Commercial Lighting

Performance and Cost Characteristics » Commercial General Service Lamps in Recessed Can Fixtures

Final

This section characterizes commercial omnidirectional incandescent, halogen, CFL, and LED screw-based general service lamps emitting approximately 1,600 lumens (equivalent to a 100W incandescent lamp) used in recessed can fixtures. A recessed can is a directional fixture set into the ceiling, in which all of the light is directed downwards from the opening. Therefore, an omnidirectional lamp is not well suited for use in such fixtures because light that emits upwards and out of the sides must be reflected downwards and out of the fixture and some light is absorbed in the process. A fixture efficiency of 61% is used to characterize these lumen losses for all omnidirectional lamps. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- A majority of general service lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100. However, CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination. High CRI products are preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these specific retail and display applications.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps which are sold only as a replacement for use in an existing fixture. There are integrated LED luminaires that are more efficient and cost effective for new installations or fixture retrofits. Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy. Therefore typical lamp prices in 2015 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial general service lamps (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for high intensity discharge (HID) lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- The Energy Independence and Security Act of 2007 (EISA 2007) established standards for 100W lamps effective in 2012. These standards cannot be achieved by incandescent bulbs, but they can be met by halogen, CFL, and LED technologies from 2012 to 2023.
- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps. These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

ENERGY STAR:

- For ENERGY STAR qualification, general service omnidirectional lamps must have a minimum lamp efficacy of 70 lm/W for products with CRI ≥ 90 and 80 lm/W for lamps with CRI < 90. Additionally, the lamps must have a CRI ≥ 80, nominal CCT of 2,700, 3,000, 3,500, 4,000/4,100, 5,000, or 6,000 K, and rated lifetime ≥ 10,000 hours (ENERGY STAR).

Performance and Cost Characteristics » Commercial General Service Lamps in Recessed Can Fixtures

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
Incandescent	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Halogen	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements as of 2022
CFL	+0.5%	0%	-0.5%	Improvements in efficacy can be made by using more rare-earth phosphors in compact fluorescent lamps. Lifetime improvements can be made by improving the compact fluorescent lamp electrodes.

1. The Energy Independence and Security Act of 2007 (EISA 2007) prescribes standards for 100 watt incandescent lamps as of January 1, 2012. Despite the phase out of incandescent lamps, these products remain in the installed stock.
2. In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. These standards cannot be met with incandescent technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023. Note: the 45 lm/W backstop applies to the lamp, not the calculated fixture efficacy.
3. Based on a fixture efficiency of 61% for an omnidirectional lamp installed in a recessed can fixture.

1. Criteria outlined in ENERGY STAR® Program Requirements Product Specification for Lamps (Light Bulbs): Eligibility Criteria Version 2.1 (Published June, 2017, Revised June 2020)
2. In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. The new minimum efficacy requirements go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023. All LED lighting products exceed the new minimum efficacy standards. Note: the 45 lm/W backstop applies to the lamp, not the calculated fixture efficacy.
3. Based on a fixture efficiency of 61% for an omnidirectional lamp installed in a recessed can fixture.

Performance and Cost Characteristics » Commercial Reflector Lamps in Recessed Can Fixtures

Final

This section characterizes commercial halogen, halogen infrared reflector (HIR), and LED screw-based reflector lamps emitting approximately 1400 lumens used in recessed can fixtures.

- HIR lamps contain a tungsten halogen capsule with a film coating on the inside of the capsule. The coating reflects infrared radiation back into the lamp filament, which forces the filament to burn at a higher temperature. This design increases the efficacy of the lamp, without reducing operating life.
- A recessed can is a directional fixture set into the ceiling, in which all of the light is directed downwards from the opening. Therefore, a reflector lamp, which employs reflective coating to direct light out in only one direction, is well suited for use in such fixtures. However, some light is not able to escape the fixture, and a fixture efficiency of 93% is used to characterize these minimal lumen losses. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- A majority of reflector lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100. However, CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination. High CRI products are preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these specific retail and display applications.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps which are sold only as a replacement for use in an existing fixture. Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial reflector lamps (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- EPAct92 established minimum performance standards for some reflector lamps and provided exemptions for certain specialty applications (e.g., ER/BR, vibration service, more than 5% neodymium oxide, impact resistant, infrared heat, colored). EPAct92 effectively phased-out R-shaped tungsten filament incandescent reflector lamps at certain wattages and bulb diameters, replacing them with more efficient and cost effective tungsten-halogen parabolic aluminized reflector (PAR) lamps. EISA2007 took away certain exemptions from EPACT 1992, requiring certain previously exempted lamps to meet EPAct92 minimum performance standards by January 1, 2008. In 2015, DOE issued a final rule that determined that amending the standards for incandescent reflector lamps could not be economically justified.
- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. **This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps.** These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

Performance and Cost Characteristics » Commercial Reflector Lamps in Recessed Can Fixtures

Final

ENERGY STAR:

- For ENERGY STAR qualification, general service reflector lamps must have a minimum lamp efficacy of 61 lm/W for products with CRI ≥ 90 and 70 lm/W for lamps with CRI < 90. Additionally, the lamps must have a CRI ≥ 80, nominal CCT of 2,700, 3,000, 3,500, 4,000/4,100, 5,000, or 6,000 K, and rated lifetime ≥ 10,000 hours (ENERGY STAR).

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
Incandescent	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Halogen	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements as of 2022
CFL	+0.5%	0%	-0.5%	In addition to higher efficiency reflector coatings, improvements in efficacy can be made by using more rare-earth phosphors in compact fluorescent lamps. Lifetime improvements can be made by improving the compact fluorescent lamp electrodes.

1. Based on a fixture efficiency of 93% for an omnidirectional lamp installed in a recessed can fixture.
2. In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. The new minimum efficacy requirements go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023. This Final Rule also amended the definition of GSLs to include previously exempted product classes, including reflector lamps. All LED lighting products exceed the new minimum efficacy standards.
3. Criteria outlined in ENERGY STAR® Program Requirements Product Specification for Lamps (Light Bulbs): Eligibility Criteria Version 2.1 (Published June, 2017, Revised June 2020)

Performance and Cost Characteristics » Commercial 4-foot Linear 2-Lamp Lighting Systems

Final

This section characterizes commercial linear fixtures that house two 4ft long linear lamps and their integrated luminaire equivalents. The technologies available for this system are linear fluorescent and LED.

- Linear fluorescent options are T5, T8, and T12 lamps. T5 lamps are approximately 40% narrower than T8 lamps and almost 60% narrower than T12 lamps. This narrowness allows T5 lamps to be coated with higher quality, more efficient phosphor blends than larger diameter lamps, resulting in a more efficacious lamp. The compact size of T5 lamps also permits greater flexibility in lighting design and construction.
- LED options for linear fixtures include replacement lamps that can fit directly into an existing fixture and fully integrated luminaires that can be used to replace existing fixtures. LED replacement lamps are also known as TLEDs. Type A TLEDs can be installed with existing ballasts and Type B and C TLEDs require the ballast to be disconnected. Replacement lamps are only sold to go into existing fixtures. If a new fixture is to be installed, a fully integrated LED luminaire is a more cost effective and efficient option. Because LED luminaires are fully integrated, they do not have lamp or fixture efficiency losses associated with ballasts and fixture optics. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- Linear lamps often have a nominal CCT rating of 3,500K, but products with CCTs of 3,000K, 4,000K, and 4,100K (neutral white) are also common. 5,000K (daylight) lamps are available as well. When replacing a light bulb, it is important to choose a product with a similar CCT value to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100, but for CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination, with high CRI products being preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these very specific retail and display applications.

Cost:

- The total installed cost is the price of 2 lamps, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps, which are sold only as a replacement for use in an existing fixture. There are integrated LED luminaires that are more efficient and cost effective for new installations or fixture retrofits. Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy. Therefore typical lamp prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours of 4055 hours/year for commercial 4ft linear systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- Beginning July 14, 2012 (or July 14, 2014, for T8 700-series phosphor lamps), DOE fluorescent lamp standards required a minimum efficacy of 89 lm/W. Although the amended performance-based standards do not explicitly prohibit T12 lamps, no T12 lamps met the standard at the time of its announcement. Since then, however, T12 lamps meeting the standard have entered the market.
- California's Title 24 mandates the use of electronic ballasts with high efficacy luminaires (including fluorescent) of 13 W or higher (CEC, 2005).

ENERGY STAR:

- ENERGY STAR does not cover commercial linear luminaires (ENERGY STAR, 2020).

Performance and Cost Characteristics » Commercial 4-foot Linear 2-Lamp Lighting Systems

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
T8 F32 Commodity	0%	0%	-0.5%	Limited because the technology is mature.
T8 F32 High Efficiency/High Output	0%	0%	-0.5%	Limited because the technology is mature.
T5 F28	0%	0%	-0.5%	Limited because the technology is mature.

1. Data and assumptions taken from the 2018 SSL Forecast. The report states that efficacy improvements for T8 lamps are not expected in the future and that cost for all commercial fixtures is expected to decrease between 0.1%-0.6% per year. We use 0.5% per year here.
2. From 2020 to 2050, fixture (and fixture price) includes ballast.

1. Only a typical dataset is provided because these lamps all have similar efficacies.
2. Data and assumptions taken from the 2018 SSL Forecast. The report states that efficacy improvements for T8 lamps are not expected in the future and that cost for all commercial fixtures is expected to decrease between 0.1%-0.6% per year. We use 0.5% per year here.
3. Assumes occupancy sensor reduces hours of use by 36% (NCI, 2019)

Performance and Cost Characteristics » Commercial 8-foot Linear 2-Lamp Lighting Systems

Final

This section characterizes commercial linear fixtures that house two 8ft long linear lamps and their integrated luminaire equivalents. The technologies available for this system are linear fluorescent and LED.

- Linear fluorescent options are T5, T8, and T12 lamps. T5 lamps are approximately 40% narrower than T8 lamps and almost 60% narrower than T12 lamps. This narrowness allows T5 lamps to be coated with higher quality, more efficient phosphor blends than larger diameter lamps, resulting in a more efficacious lamp. The compact size of T5 lamps also permits greater flexibility in lighting design and construction.
- LED options for linear fixtures include replacement lamps that can fit directly into an existing fixture and fully integrated luminaires that can be used to replace existing fixtures. LED replacement lamps are also known as TLEDs. Type A TLEDs can be installed with existing ballasts and Type B and C TLEDs require the ballast to be disconnected. Replacement lamps are only sold to go into existing fixtures. If a new fixture is to be installed, a fully integrated LED luminaire is a more cost effective and efficient option. Because LED luminaires are fully integrated, they do not have lamp or fixture efficiency losses associated with ballasts and fixture optics. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- Linear lamps often have a nominal CCT rating of 3,500K, but products with CCTs of 3,000K, 4,000K, and 4,100K (neutral white) are also common. 5,000K (daylight) lamps are available as well. When replacing a light bulb, it is important to choose a product with a similar CCT value to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100, but for CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination, with high CRI products being preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these very specific retail and display applications.

Cost:

- The total installed cost is the price of 2 lamps, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps which are sold only as a replacement for use in an existing fixture. There are integrated LED luminaires that are more efficient and cost effective for new installations or fixture retrofits. Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy. Therefore typical lamp prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours of 4147 hours/year for commercial 8ft linear systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- Beginning July 14, 2012 (or July 14, 2014, for T8 700-series phosphor lamps), DOE fluorescent lamp standards required a minimum efficacy of 89 lm/W. Although the amended performance-based standards do not explicitly prohibit T12 lamps, no T12 lamps met the standard at the time of its announcement. Since then, however, T12 lamps meeting the standard have entered the market.
- California's Title 24 mandates the use of electronic ballasts with high efficacy luminaires (including fluorescent) of 13 W or higher (CEC, 2005).

ENERGY STAR:

- ENERGY STAR does not cover commercial linear luminaires (ENERGY STAR, 2020).

Performance and Cost Characteristics » Commercial 8-foot Linear 2-Lamp Lighting Systems

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume the manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050:

Technology	Efficacy	Lifetime	Price	Potential for Improvements
T8 F59 Typical Efficiency	0%	0%	-0.5%	Limited because the technology is mature.
T8 F59 High Efficiency	0%	0%	-0.5%	Limited because the technology is mature.
T8 F96 High Output	0%	0%	-0.5%	Limited because the technology is mature.

1. N/A because the lamp and fixture are both included in the luminaire.

Performance and Cost Characteristics » Commercial Low-Bay Lighting Systems

Final

The commercial low bay lighting characterized in this report is a one-lamp and one-ballast system in a low/high bay fixture that emits between 6,000 and 10,000 system lumens. Low bay lighting is defined as "interior lighting where the roof trusses or ceiling height is less than 25ft. above the floor"(IESNA, 2000). For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- Low bay conventional lighting technologies, such as metal halide and sodium vapor lamps, provide higher efficacy ranging from 80 lm/W to 100 lm/W. Older, mercury vapor lamps have much lower efficacy at approximately 40 lm/W.
- CCT and CRI values range broadly based on technology type for low bay products.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED luminaires, which are sold as one integrated system. Many factors influence the price of LED luminaires, including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical luminaire prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial low-bay systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

ENERGY STAR:

- ENERGY STAR does not cover low/high bay luminaires (ENERGY STAR, 2012).

Performance and Cost Characteristics » Commercial Low-Bay Lighting Systems

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- (Navigant, 2019). Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

	Efficacy	Lifetime	Price	Potential for Improvements
Mercury Vapor	0%	0%	-0.5%	Limited because the technology is mature.
Metal Halide	0%	0%	-0.5%	Limited because the technology is mature.
Sodium Vapor	0%	0%	-0.5%	Limited because the technology is mature.

1. N/A because the lamp and fixture are both included in the luminaire.

Performance and Cost Characteristics » Commercial High-Bay Lighting Systems

Final

The commercial high-bay lighting characterized in this report is a one-lamp and one-ballast system in a low/high bay fixture that emits greater than 10,000 system lumens. High-bay lighting is defined as "interior lighting where the roof trusses or ceiling height is greater than 25ft. above the floor" (IESNA, 2000). For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- High bay conventional lighting technologies, such as metal halide and sodium vapor lamps, provide higher efficacy ranging from 80 lm/W to 100 lm/W. Older, mercury vapor lamps have much lower efficacy at approximately 40 lm/W.
- CCT and CRI values range broadly based on technology type for high bay products.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED luminaires, which are sold as one integrated system. Many factors influence the price of LED luminaires including, CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical luminaire prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial high bay systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

ENERGY STAR:

- ENERGY STAR does not cover low/high bay luminaires (ENERGY STAR, 2012).

Performance and Cost Characteristics » Commercial High-Bay Lighting Systems

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

	Efficacy	Lifetime	Price	Potential for Improvements
Mercury Vapor	0%	0%	-0.5%	Limited because the technology is mature.
Metal Halide	0%	0%	-0.5%	Limited because the technology is mature.
Sodium Vapor	0%	0%	-0.5%	Limited because the technology is mature.

1. The total capacity represents the nominal compressor capacity required for the entire refrigeration system of a typical supermarket. This refrigeration system usually includes two low temperature racks and two medium temperature racks. For 2018, a 1,200 MBtu/h total cooling capacity is based on a 200-ton estimate for total capacity–80 tons for the medium temperature racks and 20 tons for the low temperature racks.
2. Capacity and annual energy consumption for 2022 and beyond are based on market research and Guidehouse estimates.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Maintenance cost includes oil changes, bearing lubrication, filter replacement, and system functionality checks-approximately half a day per rack of labor for technician is assumed.

- Commercial compressor rack systems that serve commercial supermarket display cases and walk-ins consist of a number of parallel-connected compressors located in a separate machine room. By modulating compressor capacity, these integrated systems provide higher efficiency and mechanical longevity.
- Rack integrators generally supply a packaged compressor rack for which much of the necessary piping, insulation, components, and controls are pre-assembled.
- A typical supermarket will have 10 to 20 compressors mounted in racks in the 3-horsepower (hp) to 15-hp size range. Usually, each rack has three to five compressors serve a series of loads with nearly identical evaporator temperature.
- The duty cycle for compressors is usually in the range of 60% to 70%.
- Energy use and capacity for the Reference Case are projected to remain static over the coming decades because commercial compressor racks systems are a mature technology. The Reference Case assumes low R&D efforts because it is an established technology.

1. Total capacity is the total heat rejected (THR) by condensers comprised of two low temperature condensers (THRL = 240 MBtu/h each, suction temperature= -25°F, condensing temperature-110°F) and two medium temperature condensers (THRM = 520 MBtu/h each, suction temperature = 15°F, condensing temperature = 115°F); ambient temperature = 95°F. (NCI, 2009). For 2022 and beyond, capacity was estimated by Guidehouse.
2. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
3. Maintenance cost includes coil cleaning, leak checking, belt replacement as necessary, and system functionality checks.

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Condensers

Final

- Condensers are designed with multiple methods of cooling: air-cooled, water-cooled, and evaporative. These units can be single-circuit or a multiple circuit.
- Commercial condensers are remotely located, typically installed on the roof of a supermarket.
- For use with parallel compressors in supermarkets, air-cooled units are the most commonly used condensers. This analysis is based on multiple air-cooled condensers connected to a supermarket refrigeration system comprised of two low temperature condensers and two medium temperature condensers.
- Each compressor rack has a dedicated condenser or a separate circuit of a single common condenser. Condenser temperatures of multiple racks are often different.
- The duty cycle for condensers is usually in the range 50%-70%.
- Energy use is projected to remain static over the coming decades because commercial condensers are a mature technology.

1. For 2022 and beyond, energy consumption and cost values were estimated using shipment-weighted averages reported in DOE's 2014 CRE Final Rule Technical Support Document (TSD) for equipment commonly used as display cases. DOE's updated conservation standard went into effect in 2017, so units sold in 2018 are assumed to comply with this standard.
2. For consistency with DOE rulemaking practices, Supermarket Display Case Energy Use reported above includes energy use of the compressor racks and condensers. To avoid double counting, do not add Energy Use from the Compressor Rack or Condenser Systems tabs if calculating total energy consumption.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Maintenance cost includes preventative maintenance costs such as cleaning evaporator coils, drain pans, fans, and intake screens as well as lamp replacements and other lighting maintenance activities. After 2012, these values are based on a reported maintenance and repair cost of $220 per unit for preventative maintenance plus approximately $60 per linear foot for additional repair and maintenance.

Performance and Cost Characteristics » Commercial Supermarket Display Cases

Final

- DOE set federal energy efficiency standards for Commercial Refrigeration Equipment (CRE) in 2009. These standards set maximum daily energy consumption levels, in kilowatt-hours per day, for display cases manufactured sold in the United States on or after January 1, 2012.
- DOE updated its Energy Conservation Standards for Commercial Refrigeration Equipment in 2014 for equipment sold on or after March 27, 2017.
- The table below lists equipment used as supermarket display cases and their corresponding Energy Conservation Standard levels. The maximum allowable daily energy consumption for each equipment class is a linear function of Total Display Area (TDA).

Equipment Description	Standards Equation (2012)	Standards Equation (2017)
Vertical Open Cooler (VOP.RC.M)	0.82xTDA+4.07	0.64xTDA+4.07
Semi-Vertical Open Cooler (SVO.RC.M)	0.83xTDA+3.18	0.66xTDA+3.18

Horizontal Open Freezer (HZO.RC.L)	0.57xTDA+6.88	0.55xTDA+6.88

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Supermarket Display Cases

Final

- According to CBECS 2018 microdata, the average building size for food sale building type is 31,997.
- Unit energy consumption for 2022 and beyond is estimated using a shipment-weighted average by efficiency level and equipment class, using data in DOE's 2014 CRE Final Rule TSD with updated analysis from Guidehouse in 2016. The equipment classes analyzed are listed in the table on the previous slide.
- Supermarket refrigeration systems consist of refrigerated display cases, condensing units, and centralized compressor racks.
- A typical supermarket display case contains lighting, evaporators, evaporator fans, piping, insulation, valves, and controls.
- The efficiency of supermarket display cases can be increased through the use of improved evaporator coils, larger evaporators, higher efficiency evaporator fan blades, high efficiency doors, LED lighting, and improved insulation.
- Energy use is projected to remain static over the coming decades because supermarket display cases are a mature technology.

1. EPACT 2005 energy standards went into effect in 2010. 2022 low efficiency cost and energy consumption values are based on minimum compliance with this standard. Unless otherwise noted, all other cases are based on shipment-weighted averages solid- and transparent-doored units reported in the 2014 CRE TSD. DOE's updated Energy Conservation standards went into effect in 2017; therefore, compliance with this standard is assumed for 2022 and beyond.
2. The ENERGY STAR category is based on a shipment weighted average of solid- and transparent-doored units that are minimally compliant with ENERGY STAR v3, effective October 1, 2014. Units compliant with ENERGY STAR are found to be the most efficient reach-in refrigeration equipment on the market in 2022.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Installation cost for 2012 is based on NCI 2009 report that assumes a cost of $863. Installation cost for 2022 and beyond is based DOE's 2014 CRE Final Rule and additional analysis by Guidehouse, which assumes an installation cost of $878 for self-contained equipment.
5. Maintenance costs after 2012 are based on DOE's CRE 2014 Final Rule TSD, which reports $35 annual preventative maintenance, per unit, per year, plus approximately $40 per linear foot, per year of additional repair and maintenance costs for the units characterized.

Performance and Cost Characteristics » Commercial Reach-In Refrigerators

Final

- The Energy Policy Act of 2005 (EPACT 2005) set maximum daily energy consumption levels, in kilowatt-hours per day, for commercial reach-in refrigerators that went into effect on January 1, 2010. The daily energy consumption is based on the volume of the unit (V) in ft^3.
- In 2014, DOE updated its energy conservation standards for reach-in refrigerators, effective March 27, 2017. Both standards are reported in the table below.

Equipment Class	EPCA Standard Level (2010)	DOE Standard Level (2017)
Solid Door (VCS.SC.M)	0.10xV+2.04	0.05xV + 1.36
Glass Door (VCT.SC.M)	0.12xV+3.34	0.1xV+0.86

- In 2013, EPA updated its ENERGY STAR specifications for reach-in refrigerators, effective March 27, 2017. These standards are also based on the refrigerated volume of the unit.

Reach-In Refrigerator Size	0 < V < 15	15 ≤ V < 30	30 ≤ V < 50	50 ≤ V
Solid Door (VCS.SC.M)	0.022xV+0.97	0.066xV+0.31	0.04xV+1.09	0.024xV+1.89
Glass Door (VCT.SC.M)	0.095xV+0.445	0.05xV+1.12	0.076xV+0.034	0.105xV-1.111

- Unit energy consumption for 2012 and beyond was estimated based on shipment-weighted averages by efficiency level and equipment class for 49 ft3 VCS.SC.M and VCT.SC.M units reported in DOE's 2014 CRE Final Rule TSD with updated analysis from Guidehouse in 2016. These units were estimated to comprise approximately 85% and 15% of total reach-in refrigerator shipments, respectively.
- The efficiency of commercial reach-in refrigerators can be increased through the use of efficient compressors, efficient evaporator fans, efficient condenser fans, electric defrost, and more efficient lighting.
- For this referenced scenario, energy use is projected to remain static over the coming decades because reach-in refrigerators are a mature technology.

1. A 49 ft^3 unit was characterized, because it was the representative size selected for DOE's rulemaking analysis.
2. The ENERGY STAR category was based on a solid-doored unit that is minimally compliant with ENERGY STAR v3, effective October 1, 2014.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Installation cost for 2012 and 2018 is based on DOE's on-going CRE rulemaking, which assumes a cost of $863 for self-contained equipment and $950 for 2022 and beyond based on analysis from Guidehouse.
5. Maintenance costs are calculated based on a $35 per unit annual preventative maintenance cost, plus an additional $45 per linear foot repair and maintenance cost estimated based on values reported in the CRE TSD.

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Reach-In Freezers

Final

- EPACT 2005 set maximum daily energy consumption levels, in kilowatt-hours per day, for commercial reach-in freezers that went into effect on January 1, 2010. The daily energy consumption is based on the volume of the unit (V) in ft^3.
- In March of 2017, DOE updated its energy conservation standards for commercial refrigeration equipment, including reach-in freezers. Both the EPCA and DOE standards are reported in the table below.

Equipment Class	EPCA (2010)	DOE Standard Level (2017)
Solid Door (VCS.SC.L)	0.4xV+1.38	0.22xV+1.38
Transparent Door (VCT.SC.L)	0.75xV+4.10	0.29xV+2.95

- In 2013, EPA updated its ENERGY STAR specifications for reach-in freezers, effective March 27, 2017. These standards are also based on the refrigerated volume of the unit.

Reach-In Freezer Size	0 < V < 15	15 ≤ V < 30	30 ≤ V < 50	50 ≤ V
Solid Door (VCS.SC.L)	0.21xV+0.9	0.12xV+2.248	0.285xV-2.703	0.142xV+4.445
Glass Door (VCT.SC.L)	0.232xV+2.36	0.232xV+2.36	0.232xV+2.36	0.232xV+2.36

- The commercial reach-in freezer characterized in this report, which is the typical unit according to DOE's 2014 CRE rulemaking, is a 49 cubic ft. solid two-door unit with a nominal compressor size of 4,341 Btu/h.
- The efficiency of commercial reach-in freezers can be increased through the use of efficient compressors, efficient evaporator fans, efficient condenser fans, electric defrost, and more efficient lighting.
- For this referenced scenario, energy use is projected to remain static over the coming decades because reach-in freezers are a mature technology.

1. Assumes medium temperature units are refrigerators.
2. Average unit energy consumption was adapted from the DOE CRE 2016 report by assuming electronically commutated motor (ECM) evaporator fan motors are required for Energy Policy & Conservation Act (EPCA) compliance, as well as ECM condenser fan motors.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Installation cost for 2012 and beyond is based on DOE's Walk-In TSD.
5. Maintenance cost includes checking and maintaining refrigerant charge levels, checking settings, and cleaning heat exchanger coils.

- For 2012 and beyond, the unit characterized was a walk-in storage cooler, based on DOE's WICF TSD.
- A typical walk-in refrigerator includes:
  - insulated floor and wall panels
  - merchandising doors, shelving, and lighting (not included in cost estimate)
  - semi-hermetic reciprocating compressor
  - refrigerant (R404A)
  - condenser
  - evaporator
- Energy consumption is assumed to scale with the AWEF (Annual Walk-in Energy Factor), defined as the ratio of total heat removed from the refrigerated volume per year to the total electrical energy input of refrigeration systems over the same time period.
- The installation cost consists of freight and delivery costs in addition to on-site assembly.

The Energy Independence and Security Act (EISA) of 2007 included prescriptive standards for walk-in refrigerators (coolers) that went into effect in 2009. These prescriptive standards, which are included in the analysis for all units for 2012 and beyond, state that all walk-in refrigerators manufactured after January 1, 2009, must:

- For 2012 and beyond
- have automatic door closers
- have strip doors, spring hinged doors, or other method of minimizing infiltration when doors are open
- contain wall, ceiling, and door insulation of at least R–25, except for glazed portions of doors and structural members
- use electronically commutated motors or three-phase motors (for evaporator fan motors of under 1 horsepower and less than 460 volts)
- use electronically commutated motors, permanent split capacitor-type motors, or three-phase motors (for condenser fan motors of under 1 horsepower)
- use light sources with an efficacy of 40 lumens per watt or more, including ballast losses (if any), except that light sources with an efficacy of 40 lumens per watt or less, including ballast losses (if any), may be used in conjunction with a timer or device that turns off the lights within 15 minutes of when the walk-in refrigerator is not occupied by people.

In 2014, DOE updated its energy conservation standards for walk-in coolers and freezers. Minimum AWEF (Annual Walk-In Energy Factor) was set for refrigeration systems, as well as upper limits on energy consumption attributable to passage, freight, and display doors. DOE elected not to set new standards for the R-value of Walk-In Panels.

ENERGY CONSERVATION STANDARDS FOR WALK-IN COOLERS AND WALK-IN FREEZERS

Class descriptor	Class	Standard level
Refrigeration Systems Minimum AWEF (Btu/W-h)		
Dedicated Condensing, Medium Temperature, Indoor System, <9,000 Btu/h Capacity	DC.M.I, <9,000	5.61

1. Based on the average output from the Compliance Certification Database and values within 2022 Automatic Commercial Ice Maker (ACIM) TSD.
2. Defined as the average heat load to remove the latent and sensible heat required to freeze the daily output capacity of ice.
3. Water use refers to potable water.
4. EPACT 2005 energy standards went into effect in 2010. The 2015 low values are based on this standard. In 2014, DOE set new standards for commercial ice machines, with compliance required by 2018. The unit characterized for 2012 and beyond uses data from this rulemaking. All units for 2020 and beyond are assumed to comply with the updated standard.
5. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
6. The ENERGY STAR category is based on minimum compliance with the ENERGY STAR v3.0 standard, which went into effect on January 28, 2018. According to this analysis, ENERGY STAR certification is typical for the small air-cooled ice-making head (IMH) unit characterized.
7. Maintenance cost is based on the average cost of equipment within the 700 lb/day output range and includes cleaning and maintaining refrigerant levels, replacing filters, checking water distribution lines for leaks, cleaning, sanitizing, and descaling the bin and water system. Maintenance cost decreases as the size of the ice machine (i.e. output) decreases.

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Ice Machines

Final

- Commercial ice machines are typically integrated with an insulated ice storage bin or mounted on top of a separate storage bin. The retail equipment cost includes the ice making head and the integrated storage bin. Commercial ice machine condensers are either air-cooled or water-cooled. Approximately 90% of all units are the air-cooled type.
- Commercial ice machine maintenance includes periodic cleaning (every 2 to 6 weeks) to remove lime and scale and sanitizing to kill bacteria. Some ice machines are self-cleaning/sanitizing.
- ENERGY STAR® updated its maximum energy consumption levels, in kilowatt-hours per 100 pounds of ice, for air-cooled ice machines that went into effect on January 28, 2018. These efficiency levels are based on the harvest rate, in pounds per 24 hours. (H). Water-cooled ice machines are not eligible for ENERGY STAR certification.

