Case Order at 130. More specifically, the Commission stated explicitly that:

> Under this approach, the Company would be assured of recovery of all its storm costs on almost a "true-up" basis, either through the presumed annual allowance in rates or through deferral and amortization. In effect, DEP's proposal would amount to a "tracker" system for storm cost recovery, similar to the riders established by the General Assembly in G.S. 62-133.2, 62-133.8 and 62-133.9 for fuel, REPS, and DSM/EE cost recovery. If DEP is allowed to implement such a system for recovery of its storm costs, other utilities may well seek to adopt a similar approach for any of various other expense items. In light of this concern, and the attendant shifting of more risk to customers, the Commission has generally been reluctant to approve cost tracker systems, except when they are required by statute.

Id.

In this case, and at this time, the Commission is unpersuaded by DEP's contentions that there is any reason to begin allowing, in essence, a true-up of storm costs where such recovery is not explicitly statutorily permitted. Further, the Commission continues to have concerns that DEP's proposed approach might set precedent for other categories of costs in the future. The Commission notes that any storm costs not eligible for securitization or deferral are presumed to be covered by DEP's authorized base rates. For these reasons, the Commission declines to approve a storm balancing account, at this time, as requested by DEP.

EVIDENCE AND CONCLUSIONS FOR FINDINGS OF FACT NOS. 67-69

The evidence supporting these findings of fact is contained in DEP's verified Application and Form E-1; the testimony and exhibits of DEP witnesses Abernathy, Jiggetts, Harris, Quick, Bateman and Stillman, Public Staff witnesses Zhang and Boswell; and the entire record in this proceeding.

IIJA/IRA

By Application and through the direct testimony of witness Abernathy, DEP requests to defer the estimated tax benefits, net of costs, associated with the IRA and IIJA. Tr. vol. 23, 151, 154.

With respect to the IRA, DEP witness Panizza discussed the two solar MYRP projects and six battery energy storage MYRP projects that are eligible for either Investment Tax Credits (ITC) or Production Tax Credits (PTC) made available under the IRA. Tr. vol. 16, 140-44. Witness Abernathy explained how DEP estimated the IRA benefits based on the best information available and that DEP's intention is for customers to receive the full benefit (net of costs) of the tax credits. Tr. vol. 23, 151. Witness Abernathy also testified that "the Company agrees [with the Public Staff] that a deferral of IIJA impacts is appropriate and supports the recommendation for the Commission to approve an accounting order to defer any incremental revenue requirement impacts, including benefits and costs related to IIJA, to be addressed in a future rate case." Tr. vol. 23, 154.

Public Staff accounting panel witnesses Boswell and Zhang, as well as Public Staff witness Thomas, testified in support of the requested deferral treatment of the IRA impacts. Tr. vol. 19, 77, 178-80, 195. Public Staff witness Nader provided similar testimony, recommending that the Commission treat the impacts associated with the IIJA consistent with those related to the IRA. Tr. vol. 21, 114.

Based on foregoing, the Commission concludes that DEP's request for an accounting order authorizing deferral of all IRA and IIJA related impacts, net of costs, as well as any difference between realized and estimated impacts included in DEP's filing is reasonable and should be approved.

Customer Assistance Program, Payment Navigator Program, and the Tariffed On-Bill Program

In her direct testimony, DEP witness Jiggetts explained that DEP has proposed several new programs in this case to benefit customers, including the CAP, Tariffed On-Bill program, and the Payment Navigator program (Customer Programs) and that DEP would incur certain implementation and administration costs that were not included in the test period, and which are not known and measurable at this point. She stated that should the Commission approve the Customer Programs, DEP requests permission to establish a regulatory asset and defer to the account the incremental implementation and

administrative O&M costs related to the programs for future recovery in rates. Witness Jiggetts also testified that DEP is proposing PIMs as part of its PBR application and that DEP requests to defer to this regulatory asset the implementation costs for the PIMs, including, without limitation, certain costs relating to marketing, administration, and the PIMs dashboard. Tr. vol. 13, 209.

DEP witnesses Bateman and Stillman testified that the PIMs dashboard had a capital cost estimate of $540,000, with estimated annual O&M costs of approximately $100,000, with DEP proposing to allocate 43.23% of these costs to DEP's North Carolina retail customers. Tr. vol. 14, 112.

Public Staff witnesses Zhang and Boswell testified that the proposed deferral of the costs associated with the implementation of the proposed Customer Programs and PIMs fails to meet either prong of the Commission's two-prong test for deferrals, and therefore DEP's request should be denied. Tr. vol. 19, 75-76. They further testified that because PIMS are designed to protect ratepayers and are required for approval of an MYRP, PIMs are part of DEP's normal course of business and should also be denied on that basis. *Id.* at 75-76.

In her rebuttal testimony, witness Jiggetts responded to the Public Staff's recommendation to deny DEP's request on the basis of the deferral test. Tr. vol. 23, 105. Witness Jiggetts testified that DEP's request is being included as a part of its general rate case proceeding and is not an "out of period" cost subject to the Commission's two-prong deferral test. Witness Jiggetts explained that even though the costs of implementing these programs are known and measurable, DEP did not adjust operating expenses in this case to include these incremental costs which are not captured in the historic test period. *Id.* at 106. Witness Jiggetts clarified that while PIMs will become a part of DEP's normal course of business as a result of the MYRP, the costs of that new normal course of business have not been included in operating expenses for recovery from customers. *Id.* Thus, witness Jiggetts explained that creation of a regulatory asset for deferral of the costs would allow DEP to postpone recovery of these costs until the Customer Programs are implemented and benefitting customers. *Id.*

At the expert witness hearing, responses to the Public Staff discovery requests were entered into the record in which DEP indicated that many of the costs associated with implementation of the PIMs were minimal. Public Staff Cross Examination Bateman Stillman Direct and Settlement Ex. 1, Tr. Ex. vol. 16.

The Commission has historically treated deferral accounting as a tool to be allowed only as an exception to the general rule, and its use has been allowed sparingly. Deferred accounting treatment is generally authorized by the Commission only in those instances where there was a clear and convincing showing that the costs in question were of an unusual or extraordinary nature and that, absent deferral, the costs would have a material impact on the company's financial condition. Requests for the use of deferral accounting have been historically considered by the Commission on a case-by-case basis and such decisions are based on the specific circumstances of the request.