ENERGY STAR Requirements for Air-Cooled Batch-Type Ice Makers			
Equipment Type	Applicable Ice Harvest Rate Range (lbs of ice/24 hrs)	Energy Consumption Rate (kWh/100 lbs ice)	Potable Water Use (gal/hundred lbs ice)
IMH	$200 \le H \le 1600$	$\le 37.72 * H^{-0.298}$	≤ 20.0
RCU	$400 \le H \le 1600$	$\le 22.95 * H^{-0.258} + 1.00$	≤ 20.0
	$1600 \le H \le 4000$	$\le -0.00011 * H + 4.60$	≤ 20.0
SCU	$50 \le H \le 450$	$\le 48.66 * H^{-0.326} + 0.08$	≤ 25.0

ENERGY STAR Requirements for Air-Cooled Continuous-Type Ice Makers		
Equipment Type	Energy Consumption Rate (kWh/hundred lbs ice)	Potable Water Use (gal/hundred lbs ice)
IMH	$\le 9.18 * H^{-0.057}$	≤ 15.0
RCU	$\le 6.00 * H^{-0.162} + 3.50$	≤ 15.0
SCU	$\le 59.45 * H^{-0.349} + 0.08$	≤ 15.0

EPACT 2005 issued standard levels for commercial ice machines with capacities between 50 pounds and 2500 pounds per 24-hour period that are manufactured or sold in the United States on or after January 1, 2010. The energy consumption is based on the harvest rate in pounds per 24 hours (H). In 2015, DOE finalized new standards for ACIMs extending coverage to flake, nugget, and tube-type machines and to capacities up to 4,000 pounds per 24 hours.

Equipment Type	Type of Cooling	Harvest Rate (lbs ice/24 hrs)	Maximum Energy Use (kWh/hundred lbs ice)	Maximum Condenser Water Use (gal/hundred lbs ice)
Ice Making Head	Water	<500	7.80-0.0055 H	200-0.022 H
		≥500 and <1,436	5.58-0.0011 H	200-0.022 H
		≥1,436	4.0	200-0.022 H
	Air	<450	10.26-0.0086 H	Not Applicable
		≥450	6.89-0.0011 H	Not Applicable
Remote Condensing (but not remote compressor)	Air	<1,000	8.85-0.0038 H	Not Applicable
		≥1,000	5.10	Not Applicable
Remote Condensing and Remote Compressor	Air	<934	8.85-0.0038 H	Not Applicable
		≥934	5.3	Not Applicable
Self Contained	Water	<200	11.40-0.019 H	191-0.0315 H
		≥200	7.60	191-0.0315 H
	Air	<175	18.0-0.0469 H	Not Applicable
		≥175	9.80	Not Applicable

Water use is for the condenser only and does not include potable water used to make ice.

2014 DOE Standards

Energy Conservation Standards for Batch-Type Automatic Commercial Ice Makers
Effective January 2018

1. EPACT 2005 energy conservation standards went into effect in 2010. In 2015, DOE updated its energy conservation standards for commercial refrigeration equipment, including transparent-doored refrigerators with pull-down capability. Compliance with this standard is required by 2017. Units characterized for 2018 and beyond use data reported in this rulemaking's TSD. Units sold in 2022 and beyond are assumed to comply with this updated standard.
2. The ENERGY STAR category characterizes a unit that is compliant with ENERGY STAR v4, effective March 2017. This standard does not separately define units with pull-down capability.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Beverage merchandisers are shipped ready to be plugged in, so installation costs are assumed to be negligible.

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Beverage Merchandisers

Final

- EPACT 2005 sets maximum daily energy consumption levels, in kilowatt-hours per day, for commercial refrigerators with transparent doors and self-contained condensing unit designed for pull-down temperature applications (i.e., beverage merchandisers) and went into effect on January 1, 2010.
- In 2014, DOE updated its energy consumption standards for commercial refrigeration equipment, including beverage merchandisers, effective March 27, 2015. Both the DOE and EPCA standards are reported below.

Equipment Type	EPCA (2010)	DOE Standards (2017)
Beverage Merchandisers (PD.SC.M)	0.126xV + 3.51	0.11xV+0.81

- In 2013, EPA updated its ENERGY STAR specifications for glass-doored commercial refrigerators, which can be used as beverage merchandisers, effective October 1, 2014. These standards are also based on the volume of the unit (V). Note that ENERGY STAR does not have a separate equipment class for units with pull-down capability.

Beverage Merchandiser Size	0 < V < 15	15 ≤ V < 30	30 ≤ V < 50	50 ≤ V
Glass Door	0.118*V + 1.382	≤ 0.140*V + 1.050	≤ 0.088*V + 2.625	≤ 0.110*V + 1.500

- The beverage merchandiser characterized in this report, which is the typical unit according to DOE's 2014 CRE rulemaking and additional analysis by Guidehouse, is a 27 cubic foot cooler with a single hinged, transparent door, bright lighting, and shelving with a nominal compressor size of 4,700 Btu/h.
- The efficiency of beverage merchandisers can be increased through the use of more efficient compressors, fluorescent lighting with electronic ballasts, LED lighting, and improved insulation.
- For the Reference Case, beverage merchandisers are assumed to be mature technologies with few technology advancements in the coming years that would dramatically improve the efficiency.

1. Energy use for 2018 and beyond is estimated based on DOE's 2020 BVM Final Rule and the 2022 Compliance Certification Database.
2. The ENERGY STAR category assumes units are compliant with the ENERGY STAR v4 standard because combination units are currently not separately defined by ENERGY STAR. This standard went into effect on April 29, 2020. Our analysis finds ENERGY STAR certified equipment to be the most efficient currently available on the market.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Maintenance cost includes preventative maintenance costs such as checking and maintaining refrigerant charge levels, cleaning heat exchanger coils, and an annualized cost for refurbishments/remanufacturing.

Performance and Cost Characteristics » Commercial Refrigerated Vending Machines

Final

- DOE set federal energy efficiency standards for refrigerated vending machines. These standards set maximum daily energy consumption levels, in kilowatt-hours per day, for commercial refrigerated vending machines manufactured or sold in the United States on or after August 31, 2012. The daily energy consumption is based on the volume of the unit (V).
- In December 2015, DOE updated its energy conservation standards for beverage vending machines and defined two new product classes for combination vending machines. The energy conservation standard remains the same in the updated 2022 technical support document for vending machines. Compliance with these standards was required by 2019. For this analysis, compliance with these updated standards is assumed for equipment sold in 2022 and beyond. The updated standards and DOE equipment definitions are listed in the table below.

Equipment Type	Maximum Daily Energy Consumption
Class A (Transparent-Front)	MDEC= 0.052 × V + 2.43
Class B (Solid-Front)	MDEC = 0.052 × V + 2.20
Combination A	MDEC = 0.086 × V + 2.66
Combination B	MDEC = 0.111 × V + 2.04

ENERGY STAR® updated its maximum daily energy consumption efficiency levels, also in kilowatt-hours per day, for refrigerated vending machines that went into effect on April 29, 2020. These efficiency levels are based on refrigerated volume.

Equipment Class	Maximum daily energy consumption (kilowatt-hours per day)
Class A – a refrigerated bottled or canned beverage vending machine that is not a combination vending machine and in which 25% or more of the surface area on the front side of the beverage vending machine is transparent	MDEC = 0.04836 x V + 2.2599
Class B – any refrigerated bottled or canned beverage vending machine that is not considered to be Class A and is not a combination vending machine	MDEC = 0.04576 x V+1.936
Combination A – a combination vending machine where 25% or more of the surface area on the front side of the beverage vending machine is transparent	MDEC = 0.07998 x V + 2.4738
Combination B – a combination vending machine that is not considered to be Combination A	MDEC = 0.09768 x V + 1.7952

1. Based on 3800 operating hours per year (ADL, 1999) and typical zone air flow requirement profile (ASHRAE S45.11-2012)
2. Total installed cost of 16,300 CFM constant air volume (CAV) air handling unit (AHU) and hypothetical supply ductwork layout
3. Based on ASHRAE 90.1-2016 and 2019 fan power limit (Table 6.5.3.1.1-1) with no pressure drop adjustment. Assumed 80% motor load and 91% motor efficiency
4. ASHRAE 90.1-2016 and 2019 Section 6.5.3.2 require minimum two-speed fan control (no longer always constant volume).
5. Two-speed variable frequency drive (VFD)
6. Modulating VFD
7. Modulating custom engineered VFD

- Constant air volume (CAV) ventilation systems are common, inexpensive, air-side HVAC systems that operate in response to a single control zone. Historically, these systems provide a constant flow rate of air (typically a mix of recirculated and outside air) and adjust the supply temperature of that air in order to maintain the space temperature setpoint. Beginning with ASHRAE 90.1-2013 and continued in ASHRAE 90.1-2019, new CAV ventilation systems were mandated to have at least two fan speed settings with the requirement of a maximum 40% power at 66% flow. Systems with variable speed fans are increasingly popular, making the term "constant air volume" somewhat of a misnomer for this system type. This analysis examines only the fan energy of the CAV system.
- There is movement in the industry and in energy codes to reduce fan power. ASHRAE 90.1 includes fan power limits for CAV systems. Fan power can be minimized through good design practice (efficient duct layout, low pressure drop ductwork, filters, coils), proper fan selection, and high efficiency type fans. ASHRAE 90.1-2019 now requires a minimum fan efficiency grade (FEG, based on AMCA 205-12: Energy Efficiency Classification for Fans) of 67 and a design operating fan efficiency within 15% of the maximum fan total efficiency. There are exceptions to this requirement, including packaged systems such as the CAV system type considered here. Still the fan power limits are expected to become more stringent, and fan efficiency will become more important throughout the industry.
- The unit characterized in this report is a 16,300 CFM CAV system. The average commercial building is approximately 16,300 square feet (CBECS 2018). Assuming 1 CFM is needed per square foot of floor area results in a 16,300 CFM air handling unit.
- A 16,300 CFM CAV packaged indoor air handling unit with cooling and heating coils can be installed for approximately $71,829 (RS Means 2022). Ductwork would cost approximately $9,272 additional ($81,101 total). A two-speed motor (estimated $500 incremental cost) and variable frequency drive (estimated $5,800) add cost. Custom engineered variable frequency drives (estimated $9,550) and premium efficiency motors (estimated additional $1,500) add an additional cost to the system.
- Annual maintenance cost assumes 8 hours worth of labor by a technician to perform the necessary tasks (e.g., filter replacement, draining condenser water, etc.)
- ASHRAE Standard 90.1, which is used as a basis for most state energy codes, limits the fan power (brake HP or nameplate HP) for CAV systems. The 2016 version of Standard 90.1 was used to represent the 2018 minimum efficiency level (state energy codes typically refer to older versions of Standard 90.1 due to code revision cycles).
- Fan energy is affected by several factors, including fan type (e.g., centrifugal, axial), fan blade shape (e.g., forward-curved, backward-curved, backward-inclined, airfoil), drive type (belt or direct), configuration (plenum or housed centrifugal), system effects, duct design, filter and coil pressure drops, motor efficiency, and speed and flow control.

1. Based on 3800 operating hours per year (ADL, 1999) and typical zone air flow requirement profile (ASHRAES45.11-2012)
2. Total installed cost of 16,300 CFM VAV AHU, VFD, (10) VAV boxes, (10) VAV controllers with associated space temperature sensor, and hypothetical supply ductwork layout
3. Based on ASHRAE 90.1-2016 and 2019 fan power limit (Table 6.5.3.1.1-1) with no pressure drop adjustment. Assumed 80% motor load and 91% motor efficiency
4. ASHRAE 90.1-2016 and 2019 Section 6.5.3.2 minimum power-flow requirement
5. ASHRAE 90.1-2019 fan power limit and typical VAV power-flow relationship for 40%-100% flow
6. ASHRAE 90.1-2019 fan power limit and typical VAV power-flow relationship for 30%-100% flow
7. High aerodynamic efficiency fan

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Variable Air Volume

Final

- Variable air volume (VAV) ventilation systems are the most common multi-zone system type specified today for conditioning commercial buildings. These systems provide conditioned air to multiple zone terminal units (VAV boxes) that use dampers to modulate the amount of cool air to each zone. An individual zone thermostat controls the VAV box damper to allow more or less cooling. If a zone requires heating, then the VAV box provides the minimum flow rate and typically includes a reheat coil to meet the space temperature setpoint. As VAV box dampers close in the system, a variable frequency drive reduces fan speed and flow continuously to meet current requirements.
- This analysis examines only the fan energy of the VAV system. VAV systems vary fan speed and flow to meet space conditioning requirements; minimum flow settings apply for DX cooling stages and gas furnace heating stages. Most hours of operation are much lower than full speed, and fan power varies with the cube of fan speed according to fan affinity laws. The 2012 ASHRAE Handbook: HVAC Systems and Equipment (p. 45.11) provided the typical flow profile used for this analysis. The unit characterized in this report is a 16,300 CFM VAV system.
- There is movement in the industry and in energy codes to reduce fan power. ASHRAE 90.1 includes fan power limits for VAV systems. Fan power can be minimized through good design practice (efficient duct layout, low pressure drop ductwork, filters, coils), proper fan selection, and high efficiency type fans. ASHRAE 90.1-2019 now requires a minimum fan efficiency grade (FEG, based on AMCA 205-12: Energy Efficiency Classification for Fans) of 67 and a design operating fan efficiency within 15% of the maximum fan total efficiency. There are exceptions to this requirement, including packaged systems such as the VAV system type considered here. Still the fan power limits are expected to become more stringent, and fan efficiency will become more important throughout the industry.
- A 16,300 CFM VAV packaged indoor air handling unit with cooling and heating coils can be installed for approximately $82,023 (RS Means 2022). Ductwork and (10) VAV boxes with reheat would cost approximately an additional $28,272. (10) VAV controllers and the associated space temperature sensor would cost approximately $8,400 ($118,695 total). A 15 hp variable frequency drive (estimated $5,800) is an additional cost.
- ASHRAE Standard 90.1, which is used as a basis for most state energy codes, limits the fan power for VAV systems (brake HP or nameplate HP). The 2016 version of Standard 90.1 was used to represent the 2018 minimum efficiency level (state energy codes typically refer to older versions of Standard 90.1 due to code revision cycles).
- Annual maintenance cost assumes 8 hours worth of labor by a technician to perform the necessary tasks (e.g., filter replacement, draining condenser water, etc.)
- Fan energy is affected by several factors, including fan type (e.g., centrifugal, axial), fan blade shape (e.g., forward-curved, backward-curved, backward-inclined, airfoil), drive type (belt or direct), configuration (plenum or housed centrifugal), system effects, duct design, filter and coil pressure drops, and motor VFD efficiency.

1. Based on 2250 operating hours per year (ADL, 1999) and typical zone air flow requirement profile (ASHRAE S45.11-2012)
2. Total installed cost of 2-ton horizontal two-pipe fan coil unit, housing, and controls
3. Based on ASHRAE 90.1-2016 and 2019 fan power limit (Table 6.5.3.1.1-1) with no pressure drop adjustment. Assumed 80% motor load and 91% motor efficiency
4. Based on ASHRAE 90.1-2016 and 2019 Section 6.5.3.6 requirement of electronically commutated or 70+% efficient fan motor
5. Permanent split capacitor fan motor
6. Electronically commutated fan motor (single speed)
7. Electronically commutated fan motor (two-speed)
8. Electronically commutated fan motor (variable speed)
9. High aerodynamic efficiency fan

Performance and Cost Characteristics » Commercial Fan Coil Units

Final

- Commercial fan coil units (FCUs) are self-contained, mass-produced assemblies that provide cooling, heating, or cooling and heating, but they do not include the source of cooling or heating. The unit characterized in this report is a cooling only (two-pipe), horizontal unit with housing and controls. Fan coil units are typically installed in or adjacent to the space being served and have no (or very limited) ductwork.
- According to manufacturer literature, the cooling capacity for a nominal 800 CFM fan coil unit is about 2 tons. This analysis examines only the fan energy of FCUs.
- Fan coil unit fan motors can be shaded pole, a single-phase AC motor with offset start winding and no capacitor; PSC, a single-phase AC motor with offset start winding with capacitor; or ECM, an AC electronically commutated permanent magnet DC motor. PSC motors are currently the most common motor type in FCUs, but manufacturers also offer single speed, two speed, and ECM motors as an option. ASHRAE 90.1-2019 requires an electronically commutated fan motor (or minimum motor efficiency of 70%) for this system.
- There is movement in the industry and in energy codes to reduce fan power. ASHRAE 90.1 includes fan power limits for FCUs. Fan power can be minimized through good design practice and high efficiency type fans. ASHRAE 90.1-2019 now requires a minimum fan efficiency grade (FEG, based on AMCA 205-12: Energy Efficiency Classification for Fans) of 67 and a design operating fan efficiency within 15% of the maximum fan total efficiency. There are exceptions to this requirement, including small systems such as the FCU considered here. Still the fan power limits are expected to become more stringent, and fan efficiency will become more important throughout the industry.
- Fan coil units have higher maintenance costs than central air systems due to the distributed nature of the system. For each unit, the filters must be changed, and drain systems must be flushed periodically.
- ASHRAE Standard 90.1, which is used as a basis for most state energy codes, limits the fan power (brake HP or nameplate HP). The 2016 version of Standard 90.1 was used to represent the 2018 minimum efficiency level (state energy codes typically refer to older versions of Standard 90.1 due to code revision cycles).
- Fan energy is affected by several factors, including fan type configuration, filter and coil pressure drops, motor efficiency, and fan speed control.

Objective

The objective of this study is to develop baseline and projected performance and cost characteristics for residential and commercial end-use equipment in an Advanced Case that assumes accelerated adoption of energy-saving technologies due to increased R&D funding and market incentives.

- Examine 2012 and 2018 (commercial) and 2015 and 2020 (residential) baselines, as well as this year's baseline (2022).
  - Review literature, standards, installed base, contractor, and manufacturer information.
  - Provide a relative comparison and characterization of the cost and efficiency of a generic product.
- Forecast technology improvements that are projected to be available through 2050.
  - Review trends in standards, product enhancements, and research and development (R&D).
  - Project impact of product improvements and technology enhancement.

The performance and cost characterization of end-use equipment developed in this study will assist EIA in projecting national primary energy consumption.

Methodology

Input from industry stakeholders, including government, R&D organizations, and manufacturers, was used to project product enhancements concerning equipment performance and cost attributes.

- Technology forecasting involves many uncertainties.
- Technology developments affect performance and cost forecasts.
- Varied sources ensure a balanced view of technology progress and the probable timing of commercial availability.

Definitions

The following tables represent the current and projected efficiencies for residential and commercial building equipment ranging from the installed base in 2012 and 2018 (for commercial products) and 2015 and 2020 (for residential) to the highest efficiency equipment that is expected to be commercially available by 2050, assuming incremental adoption. Below are definitions for the terms used in characterizing the status of each technology.

- **Installed Stock Average**: the installed and *in use* equipment for that year. Represents the installed stock of equipment, but does *not* represent sales.
- **Current Standard**: the minimum efficiency (or maximum energy use) required (allowed) by current U.S. Department of Energy (DOE) standards, when applicable. For lighting, if no product exists at the standard efficiency level, a hypothetical wattage and lumen output is given for the standard's efficiency level.
- **ENERGY STAR®**: the minimum efficiency required (or maximum energy use allowed) to meet the ENERGY STAR® criteria, when applicable. Presented performance data represents certified products just meeting current ENERGY STAR specifications. For lighting, if no products exist at the ENERGY STAR efficiency level, a hypothetical wattage and lumen output is given for the ENERGY STAR efficiency level.
- **Low**: The minimum efficiency product or product mix available on the market. This rating typically reflects minimal compliance with DOE standards.
- **Typical**: the average, or typical, product being sold in the particular timeframe.
- **High**: the product with the highest efficiency available in the particular timeframe.
- **Lumens (lm):** the unit for luminous flux used in the SI unit system. This unit is used to indicate a light source's light output. All reported lumens are initial lumens. 1 kilolumen (klm) = 1,000 lumens.
- **Correlated Color Temperature (CCT)**: a specification of the color appearance of the light emitted by a lamp. Note: CCT is not a performance metric.
- **Color Rendering Index (CRI)**: a scale from 0 to 100 percent indicating how accurate a given light source is at rendering color when compared to a reference light source. The higher the CRI, the better the color rendering ability.
- **British thermal unit (Btu)**: a measure of the heat content of fuels or energy sources. It is the quantity of heat required to raise the temperature of one pound of liquid water by 1°F at the temperature that water has its greatest density (approximately 39 °F). 1 kBtu = 1,000 Btu.
- **Cubic Feet per Minute (CFM)**: a measure of airflow volume equal to the number of cubic feet of air flowing through a two-dimensional plane in one minute.
- **Not Available (N/A)**: data is not available where indicated.

Calculations

U21806-MNSC-CE-0771-Att 4

Final

The following metrics are commonly referred to throughout the tables to follow. Below are the calculations for each metric

— **Lighting**

- **System Wattage** = (Lamp Wattage * Ballast Factor) / Ballast Efficiency
- **System Lumens** = Lamp Lumens * Ballast Factor
- **Lamp Efficacy** = Lamp Lumens / Lamp Wattage
- **System Efficacy** = System Lumens / System Wattage
- **Lamp Cost ($/klm)** = Lamp Cost / (Lamp Lumens / 1,000)
- **Total Equipment Cost** = Lamp Cost + Fixture (including ballast) Cost
- **System Cost ($/klm)** = Total Equipment Cost / (System Lumens / 1,000). l/b/f denotes that the cost includes the luminaire, the ballast, and the fixture.
- **Total Installed Cost** = Total Equipment Cost + Labor Installation Cost
- **Ballast Luminous Efficiency (BLE)** = A/(1+B*Avg Total Lamp Arc Power^(-C)) where A, B, and C are pre-defined constants by DOE Energy Conservation Standards for Fluorescent Lamp Ballasts.

— **Commercial Refrigeration**

- **Nominal Capacity over Average Input (Btu in / Btu out)** = (Cooling or Heat Rejection Capacity)*24*365/(Annual Energy Consumption * 3,412)
- **Total Installed Cost** = Retail Equipment Cost + Labor Installation Cost
- **Total Installed Cost ($/kBtu/hour)** = Total Installed Cost*1,000 / (Cooling or Heat Rejection Capacity). h used as an abbreviation for hour throughout
- **Annual Maintenance Cost ($/kBtu/h)** = Annual Maintenance Cost * 1,000 / (Cooling or Heat Rejection Capacity)

— **Ventilation**

- **CFM out / Btu in / h** = System Airflow / (System Fan Power * 3,412)
- **Total Installed Cost ($/1,000 CFM)** = Total Installed Cost * 1,000 / System Airflow
- **Annual Maintenance Cost ($/1,000 CFM)** = Annual Maintenance Cost * 1,000 / System Fan Power

Market Transformation

U21806-MNSC-CE-0771-Att 4

Final

The market for the reviewed products has changed since this analysis was performed in 2015. These changes are noted and reflected in the efficiency and cost characteristics.

- DOE issued federal minimum efficiency standards that have gone into effect for General Service Fluorescent Lamps (2012), Incandescent Reflector Lamps (2012), and Fluorescent Lamp Ballasts (2019).

- In April 2022, DOE codified into the Code of Federal Regulations the 45 lumens per watt (lm/W) backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act (10 CFR 430, 87 FR 27439). This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

- DOE published a Final Rule updating energy conservation standards for Refrigerated Beverage Vending Machines at the end of 2015, effective in 2018. DOE also issued federal minimum efficiency standards that have or will soon go into effect for Refrigerated Beverage Vending Machines (2012), Automatic Commercial Ice Makers (2018), Walk-In Coolers and Freezers (2017), and Commercial Refrigeration Equipment (2017).

Residential Lighting

Note: More R&D investment and effort in the lighting industry only changes projections of LED technologies because additional funding and effort will likely not be applied to traditional technologies that have been exceeded in performance by their LED counterparts. Therefore, the inputs for all non-LED technologies remain unchanged from the Reference Case and are not included in this report.

Final

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Residential General Service Lamps

The residential general service lamps characterized in this report are a 60-watt and a 75-watt medium screw-based (E26) A-type incandescent lamp and their halogen, CFL, and LED equivalents. A standard 60-watt incandescent lamp produces approximately 800 – 850 lumens. A standard 75-watt incandescent lamp produces approximately 1,100 lumens.

Performance:

- A majority of residential lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100. However, CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination. High CRI products are preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these specific retail and display applications.

Cost:

- Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical lamp prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Fixture prices and installation costs are not included for the residential sector. Labor costs are assumed to be negligible because homeowners likely replaces lamps themselves as they burn out. Therefore, total installed cost is the price of a lamp, and annual maintenance costs are the cost of replacing the lamps, which is a function of lamp life, lamp price, and the annual operating hours.
- Disposal costs are not characterized for residential lighting in this analysis. In residential cases, disposal is done by the occupant. Lamp and product burnout are assumed to result in no "added" cost aside from the work performed to install the replacement.

Legislation:

- The Energy Independence and Security Act of 2007 (EISA 2007) established standards for 60-watt general service lamps, effective in 2014, and 75-watt lamps, effective in 2013. These standards cannot be achieved by incandescent bulbs, but can be by halogen, CFL, and LED technologies.
- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps. These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

ENERGY STAR:

- For ENERGY STAR qualification, general service omnidirectional lamps must have a minimum lamp efficacy of 70 lm/W for products with CRI ≥ 90 and 80 lm/W for lamps with CRI < 90. Additionally, the lamps must have a CRI ≥ 80, nominal CCT of 2,700, 3,000, 3,500, 4,000/4,100, 5,000, or 6,000 K, and rated lifetime ≥ 10,000 hours (ENERGY STAR).

Final

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Residential General Service Lamps

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent, halogen, and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050:

Technology	Efficacy	Lifetime	Price	Potential for Improvements
Incandescent	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Halogen	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements as of 2022.
CFL	+0.5%	0%	-0.5%	Improvements in efficacy can be made by using more rare-earth phosphors in compact fluorescent lamps.

Performance and Cost Characteristics » Residential Reflector Lamps

The residential reflector lamps characterized in this report are directional lamps that emit approximately 550 – 850 lumens (except for LED PAR38s which have outputs up to 1,700 lumens). Multiple baseline reflector lamps were analyzed, including 65W Incandescent BR30, Halogen PAR30, Halogen Infrared Reflector (HIR) PAR30, CFL BR30, LED BR30, and LED PAR38.

Performance:

- A majority of residential lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100, but for CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination, with high CRI products being preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these very specific retail and display applications.

Cost:

- Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy.
- Fixture prices and installation costs are not included for the residential sector. Labor costs are assumed to be negligible because homeowners likely replaces lamps themselves as they burn out. Therefore, total installed cost is the price of a lamp, and annual maintenance costs are the cost of replacing the lamps, which is a function of lamp life, lamp price, and the annual operating hours.
- Disposal costs are not characterized for residential lighting in this analysis. In residential cases, disposal is done by the occupant. Lamp and product burnout are assumed to result in no "added" cost aside from the work performed to install the replacement.

Legislation:

- EPAct92 established minimum performance standards for some reflector lamps and provided exemptions for certain specialty applications (e.g., ER/BR, vibration service, more than 5% neodymium oxide, impact resistant, infrared heat, colored). EPAct92 effectively phased-out R-shaped tungsten filament incandescent reflector lamps at certain wattages and bulb diameters, replacing them with more efficient and cost effective tungsten-halogen parabolic aluminized reflector (PAR) lamps. EISA 2007 took away certain exemptions from EPACT 1992, requiring certain previously exempted lamps to meet EPAct92 minimum performance standards by January 1, 2008. The 65W BR30, a large majority of the incandescent reflector lamp market, was still exempted until 2022.
- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. **This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps.** These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

ENERGY STAR:

- For ENERGY STAR qualification, general service, reflector lamps must have a minimum lamp efficacy of 61 lm/W for products with CRI ≥ 90 and 70 lm/W for lamps with CRI < 90, respectively. Additionally, the lamps must have a CRI ≥ 80, nominal CCT of 2,700, 3,000, 3,500, 4,000/4,100, 5,000, or 6,000 K, and rated lifetime ≥ 10,000 hours (ENERGY STAR).

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
Incandescent	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Halogen	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements as of 2022.
CFL	+0.5%	0%	-0.5%	In addition to higher efficiency reflector coatings, improvements in efficacy can be made by using more rare-earth phosphors in compact fluorescent lamps. Lifetime improvements can be made by improving the compact fluorescent lamp electrodes.

All LED lighting products exceed the new minimum efficacy standards.

Performance and Cost Characteristics » Residential 4-foot Linear 2-Lamp Lighting Systems

This section characterizes commercial linear fixtures that house two 4ft long linear lamps and their integrated luminaire equivalents. The technologies available for this system are linear fluorescent and LED.

- T5 lamps are approximately 40% narrower than T8 lamps and almost 60% narrower than T12 lamps. This narrowness allows T5 lamps to be coated with higher quality, more efficient phosphor blends than larger diameter lamps, resulting in a more efficacious lamp. The compact size of T5 lamps also permits greater flexibility in lighting design and construction.
- LED options for linear fixtures include replacement lamps that can fit directly into an existing fixture and fully integrated luminaires that can be used to replace existing fixtures. LED replacement lamps are also known as TLEDs. Type A TLEDs can be installed with existing ballasts and Type B and C TLEDs require the ballast to be disconnected. Replacement lamps are only sold to go into existing fixtures. If a new fixture is to be installed, a fully integrated LED luminaire is a more cost effective and efficient option. Because LED luminaires are fully integrated, they do not have lamp and fixture efficiency losses associated with ballasts and fixture optics.

Performance:

- Residential linear lamps often have a nominal CCT rating of 3500K, but products with CCTs of 3000K, 4000K, and 4100K (neutral white) are also common. 5000K (daylight) lamps are available as well. When replacing a light bulb, it is important to choose a product with a similar CCT value to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100, but CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination, with high CRI products being preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these very specific retail and display applications.

Cost:

- Many factors influence the price of LED lamps, including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical lamp prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps. which are sold only as a replacement for use in an existing fixture. The LED luminaire is more efficient and cost effective for new installations or fixture retrofits.
- Labor costs for lamp changes are assumed to be negligible because homeowners likely replace lamps themselves as they burn out. Therefore, annual maintenance costs are the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for residential linear systems.
- Disposal costs are not characterized for residential lighting in this analysis. In residential cases, disposal is done by the occupant. Lamp and product burnout are assumed to result in no "added" cost aside from the work performed to install the replacement.

Legislation:

- Beginning July 14, 2012 (or July 14, 2014, for T8 700-series phosphor lamps), DOE fluorescent lamp standards required a minimum efficacy of 89 lm/W. Although the amended performance-based standards do not explicitly prohibit T12 lamps, no T12 lamps met the standard at the time of its announcement. Since then, however, T12 lamps meeting the standard have entered the market.
- Beginning November 14, 2014, DOE standards required that the characterized residential ballasts have a minimum BLE = 0.993 / (1 + 0.41 * Avg Total Lamp Arc power ^ (- 0.25)). Residential ballasts also must have a minimum power factor of 0.5.
- California's Title 24 mandates the use of electronic ballasts with high efficacy luminaires (including fluorescent) of 13 W or higher (CEC, 2005).

ENERGY STAR:

- ENERGY STAR does not cover linear lamps. (ENERGY STAR, 2020)

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume that manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050:

Technology	Efficacy	Lifetime	Price	Potential for Improvements
T12	0%	0%	-0.5%	Limited because the technology is mature.
T8	0%	0%	-0.5%	Limited because the technology is mature.

1. N/A because a fixture and an LED replacement lamp would not be purchased separately for a new installation or retrofit when there are integrated LED luminaires that are more efficient and cost effective. These lamps are sold only as replacements to go into existing fixtures.

Assume no labor is associated with lamp replacement in the residential sector because residents likely replace the lamps themselves.

1. N/A because the lamp and fixture are both included in the luminaire.

Performance and Cost Characteristics » Residential Outdoor Lamps

- The residential outdoor lamps characterized in this report include reflector and general service lamps used for security and/or porch lighting that can be switched on from inside the home (i.e. parking lot/garage and outdoor common area lighting at multifamily buildings are excluded) with lumen outputs of approximately 1,000 – 1,400 lumens. Multiple baseline lamps were analyzed according to estimates of installed base average lumens by lamp type, including:

Security (Reflector Lamps)	Porch (General Service Lamps)
Incandescent BR30	Incandescent A-Type
Halogen PAR38	Halogen A-Type
Halogen Infrared Reflector (HIR) PAR38	CFL Bare Spiral
CFL PAR38	LED A-Type Lamp
LED PAR38	

Performance:

- 65W BR30 is the only viable incandescent reflector lamp due to exemption from EISA 2007. The lumen output of this lamp type is well below other reflector lamp technologies characterized for residential outdoor spaces, thus its use is limited for this application. This product is, as of 2022, expected to be eliminated by DOE's 45 lm/W backstop requirement.
- A majority of residential lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100. However, CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination. High CRI products are preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these specific retail and display applications.

Cost:

- Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical lamp prices in 2015 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Fixture prices and installation costs are not included for the residential sector. Labor costs are assumed to be negligible because homeowners likely replaces lamps themselves as they burn out. Therefore, total installed cost is the price of a lamp, and annual maintenance costs are the cost of replacing the lamps, which is a function of lamp life, lamp price, and the annual operating hours for residential reflector lamps.
- Disposal costs are not characterized for residential lighting in this analysis. In residential cases, disposal is done by the occupant. Lamp and product burnout are assumed to result in no "added" cost aside from the work performed to install the replacement.

Legislation:

- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. **This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps.** These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

ENERGY STAR:

- For ENERGY STAR qualification, general service omnidirectional lamps must have a minimum lamp efficacy of 70 lm/W for products with CRI ≥ 90 and 80 lm/W for lamps with CRI < 90.
- For ENERGY STAR qualification, general service reflector lamps must have a minimum lamp efficacy of 61 lm/W for products with CRI ≥ 90 and 70 lm/W for lamps with CRI < 90.
- Additionally, the lamps must have a CRI ≥ 80, nominal CCT of 2,700, 3,000, 3,500, 4,000/4,100, 5,000, or 6,000 K, and rated lifetime ≥ 10,000 hours (ENERGY STAR).

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
Incandescent Omnidirectional	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Incandescent Directional	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Halogen	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
CFL	+0.5%	0%	-0.5%	In addition to benefiting from higher efficiency reflector coatings, improvements in efficacy can be made by using more rare-earth phosphors in compact fluorescent lamps. Lifetime improvements can be made by improving the compact fluorescent lamp electrodes.

All LED lighting products exceed the new minimum efficacy standards.

Commercial Lighting

Note: More R&D investment and effort in the lighting industry will only change future projections of LED technologies because additional funding and effort will likely not be applied to traditional technologies that have been exceeded in performance by their LED counterparts. Therefore, the inputs for all non-LED technologies remain unchanged from the Reference Case and are therefore not included in this report.

Performance and Cost Characteristics » Commercial General Service Lamps in Recessed Can Fixtures

This section characterizes commercial omnidirectional incandescent, halogen, CFL, and LED screw-based general service lamps emitting approximately 1,600 lumens (equivalent to a 100W incandescent lamp) used in recessed can fixtures. A recessed can is a directional fixture set into the ceiling, in which all of the light is directed downwards from the opening. Therefore, an omnidirectional lamp is not well suited for use in such fixtures because light that emits upwards and out of the sides must be reflected downwards and out of the fixture and some light is absorbed in the process. A fixture efficiency of 61% is used to characterize these lumen losses for all omnidirectional lamps. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- A majority of general service lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100. However, CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination. High CRI products are preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these specific retail and display applications.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps which are sold only as a replacement for use in an existing fixture. There are integrated LED luminaires that are more efficient and cost effective for new installations or fixture retrofits. Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy. Therefore typical lamp prices in 2015 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial general service lamps (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for high intensity discharge (HID) lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- The Energy Independence and Security Act of 2007 (EISA 2007) established standards for 100W lamps effective in 2012. These standards cannot be achieved by incandescent bulbs, but they can be met by halogen, CFL, and LED technologies from 2012 to 2023.
- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps. These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

ENERGY STAR:

- For ENERGY STAR qualification, general service omnidirectional lamps must have a minimum lamp efficacy of 70 lm/W for products with CRI ≥ 90 and 80 lm/W for lamps with CRI < 90. Additionally, the lamps must have a CRI ≥ 80, nominal CCT of 2,700, 3,000, 3,500, 4,000/4,100, 5,000, or 6,000 K, and rated lifetime ≥ 10,000 hours (ENERGY STAR).

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
Incandescent	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements.
Halogen	0%	0%	-0.5%	Limited because the technology is mature and the technology cannot meet legislative requirements as of 2022
CFL	+0.5%	0%	-0.5%	Improvements in efficacy can be made by using more rare-earth phosphors in compact fluorescent lamps. Lifetime improvements can be made by improving the compact fluorescent lamp electrodes.

Performance and Cost Characteristics » Commercial Reflector Lamps in Recessed Can Fixtures

This section characterizes commercial halogen, halogen infrared reflector (HIR), and LED screw-based reflector lamps emitting approximately 1400 lumens used in recessed can fixtures.

- HIR lamps contain a tungsten halogen capsule with a film coating on the inside of the capsule. The coating reflects infrared radiation back into the lamp filament, which forces the filament to burn at a higher temperature. This design increases the efficacy of the lamp, without reducing operating life.
- A recessed can is a directional fixture set into the ceiling, in which all of the light is directed downwards from the opening. Therefore, a reflector lamp, which employs reflective coating to direct light out in only one direction, is well suited for use in such fixtures. However, some light is not able to escape the fixture, and a fixture efficiency of 93% is used to characterize these minimal lumen losses. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- A majority of reflector lamps have a nominal CCT rating of 2,700K and give off a warm, yellowish white color, but products with CCTs of 3,000K, 3,500K, 4,100K (neutral white), 5,000K (daylight), and 6,500K (blueish white) are also available. Traditional incandescent light bulbs have a nominal CCT of about 2,700K. When replacing a light bulb, it is advised to chose a product with a similar CCT value in order to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100. However, CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination. High CRI products are preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these specific retail and display applications.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps which are sold only as a replacement for use in an existing fixture. Many factors influence the price of LED lamps including CRI, lifetime, dimming capabilities, and efficacy.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial reflector lamps (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- EPAct92 established minimum performance standards for some reflector lamps and provided exemptions for certain specialty applications (e.g., ER/BR, vibration service, more than 5% neodymium oxide, impact resistant, infrared heat, colored). EPAct92 effectively phased-out R-shaped tungsten filament incandescent reflector lamps at certain wattages and bulb diameters, replacing them with more efficient and cost effective tungsten-halogen parabolic aluminized reflector (PAR) lamps. EISA2007 took away certain exemptions from EPACT 1992, requiring certain previously exempted lamps to meet EPAct92 minimum performance standards by January 1, 2008. In 2015, DOE issued a final rule that determined that amending the standards for incandescent reflector lamps could not be economically justified.
- In April 2022, DOE codified into the Code of Federal Regulations the 45 lm/W backstop requirement for general service lamps that Congress prescribed in the Energy Policy and Conservation Act. **This action also amended the definition of general service lamps to include previously exempted product classes, such as reflector lamps.** These standards can not be achieved by traditional incandescent or halogen technologies currently on the market, and given current and projected trends in industry, they will likely not be met. It is currently assumed that industry will increase its investment in LED technology at the expense of incandescent, halogen, and CFL technologies. The rule will go into effect for manufacture and import in January 2023 and for retail and distribution in July 2023.

Performance and Cost Characteristics » Commercial 4-foot Linear 2-Lamp Lighting Systems

This section characterizes commercial linear fixtures that house two 4ft long linear lamps and their integrated luminaire equivalents. The technologies available for this system are linear fluorescent and LED.

- Linear fluorescent options are T5, T8, and T12 lamps. T5 lamps are approximately 40% narrower than T8 lamps and almost 60% narrower than T12 lamps. This narrowness allows T5 lamps to be coated with higher quality, more efficient phosphor blends than larger diameter lamps, resulting in a more efficacious lamp. The compact size of T5 lamps also permits greater flexibility in lighting design and construction.
- LED options for linear fixtures include replacement lamps that can fit directly into an existing fixture and fully integrated luminaires that can be used to replace existing fixtures. LED replacement lamps are also known as TLEDs. Type A TLEDs can be installed with existing ballasts and Type B and C TLEDs require the ballast to be disconnected. Replacement lamps are only sold to go into existing fixtures. If a new fixture is to be installed, a fully integrated LED luminaire is a more cost effective and efficient option. Because LED luminaires are fully integrated, they do not have lamp and fixture efficiency losses associated with ballasts and fixture optics. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- Linear lamps often have a nominal CCT rating of 3,500K, but products with CCTs of 3,000K, 4,000K, and 4,100K (neutral white) are also common. 5,000K (daylight) lamps are available as well. When replacing a light bulb, it is important to choose a product with a similar CCT value to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100, but CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination, with high CRI products being preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these very specific retail and display applications.

Cost:

- The total installed cost is the price of two lamps, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamp, which are sold only as a replacement for use in an existing fixture. There are integrated LED luminaires that are more efficient and cost effective for new installations or fixture retrofits. Many factors influence the price of LED lamps, including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical lamp prices in 2022, reflecting a mix of lamp characteristics and features, were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours of 4055 hours per year for commercial 4ft linear systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- Beginning July 14, 2012 (or July 14, 2014, for T8 700-series phosphor lamps), DOE fluorescent lamp standards required a minimum efficacy of 89 lm/W. Although the amended performance-based standards do not explicitly prohibit T12 lamps, no T12 lamps met the standard at the time of its announcement. Since then, however, T12 lamps meeting the standard have entered the market.
- California's Title 24 mandates the use of electronic ballasts with high efficacy luminaires (including fluorescent) of 13 W or higher (CEC, 2005).

ENERGY STAR:

- ENERGY STAR does not cover commercial linear luminaires (ENERGY STAR, 2020).

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume that manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

Technology	Efficacy	Lifetime	Price	Potential for Improvements
T8 F32 Commodity	0%	0%	-0.5%	Limited because the technology is mature.
T8 F32 High Efficiency/High Output	0%	0%	-0.5%	Limited because the technology is mature.
T5 F28	0%	0%	-0.5%	Limited because the technology is mature.

1. N/A because the lamp and fixture are both included in the luminaire.

Performance and Cost Characteristics » Commercial 8-foot Linear 2-Lamp Lighting Systems

This section characterizes commercial linear fixtures that house two 8ft long linear lamps and their integrated luminaire equivalents. The technologies available for this system are linear fluorescent and LED.

- Linear fluorescent options are T5, T8, and T12 lamps. T5 lamps are approximately 40% narrower than T8 lamps and almost 60% narrower than T12 lamps. This narrowness allows T5 lamps to be coated with higher quality, more efficient phosphor blends than larger diameter lamps, resulting in a more efficacious lamp. The compact size of T5 lamps also permits greater flexibility in lighting design and construction.
- LED options for linear fixtures include replacement lamps that can fit directly into an existing fixture and fully integrated luminaires that can be used to replace existing fixtures. LED replacement lamps are also known as TLEDs. Type A TLEDs can be installed with existing ballasts and Type B and C TLEDs require the ballast to be disconnected. Replacement lamps are only sold to go into existing fixtures. If a new fixture is to be installed, a fully integrated LED luminaire is a more cost effective and efficient option. Because LED luminaires are fully integrated, they do not have lamp and fixture efficiency losses associated with ballasts and fixture optics. For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- Linear lamps often have a nominal CCT rating of 3,500K, but products with CCTs of 3,000K, 4,000K, and 4,100K (neutral white) are also common. 5,000K (daylight) lamps are available as well. When replacing a light bulb, it is important to choose a product with a similar CCT value to achieve the same look.
- Incandescent and halogen lamps have perfect color rendering with a CRI value of 100, but CFL and LEDs products commonly fall between 70 and 90 CRI, with an average around 80. CRI values of 80 are considered suitable for general illumination, with high CRI products being preferable for retail and display applications where improved color quality is of real value. Higher CRI is not expected to be a focus for future LED products except for these very specific retail and display applications.

Cost:

- The total installed cost is the price of two lamps, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED replacement lamps, which are sold only as a replacement for use in an existing fixture. There are integrated LED luminaires that are more efficient and cost effective for new installations or fixture retrofits. Many factors influence the price of LED lamps, including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical lamp prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours of 4147 hours per year for commercial 8ft linear systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

Legislation:

- Beginning July 14, 2012 (or July 14, 2014, for T8 700-series phosphor lamps), DOE fluorescent lamp standards required a minimum efficacy of 89 lm/W. Although the amended performance-based standards do not explicitly prohibit T12 lamps, no T12 lamps met the standard at the time of its announcement. Since then, however, T12 lamps meeting the standard have entered the market.
- California's Title 24 mandates the use of electronic ballasts with high efficacy luminaires (including fluorescent) of 13 W or higher (CEC, 2005).

ENERGY STAR:

- ENERGY STAR does not cover commercial linear luminaires (ENERGY STAR, 2020).

Final

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume that manufacturers will focus on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050:

Technology	Efficacy	Lifetime	Price	Potential for Improvements
T8 F59 Typical Efficiency	0%	0%	-0.5%	Limited because the technology is mature.
T8 F59 High Efficiency	0%	0%	-0.5%	Limited because the technology is mature.
T8 F96 High Output	0%	0%	-0.5%	Limited because the technology is mature.

Performance and Cost Characteristics » Commercial Low-Bay Lighting Systems

Final

The commercial low bay lighting characterized in this report is a one-lamp and one-ballast system in a low/high bay fixture that emits between 6,000 and 10,000 system lumens. Low bay lighting is defined as "interior lighting where the roof trusses or ceiling height is less than 25ft. above the floor"(IESNA, 2000). For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- Low bay conventional lighting technologies, such as metal halide and sodium vapor lamps, provide higher efficacy ranging from 80 lm/W to 100 lm/W. Older, mercury vapor lamps have much lower efficacy at approximately 40 lm/W.
- CCT and CRI values range broadly based on technology type for low bay products.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED luminaires, which are sold as one integrated system. Many factors influence the price of LED luminaires, including CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical luminaire prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial low-bay systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

ENERGY STAR:

- ENERGY STAR does not cover low/high bay luminaires (ENERGY STAR, 2012).

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime, and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. However, the ability of these conventional technologies to react rapidly (in terms of performance improvement) to the emergence of a new light source such as LED lighting is relatively small because these are mature technologies (particularly incandescent and fluorescent) and established market competitors (Navigant, 2019).
- For LED technology, efficacy, lifetime, and price improvements were based on the model described in the Energy Savings Forecast of Solid-State Lighting in General Illumination Applications (Navigant, 2019). For traditional technologies, the following future improvements were assumed to occur year over year through 2050.

	Efficacy	Lifetime	Price	Potential for Improvements
Mercury Vapor	0%	0%	-0.5%	Limited because the technology is mature.
Metal Halide	0%	0%	-0.5%	Limited because the technology is mature.
Sodium Vapor	0%	0%	-0.5%	Limited because the technology is mature.

1. N/A because the lamp and fixture are both included in the luminaire.

Performance and Cost Characteristics » Commercial High-Bay Lighting Systems

The commercial high-bay lighting characterized in this report is a one-lamp and one-ballast system in a low/high bay fixture that emits greater than 10,000 system lumens. High-bay lighting is defined as "interior lighting where the roof trusses or ceiling height is greater than 25ft. above the floor" (IESNA, 2000). For all lamp technologies, an annual fixture renovation rate of 10% (i.e., 10-year fixture service life) is used to reflect the proportion of equipment that retires each year.

Performance:

- High bay conventional lighting technologies, such as metal halide and sodium vapor lamps, provide higher efficacy ranging from 80 lm/W to 100 lm/W. Older, mercury vapor lamps have much lower efficacy at approximately 40 lm/W.
- CCT and CRI values range broadly based on technology type for high bay products.

Cost:

- The total installed cost is the price of a lamp, ballast (if applicable), and fixture plus the cost for labor associated with the installation, except for in the case of LED luminaires, which are sold as one integrated system. Many factors influence the price of LED luminaires including, CRI, lifetime, dimming capabilities, and efficacy. Therefore, typical luminaire prices in 2022 reflecting a mix of lamp characteristics and features were used as the basis for projections for both typical and high efficacy products in the future.
- Annual maintenance costs are the cost of labor for replacing the lamps and the cost of the replacement lamp itself. The frequency at which lamps are replaced is a function of lamp life and the annual operating hours for commercial high bay systems (DOE SSL Program, 2012a).
- Commercial lighting disposal costs are estimated to be $0.12 per linear foot of fluorescent lamps, $1.50 per lamp for HID lamps, and $0.50 for CFLs (EPA, 2022).

ENERGY STAR:

- ENERGY STAR does not cover low/high bay luminaires (ENERGY STAR, 2012).

Future Performance Improvements:

- Projections were provided for both typical and high performing products for 2030, 2040, and 2050. We assume manufacturers will focus would be on improving efficacy, lifetime and price for products at constant CRI and CCT values.
- Due to continued R&D investment, competition from LED lighting products, and general market demand for cost-effective lighting, the performance and cost characteristics of conventional lighting technologies are expected to improve over the analysis period. 1. The total capacity represents the nominal compressor capacity required for the entire refrigeration system of a typical supermarket. This refrigeration system usually includes two low temperature racks and two medium temperature racks. For 2018, a 1,200 MBtu/h total cooling capacity is based on a 200-ton estimate for total capacity–80 tons for the medium temperature racks and 20 tons for the low temperature racks.
2. Capacity and annual energy consumption for 2022 and beyond are based on market research and Guidehouse estimates.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Maintenance cost includes oil changes, bearing lubrication, filter replacement, and system functionality checks-approximately half a day per rack of labor for technician is assumed.

- Commercial compressor rack systems that serve commercial supermarket display cases and walk-ins consist of a number of parallel-connected compressors located in a separate machine room. By modulating compressor capacity, these integrated systems provide higher efficiency and mechanical longevity.
- Rack integrators generally supply a packaged compressor rack for which much of the necessary piping, insulation, components, and controls are pre-assembled.
- A typical supermarket will have 10 to 20 compressors mounted in racks in the 3-horsepower (hp) to 15-hp size range. Usually, each rack has three to five compressors serve a series of loads with nearly identical evaporator temperature.
- The duty cycle for compressors is usually in the range of 60% to 70%.
- Energy use and capacity for the Reference Case are projected to remain static over the coming decades because commercial compressor racks systems are a mature technology. The Reference Case assumes low R&D efforts because it is an established technology.
- **For this Advanced Case, a 10% reduction in energy consumption is assumed to occur over the Reference Case for 2022 and beyond due to vacuum insulated panel (VIP) adoption by display cases and a relaxation in charge size limits for more efficient, low global warming potential (GWP) refrigerants. Also, increased adoption of toxic/flammable refrigerants such as ammonia and propane due to improved safety technology such as leak detection**.

Performance and Cost Characteristics » Commercial Condensers

Final

- Condensers are designed with multiple methods of cooling: air-cooled, water-cooled, and evaporative. These units can be single-circuit or a multiple circuit.
- Commercial condensers are remotely located, typically installed on the roof of a supermarket.
- For use with parallel compressors in supermarkets, air-cooled units are the most commonly used condensers. This analysis is based on multiple air-cooled condensers connected to a supermarket refrigeration system comprised of two low temperature condensers and two medium temperature condensers.
- Each compressor rack has a dedicated condenser or a separate circuit of a single common condenser. Condenser temperatures of multiple racks are often different.
- The duty cycle for condensers is usually in the range 50%-70%.
- **For this Advanced Case, a 10% reduction in energy consumption and a 5% reduction in required capacity is assumed to occur over the Reference Case for 2020 and beyond due to VIP adoption by display cases and a relaxation in charge size limits for more efficient, low GWP. Also, increased adoption of toxic/flammable refrigerants such as ammonia and propane due to improved safety technology such as leak detection**.

1. For 2022 and beyond, energy consumption and cost values were estimated using shipment-weighted averages reported in DOE's 2014 CRE Final Rule Technical Support Document (TSD) for equipment commonly used as display cases. DOE's updated conservation standard went into effect in 2017, so units sold in 2018 are assumed to comply with this standard.
2. For consistency with DOE rulemaking practices, Supermarket Display Case Energy Use reported above includes energy use of the compressor racks and condensers. To avoid double counting, do not add Energy Use from the Compressor Rack or Condenser Systems tabs if calculating total energy consumption.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Maintenance cost includes preventative maintenance costs such as cleaning evaporator coils, drain pans, fans, and intake screens as well as lamp replacements and other lighting maintenance activities. After 2012, these values are based on a reported maintenance and repair cost of $220 per unit for preventative maintenance plus approximately $60 per linear foot for additional repair and maintenance.

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Supermarket Display Cases

Final

- DOE set federal energy efficiency standards for Commercial Refrigeration Equipment (CRE) in 2009. These standards set maximum daily energy consumption levels, in kilowatt-hours per day, for display cases manufactured sold in the United States on or after January 1, 2012.
- DOE updated its Energy Conservation Standards for Commercial Refrigeration Equipment in 2014 for equipment sold on or after March 27, 2017.
- The table below lists equipment used as supermarket display cases and their corresponding Energy Conservation Standard levels. The maximum allowable daily energy consumption for each equipment class is a linear function of Total Display Area (TDA).

Equipment Description	Standards Equation (2012)	Standards Equation (2017)
Vertical Open Cooler (VOP.RC.M)	0.82xTDA+4.07	0.64xTDA+4.07
Semi-Vertical Open Cooler (SVO.RC.M)	0.83xTDA+3.18	0.66xTDA+3.18
Horizontal Open Cooler (HZO.RC.M)	0.35xTDA+2.88	0.35xTDA+2.88
Transparent-Doored Cooler (VCT.RC.M)	0.22xTDA+1.95	0.15xTDA+1.95
Deli Display Cooler (SOC.RC.M)	0.51xTDA+0.11	0.44xTDA+0.11
Transparent-Doored Freezer (VCT.RC.L)	0.56xTDA+2.61	0.49xTDA+2.61
Horizontal Open Freezer (HZO.RC.L)	0.57xTDA+6.88	0.55xTDA+6.88

Performance and Cost Characteristics » Commercial Supermarket Display Cases

Final

- According to CBECS 2018 microdata, the average building size for food sale building type is 31,997.
- Unit energy consumption for 2022 and beyond is estimated using a shipment-weighted average by efficiency level and equipment class, using data in DOE's 2014 CRE Final Rule TSD with updated analysis from Guidehouse in 2016. The equipment classes analyzed are listed in the table on the previous slide.
- Supermarket refrigeration systems consist of refrigerated display cases, condensing units, and centralized compressor racks.
- A typical supermarket display case contains lighting, evaporators, evaporator fans, piping, insulation, valves, and controls.
- The efficiency of supermarket display cases can be increased through the use of improved evaporator coils, larger evaporators, higher efficiency evaporator fan blades, high efficiency doors, LED lighting, and improved insulation.
- **For 2020 and beyond, accelerated adoption of energy savings technologies is assumed to take place more than in the Reference Case, including accelerated shipments migration to doored over open units, where applicable, as well as vacuum insulated panels.**
- **The incremental cost of VIPs is assumed to decrease from its present value due to increased R&D funding.**
- **Projected installed costs for this Advanced Case are higher than the Reference Case, even assuming increased R&D funding. Advanced energy-saving technologies are assumed to be made financially viable for operators by increased market incentives such as utility efficiency rebate programs and/or carbon pricing.**
- **This Advanced Case assumes a transition from Hydrofluorocarbons (HFC) to more efficient propane and ammonia refrigerants by 2040.**
- **Advanced Case assumes a 5% reduction in energy use per decade based on technology and efficiency improvements.**

1. EPACT 2005 energy standards went into effect in 2010. 2022 low efficiency cost and energy consumption values are based on minimum compliance with this standard. Unless otherwise noted, all other cases are based on shipment-weighted averages solid- and transparent-doored units reported in the 2014 CRE TSD. DOE's updated Energy Conservation standards went into effect in 2017; therefore, compliance with this standard is assumed for 2022 and beyond.
2. The ENERGY STAR category is based on a shipment weighted average of solid- and transparent-doored units that are minimally compliant with ENERGY STAR v3, effective October 1, 2014. Units compliant with ENERGY STAR are found to be the most efficient reach-in refrigeration equipment on the market in 2022.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Installation cost for 2012 is based on NCI 2009 report that assumes a cost of $863. Installation cost for 2022 and beyond is based DOE's 2014 CRE Final Rule and additional analysis by Guidehouse, which assumes an installation cost of $878 for self-contained equipment.
5. Maintenance costs after 2012 are based on DOE's CRE 2014 Final Rule TSD, which reports $35 annual preventative maintenance, per unit, per year, plus approximately $40 per linear foot, per year of additional repair and maintenance costs for the units characterized.

Performance and Cost Characteristics » Commercial Reach-In Refrigerators

Final

- The Energy Policy Act of 2005 (EPACT 2005) set maximum daily energy consumption levels, in kilowatt-hours per day, for commercial reach-in refrigerators that went into effect on January 1, 2010. The daily energy consumption is based on the volume of the unit (V) in ft^3.
- In 2014, DOE updated its energy conservation standards for reach-in refrigerators, effective March 27, 2017. Both standards are reported in the table below.

Equipment Class	EPCA Standard Level (2010)	DOE Standard Level (2017)
Solid Door (VCS.SC.M)	0.10xV+2.04	0.05xV + 1.36
Glass Door (VCT.SC.M)	0.12xV+3.34	0.1xV+0.86

- In 2013, EPA updated its ENERGY STAR specifications for reach-in refrigerators, effective March 27, 2017. These standards are also based on the refrigerated volume of the unit.

Reach-In Refrigerator Size	0 < V < 15	15 ≤ V < 30	30 ≤ V < 50	50 ≤ V
Solid Door (VCS.SC.M)	0.022xV+0.97	0.066xV+0.31	0.04xV+1.09	0.024xV+1.89
Glass Door (VCT.SC.M)	0.095xV+0.445	0.05xV+1.12	0.076xV+0.034	0.105xV-1.111

- Unit energy consumption for 2012 and beyond was estimated based on shipment-weighted averages by efficiency level and equipment class for 49 ft^3 VCS.SC.M and VCT.SC.M units reported in DOE's 2014 CRE Final Rule TSD with updated analysis from Guidehouse in 2016. These units were estimated to comprise approximately 85% and 15% of total reach-in refrigerator shipments, respectively.
- The efficiency of commercial reach-in refrigerators can be increased through the use of efficient compressors, efficient evaporator fans, efficient condenser fans, electric defrost, and more efficient lighting.
- After 2022, the high efficiency cases are based on solid-doored units rather than shipment-weighted averages due to the assumption that stakeholders will increasingly value energy conservation.
- **Unit energy consumption is expected to decrease as a result of DOE's updated energy conservation standards, as well as a transition to more efficient propane refrigerant due to compliance with EPA Significant New Alternatives Policy (SNAP).**
- **For this Advanced Case, the typical unit in 2020 is assumed to comply with DOE's updated energy conservation standards for commercial refrigeration.**
- **A shipments migration from transparent- to solid-doored units is assumed for the Advanced Case.**
- **By 2040, the adoption of vacuum insulated panels is assumed to occur, with the aid of decreased incremental costs due to increased R&D funding.**
- **Projected installed costs for this Advanced Case are higher than the Reference Case, even assuming increased R&D funding. Advanced energy-saving technologies are assumed to be made financially viable for operators by increased market incentives such as utility efficiency rebate programs and/or carbon pricing.**
- **This analysis finds that with increased R&D and market incentives for energy-efficient technologies, a limit of possible efficiency improvements for self-contained, vapor compression refrigeration systems will be reached by 2040.**

1. Assumes medium temperature units are refrigerators.
2. Average unit energy consumption was adapted from the DOE CRE 2016 report by assuming electronically commutated motor (ECM) evaporator fan motors are required for Energy Policy & Conservation Act (EPCA) compliance, as well as ECM condenser fan motors.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Installation cost for 2012 and beyond is based on DOE's Walk-In Technical Support Document (TSD).
5. Maintenance cost includes checking and maintaining refrigerant charge levels, checking settings, and cleaning heat exchanger coils.

Performance and Cost Characteristics » Commercial Walk-In Refrigerators

Final

- For 2012 and beyond, the unit characterized was a walk-in storage cooler, based on DOE's WICF TSD.
- A typical walk-in refrigerator includes:
  - insulated floor and wall panels
  - merchandising doors, shelving, and lighting (not included in cost estimate)
  - semi-hermetic reciprocating compressor
  - refrigerant (R404A)
  - condenser
  - evaporator
- Energy consumption is assumed to scale with the AWEF (Annual Walk-in Energy Factor), defined as the ratio of total heat removed from the refrigerated volume per year to the total electrical energy input of refrigeration systems over the same time period.
- The installation cost consists of freight and delivery costs in addition to on-site assembly.
- **This Advanced Case assumes a projected 10% decrease in energy consumption over the Reference Case due to adoption of more efficient refrigerants.**

The Energy Independence and Security Act (EISA) of 2007 included prescriptive standards for walk-in refrigerators (coolers) that went into effect in 2009. These prescriptive standards, which are included in the analysis for all units for 2012 and beyond, state that all walk-in refrigerators manufactured after January 1, 2009, must:

- For 2012 and beyond
- have automatic door closers
- have strip doors, spring hinged doors, or other method of minimizing infiltration when doors are open
- contain wall, ceiling, and door insulation of at least R–25, except for glazed portions of doors and structural members
- use electronically commutated motors or three-phase motors (for evaporator fan motors of under 1 horsepower and less than 460 volts)
- use electronically commutated motors, permanent split capacitor-type motors, or three-phase motors (for condenser fan motors of under 1 horsepower)
- use light sources with an efficacy of 40 lumens per watt or more, including ballast losses (if any), except that light sources with an efficacy of 40 lumens per watt or less, including ballast losses (if any), may be used in conjunction with a timer or device that turns off the lights within 15 minutes of when the walk-in refrigerator is not occupied by people.

In 2014, DOE updated its energy conservation standards for walk-in coolers and freezers. Minimum AWEF (Annual Walk-In Energy Factor) was set for refrigeration systems, as well as upper limits on energy consumption attributable to passage, freight, and display doors. DOE elected not to set new standards for the R-value of Walk-In Panels.

ENERGY CONSERVATION STANDARDS FOR WALK-IN COOLERS AND WALK-IN FREEZERS

Class descriptor	Class	Standard level
Refrigeration Systems Minimum AWEF (Btu/W-h)		
Dedicated Condensing, Medium Temperature, Indoor System, <9,000 Btu/h Capacity	DC.M.I, <9,000	5.61
Dedicated Condensing, Medium Temperature, Indoor System, ≥9,000 Btu/h Capacity	DC.M.I, ≥9,000	5.61
Dedicated Condensing, Medium Temperature, Outdoor System, <9,000 Btu/h Capacity	DC.M.O, <9,000	7.60
Dedicated Condensing, Medium Temperature, Outdoor System, ≥9,000 Btu/h Capacity	DC.M.O,≥9,000	7.60
Dedicated Condensing, Low Temperature, Indoor System, <9,000 Btu/h Capacity	DC.L.I, <9,000	$5.93 \cdot 10^{-5} \cdot Q + 2.33$
Dedicated Condensing, Low Temperature, Indoor System, ≥9,000 Btu/h Capacity	DC.L.I, ≥9,000	3.10
Dedicated Condensing, Low Temperature, Outdoor System, <9,000 Btu/h Capacity	DC.L.O, <9,000	$2.30 \cdot 10^{-4} \cdot Q + 2.73$
Dedicated Condensing, Low Temperature, Outdoor System, ≥9,000 Btu/h Capacity	DC.L.O, ≥9,000	4.79
Multiplex Condensing, Medium Temperature	MC.M	10.89
Multiplex Condensing, Low Temperature	MC.L	6.57
Panels Minimum R-value (h-ft2-°F/Btu)		
Structural Panel, Medium Temperature	SP.M	25
Structural Panel, Low Temperature	SP.L	32
Floor Panel, Low Temperature	FP.L	28
Non-Display Doors Maximum energy consumption (kWh/day) **		
Passage Door, Medium Temperature	PD.M	$0.05 \cdot A_{nd} + 1.7$
Passage Door, Low Temperature	PD.L	$0.14 \cdot A_{nd} + 4.8$
Freight Door, Medium Temperature	FD.M	$0.04 \cdot A_{nd} + 1.9$
Freight Door, Low Temperature	FD.L	$0.12 \cdot A_{nd} + 5.6$
Display Doors Maximum Energy Consumption (kWh/day) †		
Display Door, Medium Temperature	DD.M	$0.04 \cdot A_{dd} + 0.41$
Display Door, Low Temperature	DD.L	$0.15 \cdot A_{dd} + 0.29$

1. Based on DOE's 2014 WICF Final Rule TSD and additional analysis by Guidehouse, the average floor area for a walk-in storage freezer as 161 ft^2.
2. EISA 2007 includes prescriptive standards for walk-in freezers that went into effect in 2009. All units for 2012 and beyond include these prescriptive standards. Units for 2022 and beyond are characterized using data from DOE's 2014 WICF rulemaking. All units for 2022 and beyond are assumed to comply with this standard.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Installation cost for 2012 and beyond is based on DOE's WICF TSD and additional analysis by Guidehouse.
5. Maintenance cost includes checking and maintaining refrigerant charge levels, checking settings, and cleaning heat exchanger coils.

- The commercial walk-in freezer characterized in this report is a walk-in storage freezer with an area of 161 ft^2.
- A typical walk-in freezer includes:
  - insulated floor, door, and wall panels
  - semi-hermetic reciprocating compressor
  - refrigerant (R404A)
  - condenser
  - evaporator
- Energy consumption is assumed to scale with the AWEF (Annual Walk-in Energy Factor), defined as the ratio of total heat removed from the refrigerated volume per year to the total electrical energy input of refrigeration systems over the same time period.
- The installation cost consists of freight and delivery costs in addition to on-site assembly.
- **This Advanced Case assumes a projected 10% decrease in energy consumption over the Reference Case due to adoption of more efficient refrigerants.**

EISA 2007 included prescriptive standards for walk-in freezers that went into effect in 2009. These prescriptive standards, which are included in all units for 2011 and beyond, state that all walk-in freezers manufactured after January 1, 2009, must:

- have automatic door closers
- have strip doors, spring hinged doors, or other method of minimizing infiltration when doors are open
- contain wall, ceiling, and door insulation of at least R–32, except for glazed portions of doors and structural members
- contain floor insulation of at least R–28
- use electronically commutated motors or three-phase motors (for evaporator fan motors of under 1 horsepower and less than 460 volts)
- use electronically commutated motors, permanent split capacitor-type motors, or three-phase motors (for condenser fan motors of under 1 horsepower)
- use light sources with an efficacy of 40 lumens per watt or more, including ballast losses (if any), except that light sources with an efficacy of 40 lumens per watt or less, including ballast losses (if any), may be used in conjunction with a timer or device that turns off the lights within 15 minutes of when the walk-in freezer is not occupied by people.

In 2014, DOE updated its energy conservation standards for walk-in coolers and freezers. Minimum AWEF (Annual Walk-in Energy Factor) was set for refrigeration systems, as well as upper limits on energy consumption attributable to passage, freight, and display doors. DOE elected not to set new standards for the R-value of Walk-in Panels.

1. Based on the average output from the Compliance Certification Database and values within 2022 Automatic Commercial Ice Maker (ACIM) TSD.
2. Defined as the average heat load to remove the latent and sensible heat required to freeze the daily output capacity of ice.
3. Water use refers to potable water.
4. EPACT 2005 energy standards went into effect in 2010. The 2015 low values are based on this standard. In 2014, DOE set new standards for commercial ice machines, with compliance required by 2018. The unit characterized for 2012 and beyond uses data from this rulemaking. All units for 2020 and beyond are assumed to comply with the updated standard.
5. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
6. The ENERGY STAR category is based on minimum compliance with the ENERGY STAR v3.0 standard, which went into effect on January 28, 2018. According to this analysis, ENERGY STAR certification is typical for the small air-cooled ice-making head (IMH) unit characterized.
7. Maintenance cost is based on the average cost of equipment within the 700 lb/day output range and includes cleaning and maintaining refrigerant levels, replacing filters, checking water distribution lines for leaks, cleaning, sanitizing, and descaling the bin and water system. Maintenance cost decreases as the size of the ice machine (i.e. output) decreases.

Performance and Cost Characteristics » Commercial Ice Machines

Final

- Commercial ice machines are typically integrated with an insulated ice storage bin or mounted on top of a separate storage bin. The retail equipment cost includes the ice making head and the integrated storage bin. Commercial ice machine condensers are either air-cooled or water-cooled. Approximately 90% of all units are the air-cooled type.
- Commercial ice machine maintenance includes periodic cleaning (every 2 to 6 weeks) to remove lime and scale and sanitizing to kill bacteria. Some ice machines are self-cleaning/sanitizing.
- ENERGY STAR® updated its maximum energy consumption levels, in kilowatt-hours per 100 pounds of ice, for air-cooled ice machines that went into effect on January 28, 2018. These efficiency levels are based on the harvest rate, in pounds per 24 hours. (H). Water-cooled ice machines are not eligible for ENERGY STAR certification.
- **For this Advanced Case, a 10% reduction in energy consumption is projected over the Reference Case due to the adoption of more efficient refrigerants such as propane, which, while not currently required by EPA SNAP, are a source of possible efficiency improvements.**

ENERGY STAR Requirements for Air-Cooled Batch-Type Ice Makers

Equipment Type	Applicable Ice Harvest Rate Range (lbs of ice/24 hrs)	Energy Consumption Rate (kWh/100 lbs ice)	Potable Water Use (gal/hundred lbs ice)
IMH	$200 \le H \le 1600$	$\le 37.72 * H^{-0.298}$	≤ 20.0
RCU	$400 \le H \le 1600$	$\le 22.95 * H^{-0.258} + 1.00$	≤ 20.0
	$1600 \le H \le 4000$	$\le -0.00011 * H + 4.60$	≤ 20.0
SCU	$50 \le H \le 450$	$\le 48.66 * H^{-0.326} + 0.08$	≤ 25.0

ENERGY STAR Requirements for Air-Cooled Continuous-Type Ice Makers

Equipment Type	Energy Consumption Rate (kWh/hundred lbs ice)	Potable Water Use (gal/hundred lbs ice)
IMH	$\le 9.18 * H^{-0.057}$	≤ 15.0
RCU	$\le 6.00 * H^{-0.162} + 3.50$	≤ 15.0
SCU	$\le 59.45 * H^{-0.349} + 0.08$	≤ 15.0

Performance and Cost Characteristics » Commercial Ice Machines

Final

EPACT 2005 issued standard levels for commercial ice machines with capacities between 50 pounds and 2500 pounds per 24-hour period that are manufactured or sold in the United States on or after January 1, 2010. The energy consumption is based on the harvest rate in pounds per 24 hours (H). In 2015, DOE finalized new standards for ACIMs extending coverage to flake, nugget, and tube-type machines and to capacities up to 4,000 pounds per 24 hours.

Equipment Type	Type of Cooling	Harvest Rate (lbs ice/24 hrs)	Maximum Energy Use (kWh/hundred lbs ice)	Maximum Condenser Water Use (gal/hundred lbs ice)
Ice Making Head	Water	<500	7.80-0.0055 H	200-0.022 H
		≥500 and <1,436	5.58-0.0011 H	200-0.022 H
		≥1,436	4.0	200-0.022 H
	Air	<450	10.26-0.0086 H	Not Applicable
		≥450	6.89-0.0011 H	Not Applicable
Remote Condensing (but not remote compressor)	Air	<1,000	8.85-0.0038 H	Not Applicable
		≥1,000	5.10	Not Applicable
Remote Condensing and Remote Compressor	Air	<934	8.85-0.0038 H	Not Applicable
		≥934	5.3	Not Applicable
Self Contained	Water	<200	11.40-0.019 H	191-0.0315 H
		≥200	7.60	191-0.0315 H
	Air	<175	18.0-0.0469 H	Not Applicable
		≥175	9.80	Not Applicable

Water use is for the condenser only and does not include potable water used to make ice.

Annual Maintenance Cost (2022$/kBtu/h)	$23.03	$22.98	$20.21	$20.21	$20.11	$20.11	$20.21	$20.11	$20.21	$20.11	$20.21	$20.11

1. EPACT 2005 energy conservation standards went into effect in 2010. In 2015, DOE updated its energy conservation standards for commercial refrigeration equipment, including transparent-doored refrigerators with pull-down capability. Compliance with this standard is required by 2017. Units characterized for 2018 and beyond use data reported in this rulemaking's TSD. Units sold in 2022 and beyond are assumed to comply with this updated standard.
2. The ENERGY STAR category characterizes a unit that is compliant with ENERGY STAR v4, effective March 2017. This standard does not separately define units with pull-down capability.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Beverage merchandisers are shipped ready to be plugged in, so installation costs are assumed to be negligible.

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Beverage Merchandisers

Final

- EPACT 2005 sets maximum daily energy consumption levels, in kilowatt-hours per day, for commercial refrigerators with transparent doors and self-contained condensing unit designed for pull-down temperature applications (i.e., beverage merchandisers) and went into effect on January 1, 2010.
- In 2014, DOE updated its energy consumption standards for commercial refrigeration equipment, including beverage merchandisers, effective March 27, 2015. Both the DOE and EPCA standards are reported below.

Equipment Type	EPCA (2010)	DOE Standards (2017)
Beverage Merchandisers (PD.SC.M)	0.126xV + 3.51	0.11xV+0.81

- In 2013, EPA updated its ENERGY STAR specifications for glass-doored commercial refrigerators, which can be used as beverage merchandisers, effective October 1, 2014. These standards are also based on the volume of the unit (V). Note that ENERGY STAR does not have a separate equipment class for units with pull-down capability.

Beverage Merchandiser Size	0 < V < 15	15 ≤ V < 30	30 ≤ V < 50	50 ≤ V
Glass Door	0.118*V + 1.382	≤ 0.140*V + 1.050	≤ 0.088*V + 2.625	≤ 0.110*V + 1.500

Performance and Cost Characteristics » Commercial Beverage Merchandisers

Final

- The beverage merchandiser characterized in this report, which is the typical unit according to DOE's 2014 CRE rulemaking and additional analysis by Guidehouse, is a 27 cubic foot cooler with a single hinged, transparent door, bright lighting, and shelving with a nominal compressor size of 4,700 Btu/h.
- The efficiency of beverage merchandisers can be increased through the use of more efficient compressors, fluorescent lighting with electronic ballasts, LED lighting, and improved insulation.
- For the Reference Case, beverage merchandisers are assumed to be mature technologies with few technology advancements in the coming years that would dramatically improve the efficiency.
- **For this Advanced Case, the typical unit in 2030 is assumed to comply with DOE's updated energy conservation standards for commercial refrigeration**
- **By 2040, the adoption of vacuum insulated panels is assumed to occur, with the aid of decreased incremental costs due to increased R&D funding**
- **Beverage merchandisers may transition from HFC to more efficient propane.**
- **Projected installed costs for this Advanced Case are the same as the Reference Case, assuming increased R&D funding. Advanced energy-saving technologies are assumed to be made financially viable for operators by increased market incentives such as utility efficiency rebate programs and/or carbon pricing.**
- **This analysis finds that with increased R&D and market incentives for energy efficiency technologies, a limit of possible efficiency improvements for self-contained, vapor compression refrigeration systems will be reached by 2040 and a 5% decrease in energy use from 2030 to 2040.**

1. Energy use for 2018 and beyond is estimated based on DOE's 2020 BVM Final Rule and the 2022 Compliance Certification Database.
2. The ENERGY STAR category assumes units are compliant with the ENERGY STAR v4 standard because combination units are currently not separately defined by ENERGY STAR. This standard went into effect on April 29, 2020. Our analysis finds ENERGY STAR certified equipment to be the most efficient currently available on the market.
3. Annual efficiency normalized to the efficiency of the 2012 installed base. Indexed Annual Efficiency = (2012 Energy Use) / (Energy Use).
4. Maintenance cost includes preventative maintenance costs such as checking and maintaining refrigerant charge levels, cleaning heat exchanger coils, and an annualized cost for refurbishments/remanufacturing.

Performance and Cost Characteristics » Commercial Refrigerated Vending Machines

Final

- DOE set federal energy efficiency standards for refrigerated vending machines. These standards set maximum daily energy consumption levels, in kilowatt-hours per day, for commercial refrigerated vending machines manufactured or sold in the United States on or after August 31, 2012. The daily energy consumption is based on the volume of the unit (V).
- In December 2015, DOE updated its energy conservation standards for beverage vending machines and defined two new product classes for combination vending machines. The energy conservation standard remains the same in the updated 2022 technical support document for vending machines. Compliance with these standards was required by 2019. For this analysis, compliance with these updated standards is assumed for equipment sold in 2022 and beyond. The updated standards and DOE equipment definitions are listed in the table below.

Equipment Type	Maximum Daily Energy Consumption
Class A (Transparent-Front)	MDEC= 0.052 × V + 2.43
Class B (Solid-Front)	MDEC = 0.052 × V + 2.20
Combination A	MDEC = 0.086 × V + 2.66
Combination B	MDEC = 0.111 × V + 2.04

ENERGY STAR® updated its maximum daily energy consumption efficiency levels, also in kilowatt-hours per day, for refrigerated vending machines that went into effect on April 29, 2020. These efficiency levels are based on refrigerated volume.

Equipment Class	Maximum daily energy consumption (kilowatt-hours per day)
Class A – a refrigerated bottled or canned beverage vending machine that is not a combination vending machine and in which 25% or more of the surface area on the front side of the beverage vending machine is transparent	MDEC = 0.04836 x V + 2.2599
Class B – any refrigerated bottled or canned beverage vending machine that is not considered to be Class A and is not a combination vending machine	MDEC = 0.04576 x V+1.936
Combination A – a combination vending machine where 25% or more of the surface area on the front side of the beverage vending machine is transparent	MDEC = 0.07998 x V + 2.4738
Combination B – a combination vending machine that is not considered to be Combination A	MDEC = 0.09768 x V + 1.7952

U21806-MNSC-CE-0771-Att 4

Performance and Cost Characteristics » Commercial Refrigerated Vending Machines

Final

- DOE set federal energy efficiency standards for refrigerated vending machines in 2009. These standards set maximum daily energy consumption levels, in kWh/day, for commercial refrigerated vending machines manufactured and/or sold in the United States on or after August 31, 2012. The daily energy consumption is based on the volume of the unit (V).
  - Refrigerated Vending Machines that are fully-cooled (Type A) $\leq 0.055*V + 2.56$
  - Refrigerated Vending Machines that are zone-cooled (Type B) $\leq 0.073*V + 3.16$
- ENERGY STAR® updated its maximum daily energy consumption efficiency levels, also in kWh/day, for refrigerated vending machines, which went into effect on March 1, 2013. These efficiency levels are based on refrigerated volume.

Equipment Type	Maximum Daily Energy Consumption	Low Power Mode Requirement
Class A (Transparent-Front)	MDEC= 0.0523 x V + 2.432	Hard-wired controls and/or software capable of placing the machine into a low power mode during periods of extended inactivity while still connected to its power source
Class B (Solid-Front)	MDEC = 0.0657 x V + 2.844	

- **Currently, stakeholders such as Coca Cola have indicated a preference for CO_2 refrigerant, which is less efficient. However, this Advanced Case scenario assumes a shift to more efficient propane for cost and energy consumption projections due to the superior efficiency of propane refrigerant.**
- **By 2040, the adoption of vacuum insulated panels is assumed to occur, with the aid of decreased incremental costs due to increased R&D funding**
- **Projected installed costs for this Advanced Case are higher than the Reference Case, even assuming increased R&D funding. Advanced energy-saving technologies are assumed to be made financially viable for operators by increased market incentives such as utility efficiency rebate programs and/or carbon pricing.**
- **This analysis finds that with increased R&D and market incentives for energy efficiency technologies, a limit of possible efficiency improvements for self-contained, vapor compression refrigeration systems will be reached by 2040.**

In December 2015, DOE updated its energy conservation standards for beverage vending machines, and defined two new product classes for combination vending machines Compliance with these standards is required by 2019. For this analysis, compliance with these updated standards is assumed for equipment sold in 2020 and beyond. The updated standards and DOE equipment definitions are listed in the table below.

Equipment Class	Maximum daily energy consumption (kilowatt hours per day)
Class A – a refrigerated bottled or canned beverage vending machine that is not a combination vending machine and in which 25 percent or more of the surface area on the front side of the beverage vending machine is transparent	MDEC = 0.052 x V + 2.43

1. Based on 3800 operating hours per year (ADL, 1999) and typical zone air flow requirement profile (ASHRAE S45.11-2012)
2. Total installed cost of 16,300 CFM constant air volume (CAV) air handling unit (AHU) and hypothetical supply ductwork layout
3. Based on ASHRAE 90.1-2016 and 2019 fan power limit (Table 6.5.3.1.1-1) with no pressure drop adjustment. Assumed 80% motor load and 91% motor efficiency
4. ASHRAE 90.1-2016 and 2019 Section 6.5.3.2 require minimum two-speed fan control (no longer always constant volume).
5. Two-speed variable frequency drive (VFD)
6. Modulating VFD
7. Modulating custom engineered VFD

- Constant air volume (CAV) ventilation systems are common, inexpensive, air-side HVAC systems that operate in response to a single control zone. Historically, these systems provide a constant flow rate of air (typically a mix of recirculated and outside air) and adjust the supply temperature of that air in order to maintain the space temperature setpoint. Beginning with ASHRAE 90.1-2013 and continued in ASHRAE 90.1-2019, new CAV ventilation systems were mandated to have at least two fan speed settings with the requirement of a maximum 40% power at 66% flow. Systems with variable speed fans are increasingly popular, making the term "constant air volume" somewhat of a misnomer for this system type. This analysis examines only the fan energy of the CAV system.
- There is movement in the industry and in energy codes to reduce fan power. ASHRAE 90.1 includes fan power limits for CAV systems. Fan power can be minimized through good design practice (efficient duct layout, low pressure drop ductwork, filters, coils), proper fan selection, and high efficiency type fans. ASHRAE 90.1-2019 now requires a minimum fan efficiency grade (FEG, based on AMCA 205-12: Energy Efficiency Classification for Fans) of 67 and a design operating fan efficiency within 15% of the maximum fan total efficiency. There are exceptions to this requirement, including packaged systems such as the CAV system type considered here. Still the fan power limits are expected to become more stringent, and fan efficiency will become more important throughout the industry.
- The unit characterized in this report is a 16,300 CFM CAV system. The average commercial building is approximately 16,300 square feet (CBECS 2018). Assuming 1 CFM is needed per square foot of floor area results in a 16,300 CFM air handling unit.
- A 16,300 CFM CAV packaged indoor air handling unit with cooling and heating coils can be installed for approximately $71,829 (RS Means 2022). Ductwork would cost approximately $9,272 additional ($81,101 total). A two-speed motor (estimated $500 incremental cost) and variable frequency drive (estimated $5,800) add cost. Custom engineered variable frequency drives (estimated $9,550) and premium efficiency motors (estimated additional $1,500) add an additional cost to the system.
- Annual maintenance cost assumes 8 hours worth of labor by a technician to perform the necessary tasks (e.g., filter replacement, draining condenser water, etc.)
- ASHRAE Standard 90.1, which is used as a basis for most state energy codes, limits the fan power (brake HP or nameplate HP) for CAV systems. The 2016 version of Standard 90.1 was used to represent the 2018 minimum efficiency level (state energy codes typically refer to older versions of Standard 90.1 due to code revision cycles).
- Fan energy is affected by several factors, including fan type (e.g., centrifugal, axial), fan blade shape (e.g., forward-curved, backward-curved, backward-inclined, airfoil), drive type (belt or direct), configuration (plenum or housed centrifugal), system effects, duct design, filter and coil pressure drops, motor efficiency, and speed and flow control.
- **For this Advanced Case, the projections from 2030 to 2050 for system fan power and annual fan energy use assume a 5% improvement per decade based on the assumption that use of variable frequency drives and incremental improvements in technology will increase.**

Performance and Cost Characteristics » Commercial Variable Air Volume

Final

- Variable air volume (VAV) ventilation systems are the most common multi-zone system type specified today for conditioning commercial buildings. These systems provide conditioned air to multiple zone terminal units (VAV boxes) that use dampers to modulate the amount of cool air to each zone. An individual zone thermostat controls the VAV box damper to allow more or less cooling. If a zone requires heating, then the VAV box provides the minimum flow rate and typically includes a reheat coil to meet the space temperature setpoint. As VAV box dampers close in the system, a variable frequency drive reduces fan speed and flow continuously to meet current requirements.
- This analysis examines only the fan energy of the VAV system. VAV systems vary fan speed and flow to meet space conditioning requirements; minimum flow settings apply for DX cooling stages and gas furnace heating stages. Most hours of operation are much lower than full speed, and fan power varies with the cube of fan speed according to fan affinity laws. The 2012 ASHRAE Handbook: HVAC Systems and Equipment (p. 45.11) provided the typical flow profile used for this analysis. The unit characterized in this report is a 16,300 CFM VAV system.
- There is movement in the industry and in energy codes to reduce fan power. ASHRAE 90.1 includes fan power limits for VAV systems. Fan power can be minimized through good design practice (efficient duct layout, low pressure drop ductwork, filters, coils), proper fan selection, and high efficiency type fans. ASHRAE 90.1-2019 now requires a minimum fan efficiency grade (FEG, based on AMCA 205-12: Energy Efficiency Classification for Fans) of 67 and a design operating fan efficiency within 15% of the maximum fan total efficiency. There are exceptions to this requirement, including packaged systems such as the VAV system type considered here. Still the fan power limits are expected to become more stringent, and fan efficiency will become more important throughout the industry.
- A 16,300 CFM VAV packaged indoor air handling unit with cooling and heating coils can be installed for approximately $82,023 (RS Means 2022). Ductwork and (10) VAV boxes with reheat would cost approximately an additional $28,272. (10) VAV controllers and the associated space temperature sensor would cost approximately $8,400 ($118,695 total). A 15 hp variable frequency drive (estimated $5,800) is an additional cost.
- ASHRAE Standard 90.1, which is used as a basis for most state energy codes, limits the fan power for VAV systems (brake HP or nameplate HP). The 2016 version of Standard 90.1 was used to represent the 2018 minimum efficiency level (state energy codes typically refer to older versions of Standard 90.1 due to code revision cycles).
- Annual maintenance cost assumes 8 hours worth of labor by a technician to perform the necessary tasks (e.g., filter replacement, draining condenser water, etc.)
- Fan energy is affected by several factors, including fan type (e.g., centrifugal, axial), fan blade shape (e.g., forward-curved, backward-curved, backward-inclined, airfoil), drive type (belt or direct), configuration (plenum or housed centrifugal), system effects, duct design, filter and coil pressure drops, and motor VFD efficiency.
- **For this Advanced Case, the projections from 2030 to 2050 for system fan power and annual fan energy use assume a 5% improvement per decade based on the assumption use of variable frequency drives and incremental improvements in technology will increase.**

1. Based on 2250 operating hours per year (ADL, 1999) and typical zone air flow requirement profile (ASHRAE S45.11-2012)
2. Total installed cost of 2-ton horizontal two-pipe fan coil unit, housing, and controls
3. Based on ASHRAE 90.1-2016 and 2019 fan power limit (Table 6.5.3.1.1-1) with no pressure drop adjustment. Assumed 80% motor load and 91% motor efficiency
4. Based on ASHRAE 90.1-2016 and 2019 Section 6.5.3.6 requirement of electronically commutated or 70+% efficient fan motor
5. Permanent split capacitor fan motor
6. Electronically commutated fan motor (single speed)
7. Electronically commutated fan motor (two-speed)
8. Electronically commutated fan motor (variable speed)
9. High aerodynamic efficiency fan

- Commercial fan coil units (FCUs) are self-contained, mass-produced assemblies that provide cooling, heating, or cooling and heating, but they do not include the source of cooling or heating. The unit characterized in this report is a cooling only (two-pipe), horizontal unit with housing and controls. Fan coil units are typically installed in or adjacent to the space being served and have no (or very limited) ductwork.
- According to manufacturer literature, the cooling capacity for a nominal 800 CFM fan coil unit is about 2 tons. This analysis examines only the fan energy of FCUs.
- Fan coil unit fan motors can be shaded pole, a single-phase AC motor with offset start winding and no capacitor; PSC, a single-phase AC motor with offset start winding with capacitor; or ECM, an AC electronically commutated permanent magnet DC motor. PSC motors are currently the most common motor type in FCUs, but manufacturers also offer single speed, two speed, and ECM motors as an option. ASHRAE 90.1-2019 requires an electronically commutated fan motor (or minimum motor efficiency of 70%) for this system.
- There is movement in the industry and in energy codes to reduce fan power. ASHRAE 90.1 includes fan power limits for FCUs. Fan power can be minimized through good design practice and high efficiency type fans. ASHRAE 90.1-2019 now requires a minimum fan efficiency grade (FEG, based on AMCA 205-12: Energy Efficiency Classification for Fans) of 67 and a design operating fan efficiency within 15% of the maximum fan total efficiency. There are exceptions to this requirement, including small systems such as the FCU considered here. Still the fan power limits are expected to become more stringent, and fan efficiency will become more important throughout the industry.
- Fan coil units have higher maintenance costs than central air systems due to the distributed nature of the system. For each unit, the filters must be changed, and drain systems must be flushed periodically.
- ASHRAE Standard 90.1, which is used as a basis for most state energy codes, limits the fan power (brake HP or nameplate HP). The 2016 version of Standard 90.1 was used to represent the 2018 minimum efficiency level (state energy codes typically refer to older versions of Standard 90.1 due to code revision cycles).
- Fan energy is affected by several factors, including fan type configuration, filter and coil pressure drops, motor efficiency, and fan speed control.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

MATTHEW J. FOSTER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Matthew J. Foster, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Matthew J. Foster who previously presented direct testimony in this case on behalf of Consumers Energy Company ("Consumers Energy" or the "Company")?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to the Attorney General's ("AG") proposed adjustment to Corporate Services operating and maintenance ("O&M") Expense and the Michigan Public Service Commission ("MPSC" or the "Commission") Staff's ("Staff") update to Unamortized Manufactured Gas Plant ("MGP") and MGP Amortization Expense.

Q. Have you prepared any exhibits in conjunction with your rebuttal testimony?

A. Yes, I prepared the following exhibit:

Exhibit A-134 (MJF-13) Gas General Activities Labor Expense.

Q. What adjustments did the AG propose to the Corporate Services Expense?

A. As shown in pages 183 through 184 of his direct testimony, AG witness Sebastian Coppola recommends a reduction of $10,910,000 to the Company's requested Corporate Services O&M projection of $26,874,473. Mr. Coppola calculated the proposed adjustment by using the 2024 General Activities Labor ("General Activities") plus inflation to calculate the forecasted amount for the projected test year.

Q. What is the AG's reasoning for the proposed adjustment to Corporate Services O&M?

A. Starting on line 2, page 183, of Mr. Coppola's testimony, he describes the 2023 General Activities as being "unusual and excessive" as a result of the 2023 expense being larger than recent years.

Q. Does the Company agree with the AG's proposed adjustment to the Corporate Services O&M related to General Activities?

A. No, the Company does not agree with the proposed adjustment. In 2023, General Activities included Voluntary Separation Program ("VSP") expenses of $12.6 million and Employee Incentive Compensation Program ("EICP") expenses of $7.8 million. The Company removed both expenses from the Corporate projected test year O&M as VSP is a non-recurring event and EICP is covered under the direct testimony of Company witness Amy M. Conrad. Per Exhibit A-134 (MJF-13), when excluding these expenses, the adjusted 2023 General Activities is a credit balance of $13.0 million, which is consistent with prior years. Therefore, the projected test year balance of General Activities is in no way "unusual and excessive" as stated by the AG.

Q. Please describe Exhibit A-134 (MJF-13).

A. Exhibit A-134 (MJF-13) reports the expenses included in General Activities. The expense components include Senior Officer Expense, Capitalized Credits, Billing Credits, EICP, VSP, and other miscellaneous expenses.

Q. Please explain why the General Activities has fluctuated in recent years.

A. As shown in Exhibit A-134 (MJF-13), VSP expense included on line 5 and EICP expense included on line 4 are the primary reasons for the fluctuation in General Activities in recent

years. As previously stated, when excluding these expenses, the remaining cost components in General Activities have been reasonably consistent.

Q. Please explain line 8 from Exhibit A-134 (MJF-13).

A. Exhibit A-134 (MJF-13), line 8, calculates Total General Activities less VSP and less EICP expenses. The General Activities calculation, normalizing for VSP and EICP expenses, results in negative expense (credit) of approximately $12 to $13 million in recent years. Line 8 validates that VSP and EICP expense components, which the Company has removed from the projected test year, are driving the General Activities fluctuations noted by the AG as being "unusual."

Q. Does the Company agree with the Staff's adjustments to the Unamortized MGP balance and the test year projection of MGP amortization expense?

A. Yes. The Company agrees with the adjustments proposed by Staff.

Q. Does this conclude your rebuttal testimony?

A. Yes.

REBUTTAL TESTIMONY

OF

SAMUEL M. GELLER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Samuel M. Geller, and my business address is One Energy Plaza, Jackson, Michigan, 49201.

Q. Are you the same Samuel M. Geller who previously presented direct testimony in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to Cost-of-Service Study ("COSS") issues raised in the direct testimonies of Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") witnesses Kevin S. Krause and Nicholas M. Revere; Lansing Board of Water and Light and Michigan State University ("LBWL-MSU") witness Timothy S. Lyons, and Citizens Utility Board of Michigan ("CUB") witness Richard J. Bunch.

Q. Have you prepared any exhibits in conjunction with your rebuttal testimony?

A. No.

Q. How is your rebuttal testimony organized?

A. My rebuttal testimony is organized as follows:

I. REBUTTAL OF STAFF WITNESS KRAUSE AND CUB WITNESS BUNCH

II. REBUTTAL OF STAFF WITNESS REVERE

III. REBUTTAL OF LBWL-MSU WITNESS LYONS

I. REBUTTAL OF STAFF WITNESS KRAUSE AND CUB WITNESS BUNCH

Q. Please describe Staff witness Krause's proposed allocator change.

A. Beginning on page 5 of his direct testimony, Staff witness Krause proposes changing the allocator for uncollectible expenses based on revenue. Staff witness Krause reasons that the three-year average of historical write-offs is inappropriate as it does not reflect the reality of the way uncollectible costs are incurred or how they should be borne by the classes. Staff witness Krause argues that uncollectible expenses should be shared by all customers consistent with how their overall costs are recovered by the Company.

Q. Do any other witnesses propose a similar allocator change?

A. Yes. On page 25 of his direct testimony, CUB witness Bunch recommends that the Commission order the Company to allocate uncollectible expenses to each class according to Cost of Service plus Cost of Gas. On page 26 of his direct testimony, Mr. Bunch clarifies that his recommendation is to also allocate uncollectible expenses according to revenue. CUB witness Bunch argues that the current method for allocating uncollectible expenses is inconsistent with past commission orders.

Q. Does the Company agree with Staff witness Krause's proposed allocator change?

A. Yes. The Company will agree to Staff's proposal to use Present Total Revenue (Allocator 111) for uncollectible expenses and discontinue using a three-year average of historical write-offs, as previously approved by the MPSC in its Case No. U-20322 Order. This allocation method follows Staff witness Krause's proposal to allocate uncollectible expenses consistent with the way the Company allocates these expenses in the electric COSS.

Q. Please describe Staff witness Krause's proposal to modify the Company's calculation of customer charges.

A. On page 7 of his direct testimony, Staff witness Krause proposes to calculate customer charges based solely on historical amounts in the instant case. This is a departure from the method approved in the Company's previous gas rate case in which the customer charge was calculated based on a combination of historical and projected expenses. Staff witness Krause argues that utilizing only historical costs ensures that the customer charge calculation will avoid including inappropriate costs in the customer charge.

Q. Does the Company agree with Staff witness Krause's calculation of the customer charge?

A. No. The breakout of test year costs in the COSS based on historic ratios is reasonable and appropriate. Since rates are designed based on a forward-looking test year, customer costs (and the customer charge) should reflect test year costs. Accordingly, the Company applied the same methods and used the same inputs previously approved by the Commission to calculate the customer costs and resulting customer charge in this case.

II. REBUTTAL OF STAFF WITNESS REVERE

Q. Please describe Staff witness Revere's proposed allocator change.

A. On page 7 of his direct testimony, Staff witness Revere proposes allocating FERC account 378 costs based on a composite allocator (shown in Exhibit S-21.0) that seeks to more accurately assigns costs to serve customers based on pressure level. As required in the settlement agreement in Case No. U-21406, the Company submitted a more detailed analysis of the costs in FERC Account 378 in this case which identified the costs associated with measuring and regulating stations serving different pressure levels. The composite

allocator crafted by Staff witness Revere utilizes this information to sort FERC Account 378 costs and assign them based on pressure level.

Q. Does the Company agree with Staff witness Revere's proposed allocator change?

A. Yes. The Company agrees to use Staff witness Revere's composite allocator for FERC account 378 costs. Staff witness Revere's composite allocator better reflects the cost-causative relationship than the Company's current method which allocates costs based on annual and peak usage for all customers at all pressure levels.

III. REBUTTAL OF LBWL-MSU WITNESS LYONS

Q. Please describe LBWL-MSU witness Lyons' proposed allocator change.

A. On pages 12 through 15 of his direct testimony, Mr. Lyons proposes allocating FERC accounts 374, 375, 377, and 378 with Allocator 217 which functionalizes other distribution plant costs into High Pressure ("HP") and non-HP mains before allocating costs to each rate class. LBWL-MSU witness Lyons argues that this approach is widely accepted in the utility industry and ensures that HP customers are not allocated costs for assets that do not serve them.

Q. Does the Company agree with LBWL-MSU witness Lyons' recommendation for FERC account 378?

A. No. As described above, Staff witness Revere's proposal represents a more accurate methodology for allocating other plant distribution expenses. Staff witness Revere's composite allocator uses Company-provided data for FERC account 378 to first evaluate which cost categories should be broken out by pressure class and which should not. As described in Staff witness Revere's testimony on page 7, "Allocator 104 is appropriately applied to the two 'All Other Costs' categories (Huron Compressor Station and

Odorization) which represent approximately 14% of the total, as no evidence has been provided showing those costs are associated with any given pressure level directly." This first step ensures that the over $41 million in these cost categories continue to be allocated to all customer classes based on average and peak use. LBWL-MSU witness Lyons' proposal does not critically examine which cost categories within FERC account 378 serve all pressure classes which allow the XXLT customers to avoid costs that are appropriately allocated to them.

Q. Does the Company agree with LBWL-MSU witness Lyons' recommendation to apply Allocator 217 to the remaining Other - Distribution Plant expenses in FERC accounts 374, 375, and 377?

A. No. The Company also disagrees with LBWL-MSU witness Lyons' approach to functionalizing FERC accounts 374, 375, and 377 based on pressure. Without additional analysis of the composition of the remaining $149 million in Other Distribution Plant, the Company believes it is unreasonable to change the allocation method for FERC accounts 374, 375, and 377 solely based on pressure. As described above, closer study of FERC account 378 revealed that allocating the entirety of Other Distribution Plant expenses based on pressure is inappropriate since it contains costs that are not associated with any particular pressure class. As an example, one of these cost categories cited by Staff witness Revere is the Huron Compressor Station which maintains the pressure and the flow of natural gas to the high-pressure distribution system. All customers, at all pressure levels, are served by high pressure distribution either directly or downstream of the high-pressure system. According to Figure 2 in LBWL-MSU witness Lyons' testimony, FERC account 377 contains $11 million worth of assets serving the very same Huron Compressor station.

If it is not appropriate to allocate Huron Compressor Station Costs within FERC account 378 based solely on pressure, then it stands to reason that allocating an entire account of Huron Compressor Station costs based on pressure is similarly inappropriate.

IV. SUMMARY

Q. Please summarize your response to the direct testimony of Staff, LBWL-MSU, and CUB.

A. 1. The Company agrees with Staff witness Krause's and CUB witness Bunch's proposals to change the allocation of uncollectible expense based on revenue. The Company supports using Present Total Revenue (Allocator 111) for uncollectible expenses in this case. This allocation is consistent with the Company's allocation for uncollectible expenses in the Electric COSS.

2. The Company agrees with Staff witness Revere's proposal to change the allocation of FERC account 378 expenses based on a composite allocator detailed in Exhibit S-21.

3. The Company recommends rejecting LBWL-MSU witness Lyons' proposal to allocate other distribution plant costs in FERC accounts 374, 375, 377, and 378 based on pressure class by using Allocator 217.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

MICHAEL P. GRIFFIN

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Michael P. Griffin, and my business address is 4600 Coolidge Highway, Royal Oak, Michigan 48073.

Q. Are you the same Michael P. Griffin that testified previously in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to address the proposed reductions to Consumers Energy Company's ("Consumers Energy" or the "Company") projected capital expenditures and Operating and Maintenance ("O&M") expenses and the rejection of an accounting treatment change proposed by Attorney General Dana Nessel ("Attorney General") witness Sebastian Coppola. Next, I will provide rebuttal testimony concerning the proposed increases and reductions to the Company's projected capital expenditures and O&M expenses proposed by Citizens Utility Board ("CUB") witness Ram Veerapaneni. Finally, I will provide rebuttal testimony concerning investment levels in future rate case applications and the suggestion that all utility programs should be assessed for risk reduction and cost effectiveness brought forth by Michigan Environmental Council ("MEC") and Sierra Club ("SC") (collectively, MEC) witness Dr. Sol deLeon.

Q. Are you sponsoring any exhibits with your direct testimony?

A. Yes, I am sponsoring the following exhibits:

Exhibit A-12 (MPG-2) Revised	Schedule B-5.5	Projected Capital Expenditures Transmission & Distribution Plant - Summary of Actual & Projected Gas Capital Expenditures;

Exhibit A-61 (MPG-5) Revised	Actual & Projected Gas Transmission and Distribution Capital Expenditures - Capacity/Deliverability Program;
Exhibit A-135 (MPG-8)	Workpapers, WP-MPG-13, WP-MPG-15, WP-MPG-17 and WP-MPG-19;
Exhibit A-136 (MPG-9)	Response to Discovery Request U-21806-CECo-AG_DR2; and
Exhibit A-137 (MPG-10)	Response to Discovery Request U-21806-CUB-CE-0248.

Q. Were these exhibits prepared by you or under your direction or supervision?

A. Yes.

Q. Please describe Exhibit A-12 (MPG-2), Schedule B-5.5 Revised and Exhibit A-61 (MPG-5) Revised.

A. These exhibits reflect a revision that I am making to my originally filed exhibits and changes I am making to my projections as described in my rebuttal testimony below. Exhibits A-12 (MPG-2), Schedule B-5.5 Revised and A-61 (MPG-5) Revised, reflect adjustments to the Capacity/Deliverability Program and the sub-program Deliverability Base Pipeline. These changes will be further explained in my rebuttal testimony to Attorney General witness Coppola below.

I. ATTORNEY GENERAL WITNESS COPPOLA

Q. On page 60, beginning on line 12, through page 61, line 5, of his direct testimony, Mr. Coppola discusses the Company's Pipeline Integrity Transmission Operated by Distribution ("TOD") capital expenditures. He goes on to state that I provided no other details about activities or work volumes to support the forecasted capital expenditures for the TOD program. Do you agree with this assessment?

A. No, I do not. Included with the Company's initial filing were four workpapers showing Assessment IDs (projects), work dig types, costs, and other information used to develop both the capital and O&M costs for the program for 2023 through 2026. Those workpapers, WP-MPG-13, WP-MPG-15, WP-MPG-17 and WP-MPG-19 are included as Exhibit A-135 (MPG-8).

Q. On page 61, beginning on line 13, through page 62, line 13, of his direct testimony, Mr. Coppola discusses the Company's casing assessment program. As part of his review, he states that casing assessment is a new category of costs and that "the Company stated that is has very limited experience with the cost of inspecting and remediating casings." Do you agree with his statement?

A. No, I do not. This is the third time the Company has assessed the casings on the system since the requirement went into effect in 2004. Additionally, his assertion about the Company stating that it has limited experience is not true and this has been acknowledged by Mr. Coppola. I am including Exhibit A-136 (MPG-9) which is the response to discovery request U-21806-CECo-AG_DR2. In his response, Mr. Coppola acknowledges that the Company did not make the statement that it has very limited experience with the cost of inspecting and remediating casings.

Q. Additionally, as part of his review of the casing assessment program, Mr. Coppola states that the $2.0 million included for assessments in 2025 and 2026 seem to be "ballpark" amounts and that due to the early phase of project development, the test year amount of $2.0 million should be eliminated. Do you agree with this recommendation?

A. No, I do not. The $2.0 million is based on what the Company has historically needed to complete the assessment of casings. The level of planning and cost to accomplish four examinations is complex and expensive. In order to levelize work and cost, the projects are spread across two years. To assess the casings within the system, the Company surveyed and tested them in 2023. The data is then analyzed, and four casings were selected in 2024 for examination in 2025 and 2026. This examination can happen in one of two ways. Utilizing a robotic In-Line Inspection ("ILI") tool or by removing the pipeline from the casing to physically inspect the pipe. If the pipe has to be physically removed from the casing for inspection, new pipe is inserted into the casing to replace the old pipe. The method of examination depends on the configuration of the pipe and possibility of utilizing a robotic ILI tool. As to Mr. Coppola's concern about the phase of these projects, the planning and scheduling phase is a part of the normal cadence required to meet these code requirements. For the casings within our system to be considered assessed, the 2025 and 2026 work must be completed within seven years of the prior assessment. These projects are on track and Mr. Coppola's proposed test year reduction of $2.0 million for casing assessments should be rejected by the Michigan Public Service Commission ("MPSC" or the "Commission").

Q. On page 62, beginning on line 14, through page 63, line 7, of his direct testimony, Mr. Coppola discusses the Company's risk mitigation program cost variability and concludes that the Company's test year projection should be reduced by $2.953 million. Do you agree with his reasoning and assessment of the program?

A. No, I do not. The increase in mileage and cost from 2024 to 2026 is a result of the Company ramping up the program and secure the resources needed to complete more mileage in a single year. In order to align the non-high Consequence area ("HCA") assessments with the HCA assessments, more survey and remediation work would need to be completed than what has been done in prior years. The reason for and importance of this program is shown in Exhibit AG-15 at pages 1 and 2. These assessments will inform the Company of the condition of these pipe segments and improve public safety. A stepped increase in 2024 and 2025 is being used to evaluate and secure the resources necessary for the Company, as well as for the contractors that will be utilized. The increase in 2026 allows the Company to assess all the non-HCA on the pipelines scheduled for assessment that year. In 2024 and 2025, only portions of the non-HCA mileage were assessed for those pipelines. As explained in Exhibit AG-15 (discovery response U21806-AG-CE-0316), performing the non-HCA and HCA assessments together gives the Company a better understanding of cathodic protection of the pipe and allows the Company to address deficiencies in the cathodic protection system more holistically. Risk Mitigation assessments are performed to improve safety of the Company's transmission system by assessing for external corrosion on the pipelines. This will reduce the risk of leaks due to external corrosion and improve the overall safety of the system. For the reasons stated above, Mr. Coppola's

proposed test-year reduction of $2.953 million related to Risk Mitigation assessments should be rejected by the Commission.

Q. On page 64, beginning on line 10 of his direct testimony, Mr. Coppola discusses proposed reduction of $3,491,000 to rate base for the 2023 and 2024 expenditures for project GL-03042 within the Maximum Allowable Operating Pressure ("MAOP") Pipeline capital program for which the Company has stated it no longer intends to complete the project. Do you agree with this recommendation?

A. No, I do not. The Company is willing to remove the dollars from rate base for this project, however, workpaper WP-MPG-2 (Exhibit AG-16) is in whole dollars and not thousands. So the rate base reduction for this project should be $3,491 ($1,692 in 2023 and $1,799 in 2024) and not $3,491,000 as proposed by Mr. Coppola.

Q. On page 63, beginning on line 10 of his direct testimony, Mr. Coppola discusses proposed reductions to the Company's Regulatory Compliance – MAOP Project capital expenditures. In this section, he discusses his assessment of the program and states that the "issues here are the same as in the Distribution MAOP projects." Do you agree with his assessment of the Company's MAOP programs?

A. No, I do not. Please see the rebuttal testimony of Company witness Lincoln D. Warriner which provides rebuttal to the arguments Mr. Coppola makes concerning the MAOP Compliance programs in general.

Q. How did the Company decide the most feasible option for the projects you are sponsoring that require reconfirmation under 49 CFR § 192.624?

A. For the projects requiring reconfirmation, the Company selected an MAOP reconfirmation method that provided benefits beyond compliance for the lack of MAOP Traceable,

Verifiable, and Complete ("TVC") pressure test documentation. For other projects, the Company was able to conduct engineering and construction efficiencies while addressing pressure test documentation issues. Further information about these situations and projects is summarized below. These projects are all shown on Exhibit AG-16.

- For project GL-0341 (STC-LN 1060 Mt. Clemens LR Drain Retirement), the Company selected an MAOP reconfirmation solution that provided benefits beyond compliance for the lack of MAOP TVC pressure test documentation. A part of the gap segment is on a drain line that is not utilized by Company operations employees for liquid removal on the launcher/receiver. The project is opting to retire the drain line instead of re-testing or replacing it and installing a new drain assembly. The remaining portion of the gap along the main line will be re-tested which will be expensed (O&M). The Company evaluated undertaking a pressure reduction on the full gap segment, which was determined to not be feasible due to the negative impacts on gas deliverability to Mt. Clemens city gate. Because of these reasons, it was determined that retirement of the drain line, installation of new drain assembly, and retesting the remaining segment was the best option for safety, delivery, and compliance.

- For project GL-03461 (Line 1900 – Metamora City Gate – Hot Tap Replacement & Mainline Valve Install), the Company selected an MAOP reconfirmation solution that provided benefits beyond compliance for the lack of MAOP TVC pressure test documentation. The project also provides an opportunity to install a new main line valve/dual tap assembly to increase system resiliency during outages and lower the amount of methane released during a partial system outage. Due to the short length of the segment, a pressure test is impractical due to the cost associated with multiple cut-outs and welding required in order to conduct testing. The Company is doing the project in conjunction with other projects on the Line 1900 for efficiency. The Company evaluated undertaking a pressure reduction on this line, but it was determined that this is not feasible due to negative impacts on gas deliverability to/from storage fields and would require additional pressure control devices to be installed. Because of these reasons, it was determined to be in the best interest of safety, deliverability, and compliance for replacement as identified by 49 CFR § 192.624(c)(4).

- For Project GL-03462 (STC-Ln 1060 4" BD Repl), the Company selected an MAOP reconfirmation solution that benefits from construction efficiencies and provides some benefit beyond reconfirmation. Due to the short length of the segment, material verification is impractical as it would require replacement of the whole blowdown ("BD") assembly; it would also require the destruction of the welded end valve in order to obtain a sample. A new flanged end valve will be installed, which will allow for equipment connection during temporary

compression/flaring operations. The new BD assembly will also be designed to meet the current engineering standard. This project will also take place in conjunction with other O&M projects at the site for construction efficiencies (L1060 O&M Pressure test). The Company evaluated undertaking a pressure reduction on the segment, which was determined not to be feasible due to the negative impacts on gas deliverability to the nearby Mt. Clemens city gate, which feeds the distribution system.

- For project B-GL-00289 (2026 project for Capital MAOP Replacement Project), the Company continues to review its records and requires funding to remediate any additional gaps that are discovered in between rate case submittals.

Q. Are there other reasons these projects are being conducted and should be approved by the Commission?

A. Yes, there are. Three of the projects shown on Exhibit AG-16, (GL-03197, GL-03210, and GL-03261) are projects for which the Standardized Engineering Analysis research indicated that segments needed replacement due to a class location change that required remediation regardless of TVC records status per 49 CFR § 192.611. Pressure reduction is not feasible as it would not allow the Company to meet gas deliverability requirements. For the reasons stated above, Mr. Coppola's proposed reduction of $3,902,000 for 2023, $2,153,000 for 2024, $1,205,000 for 10 months ending October 2025, and $2,790,000 for the projected test year should be rejected by the Commission.

Q. On page 65, beginning on line 10, through page 66, line 7, of his direct testimony, Mr. Coppola proposes reductions to several Asset Relocation Transmission Program projects. As part of his analysis, he states that based upon the status of the projects in early March of 2025, the cost level and timing of the capital expenditures is still uncertain and premature to include in rate base. Do you agree with this assessment and reason?

A. No, I do not. Each of these projects are progressing and have undertaken activities commensurate with projects that will be constructed in 2026. Company engineers primarily manage projects being constructed in the current year up until late spring when these projects start to be released for construction. They then begin to work on projects for the next year which would include pre-engineering work such as SAP order creation, design commencement, environmental reviews, and long lead-time material ordering. Then they meet with gas control on when the projects can be done based on all other project work and system demands which determines the final scheduling of construction. Thus, Company engineering sources utilize a prudent cadence prior to construction. Further, the timing of and cost of these projects is shown in Exhibit AG-17 (workpaper WP-MPG-1). The Company continues its normal cadence with these projects which also accounts for overall program risk and which ensures continued safety of the system. Mr. Coppola's recommendation that these projects are too premature to include in rate base and should be rejected by the Commission and the Company's full projection for the Asset Relocation Transmission Program should be approved by the Commission.

Q. On page 67, beginning on line 1, through page 67, line 19, of his direct testimony, Mr. Coppola proposes that the Commission disallow the expenditures for project GM-01047 JXN-Lainsburg Jnc. Meter Installation in the Deliverability Base Field Measurement Program based upon his review. Do you agree with this assessment and reason?

A. No, I do not. This project is at a major interstage where multiple large Company-owned pipelines intersect. Having the available metering data will improve measurement accuracy, and associated reports to identify losses on the system earlier as identified in the benefits that were previously described in discovery response U21806-AG-CE-322-Griffin_ATT_1 (Exhibit AG-18). This investment will allow the Company to continue to conform to the MPSC technical standards described in my direct testimony on page 39, lines 15 through 17. Mr. Coppola's recommendation should be rejected by the Commission and the Company's projection for this project should be approved by the Commission.

Q. On page 68, beginning on line 1, through page 69, line 7, of his direct testimony, Mr. Coppola discusses the Deliverability Base Field Measurement Program. As part of his analysis, on page 68, beginning on line 10, through page 68, line 14, of his direct testimony, Mr. Coppola discusses the $100,000 annual savings the Company would experience with gas analysis buildings that are part of project GM-01089, Williamston Meter Proving Station. Do you agree with his assessment?

A. No, I do not. Mr. Coppola seems to be confusing the Company's physical, permanent building at the site with multiple gas analysis buildings that will be constructed at this site. The $100,000 savings is not from using Company resources to build the Company building

in Williamston Michigan called the Williamston Meter Proving station facility. This is savings from constructing the multiple gas analysis buildings that is described beginning on page 68, line 19 of Mr. Coppola's direct testimony. The savings identified is from utilizing Company internal resources versus relying on third-party resources. Third-party contractors labor rates are significantly higher than the Company, and the third-party contract includes charges for project management, master electrician/journeyman, laborers, and costs for tools and equipment. The Company would only incur costs for labor as the project management and master electrician/journeyman costs would be leveraged by increasing the scope of work of existing licensed and experienced salaried employees.

Q. On page 68, beginning on line 14, through page 68, line 17, of his direct testimony, Mr. Coppola discusses the $50,000 annual efficiency from the Company building a Gas Sampling Site at the Williamston Transmission Meter Proving Station, which would eliminate the need for a vendor's sampling site. He concludes that the analysis is incomplete. Do you agree with this assessment?

A. No, I do not. By utilizing the Williamston Transmission Meter Proving Station Site to construct a Gas Sampling Station, the Company would realize immediate savings in labor resources, travel, and fleet expenses. Currently the Company employs a third-party natural gas analysis lab, located in Traverse City, to perform monthly and annual gas analysis. The Company's Operations employees travel more than 400 miles round-trip, often on a monthly basis. The cost of the gas analysis ranges from $150 to $200, or greater, per sample, depending on the type of analysis required. Gas Samples can range from 10-25 per month. The Company intends to leverage internal salaried employees, skilled and experienced, to perform the gas sample analysis at the Williamston Facility. The costs of

the third party performing the gas analysis would be eliminated as well as the significant costs for travel and fleet expenses. An ancillary value/benefit is the fact that this would reduce the turnaround-time between when a gas sample is taken and analyzed, enhancing gas quality best practices. Currently the Company bundles gas samples to attempt to create efficiencies and reduce travel.

Q. On page 68, beginning on line 18, through page 69, line 1, of his direct testimony, Mr. Coppola discusses the $750,000 annual savings the Company would experience with the Williamston Transmission Meter Proving Station. Do you agree with his assessment?

A. No, I do not. The $750,000 is not for the purchase of tools and equipment. The initial investment in tools and equipment is a one-time cost for the Company. As explained above, the third-party contractor incorporates the recurring costs of tools and equipment on each gas analysis building that they construct. The $750,000 savings would be realized by offsetting the Company's growing costs for constructing the gas analysis buildings out-of-state and leveraging the Williamston Transmission Meter Proving Station as a centralized location, where the Company or a third-party contractor can construct the gas analysis buildings. The current third-party out-of-state facilities are limited in the space they have to construct these gas analysis buildings. The Williamston Facility would have the necessary space, tools, equipment, and resources to realistically double the production output of current gas analysis buildings.

Q. On page 69, beginning on line 1, through page 69, line 4, of his direct testimony, Mr. Coppola discusses the $108,000 annual savings the Company would experience with the Williamston Facility. Do you agree with his assessment?

A. No, I do not. The estimated $108,000 annual savings would be realized by eliminating the Company's out-of-state travel/mileage/hotel expense costs for employees attending Factory Acceptance Testing at the third-party contractor's facility. Currently, the Company requires six representatives to attend the Factory Acceptance Testing to ensure quality control and perform safety, compliance, and functionality testing, for their particular disciplines. Factory Acceptance Testing is required twice, per gas analysis building, onsite at the contractor's facility, for the 50% completion and 100% completion of the gas analysis buildings. In addition to the actual travel/mileage/hotel expenses, there are associated costs during travel for the hourly employees required to attend and perform inspections. The Williamston Facility will be an average of 1.5 hours away from the majority of the Company's employees. This would eliminate most of the travel/hotel expenses and significantly reduce mileage and time charged for travel.

Q. Should the Commission approve the Company's projection for the Williamston Meter Proving Station facility?

A. Yes. This station will allow a testing environment for gas transmission measurement technology to comply with API-1164, which requires any new protocol, application, or software proposed to be added to the Supervisory Control and Data Acquisition ("SCADA") network should be run in a test-bed or development environment to evaluate the potential for impairing the performance of the SCADA system. Not only are the costs of the project reasonable, but I have described above the efficiencies gained with the

project. As shown on Exhibit AG-18, the annual projected efficiency from this project will be over $1,000,000. The Commission should reject Mr. Coppola's proposed reduction.

Q. On page 69, beginning on line 8, through page 69, line 20, of his direct testimony, Mr. Coppola proposes that the Commission disallow the expenditures for project GM-00041 Rose Center Meter Replacement in the Deliverability Base Field Measurement Program based upon his review. Do you agree with this assessment and reason?

A. No, I do not. The reasons for this project include the fact that the asset is at the end of its useful life. The operational deficiencies from the current meter are all described in Exhibit AG-18 (discovery response U21806-AG-CE-322_ATT_1). As seen in Exhibit AG-18, not proactively addressing the age of the measurement asset could impact over/under odorization and inaccuracies in volume measurement (gains or losses in Lost and Unaccounted for calculations for the site) due to inability to change the orifice plate. Mr. Coppola's recommendation should be rejected by the Commission and the Company's projection for this project should be approved by the Commission.

Q. On page 42, beginning on line 5, through page 43, line 2, of his direct testimony, Mr. Coppola proposes reductions to six Deliverability Base Field Measurement Program projects based upon the status of the projects as of early March 2025. Do you agree with this assessment and reason?

A. No, I do not. Each of these projects are progressing and have undertaken activities commensurate with projects that will be constructed in 2026. These are projects that are being actively worked on including site evaluation and other pre-engineering activities. Pre-engineering work would include survey work, SAP order creation, design

commencement, environmental reviews, real estate evaluation, scoping, and long lead-time material ordering. Company engineering sources utilize a prudent cadence prior to construction. The Company continues its normal cadence with these projects. Mr. Coppola's recommendation to remove project costs based upon the status should be rejected by the Commission and the Company's projection for these six projects in the Deliverability Base Field Measurement program should be approved by the Commission.

Q. Beginning on page 70, line 11, through page 70, line 13, of his direct testimony, Mr. Coppola states that the Commission should remove $3,647,000 for the 10 months ending October 2025, and $17,559,000 for the projected test year from the Company's forecasted capital expenditures for the Deliverability Base Field Measurement Program. Do you agree with this recommendation?

A. No, I do not. I have described above the reasons for each of Mr. Coppola's proposed reductions. The Company's full projection for this program should be approved by the Commission.

Q. Beginning on page 70 of his direct testimony, Mr. Coppola discusses his review of the Deliverability Base Pipeline Program. On page 71, lines 5 through 12, he discusses a change to the Company's projects that the Company acknowledged in a discovery response and concludes that there should be a substantial reduction to rate base due to the insufficient information he purports to lack. Do you agree with this assessment?

A. No, I do not. The Company acknowledged in Exhibit AG-19 (discovery response U21806-AG-CE-0333) that the 2025 project, B-GL-00251, had been cancelled and replaced by project GL-03313, a project originally planned for 2026. In that same response, the

Company provided sufficient information pertaining to a project that will be done in place of GL-03313 in 2026. This project, B-GL-00274, is an emergent inoperable valve project that will take place in 2026. The information provided in Exhibit AG-19 included the project phase, reason, and cost. This is the same information that had been provided for all other projects on my original workpaper, WP-MPG-4 (Exhibit AG-19), except for the project location, Ray, Michigan. I have included Exhibit A-12 (MPG-12), Schedule B-5.5 Revised and Exhibit A-61 (MPG-5) Revised to reflect the reductions to rate base for the changes described above.

Q. Beginning on page 71, line 13 of his direct testimony, Mr. Coppola proposes reductions to eleven Deliverability Base Pipeline Program projects based upon the status of the projects as of early March 2025. Do you agree with this assessment and reason?

A. No, I do not. Each of these projects are progressing and have undertaken activities commensurate with projects that will be constructed in 2026. Company engineers primarily manage projects being constructed in the current year up until late spring when these projects start to be released for construction. They then begin to work on projects for the next year which would include pre-engineering work such as SAP order creation, design commencement, environmental reviews, and long lead-time material ordering. Then they meet with gas control on when the projects can be done based on all other project work and system demands which determines the final scheduling of construction. Thus, Company engineering sources utilize a prudent cadence prior to construction. The Company continues its normal cadence with these projects. These projects support maintaining operations in accordance with the Michigan Gas Safety Standards ("MGSS").

Mr. Coppola's recommendation that these projects are too premature to include in rate base should be rejected by the Commission and the Company's projection for the Deliverability Base Pipeline Program shown on Exhibit A-61 (MPG-5) Revised should be approved by the Commission.

Q. On page 72, line 6, through page 74 line 3, of his direct testimony, Mr. Coppola proposes reductions to city gate projects based upon an analysis of the historical average cost of projects in this program. Do you agree with this assessment and reductions?

A. No, I do not. As shown in Mr. Coppola's analysis (Exhibit AG-20, page 6) there is a wide variation in the cost (and scope) of city gate modernization projects. This is because no two city gates are exactly alike, and the work required to modernize a city gate can vary widely. The cost for major rebuild projects during the 2022-2026 time frame range from $3,306,450 for GM-00914 (OVS Dorr CG Rbld) to $13,591,760 for GM-00943 (STC-Orion CG Rbld). It is also worth noting that many of the projects are very small in scope and though they do result in a modernized city gate, these projects do not compare to the size and scope of the majority of the test year projects. For example, project B-GL-00308 only involved installing a remote terminal unit ("RTU") and an emergency shut-down valve ("ESD") and cost $1.3 million and project GM-01078 only involved an ESD and cost $1.2 million. These projects were included in the average project cost calculation conducted by Mr. Coppola which reduces the overall average cost.

Q. What would cause such variability in the cost of these projects?

A. Below are some examples of the differences in scope and by extension cost of various city gate projects:

Small City Gate projects typically involve:

- Partial rebuild – some portion of the site is being rebuilt but not in its entirety;
- Small load – the flow at the city gate results in smaller piping and equipment; and
- Less equipment - may not contain an odorizer or single outlet.

Medium City Gate projects typically involve:

- Partial rebuild – some portion of the site is being rebuilt but not in its entirety;
- Less equipment - may not contain an odorizer or single outlet; and
- Full rebuild of a small to medium load facility.

Large City Gate projects typically involve:

- Full rebuild;
- Facilities that contain odorizers or multiple runs or large equipment;
- Large load – the flow at the city gate results in larger equipment and piping; and
- Includes additional measurement or valving requirements.

Q. Can you provide some examples from Exhibit AG-20, page 6, of projects with varying costs and the equipment installed?

A. Yes, I can. Below are some examples of projects of various sizes and the equipment replaced demonstrating the cost discrepancies in these projects.

Dorr City Gate – Small - $3.3 million:

- Small load with single medium pressure outlet and partial rebuild; and
- Scope included replacement of heater, odorizer, RTU, partial regulation replacement with trip out added and necessary piping; new filter separator. Equipment in the 2" and 4" sizing done for modernization needs. Building was not replaced, minimal site work.

Napoleon-Brooklyn City Gate – Medium –$6.5 million:

- 4" inlet 6" outlet full rebuild, includes medium sized odorizer and equipment; and
- Regulation with ESD, filter separator, heater, odorizer, electrical modernization, building, heater fuel meter, gas chromatograph cabinet, no additional transmission valving needs.

Bancroft City Gate – Large - $11 million:

- Full rebuild 6" inlet and 10" outlet piping; includes odorizer, measurement, and valving; and
- Includes demolition, construction of multiple measurement runs, electrical modernization and yard lighting, heater, odorizer, filter separator, regulation, emergency slam shut devices, meters, Remote Control Valve ("RCV"), check valve installation around tap valves, site work in the form of building, driveway, foundations.

Kalamazoo M Ave City Gate – Large – $13 million:

- Full rebuild with 12" inlet piping, 4 outlets, 2 at 12", 8" and 16"; includes odorization, measurement; and
- Large equipment – heater, filter separator, odorizer, nine regulators, ESD, tie-in valve depth work, new building, driveway, fencing, electrical modernization, ultrasonic meters, hydrocarbon dew point and O2 analyzers, and utilizing a refurbished Gas Chromatograph building.

Q. On page 74, lines 1 through 3, of his direct testimony, Mr. Coppola recommends that the Commission remove $11,074,000 for the 10 months ending October 2025 and $14,408,000 for the projected test year from the city gate program projection. Do you agree with this recommendation?

A. No, I do not. Mr. Coppola's analysis fails to take into account the varying costs of city gate projects. Each project was projected based upon the scope, size, equipment, and other factors described above. The Commission should reject the removal of the dollars proposed by Mr. Coppola for the city gate program.

Q. On page 73, lines 9 through 12, of his direct testimony, Mr. Coppola discusses project status for the 2025 and 2026 projects and says, "it is very likely that the cost for these projects will change and could slip into a future year". Do you agree with this assessment?

A. No, I do not. Mr. Coppola provides no evidence that this could or will likely happen. The status of these projects is in line with the normal cadence for projects in this program. At the time of this discovery response, the 2025 projects were in engineering design as they cannot be constructed until after the heating and storage field injection seasons are completed so that outages can be taken on the pipelines.

Q. Beginning on page 74, line 4, through page 75, line 7, of his direct testimony, Mr. Coppola proposes a reduction to the TED-I Program for seven RCV projects based upon the status of the certain projects as of early March 2025. Do you agree with this assessment and reasoning?

A. No, I do not. The RCV projects Mr. Coppola describes are in the normal phase for RCV projects that will be constructed the following year. The project process for RCVs is the following. The creation of the project scope documents, and potential surveying and material selection typically occur the year prior to construction (in 2025 in this case). The year of construction (2026) includes site survey work not completed in the prior year, the receipt of materials, the engineering and design work, release of design packages, contractor bidding and selection, and finally construction and project closeout. These seven projects are following the normal cadence for RCV projects and are thus not premature to be included in rate base. Mr. Coppola's proposed reduction to the RCV program should be rejected by the Commission.

Q. On page 171, beginning on line 15, through page 172, line 11, of his direct testimony, Mr. Coppola proposes reductions to the Company's MAOP Transmission O&M related to the Standardized Engineering Analysis expenses. Do you agree with this assessment and reasoning?

A. No, I do not. These expenses are a direct result of the Pipeline Safety, Regulatory Certainty, and Job Creation Act of 2011 and subsequent 2019 Safety of Gas Transmission Rules issued by the Pipeline and Hazardous Materials Safety Administration ("PHSMA") as described in my direct testimony beginning on page 24, line 21, through page 25, line 22. In MPSC Case No. U-21291, the case cited by Mr. Coppola, the Commission stated, "the 2019 revisions to federal pipeline safety regulations and the 2011 advisory bulletin are not new record keeping requirements and that DTE Gas was previously required by MGSS to perform strength tests, including MAOP tests, and to maintain those records for the life of the pipeline." The Company concurs that the Commission's second statement from this quote is correct; pipeline operators have been required to perform strength tests and keep those records for the life of facility since 1970 when subpart J pressure testing standards were implemented per 49 CFR § 192.517. Regarding the first statement, the Company maintains that the traceable, verifiable, and complete standard that PHMSA implemented in 2019 is an additional threshold beyond the recording requirements described in 49 CFR § 192.517. PHSMA deemed these original standards as not sufficient enough to prevent the recent incidents cited in the regulation; per the 2019 pre-amble, PHMSA states, "the purpose of this final rule is to increase the level of safety associated with the transportation of gas." Per the FAQ-30[1] provided in the Batch 1 FAQs, PHSMA details what it deems as

[1] https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2023-05/Batch-1-FAQs-PHMSA-2019-0225-9-15-20.pdf

a TVC record; there are additional requirements that are not included in 49 CFR § 192.517. As an example of this higher standard, pressure test records are now required to be verifiable, which PHMSA states that they are "confirmed by the purchase order or project specification for the pipeline or the alignment sheet with consistent information." The study is appropriate so the Company can prove that its records now meet the TVC threshold in order to be compliant, which was directed by PHMSA in the 2011 bulletin that states "An operator must diligently search, review and scrutinize documents and records". All of the supporting evidence points to the conclusion that PHMSA intended to increase thresholds for records and require operators to evaluate said records in the name of safety. Therefore, the Company disagrees with Mr. Coppola's proposed 50% reductions.

Q. Is the Company following the guidance from the MPSC Staff in its accounting treatment of these expenses.

A. Yes. This is described in my direct testimony beginning on page 29, line 1, through page 30, line 1.

Q. On page 172, beginning on line 12, through page 173, line 18, of his direct testimony, Mr. Coppola proposes reductions to the Company's Corrosion Control Transmission O&M expenses. In his review, he states that the expense for the test year is not supported by any increased work units or activities. Do you agree with this assessment?

A. No, I do not. The discovery requests Mr. Coppola refers to in his direct testimony and are shown in Exhibit A-59 (MPG-3) were responsive to the information he requested. As shown in the response to discovery request U21806-AG-CE-338, the Attorney General did not ask for work units or activities. Further, in discovery request U21806-AG-CE-760, the

request was to explain what work was being done and not to provide work units or activities.

Q. Were intervenors in this case provided the work units and associated costs in discovery?

A. Yes, they were. Discovery request U21806-CUB-CE-0248, which was sent to all parties to this case provided the number of projects and average cost for each category in this program. Exhibit A-137 (MPG-10) includes the response to discovery request U21806-CUB-CE-0248. The difficulty with projecting work based on units in this program is the variability in the work. Specifically, for atmospheric corrosion projects, a project can be one item at a compressor station, or an entire city gate. The amount of work and resulting cost can be significantly different. Similarly, for recoat projects, the diameter of the pipe as well as length of the project are both variables that are difficult to anticipate and significantly affect the cost. These projected costs will ensure that sufficient funds are available for the Company to complete required work, including those mandated in recent rulemaking, in the required timeframes. Mr. Coppola's reduction to the Company projection in this program should be rejected by the Commission.

Q. On page 195 of his direct testimony, Mr. Coppola states that there is no reason for the Commission to approve the Company's proposal to capitalize hydrotesting of pipelines in certain circumstances. Do you agree with this assessment?

A. No, I do not. The Federal Energy Regulatory Commission has provided accounting guidance and the specific situations where the Company would utilize this accounting treatment is spelled out in Company witness Heather L. Rayl's direct testimony beginning on page 24, lines 1 through 16. In order to be able to capitalize these projects, the Company

needs to get approval from the Commission. Waiting for a project and then seeking approval is not practical. The Commission should reject Mr. Coppola's proposal.

II. CUB WITNESS VEERAPANENI

Q. Beginning on page 9 of his direct testimony, CUB witness Veerapaneni proposes a reduction to the Asset Relocation – Transmission Program expenditures in the test year. Do you agree with his proposal?

A. No, I do not. The Company provided justification for the expenditures in the program through my direct testimony beginning on page 5, line 5, through page 9, line 20. My direct testimony describes the necessity of the expenditures and lists the projects to be conducted. Each project through the test year, the project reason, location, pipe length and approximate construction time frame are further shown in workpaper WP-MPG-1 (Exhibit AG-17). Mr. Veerapaneni simply took the average of the 2023 and 2024 actual expenditures and applied inflation to project a test year amount. The Company's projections are based upon knowledge of specific projects planned for the next several years. Annual projects and program costs vary depending upon customer requests for modifications, regulations, system condition, scope of projects, specific projects, and outage planning. Mr. Veerapaneni did not review the reasonableness of the projects proposed during the test year nor the benefits the projects would provide to customers. This methodology should be rejected by the Commission and the Company's projection should be approved.

Q. Beginning on page 10 of his direct testimony, CUB witness Veerapaneni proposes an increase to the Regulatory Compliance Program expenditures in the test year. Do you agree with his proposal?

A. No, I do not. The Company provided extensive documentation for the expenditures in this program and the sub-programs throughout my direct testimony, beginning on page 10, line 1, through page 30, line 1. These sub-programs are Pipeline Integrity Transmission, Pipeline Integrity TOD, Cathodic Compression, Storage and Pipeline, and MAOP Compliance Pipeline. My direct testimony describes the necessity of the expenditures and the regulations for which these expenditures allow the Company to comply. Mr. Veerapaneni simply took the average of the 2023 and 2024 actual expenditures and applied inflation to project a test year amount. The Company's projections are based upon knowledge of specific projects planned for the next several years. Annual projects and expenditures vary depending upon regulations, system condition, scope of projects, specific projects, and outage planning. Mr. Veerapaneni did not review the reasonableness of the projects proposed during the test year nor the benefits the projects would provide customers. This methodology should be rejected by the Commission and the Company's projection should be approved.

Q. Beginning on page 12 of his direct testimony, CUB witness Veerapaneni proposes an increase to the Capacity/Deliverability Program expenditures in the test year. Do you agree with his proposal?

A. No, I do not. The Company provided extensive documentation for the expenditures in this program and the many sub-programs throughout my direct testimony beginning on page 30, line 8, through page 48, line 20. These programs include TED-I, Deliverability

Base Field Measurement, Deliverability Base Pipeline, Regulator Stations – Distribution, and T&S City Gates. My direct testimony describes the necessity of the expenditures, lists the projects to be conducted and provides the expenditures. These projections are based upon knowledge of specific projects planned for the next several years. Further, capacity requirements can increase due to changes in customer population density in specific locations and also because of changes in system requirements.

Annual projects vary depending upon regulations, system condition, scope of projects, specific projects, and outage planning. The Company believes that the methodology used by CUB is unreasonable. Mr. Veerapaneni did not review the reasonableness of the projects proposed during the test year or the benefits the projects would provide to customers. This methodology should be rejected by the Commission.

Q. On page 17 of his direct testimony, CUB witness Veerapaneni proposes a reduction to the Gas Regulatory Compliance Program O&M expenses in the test year. Do you agree with his proposal?

A. No, I do not. As with the programs mentioned above, I provided a description of the necessity for the expenses in this program in my direct testimony beginning on page 10, line 1, through page 30, line 1. Mr. Veerapaneni simply took the average of the 2023 and 2024 actual amounts and applied inflation to project a test year amount. My direct testimony describes the necessity of the expenses and the regulations for which these expenditures allow the Company to comply. Mr. Veerapaneni did not review the reasonableness of the projects proposed during the test year or the benefits the projects would provide to customers. This methodology should be rejected by the Commission.

III. MEC WITNESS DELEON

Q. On page 30, line 9 of her direct testimony, MEC witness deLeon suggests that all utility programs should be assessed for risk reduction and cost effectiveness. Is it practical for every program to utilize a risk model and cost-effectiveness calculation?

A. No, it is not. For Transmission programs and projects, some projects are customer requested, and a large number are in response to regulatory requirements or to maintain the reliability and resiliency of the Company's system. Thus, not all programs have projects that are as a result of a risk model. Pipeline Integrity and Asset Relocation Transmission programs utilize data from the model to prioritize projects. But a significant portion of the other transmission programs' projects are otherwise indicated. For example, Corrosion Control projects allow the Company to maintain compliance with federal regulations for cathodic protection of facilities. MAOP Compliance Pipeline projects involve MAOP verification and remediation of the Company's transmission pipelines. Most TED-I projects going forward concern the installation of RCVs to improve public safety and minimize gas flows after a failure. The Deliverability Base Field Measurement Program is essential to ensure accurate gas quality and measurement. The Deliverability Base Pipeline Program supports maintaining operations in accordance with the MGSS. City gate investments allow for the rebuilding or other improvements to existing city gate facilities to ensure system reliability and in response to increased customer load demands. Regulator station investments are distribution assets but aimed at maintaining the integrity of 648 regulator station on the Company system.

Q. Beginning on page 41, lines 1 through 5 of her direct testimony, MEC witness deLeon makes recommendations concerning investment levels in future rate case applications. Do you agree with this recommendation?

A. No, I do not. Dr. deLeon seems to be indicating that the Company be frozen at the 2024 level for capital investment amounts regardless of the historical test year or other changes in regulations in future rate case filings. This recommendation is unreasonable. The Company's forward looking rate case filings contain projects and programs supported by expert witness testimony which describe the necessity of the expenditures based upon system conditions, safety improvements and compliance with regulations. This recommendation should be rejected by the Commission.

Q. Does this conclude your rebuttal testimony?

A. Yes, it does.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

EXHIBITS

OF

MICHAEL P. GRIFFIN

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Schedule: B-5.5

Unless noted otherwise, capital "other" costs include expenses such as AFUDC, fleet transportation, pension, administrative/general expenses, indirect non-labor expenses, rent/utility costs, employee benefits, and business expenses (e.g., travel, meals, etc.).

This exhibit demonstrates the projected break down for each program into the cost components shown above. The 2023 amounts are the actual amounts. The cost component projections for all programs and projects except for the Mid-Michigan Pipeline MMPL) for 2024 and beyond are based upon the 2023-2024 18 month (Jan 2023 - Jun 2024) average actual percentage of the breakdown of these components in these programs. The Company projects the program expenditures at a total dollar level based upon historical spending and known projects or other changes. Cost confidence levels were not used to develop projected test year costs.

MPSC Case No.	**U-21806**
Responding Party:	Attorney General
Respondent:	Sebastian Coppola
Requestor:	CECo
Question No.:	**2-CE-AG-4**

2-CE-AG-4
The following question pertains to the Company's Pipeline Integrity TOD program, specifically casing assessments. On page 61, beginning on line 6, through page 61, line 8 of his direct testimony, Mr. Coppola states "In response to additional discovery, the Company stated that is has very limited experience with the cost of inspecting and remediating casings." Please provide the specific discovery response and location where the Company made this statement.

Response:

Assuming the reference is to page 62 of Mr. Coppola's direct testimony, that section of the testimony should have been a conclusion reached by Mr. Coppola and not a direct statement attributed to the Company. Mr. Coppola reached his conclusion that the Company had very limited experience with the cost of inspecting and remediating casings based on the following information provided by the Company in response to discovery:

a. AG-CE-0329b: The two casings are scheduled to be inspected using a robotic ILI tool in August of 2025. After the inspection, the condition of the pipe inside the casing will be determined and remediation performed if required.

b. AG-CE-0329e: There weren't any similar casing projects performed in 2022, 2023 or 2024. Casings are assessed every 6 to 7 years.

c. AG-CE-0329f. Currently these casing[s] are in the planning and scheduling phase. The ILI tool vendor is being scheduled along with construction crews to perform excavation and construction.

DR AG-CE-0329 is included in Exhibit AG-15.

Date: 5/2/2025

U21806-CUB-CE-0248
Page **1** of **1**

Question:

30. Refer to Griffin, p. 23, which discusses the Corrosion Control – Transmission O&M Program. Please provide, for 2023-2026, the number of special projects and average cost per project to be completed for each project type listed by Griffin in this category: large atmospheric painting, pipeline recoating, shorted casing remediation, close internal survey.

Response:

The table below shows a breakdown of project types by year for each category.

	2023 Actual			2024 Preliminary Actual			2025 Projection			2026 Projection		
	Units	Avg Cost	Total	Units	Avg Cost	Total	Units	Avg Cost	Total	Units	Avg Cost	Total
Atmospheric Painting (projects)	7	$56,118	$392,825	8	$81,644	$653,155	8	$81,875	$655,000	8	$82,727	$910,000
Pipeline Recoating (feet)	300	$949	$284,634	790	$387	$305,784	2500	$400	$1,000,000	2500	$400	$1,000,000
Shorted casing/Test Stations (projects)	7	$11,704	$81,925	19	$1,702	$32,335	10	$10,000	$100,000	10	$10,000	$100,000
Close Interval survey (miles)	95	$1,975	$187,616	90	$1,972	$177,473	100	$2,000	$200,000	100	$2000	$200,000
Total			$947,000			$1,168,747			$1,955,000			$2,210,000

As stated in my direct testimony, much of the work performed in this program is typically identified in yearly surveys and remediated in a short timeframe.

For atmospheric painting, the annual variations in average cost for projects is due to the nature and size of the projects. This work is typically large painting projects at compressor stations, city gates or valve sites. It may be a portion of the facility (a couple of components of varying size pipe) or the entire facility. The survey for the atmospheric inspection is performed on a 3-year basis. The increase in cost in 2026 is based on doing larger projects since smaller projects were completed in 2023.

Pipeline recoating also has several variables that make establishing a unit cost difficult. The units shown here are in feet, but the pipe diameter plays a significant role as well in determining the final cost. This work consists of excavating the pipe, removing old coating and applying new coating. A large, 26" diameter pipe, will have a larger cost per foot to recoat than a 10" pipe. For the 2024 work, a large project on Line 1200A was identified for recoat and much of the money spent in this category was to recoat this pipeline.

The shorted casings/test station work is a conglomeration of various types of work that include excavating the pipe, inspecting the pipe and installation of test stations to perform future monitoring. Due to the varying nature and complexity of the work, the unit cost can vary as seen between 2023 and 2024. In 2023, more casing investigation work was done, which typically requires deep excavations approximately 10 feet deep. In 2024, more test station work was performed on pipe at more typical/shallower depths.

Witness: MICHAEL P. GRIFFIN
Date: February 26, 2025

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

KENDRA K. GROB

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Kendra K. Grob, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Kendra K. Grob who previously submitted direct testimony in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. My rebuttal testimony will address Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") witness Shannon Rueckert's recommended disallowance for Leaving It Better Awards ("LIBA"). My rebuttal testimony will also address Attorney General witness Sebastian Coppola's recommended adjustments for projected active health care, life insurance, and long-term disability ("LTD") expenses.

Q. Are you sponsoring any exhibits with your rebuttal testimony?

A. No.

LIBA

Q. Staff witness Rueckert's direct testimony, pages 3 to 5, recommends a disallowance of the LIBA program costs. Does Consumers Energy Company ("Consumers Energy" or the "Company") agree with this proposed disallowance?

A. No. The LIBA program rewards employees with highly effective or better performance ratings for exceeding expectations. Recently centralized under the benefits area, LIBA recognizes efforts like taking on extra work for colleagues on extended leave or handling demanding projects. These awards help the Company retain talent, increase morale, enforces behaviors that support company values and improved performance which in turn

benefits customer service. The Commission should approve the O&M and capital costs for continuing LIBA, as it ultimately reduces overall rate costs for customers.

Q. On page 4, lines 7 through 9, of his direct testimony, Mr. Rueckert explained that one reason he recommended the LIBA disallowance was that "[p]romotability and salary increases are already incentives to achieve operational excellence." How do you respond?

A. While merits and annual incentives can promote operational excellence, the LIBA is another tool at the Company's disposal to encourage excellence. It is an instant acknowledgment of exceptional work, reinforcing positive behaviors and motivating employees to maintain high-performance levels. Studies have confirmed that awards differ fundamentally from direct compensation increases, like promotions and merits.[1] And, when designed appropriately, awards can provide further incentive to excel.[2]

Q. On page 4, lines 15–16, of his direct testimony, Mr. Rueckert also noted that the Company's Employee Incentive Compensation Program ("EICP") already provides short-term incentive compensation for operational goals. Does the Company's EICP serve the same function as the LIBA?

A. The Company's EICP differs from LIBA in that the EICP is based on pre-determined performance criteria, whereas the Company has more discretion under LIBA to award employees for outstanding performance after the fact. Both the EICP and LIBA provide value to customers, but in different ways.

[1] Jana Gallus & Bruno S. Frey, *Awards: A strategic management perspective*, 37 STRATEGIC MANAGEMENT JOURNAL 1527 (2016).
[2] Indeed Editorial Team, *Rewards and Incentives in the Workplace (Advantages and Examples)*, at https://www.indeed.com/career-advice/career-development/rewards-incentives (last visited May 12, 2025).

Q. On page 3, lines 19 through 21, of his direct testimony, Mr. Rueckert suggests that LIBA is always awarded in a lump sum of $4,000. Is this always true?

A. No. Awards vary from $250 to $4,000 depending on the nature of the work meriting the award. The Company considers whether a nominee's work benefits the nominee's immediate work area or whether it has a wider department-level or Company-wide impact.

Q. On page 342 of its March 21, 2025 Order in Case No. U-21585, the Commission recognized the potentially valuable benefits that the LIBA program provides. It did not approve recovery of the LIBA expense in that case but did not preclude the possibility it would approve the expense in other cases. It specifically expressed an interest in how the program has been funded in the past and whether the program has previously been included in rates. How has the program been funded in the past and when did this change?

A. The LIBA program was funded as a part of individual department labor costs budgets prior to 2024. In 2024, a formal budget at the corporate level was established to centralize the cost of the program and allow for better visibility into the utilization and benefits.

Q. Staff witness Rueckert's direct testimony, page 5, recommends a disallowance of the LIBA program capital expense of $824,000 for 2024, $702,500 for the 10 months ending October 31, 2025, and $861,000 for the test year ending October 31, 2026. Does the Company agree to the amount of capital listed for those time periods?

A. No. The Company does not agree with Staff's stated costs that 2024 actual capital amount booked was $590,000. The Company does agree that the amounts listed for the 10 months ending October 31, 2025, of $702,500 and $861,000 for the test year ending October 31, 2026, would be the correct capital projections in this gas rate case. However, the

Commission should not disallow any of the projected capital amounts as the cost of the LIBA program should be included in this case as it does benefit the customer overall in reduced labor costs.

Active Health Care, Life Insurance, and LTD Expense

Q. Please summarize Attorney General witness Coppola's proposed adjustment to Active Health Care Expense, Life Insurance, and LTD Expense.

A. On pages 184 and 185 of his direct testimony, Attorney General witness Coppola recommends a $2,754,000 reduction in Active Health Care Expense to reflect his calculated impact of program savings on this expense category.

Q. Do you agree that Active Health Care, Life Insurance, and LTD Expenses should be reduced by $2,754,000 to reflect the program savings reductions?

A. No. First, the amounts listed in discovery request U21806-AG-CE-0686 and Exhibit AG-65 are gross amounts savings for the assumed plan changes for the listed items. So, the amounts are both electric and gas amounts before capitalization. $2,754,000 gross would only be gas operating and maintenance ("O&M") of $483,000. Second, the Attorney General is assuming that these amounts are not included in the projections for this case. This is not true; these savings are included as the Company is still experiencing health care expense increase over the plan changes. Healthcare costs are still trending well above the inflation rates that were used to set the expense in this case. The actual gas O&M portion of the Active Health Care, Life Insurance, and LTD Expense for 2024 was $19.860 million, while the projected expense for 2024 was $18.921 million. The Company's projected Active Health Care Expense remains reasonable. The Commission should not accept the

Attorney General's reduction amount of $2,754,000 for Active Healthcare, Life Insurance, and LTD expenses.

Q. Does this complete your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	))))))	Case No. U-21806

REDACTED

REBUTTAL TESTIMONY

OF

QUENTIN A. GUINN

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Quentin A. Guinn, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Quentin A. Guinn who previously filed direct testimony in this proceeding?

A. Yes. I am also adopting the direct testimony and exhibits of Consumers Energy Company ("Consumers Energy" or the "Company") Company witness Corey E. Ballinger.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to address Attorney General Dana Nessel ("Attorney General") witness Sebastian Coppola's recommendation that the Michigan Public Service Commission ("MPSC" or the "Commission") remove Fleet Services forecasted capital expenditures of $1,202,000 for the 10 months ending October 2025 and $4,809,000 for the 12 months ending October 2026 for Fleet Vehicle Capital Replacement and Fleet Vehicle Electrification. I will also address Citizens Utility Board of Michigan's ("CUB") witness Joshua W. Denzler's recommendations that: (i) the Commission remove Fleet Services forecasted capital expenditures of $3,390,000 for the 22 months ending October 31, 2025 and $2,580,000 for the 12 months ending October 31, 2026 for Fleet Vehicle Capital Replacement Spend; (ii) the Commission reduce Fleet Services forecasted Operating and Maintenance ("O&M") expenses by [redacted] for the 12 months ending October 31, 2026 for Fleet Responsibility costs; (iii) the Commission order the Company to conduct a more specific study as to the expected savings of electrifying its fleet assets, by asset type (e.g., light duty car, pickup, van, heavy-duty, etc.) and provide the study in its next gas rate case with results incorporated into future requested cost recovery; (iv) the

Commission reduce Fleet Responsibility costs by $15,008,000 in 2025 and $15,008,000 in 2026; (v) the Commission order the Company to provide historical and projected fleet responsibility costs by capital and O&M, with more detailed information on the types of work these dollars support and the value received for these expenditures, by cost category and business unit for future rate cases; (vi) the Commission order the Company to prepare a more detailed analysis of its vehicle idling; (vii) the Commission remove Facility Operations forecasted capital expenditures of $14,937,000 for the 22 months ending October 31, 2025 for the Lansing Service Center Project; (viii) the Commission remove Facility Operations forecasted capital expenditures of $7,199,000 for the 12 months ending October 31, 2026 for the Lansing Service Center Project; (ix) the Commission remove Facility Operations forecasted capital expenditures of $114,000 for the 22 months ending October 31, 2025 for the Hastings Service Center Project; (x) the Commission remove Facility Operations forecasted capital expenditures of $4,380,000 for the 22 months ending October 31, 2025 for the Kalamazoo Service Center Project; and (xi) the Commission remove Facility Operations forecasted capital expenditures of $616,000 for the 12 months ending October 31, 2026 for the Kalamazoo Service Center Project.

Q. Are you sponsoring any exhibits in connection with your rebuttal testimony?

A. No.

Q. Does the Company agree with Attorney General witness Coppola's recommendation on page 99 of his direct testimony that the Commission remove Fleet Services forecasted capital expenditures of $1,202,000 for the 10 months ending October 2025 and $4,809,000 for the 12 months ending October 2026 for Fleet Vehicle Capital Replacement and Fleet Vehicle Electrification?

A. No. Mr. Coppola's proposed reduction is based on an average cost per vehicle in 2024, inflating that cost by inflation factors for 2025 and 2026, and multiplying the resulting average cost by the number of vehicles planned to be purchased in those years. The Company does not purchase the same combination of vehicles each year. Therefore, the average cost per vehicle in the Company's Vehicle Replacement Plan may vary considerably from year to year, and the Company's projected unit costs are based on current manufacturer pricing. The Company's total Fleet Vehicle Capital Replacement Cost is the relevant metric for gauging year-over-year growth in capital spend. For the gas Fleet Vehicle Capital Replacement expenditures, the 2024 projected spend is $9.687 million and the 2025 projected spend is $9.919 million, a 2.4% increase.

Q. Does the Company agree with CUB witness Denzler's recommendation on page 19 of his direct testimony that the Commission remove Fleet Services forecasted capital expenditures of $3,390,000 for the 22 months ending October 31, 2025 and $2,580,000 for the 12 months ending October 31, 2026 for Fleet Vehicle Capital Replacement Spend?

A. No. Mr. Denzler recommended a 20% reduction in these expenditures based on his argument that the Company did not demonstrate the reliability of the Blended Factor model in making vehicle replacement decisions. First, as outlined on pages 8 through 12 of

Company witness Ballinger's direct testimony, the Blended Factor is only one of multiple quantitative and qualitative factors used to make vehicle replacement plan decisions. The efficacy of the Company's replacement plan decision making does not rest solely on the Blended Factor. Second, on page 18 of his direct testimony, Mr. Denzler cites a few instances in which the Company's Blended Factor model failed to accurately predict vehicle failure. As noted on page 12 of Company witness Ballinger's direct testimony, there are over 7,200 units in the Company's vehicle fleet. Therefore, the failure of the Blended Factor to accurately predict a few vehicle failures in this portfolio of over 7,200 assets during the course of several years does not statistically disprove the reliability of the Blended Factor model. Third, Mr. Denzler does not provide any calculation or explanation as to why a 20% disallowance is appropriate for projecting vehicle replacement costs as a result of Mr. Denzler's concerns with the use of the Blended Factor. Finally, the Company has included express reference to the Blended Factor in electric and gas rate case testimony for Fleet Services since the Commission's order issued in Case No. U-20963 in December 2021. During this nearly four-year period, the Commission's orders have not questioned the reliability of the Company's Blended Factor model.

Q. Does the Company agree with CUB witness Denzler's recommendation on page 21 of his direct testimony that the Commission reduce for Fleet Services forecasted O&M expenses of [redacted] for the 12 months ending October 31, 2026 for Fleet Responsibility expense because this total represents estimated fuel and maintenance savings from electric vehicles ("EVs") in the Company's fleet?

A. No. First, Mr. Denzler derived the O&M estimate from an analysis outlined on pages 20 and 21 of his direct testimony. Mr. Denzler's figure, however, is still an estimate based on

estimated savings across the major categories of passenger EVs owned by the Company. In response to discovery request U21806-AG-CE-0229, the Company indicated that it "has not yet incorporated specific fuel, maintenance and other savings assumptions into its budget projections for the replacement of an ICE [internal combustion engine] vehicle with an EV. Deployment of the Test Year units proposed in this case will provide empirical data needed to establish accurate assumptions about fuel, maintenance and other savings to be realized upon replacing ICE vehicles with EVs." Thus, it is premature to include these estimated savings in the projections in this case. Finally, it would be incorrect to assume that these types of savings would be entirely O&M. Fleet Responsibility costs include both an O&M and capital component, estimated in total at approximately 75% capital and 25% O&M based on historical actuals.

Q. How do you respond to CUB witness Denzler's recommendation on page 21 of his direct testimony that the Company conduct a more specific study as to the expected savings of electrifying its fleet assets?

A. The Company agrees to provide more specific information regarding expected savings from electrifying its fleet assets in future cases.

Q. Does the Company agree with CUB witness Denzler's recommendation on page 23 of his direct testimony that the Commission remove forecasted Fleet Responsibility costs of $15,008,000 in 2025 and $15,008,000 in 2026?

A. No. First, as noted on pages 6 and 7 of Company witness Ballinger's direct testimony, Fleet Responsibility costs are incurred to maintain the Company's vehicle fleet. Exhibit A-27 (CEB-2) includes annual historical Fleet Responsibility costs from 2016 through 2023. The amounts in Exhibit A-27 (CEB-2) represent actual Fleet Responsibility costs

and during this eight-year period the Commission never determined that these expenses are not reasonable or prudent. Second, Mr. Denzler notes that the Company is estimating approximately $75 million in Fleet Responsibility costs in 2025 and 2026. Given that actual Fleet Responsibility costs were $86.7 million in 2022 and $80 million in 2023 as shown in Exhibit A-27 (CEB-2), it would not be reasonable to reduce these expected costs by 20% of $75 million in 2025 and 2026. In addition, as discussed above, Fleet Responsibility costs include both an O&M and capital component, estimated in total at approximately 75% capital and 25% O&M. If the Commission adopted a disallowance of Fleet Responsibility costs, which it should not, the disallowance should be 75% capital and 25% O&M.

Q. Does the Company agree with CUB witness Denzler's recommendation on page 23 of his direct testimony that the Company provide historical and projected fleet responsibility costs by capital and O&M, with more detailed information on the types of work these dollars support and the value received for these expenditures, by cost category and business unit in future rate cases?

A. The Company agrees to provide the additional requested detail regarding Fleet Responsibility costs in future cases.

Q. Does the Company agree with CUB witness Denzler's recommendation on pages 26 and 27 of his direct testimony that the Company prepare a more detailed analysis of its vehicle idling?

A. The Company agrees to work on performing such an analysis.

Q. Does the Company agree with CUB witness Denzler's recommendation on pages 29 and 30 of his direct testimony that the Commission remove Facility Operations forecasted capital expenditures of $14,937,000 for the 22 months ending October 31, 2025 for the Lansing Service Center Project?

A. The Company disagrees with a portion of Mr. Denzler's recommendation. As outlined in response to discovery request U21806-AG-CE-0652, the Company's capital expenditures for the Lansing Service Center Project totaled $1,817,000 for the 12 months ended December 31, 2024. The Company's actual capital expenditures totaling $1,817,000 for the Lansing Service Center for the 12 months ended December 31, 2024 should be approved because they have actually been spent on the project. Based on the Commission's determination in Case No. U-21585, the Company will not oppose removal of the remaining forecasted capital expenditures of $13,120,000 ($1,817,000 less than Mr. Denzler's recommended $14,937,000) for the 22 months ending October 31, 2025 for the Lansing Service Center Project. The Company will present post-2024 expenditures for approval in a future rate case.

Q. Does the Company agree with CUB witness Denzler's recommendation on pages 29 and 30 of his direct testimony that the Commission remove Facility Operations forecasted capital expenditures of $7,199,000 for the 12 months ending October 31, 2026 for the Lansing Service Center Project?

A. Based on the Commission's Order in Case No. U-21585, the Company will not oppose this recommendation. The Company will present these expenditures for approval in a future rate case.

Q. Does the Company agree with CUB witness Denzler's recommendation on page 31 of his direct testimony that the Commission remove Facility Operations forecasted capital expenditures of $114,000 for the 22 months ending October 31, 2025 for the Hastings Service Center Project?

A. No. The Company disagrees with a portion of this recommendation. As outlined in my response to discovery request U21806-AG-CE-0652, the Company's capital expenditures for the Hastings Service Center Project totaled $95,000 for the 12 months ended December 31, 2024. The Company's capital expenditures totaling $95,000 for the Hastings Service Center Project for the 12 months ended December 31, 2024 should be approved because they have actually been spent on the project. Based on the Commission's determination in Case No. U-21585, the Company will not oppose removal of the remaining forecasted capital expenditures of $19,000 ($95,000 less than Mr. Denzler's recommended $114,000) for the 22 months ending October 31, 2025 for the Hastings Service Center Project. The Company will present post-2024 expenditures for approval in a future rate case.

Q. Does the Company agree with CUB witness Denzler's recommendation on page 32 of his direct testimony that the Commission remove Facility Operations forecasted capital expenditures of $4,380,000 for the 22 months ending October 31, 2025 and $616,000 in the test year for the Kalamazoo Service Center Project?

A. No. Mr. Denzler's argument that the project is being overbuilt by 40% is incorrect. At page 31 of his direct testimony, Mr. Denzler points to the Company's statement that the renovation will "incorporate and allow for up to 40% future growth opportunities" for his contention that the facility is being overbuilt by 40%. The Company is renovating its

existing Kalamazoo Service Center. As outlined on pages 29 and 30 of my direct testimony in this case, the Company did not construct or add space to the existing facility as part of this renovation. Rather, the footprint of the existing Kalamazoo Service Center is unchanged with renovations being done to the facility as is. While the Company could reduce the size of the facility as part of this renovation by demolishing a portion of the building, demolition of part of the building would add considerably to the cost of this project. It is far more cost effective to simply utilize existing space as is.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

TIMOTHY K. JOYCE

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Timothy K. Joyce, and my business address is 17000 Croswell, West Olive, Michigan 49460.

Q. Are you the same Timothy K. Joyce who previously submitted testimony in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to rebut the adjustments to Lost and Unaccounted For ("LAUF") and Consumers Energy Company ("Consumers Energy" or the "Company") Use ("CU") gas, and Compression Operating and Maintenance ("O&M") expenses; and Gas Compression and Storage Capital expenditures and recommendations proposed by Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") witnesses Kevin P. Spence, Citizens Utility Board of Michigan ("CUB") witness Ram Veerapaneni and Attorney General Dana Nessel ("AG") witness Sebastian Coppola.

Q. How is the remainder of your rebuttal testimony organized?

A. My rebuttal testimony is organized by topical sections as follows:

I. LAUF and Company Use O&M Expenditure Adjustments

II. Compression O&M Expenditure Adjustment

III. New Well Capital Expenditure Adjustment

IV. Lyon 29/34 (Northville Storage) Dehydration Capital Expenditure Adjustment

V. Storage Capital Expenditure Adjustments

VI. Compression Project Capital Engineering Status Expenditure Adjustment

VII. Compression and Storage Capital Expenditure Adjustments

I. LAUF AND COMPANY USE O&M ADJUSTMENTS

A. O&M Expenditure Summary

Q. Please summarize the adjustments proposed by AG witness Coppola for LAUF and CU O&M expenditures.

A. A comparison of the Company's O&M expenditure projections to those recommended by the AG is provided in the table below:

Description	Company Amount (000)	AG Recommendation (000)	AG Adjustment (000)
LAUF			
12 ME 10/31/26	12,709	7,823	-4,886
CU			
12 ME 10/31/26	5,502	3,702	-1,800
TOTAL	18,211	11,525	-6,686

B. AG Witness Coppola

Q. Please summarize AG witness Coppola's recommendation regarding the amount allocated to LAUF.

A. On pages 178 and 179 of his direct testimony, AG witness Coppola recommends a 221 MMcf reduction in the LAUF volume based on the Company's 2050 net-zero emissions goals, resulting in reduced LAUF expense of $728,000.

Q. Do you agree with this recommendation?

A. No, I do not. There is no mention of the Company's Net Zero goals in the LAUF section of my direct testimony, as suggested by AG witness Coppola, because methane reduction and LAUF are not the same, and should not be treated as synonymous. A reduction in methane emissions does not guarantee a reduction in total LAUF, as LAUF also includes theft, customer billing, metering and storage adjustments, described in my direct testimony on pages 22 through 25. There are methane emissions that are not LAUF, like blowdowns

before construction that are accounted for in project expenses and there are LAUF volumes that are not methane emissions, such as theft and metering inaccuracies. To the extent that there are some methane emissions that are part of LAUF, the use of the five-year average gas loss percentage in the approved LAUF calculation methodology, as shown in Exhibit A-74 (TKJ-3), will account for future methane emission reductions as the Company moves toward its 2050 net-zero goals. Therefore, the Commission should reject Mr. Coppola's position.

Q. On pages 177 and 178 of AG witness Coppola's direct testimony he recommends a reduction of $1.8 million in CU and $4.158 million in LAUF gas due to an error in the calculation WP-TKJ-14 in the Company's original filing, do you agree with the adjustment?

A. No, I do not. After filing the case, an error was identified in WP-TKJ-14, however it did not have an impact on the LAUF and CU calculation. The LAUF and CU calculation uses the forecasted volumes for the projected test year based on a five-year average of Public Act 9 of 1929 ("Act 9") transportation customers only, i.e. a small group of transportation customers who do not take service on a tariff rate, but instead take service pursuant to an Act 9 contract. This information is provided from WP-TKJ-15 as shown on line 20 of Exhibit A-75 (TKJ-4). AG witness Coppola incorrectly concluded that the Gas in Kind ("GIK") volumes from WP-TKJ-14 flow into WP-TKJ-15. See page 177, lines 13-14 of Mr. Coppola's testimony. However, that is not entirely accurate. WP-TKJ-14 includes the GIK volumes of the Company's Act 9 customers plus the GIK volumes of transportation customers who are on a tariff rate; whereas, the volumes shown on WP-TKJ-15 include only Act 9 customers. Nevertheless, Mr. Coppola erroneously replaced the Act 9 value

from WP-TKJ-5 on Exhibit A-75 (TKJ-4) with the five-year historical average he requested of the information included in WP-TKJ-14. Compare Exhibit A-75 (TKJ-4), line 20, column (i) with Exhibit AG-62, line 20, column (i). Contrary to Mr. Coppola's unexplained and unsupported assumption, the error in WP-TKJ-14 did not flow into WP-TKJ-15, so the correction to WP-TKJ-14 had no relationship to the Act 9 GIK value used in Exhibit A-75 (TKJ-4), and Mr. Coppola should not have substituted information from WP-TKJ-14 into that exhibit instead of the correct information from WP-TKJ-15. Due to this incorrect application of the LAUF and CU calculation, the Commission should reject Mr. Coppola's recommended disallowance.

II. COMPRESSION O&M EXPENDITURE ADJUSTMENT

A. O&M Expenditure Recommendation Summary

Q. Please summarize the adjustments proposed for Compression O&M expenditures.

A. A comparison of the Company's O&M expenditure projections to those recommended by CUB is provided in the table below:

Description	Company Amount (000)	CUB Recommendation (000)	CUB Adjustment (000)
2024 Projected	17,030	-	0
2024 Actual	17,142	-	0
12 ME 10/31/26	17,577	18,087	510

B. CUB Witness Veerapaneni

Q. On page 18 of his direct testimony, CUB witness Veerapaneni proposes an adjustment for Compression O&M expenditures. Do you agree with this recommendation?

A. No, I do not. I provided a description of the necessity for the Compression O&M expenditures in my direct testimony beginning on page 7, line 2, through page 10, line 10. Mr. Veerapaneni simply took the average of the 2023 and 2024 actual amounts and applied

inflation to project a test year amount. CUB witness Veerapaneni did not review the reasonableness of the proposed expenditures during the test year or the benefits they would provide to customers. Even though Mr. Veerapaneni's two-year-average methodology results in an increase in O&M expense included in rates in this instance, the Commission should reject his position.

III. NEW WELL CAPITAL EXPENDITURE ADJUSTMENT

A. Capital Expenditure Recommendation Summary

Q. Please summarize the adjustments proposed for New Well capital expenditures.

A. A comparison of the Company's capital expenditure projections to those recommended by the AG is provided in the table below:

Description	Company Amount (000)	AG Recommendation (000)	AG Adjustment (000)
10 ME 10/31/25	28,004	-	-4,647
12 ME 10/31/26	32,296	-	-3,916

B. AG Witness Coppola

Q. On pages 80 through 82 of his direct testimony, AG witness Coppola proposes adjustments to the Company's New Well expenditures. Do you agree with the proposed adjustments?

A. No, I do not. The method that AG witness Coppola uses to determine the proposed adjustments are overly simplistic and do not accurately account for the cost associated with the new well projects. First, Mr. Coppola recommends using a very simple total cost of wells drilled in 2023 and 2024 divided by the number of wells drilled to determine an average cost per new well plus an inflation factor for forecasting the cost of new wells in this case. But that approach assumes that all new wells have a similar geological formation,

drill depths, pipeline lengths, and site preparation. These assumptions are not correct. The Storage Engineering group uses information about the specific attributes of a planned new well to create projected expenses for each of the new well projects. The Company's method is far more accurate for projecting the new well expense than the one proposed by AG witness Coppola. AG witness Coppola's analysis is overly simplistic and does not represent the true new well expense. Therefore, the Commission should reject his position.

IV. LYON 29/34 (NORTHVILLE STORAGE) DEHYDRATION PROJECT CAPITAL EXPENDITURE ADJUSTMENT

A. Capital Expenditure Recommendation Summary

Q. Please summarize the adjustments proposed for Lyon 29/34 (Northville Storage) Dehydration project capital expenditures.

A. A comparison of the Company's capital expenditure projections to those recommended by the AG is provided in the table below:

Description	Company Amount (000)	AG Recommendation (000)	AG Adjustment (000)
2022 Actual	1,149		-1,149
2023 Actual	1,191		-1,191
2024 Actual	6,122		-8,453
10 ME 10/31/25	25,249		-25,351
12 ME 10/31/26	3,649		-4,672

B. AG Witness Coppola

Q. Please summarize AG witness Coppola's recommended capital disallowance regarding the Lyon 29/34 (Northville Storage) Dehydration project.

A. Mr. Coppola raises several concerns with the basis, justification, and business needs that the Company has prudently made concerning the Lyon 29/34 (Northville Storage)

Dehydration project. However, none of Mr. Coppola's concerns are valid. I will address each issue individually below.

Q. On pages 76 and 77 of his direct testimony, Mr. Coppola argues that the total project expense that was included in discovery response U21806-AG-CE-0506 of $37.4 million is different from what was included in the original case filing. Do you agree with his claim about inconsistent project expense estimates?

A. No, I do not. Mr. Coppola claims that WP-TJK-6 shows larger capital expenditures from 2024 to 2026 than what the Company has included in this case, suggesting that the Company itself is confused about its planned investments in the Lyon 29/34 (Northville Storage) Dehydration project. However, WP-TJK-6 includes costs for two other projects at the Northville storage location in addition to the dehydration project. Mr. Coppola has confused and conflated multiple projects. In coming up with his $41 million figure for the Lyon 29/34 (Northville Storage) Dehydration project, Mr. Coppola inflates the total project expense estimates by using the expenses from the two other projects being performed at the Northville storage location that are listed in WP-TKJ-6. Again, the other two projects are independent of the Lyon 29/34 (Northville Storage) Dehydration project and should not be included in its total project expense. The Company has not presented any inconsistent information about the planned spending on the project.

Q. On page 77 of his direct testimony, Mr. Coppola mentions his assessment from previous rate cases that the Company should further evaluate the system for a more cost-effective solution. Do you agree with his assessment?

A. No, I do not. The Company has reviewed technologies and methods to provide the regulatory required 7 lbs/MMcf (max) moisture content as required by Rule 81(4) of the

Commission's Technical Standards for Gas Service (R 460.2381(4)). The project design is reflective of the best evaluated option, providing the ability to operate in a manner that supports the peaking nature of the Northville Lyon 29 and 34 fields, with short cycle "turn on" and "turn off" times, zero emissions, lower O&M costs, and lower installation costs.

Q. On page 78 of his direct testimony, Mr. Coppola states that "[b]eginning in 2021, the Company changed the utilization of the Northville storage fields to be a peaking storage facility to be used only during days in winter when customer gas demand reaches near peak demand." Do you agree with this statement?

A. No, I do not. The Northville Storage fields have always been, and continue to be, operated as peaking fields supporting the gas system during times of peak demand. Peak demand is typically experienced due to seasonal loads and can also be experienced due to additional system constraints such as emergencies that limit the amount of gas delivery to the system. The Ray Fire emergency experienced in January 2019 is one example where peak demand was met with the utilization of the Northville storage fields. In mid-March of 2022, the Northville fields were again dispatched; however, utilization was limited due to high moisture content.

Q. On page 78 of his direct testimony, Mr. Coppola asserts that based on the historical usage of the Northville Storage fields, it is not wise to build a high cost facility that will sit idle and not be utilized other than on rare occasions. Do you agree with his assertion?

A. No, I do not. As seen in Attachments 3 and 4 of discovery response U21806-AG-CE-0506 (attached to Mr. Coppola's testimony as Exhibit AG-22, pages 5 and 6), the field has been limited in use and manually controlled to avoid exceeding the 7 lbs/MMcf moisture

entering the Company's pipeline system to the extent possible. In other words, the dehydration project is needed so that the Company can utilize the Northville Storage fields more reliably without the risk of impacting Company assets and downstream customers. The Northville Storage fields are peaking units and by design are intermittent use associated with peak demand; however, their dispatch to the system is limited based on the moisture testing data over the last five years. The Company has done additional testing and monitoring since recognizing the issue with moisture content exceeding the regulatory limit, to verify performance up to the moisture content threshold of 7 lbs/MMcf, which is the basis for this project. This project is needed to reduce the risk of utilizing these peaking fields to their design capacity during peak demand, ensuring the capability to deliver consistent gas quality performance and improving system resiliency. After completing this project, the fields will no longer have to be a "last on, first off" resource and are more likely to be used each winter.

Q. On pages 78 and 79 of his direct testimony, Mr. Coppola states that gas blending can be an effective strategy for achieving gas quality in limited volumes. Do you agree with his position that gas blending can be utilized?

A. No, I do not. The Company does not consider blending a competent means of ensuring gas quality. Various conditions can affect how and whether gases are mixed in a pipe. Due to the integrated nature of Consumers Energy's gas system, its variable operating conditions, and the fact that the system is not designed to assure mixing of gas from different sources, it would be inaccurate to assume mixing occurs. While Mr. Coppola comments that DTE Gas Company ("DTE") utilizes blending, he provides no specific information regarding

which pipelines or storage fields DTE utilizes blending at nor any analysis concerning the differences between the Company's system and the system operated by DTE.

Q. On pages 79 and 80 of his direct testimony, AG witness Coppola proposes adjustments to the Company's Lyon 29/34 (Northville Storage) Dehydration project expenditures. Do you agree with the proposed adjustments?

A. No, I do not. As I have explained above, the Northville Storage fields are a critical part of the Company's natural gas system providing the ability to meet peak demand. The unique ability and configuration of the Northville Storage fields is such that it requires upgrades to meet the regulatory requirements for gas quality, specifically the threshold for moisture content at 7 lbs/MMcf (max). Utilization of the fields is currently limited due to the moisture content as the fields are shut in when the threshold is met. By installing the dehydration equipment proposed, the Company will have the ability to utilize the field to its peaking capacity, ensure reliable gas measurement, limit corrosive liquid from the pipeline system, provide resiliency to the gas system, and ultimately be able to provide more reliable gas service to its customers. The total removal of the project costs in 2022, 2023, 2024, and the bridge and test year is unwarranted and should be rejected by the Commission.

V. STORAGE CAPITAL EXPENDITURE ADJUSTMENTS

A. Capital Expenditure Summary

Q. Please summarize the adjustments proposed for C-1103, W-1004, W-1005, W-1006 New Well projects, and Hessen Field Pipeline Replacement capital expenditures.

A. A comparison of the Company's capital expenditure projections to those recommended by Staff and the AG is provided in the table below:

Description	Company Amount (000)	Staff Recommendation (000)	Staff Adjustment (000)	AG Recommendation (000)	AG Adjustment (000)
12 ME 12/31/24	3,088	62	-2,946		
10 ME 10/31/25	38,689	0	-38,689		-13,450
12 ME 10/31/26	6,494	0	-6,494		-2,003

B. Staff Witness Spence

Q. On pages 16 through 18 for new wells C-1103, W-1004, W-1005 and W-1006; and pages 19 through 21 for Hessen Storage Pipeline Replacement project, Staff Witness Spence recommends disallowance of the Company's planned capital spending for those projects because the Company does not have approved Act 9 certificates for the projects yet. Do you agree?

A. No. The Act 9 certificate of need process is not a cost approval mechanism. The gas rate case includes a forward-looking projection of expenses that are appropriate for inclusion in rates during the test year. While construction on these projects cannot commence until after Act 9 approval, the Company will incur legitimate expenses for these projects even before construction begins including engineering and procurement activities. All three of these projects are well-positioned to receive a final Act 9 order before the final order in this rate case, and no party has challenged any of the Act 9 applications to date. Furthermore, the Company accounted for the time required to navigate the Act 9 process when planning for the expected start date for construction, so there is no reason to expect misalignment between the start of construction and the rate recovery included in the Company's filing. The Company appreciates Staff witness Spence's acknowledgement on

page 22 of his direct testimony that Staff may withdraw its recommended disallowances if the Act 9 certificates are approved before the final order in this case. Given the circumstances and current status of these Act 9 filings, the Company believes the Commission would be warranted in approving the test year investments for these projects in rate even if the Act 9 certificates have not been finalized when this order is released.

C. AG Witness Coppola

Q. On pages 82 through 83 of his direct testimony, AG witness Coppola proposes that the Commission disallow proposed capital expenditures for the Hessen pipeline replacement because it does not have an approved Act 9 creating uncertainty in the timing of the project expenditures. Do you agree?

A. No. For the reasons discussed above in response to Staff witness Spence, the Commission should reject Mr. Coppola's similar disallowance recommendation.

VI. COMPRESSION CAPITAL EXPENDITURE ADJUSTMENT

A. Capital Expenditure Recommendation Summary

Q. Please summarize the adjustments proposed for Compression capital expenditures.

A. A comparison of the Company's capital expenditure projections to those recommended by the AG is provided in the table below:

Description	Company Amount (000)	AG Recommendation (000)	AG Adjustment (000)
10 ME 10/31/25	786	-	-786
12 ME 10/31/26	29,295	-	-29,295

B. AG Witness Coppola

Q. On pages 83 and 84 of his direct testimony, AG witness Coppola criticizes the length of time that some Company projects remain in engineering design. Is there any merit to this criticism?

A. No. Mr. Coppola's unsupported assumption that the project engineering design durations are "very unusual for the relatively moderate size of the projects being undertaken" is incorrect. The duration of the Company's engineering design phase is appropriate for at least two reasons. First, it reflects and includes an appropriate allotment of time to procure the equipment and materials needed to complete construction of the project. The amount of time needed to procure materials and equipment has increased in recent years, which has extended the engineering design phase for some of the Company's projects. But, that longer duration appropriately reflects the state of the marketplace for procuring those materials and equipment. Second, projects with significant construction durations can have a potential impact on system resilience and reliability and impact the Company's ability to support the gas inventory plans. Therefore, it is not prudent to begin projects with a long construction timeline until the engineering is complete. With the Company's recent focus on optimization of the compression fleet, the Company is focusing on having engineering and procurement activities completed prior to proceeding with construction, which results in longer engineering durations. Again, this is an appropriate practice to minimize potential disruption of the Company's ability to serve its customers. I also disagree with Mr. Coppola's observation that the projects he was referring to are necessarily "moderate" in size. In some instances, the investments reflected in this case include only the early spending for projects that will extend beyond the end of the test year. Contrary to

Mr. Coppola's unwarranted assumption, these are large projects that require a considerable amount of engineering and, therefore, more time to complete the engineering.

Q. Based on his inaccurate claim regarding the "very unusual" duration of engineering design, AG witness Coppola identified thirteen compression projects that will not begin construction until the end of the test year in this case and recommends that the Commission disallow the projects. Do you agree with his recommendation?

A. No. Mr. Coppola correctly notes that thirteen compression projects have construction and completion dates after the test year, but the Company will still incur costs for those projects during the engineering design phase, including costs for material and equipment procurements as discussed abobe. Therefore, Mr. Coppola's recommended disallowances are inappropriate. The correct ratemaking treatment for projects that incur legitimate capital costs during the bridge period and test year but will not be in service before the end of the test year is to apply an AFUDC offset – not to disallow them. Mr. Coppola's argument that these project costs should not be included in rate base should be rejected by the Commission and the Company's full projection for the compression projects should be approved.

VII. COMPRESSION AND STORAGE CAPITAL EXPENDITURE ADJUSTMENTS

A. Capital Expenditure Recommendation Summary

Q. Please summarize the adjustments proposed by AG witness Coppola and CUB witness Veerapaneni for Compression and Storage capital expenditures.

A. A comparison of the Company's capital expenditure projections to those recommended by the AG and CUB are provided in the table below:

Description	Company Amount (000)	AG Recommendation (000)	AG Adjustment (000)	CUB Recommendation (000)	CUB Adjustment (000)
2024 Proj	175,339		0		
2024 Act	165,776		-7,563		
12 ME 10/31/26	162,039			145,031	-17,008

B. AG Witness Coppola

Q. On pages 84 and 85 of his direct testimony, AG witness Coppola proposes adjustments to the Company's 2024 Compression and Storage capital expenditures based on the proposed versus actual spending levels. Do you agree with the proposed adjustments?

A. Yes, the Company accepts the proposed adjustment.

C. CUB Witness Veerapaneni

Q. Beginning on page 14, line 14 of his direct testimony, CUB witness Veerapaneni proposes test year adjustments to the Company's Compression and Storage projects that you are sponsoring. Do you agree with these proposed adjustments?

A. No, I do not. I provided a description of the necessity for the Compression and Storage expenditures in my direct testimony beginning on page 26, line 10, through page 47, line 25. Mr. Veerapaneni simply took the average of the 2023 and 2024 actual amounts and applied inflation to project a test year amount. CUB witness Veerapaneni did not review the reasonableness of the projects proposed during the test year or the benefits the projects would provide to customers. The Company believes that the methodology used by CUB is unreasonable and should be rejected by the Commission.

Q. Does this conclude your rebuttal testimony?

A. Yes.

S T A T E O F M I C H I G A N

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

ASHLEY E. MESCHKE

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Ashley E. Meschke, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Ashley E. Meschke who previously submitted testimony in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to rebut the direct testimony presented by Attorney General witness Sebastian Coppola regarding Consumers Energy Company's ("Consumers Energy" or the "Company") Employee Incentive Compensation Plan ("EICP"). I will specifically respond to Mr. Coppola's comments about the operating performance measures.

Q. Are you sponsoring any exhibits?

A. No.

Q. Please provide an overview of your rebuttal testimony.

A. Mr. Coppola argues that $526,000 of EICP expenses included in the test year should be disallowed. On page 190, lines 8 through 11 of Mr. Coppola's direct testimony, he states that cost savings calculated are inconsistent with recent trends in performance, aspirational, and not based on actual performance. This is incorrect and my rebuttal testimony provides further information to substantiate that customer benefits from the EICP program exceed the cost to customers. Mr. Coppola's recommendation to disallow EICP costs should be rejected.

Q. Are you seeking full recovery of the customer benefits of $3,600,000 as outlined in your direct testimony?

A. No. It is important to clarify that the intent of my testimony is not to recover the full projected cost savings for the test year. Instead, it is intended to provide a reasonable expectation of customer benefits in the test year as the Company achieves operational goals associated with the EICP. My testimony and supplemental exhibits outline $3,600,000 in projected savings – which exceeds the Company's request for recovery of $1,546,000 and is considered reasonable and prudent for the Company's customers.

Q. On page 189, lines 6 through 9, Mr. Coppola indicates that there has been a negative performance trend in safety incidents. Do you agree with his assessment?

A. No. Mr. Coppola's analysis of recordable incidents on a short-term basis to assert a negative trend does not accurately reflect the Company's overall safety performance, as detailed later in my testimony. In 2007 and 2008 the Company incurred 558 and 335 incidents respectively, prompting a transformation in its approach to employee safety and health. Since 2012, recordable incidents have consistently been at or below 150 per year, and the Company has exceeded the average performance of peer utilities nine of the last ten years.

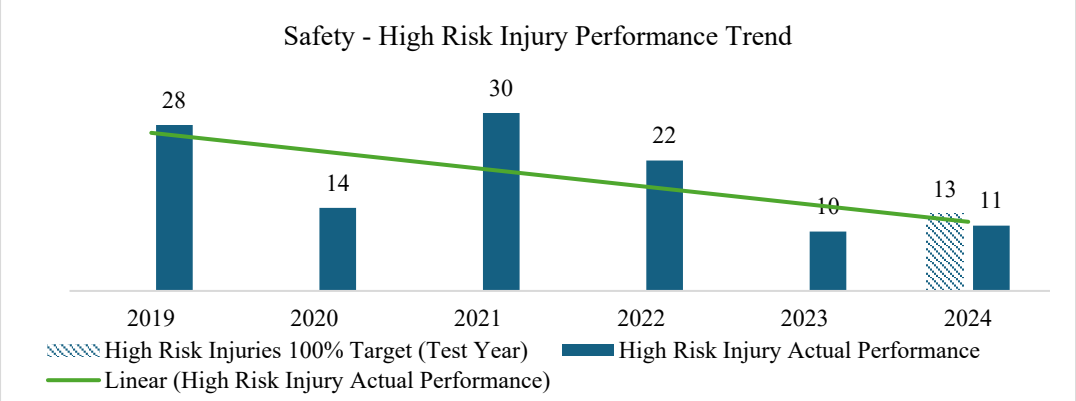
Q. Please explain why only analyzing recordable incidents is not a holistic representation of the Employee Safety EICP operating performance metric.

A. As outlined in Exhibit A-39 (AMC-1), the Employee Safety EICP operating performance measure is composed of three components: (1) Recordable Incident Rate, (2) High Risk Injuries, and (3) Fatalities. The Recordable Incident Rate accounts for 30% of the metric and the total number of recordable incidents is only one variable of the equation outlined in Exhibit A-95 (AEM-1). High-Risk Injuries account for 70% of the metric and include

both OSHA recordable and non-recordable incidents that have the potential to result in a severe injury or fatality. In the event there is a fatality, there is a 0% payout for the Employee Safety operational goal in its entirety. Many peer utilities in the industry are shifting their focus toward high risk and severity-based incidents as opposed to recordables, and the Employee Safety operational measure weighting reflects changes in the industry.

Q. Please explain the trend in High Risk Injuries and fatalities to provide a more holistic representation of the Employee Safety EICP operating performance metric.

A. As previously stated, the Company began tracking High Risk Injuries in 2019, and the historical performance indicates a strong positive performance – with a notable change starting in 2022 which was the first year the metric was included as part of the Employee Safety metric for the EICP.



Additionally, the Company's last employee fatality was in 2018 and this year marks the longest duration in the Company's 139-year history without an employee fatality.

Q. Do you believe the Employee Safety metrics have improved because they have been included in the EICP operating performance measures?

A. Absolutely. As Company witness Amy M. Conrad outlines in her direct testimony on pages 11 through 12, the intent of the EICP operational metrics is to incentivize employees

to participate in increasing productivity and achieving performance metrics that are critical to the Company's utility business and customers. This is one of several examples where including a metric in the Company's EICP has led to positive performance trends. The Employee Safety metric is designed to ensure employee safety and well-being – while preventing productivity losses that can result in delays in completing the work plans that will deliver safe and reliable service to customers and keeping the cost associated with safety incidents low.

Q. On page 189, lines 8 and 9 of Mr. Coppola's direct testimony, there is an indication that achieving 81 recordable incidents is unrealistic. Do you agree?

A. No. This is the target that has been established to drive continuous improvement in the Company's safety performance – while striving to achieve high performance compared to peer utilities in benchmark studies. Although it may be aggressive, it is intended to be challenging, yet achievable to keep employees motivated to achieve the targeted levels of performance. EICP targets are established with the intent of achieving a first quartile performance compared to peer utilities.

Q. On page 189, lines 9 and 10 of Mr. Coppola's direct testimony, Mr. Coppola indicates that the data provided in Exhibit A-96 (AEM-2) does not indicate actual cost savings. Do you agree with his assessment?

A. The Company never stated that the savings shown in my exhibits represent historical costs savings. My exhibits demonstrate the cost savings that the Company would expect to realize and pass on to customers in future if it achieves the operations goals associated with each exhibit. Furthermore, as I discussed earlier in my rebuttal testimony, the Company is not asking the Commission to approve EICP costs equivalent to the expected savings. My

exhibits show that the expected savings are meaningfully higher than the costs to achieve them and justify the modest amount of EICP expense the Company is requesting in this case.

Q. On page 189, lines 11 through 14, Mr. Coppola highlights that the costs associated with safety incidents have increased not decreased and that costs have been erratic between 2020 and 2023. Do you agree with this assessment?

A. No. Mr. Coppola has not provided sufficient analysis to make this claim. The cost outlined in Exhibit A-96 (AEM-2) is broken down by lost time and medical expenses, workers' compensation, and other exposures. To adequately indicate a trend in costs, cost per incident should be analyzed as opposed to total cost. When analyzing these costs between 2020 and 2024, there is a negative trend in costs associated with lost days. In reviewing the cost per incident associated with medical expenses, workers compensation, and other exposures, there has been an increase in actual costs – which is reasonable given national headlines indicating the rise in inflation and healthcare cost since 2020. However, the cost trends are not erratic as Mr. Coppola indicates. These costs are within statistical control limits. Additionally, by including High Risk Injuries into the EICP, the Company is focused on reducing the potential for safety incidents that have the potential to result in a fatality or severe injury – which would more than likely result in higher costs – as opposed to injuries such as insect bites and minor abrasions – which are also included in the cost savings projection.

Q. On page 189, lines 16 through 20, of his direct testimony, Mr. Coppola criticizes the Company's methodology used to calculate customer savings based on projected savings in 2024 versus actual savings for the System Average Interruption Duration Index ("SAIDI") metric. Do you agree with his opinion?

A. No. For the test year, the company leveraged the EICP 100% target for SAIDI of 170 customer minutes to estimate projected cost savings to customers. This is a reasonable approach to indicate the savings customers should expect when the Company achieves targeted levels of SAIDI performance. If the Company leveraged actuals from 2020-2024 and calculated the average impact, the results would have been 155 customer minutes in 2024 – resulting in an eight-minute reduction in customer minutes and customer benefits of $25,115,262 as opposed to the results outlined in Exhibit A-97 (AEM-3). This indicates that the Company's approach to calculate projected savings are conservative and understated by three minutes and $9,687,366.

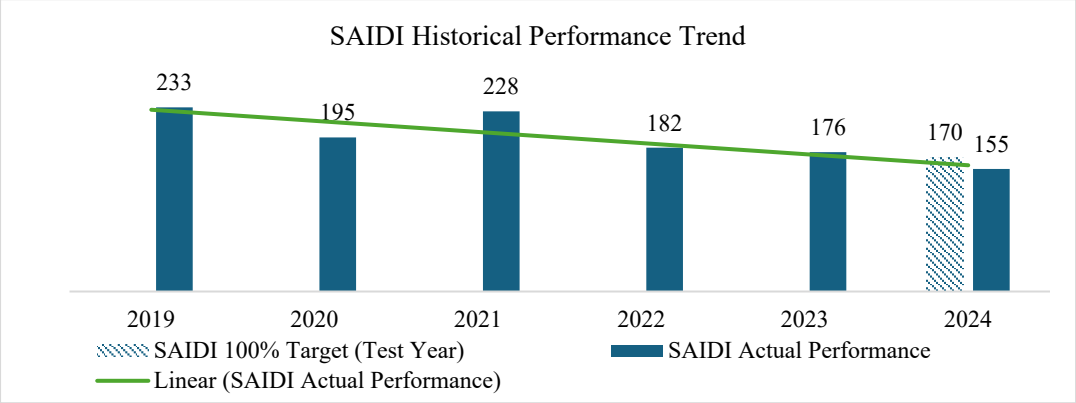
Q. Why does the Company use a four-year historical average to project savings?

A. Leveraging historical averages to set targets and project customer benefits is the best practice in data analytics because it provides a more stable and reliable basis for decision-making. This approach avoids the inconsistencies and anomalies that can arise from year-over-year fluctuations, ensuring that targets are based on consistent long-term trends.

Q. Do you believe the EICP program has positively contributed to SAIDI performance?

A. Yes. This is another example that illustrates a positive performance trend can be observed when a metric is included in the Company's EICP – as outlined earlier in my testimony. If you analyze the longer-term trend in SAIDI performance, you will see a negative trend

over the last several years – demonstrating the Company's commitment to continuous improvement to deliver customer value through EICP operating performance measures.



Q. On page 190, lines 2 through 4, of his direct testimony, Mr. Coppola indicates that there has been a negative performance trend in employee turnover between 2020 and 2023. Do you agree with his statement?

A. No. The 2020 data point selected by Mr. Coppola to indicate a negative trend represents an extreme outlier in the Company's historical performance trend. It should be noted that, in 2020, voluntary turnover during the COVID-19 global pandemic was generally exceptionally low in many industries due to economic uncertainty and unprecedented actions by governments to curtail normal business activity. As referenced in my direct testimony on page 4, lines 11 through 12, the Company's employee turnover rates are significantly lower than the average across peer utilities and indicate a very strong performance. When achieving performance in the top quartiles, it is natural to see some year-over-year variation without significant performance improvement. Instead, the goal is focused on maintaining the Company's strong performance.

Q. On page 190, lines 5 through 7, Mr. Coppola indicates that this is a clear mismatch between employee satisfaction measures and cost savings based on peer company turnover rates. Do you agree with his assessment?

A. No. In Exhibit A-95 (AEM-1), the Company outlines the Culture Index survey questions. The following questions from the survey are leading indicators for employee retention: (1) If I were offered a similar job elsewhere at the same pay, I would stay at the Company; (2) Given your choice, how long would you plan to continue working for the Company?; (3) I would recommend my Company as a good place to work; (4) I feel proud to work for the Company; (5) I feel able to be myself at work; and (6) I feel like I belong at the Company. Consumers Energy's historical trends indicate that there is a strong correlation between its Culture Index and employee turnover. When Culture Index performance is high, the employee turnover is low. Despite fluctuations in year-over-year performance, the Company has consistently exceeded benchmark performance in employee turnover – illustrating that by including the Culture Index in the Company's EICP operational metrics it is achieving a cost savings compared to peer utilities.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

HEIDI J. MYERS

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Heidi J. Myers, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Heidi J. Myers who previously presented direct testimony in this case on behalf of Consumers Energy Company ("Consumers Energy" or the "Company")?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. I will rebut certain assertions and recommendations of the Association of Businesses Advocating Tariff Equity ("ABATE") witness Jessica A. York and the Citizens Utility Board of Michigan ("CUB") witnesses Ram Veerapaneni and Richard J. Bunch regarding the use of a projected test year and productivity assumptions. I will also address ABATE witness Colin T. Fitzhenry's position taken on inflation. In addition, I will also address Attorney General Dana Nessel ("AG") witness Sebastian Coppola regarding his proposed Operating and Maintenance ("O&M") adjustments related to the Company's Voluntary Separation Program ("VSP"), his proposed adjustments related to the Riverside Storage Field, and his recommendation related to the accounting for the SAP S4/HANA project.

Q. Have you prepared any exhibits in conjunction with your rebuttal testimony?

A. No.

Q. Are there any statements you would like to make regarding your rebuttal testimony?

A. Yes. Any items not specifically addressed in my rebuttal testimony does not indicate my agreement with them.

Test Year

Q. Has the Michigan Public Service Commission ("MPSC" or the "Commission") previously approved Consumers Energy's ability to utilize a Projected Test Year?

A. Yes, the Commission has, for many years, approved the use of projected test years. Most recently in Consumer Energy's electric rate case, Case No. U-21585, the MPSC's March 21, 2025 Order once again approved the use of a projected test year despite being presented with the same arguments from intervening parties that will be addressed in this rebuttal testimony.

Q. What specific guidance did the Commission provide in Case No. U-21585?

A. The Commission "…acknowledges that the use of projected test years by utilities in developing requested rates in rate cases is permissible by statute – subject, however, to the burden that the company prove the accuracy of each and every test year projection." The Commission further opines "… the Commission agrees with the ALJ that "the burden of proof to substantiate projections lies with the utility, and absent sufficient support, historical data may be used to develop the revenue requirement," that "the used and useful standard should be applied on a case-by-case basis," and that "Consumers' projected test year should be adopted in this case, with costs and revenues adjusted based on the preponderance of the evidence." See MPSC Case No. U-21585, March 21, 2025 Order, page 9.

Q. Does ABATE witness York propose to deviate from the Commission's long-standing approval of the use of projected test years?

A. Yes. Starting on page 8 of her direct testimony, Ms. York asserts that all cost projections should be based on historical test year amounts with costs adjusted for known and

measurable changes, but goes on to recommend no rate increase for this case without providing for any known and measurable changes.

Q. What examples does Ms. York provide for known and measurable changes to a historical test year?

A. On pages 8 and 9 of her direct testimony, Ms. York provides four examples of what she considers valid known and measurable changes to a historical test year. They include normalizations to address the effects of volatility, annualization of costs that occur on a periodic basis, but not in every year, annualization of costs that occurred in the later months of the historical year that are expected to continue at that level going forward, and imminent changes in costs that will occur during the period between the end of the historical period and the date new base rates go into effect.

Q. Has Ms. York incorporated her thoughts on valid known and measurable changes in her recommendation to the Commission?

A. She has not. Ms. York did not propose any modifications to the historical test year that she perceives as valid known and measurable adjustments. Her ultimate recommendation to the Commission to have no rate increase based on the results of the historical test year deviates from her own thoughts on the appropriate method to set rates. This alone is reason enough to reject Ms. York's recommendation.

Q. Do you agree with ABATE witness York's rationale for moving away from the long-standing Commission approved use of projected test years?

A. No. The following testimony will individually address each of the points made by Ms. York.

Q. Please comment on Ms. York's assertion on page 6 of her direct testimony that customers experience rate increases sooner using a projected test year than they would under a historical test year.

A. The use of a projected test year provides the calculation of rates necessary during the period for which the rates will be in effect. This is the most accurate way to set rates and, as will be discussed further below, provides intervenors with an opportunity to comment on the Company's plans for spending prior to the dollars actually being spent. Not only does Ms. York's assertion ignore these points, it identifies a fact, that if acted upon by the Commission, would unfairly remove the fundamental ability of the Company to have an opportunity to earn a fair rate of return on its investments and knowingly provide customers rates that are below the cost to serve them.

Q. Do you agree with Ms. York's assertion on page 7 of her direct testimony that a projected test year eliminates cost containment?

A. I do not. The Company has an incentive to hold spending at levels approved in rates and work to spend efficiently. Once rates are established, the Company is left to manage the business within those rates inclusive of risks that are outside the control of the Company such as weather impact on sales. This provides a powerful incentive for cost containment.

Q. Do you agree with Ms. York's assertion on page 7 of her direct testimony that the use of a projected test year handicaps Staff and intervenors in reviewing Consumers Energy's rate filings to ensure the projected capital expenditures and expenses are reasonable because they are not actual capital expenditures?

A. I do not. Providing expected spending for a future test year provides a more transparent rate making process allowing Staff and intervenors an opportunity to understand how dollars

are intended to be spent and opine on the merits of the proposed spending. In comparison, setting rates based on historical spending is inferior as it only allows for review of spending after it has already occurred. This can have unfortunate consequences. If spending is only reviewed after it is spent and only then determined to be an item that should be disallowed from rates, it can lead to write-offs for the Company and an inefficient use of a finite amount of dollars available to invest in the system. This is not good for the Company or customers. Customers are better served by the rate setting process provided by projected test years that allows parties to the rate case proceedings an opportunity to understand and opine on the merits of how dollars will be spent in advance of the spending.

Q. On page 6 of Ms. York's direct testimony, she has included Table JAY-2 titled Historic Test Year and Projected Test Year Rate Sufficiency/(Deficiency). Do you agree with the conclusion that Ms. York reached as a result of the data on this table?

A. I do not. Ms. York's assertion based on the table is that the Company "…would not have been able to seek the large rate increases it has sought in seven out of its eight most recent rate cases, including this proceeding, but for basing the requested rate increases on projected test years." While it may be true that rate requests would be different if the Company were required to rely on a historical test year for rate relief, it would not remove the need for rate relief but would only unfairly delay it. In fact, the very first time rates were established rates on a historical test year it would create a greater deficiency in the next historical year requiring a greater increase in that year. This does not create a regulatory environment conducive to customer interest. ABATE's request to rely on historical test years for setting rates is really an ask to trade an environment where stakeholders and the Commission have an opportunity to weigh in on spending, projects, and programs before they are implemented

for a short-term and inappropriate delay in rate relief. Establishing a built-in regulatory lag as proposed by Ms. York would be detrimental to the Company and its customers, and is inconsistent with the Michigan Law providing for rates to be set using projected test years.

Q. Pages 12 through 13 of Ms. York's direct testimony provides what she labels as her longer-term recommendation to the Commission. How do you respond?

A. In that portion of her direct testimony, Ms. York describes other filings and dockets where ABATE has opined on test years. This portion of her testimony has either already been addressed by the Commission or will be addressed by the Commission in those other dockets.

Q. Have any other witnesses commented on the use of a projected test year?

A. Yes. CUB witness Veerapaneni recommends moving away from a projected test year. He recommends the use of an average of 2023 and 2024 historical data for capital and O&M expense for the case. He indicates that the cycle of annual rate case filings never ends if the MPSC approves even a small portion of the increase and goes on to note that Consumers Energy has the responsibility to provide safe and reliable utility service because Consumers Energy does not have competition to provide gas service. He requests the Commission consider customer's inability to look for other sources of gas and use average historical data for capital and O&M expense.

Q. Please respond.

A. I do not agree with Mr. Veerapaneni's request or reasons for the request. First, Mr. Veerapaneni did not review the Company's capital or O&M expense projects. His testimony described several capital and O&M programs but did not provide any critique of

the proposed spending or rationale as to why the spending was not reasonable or prudent. On one point, I do agree with Mr. Veerapaneni. Consumers Energy is obligated to provide safe and reliable utility service. The testimony of Company witnesses provides support for the needed capital and O&M spending included in the case to do just that. Mr. Veerapaneni does not make any assertions that the Company has not adequately supported the costs included in this case and he does not provide any clear evidence as to why an average of 2023 and 2024 historical spend as the basis for the entirety of capital and O&M expenditures is appropriate. As such, Mr. Veerapaneni's request to base all capital and O&M expense on historical experience is not appropriate and should be rejected by the Commission.

Productivity Factors

Q. Please describe CUB witness Bunch's recommendation related to the use of a productivity factor in this case.

A. On pages 13 through 23 of his direct testimony, CUB witness Bunch supports his recommendation that the Commission apply a productivity adjusted inflation factor to all actual historical O&M and capital project labor costs to determine test-year spending projections. Mr. Bunch also recommends the same treatment for non-labor costs, both O&M and capital. He indicates that the inflation rates supported by the Company should be reduced by a 0.79% productivity factor based on the average annual Michigan labor productivity factor and applied to historical labor costs and he recommends reducing inflation rates by a 0.83% productivity factor based on the non-labor total factor productivity factor to be applied to non-labor O&M and capital. Ultimately, he argues that rates that rise at the rate of inflation are not justified because inflationary pressures on costs should be mitigated by gains in productivity and the Company should be able to fully

recover its costs with rates that rise slower than inflation if it realizes productivity gains. He goes on to argue that utilities do not face competitive pressures to contain costs and a reasonable opportunity to recover their costs should include a reasonable expectation that it demonstrate over time that it is attaining productivity gains comparable to those of companies operating in competitive markets.

Q. Do you agree that projected test year costs should be determined based on historical amounts increased by inflation that has been reduced by a productivity factor?

A. No. The Company strives to continuously improve through its CE Way Operating System that identifies and executes on productivity improvements leveraging new technology and sustainable productivity improvements to help mitigate inflationary pressure and control costs over time. All known cost reductions related to productivity are incorporated in financial exhibits of each witness. Mr. Bunch's recommendation to determine projected test year costs by applying a productivity-adjusted inflation factor to historical actual costs is overly simplistic and does not align with the reality of the costs the Company is experiencing or expects to experience. The standard that must be applied to the projected costs is whether they are reasonable and prudent. Broad productivity adjustments do not meet this standard. If the Commission were to simply apply cost indexes to historical costs, there would be no need for any evidence to be presented in the contested case. Further, Mr. Bunch's recommendation removes the ability for the Company to utilize a projected test year. As noted above, the Commission has indicated numerous times that a projected test year is permissible by statute, and it is the Company's burden to support its rate case projections. The Company witnesses fully support the projected test year costs they sponsor. Any adjustments should be based on the merits of the specific costs in question.

Q. Please respond to Mr. Bunch's conclusion at page 17 of his direct testimony that utilities do not face competitive pressures to contain costs and a reasonable opportunity to recover its costs should include a reasonable expectation that it demonstrate over time that it is attaining productivity gains comparable to those of companies operating in competitive markets.

A. As noted above, I do not consider this an appropriate consideration in determining proper rates. However, even it were, the Company has in fact demonstrated over time that its rates have remained lower than inflation. Company witness Neal P. Dreisig provides testimony that over the past 10 years customer bill increases are well below inflation.

Q. Mr. Bunch also indicates that the Company's costs must be increasing at rates higher than inflation because the proposed rate increase is higher than inflation. Please respond.

A. Mr. Bunch has not considered all necessary facts to make this assertion. He went on to discuss only the changes in O&M expense when trying to connect cost increases to the proposed rate increase. However, changes in O&M expense only explains 17% of the proposed increase or a 1.8% increase which is lower than inflation. The largest driver of the proposed increase is the needed investments in the system which represents additions of capital assets and are not necessarily indicative of a rise in costs. They represent additions of assets that serve customers and are supported in great detail by other Company witnesses.

Q. Has Mr. Bunch provided evidence that the productivity factors are appropriately applied to costs incurred by the Company?

A. No. Mr. Bunch provided no explanation of how his suggested productivity factors are calculated or used in practice, nor did he provide compelling evidence that they would be

appropriately used to set utility rates. The U.S. Bureau of Labor Statistics ("BLS") indicates that labor productivity is equal to output divided by hours worked and the total factor productivity is equal to output divided by combined inputs.[1] Mr. Bunch's broadbrush proposal to apply productivity factors to all capital and O&M costs ignores the fact that the Company does not have control over all costs and may have less control over the inputs used to calculate the productivity factors than other companies. Any recommended adjustments to projected costs should be based on the merits of those specific costs.

Q. CUB witness Bunch also recommends that the Commission replicate the order it issued in Consumers Energy's electric rate case, Case No. U-21585, namely that it should direct Consumers Energy to present more detailed evidence to demonstrate that it is in fact offsetting inflation by productivity in the Company's next gas rate case. Do you agree with this recommendation?

A. No. In each rate case the Company must demonstrate that its costs are reasonable and prudent. The Company strives to continuously improve its efficiency through the CE Way Operating System and incorporates known savings in its financial exhibits. However, accurately measuring productivity gains that accumulate over time and pointing to a specific spending line item in the case that is impacted can be complex. Productivity as defined by the BLS, is outputs divided by inputs. Trying to identify each and every change in either outputs or inputs in the context of productivity as part of a regulatory filing would be overly burdensome. The Company understands its obligation to provide clear cost projections along with support for the reasonableness of its projections and responds to feedback received in Commission orders. Requesting more information on specific cost items, if

[1] https://www.bls.gov/productivity/educational-material/labor-productivity-total-factor-productivity-comparison.htm

needed, is a more constructive request than requesting an overly complex isolation of all productivity included in the case.

Q. Does Consumers Energy agree that the Company must support all costs included in its rate cases?

A. Yes. It is on this basis that I again respectfully requesting the Commission reject the recommendations of ABATE witness York and CUB witnesses Bunch and Veerapaneni to leverage either a productivity factor, historical based capital and O&M costs, or outright rejection of using a projected test year as a means to disallow projects without deeper consideration. Disallowances for all projects and programs in this manner would disregard the evidence provided by the Company witnesses in support of the reasonableness and prudence of investments. The Company requests the Commission continue to evaluate each proposed project on its individual merits in the instant case to determine its reasonableness and prudency.

Inflation

Q. Describe ABATE witness Fitzhenry's proposal related to inflation.

A. At pages 18 and 19 of his direct testimony, Mr. Fitzhenry proposes to use the Blue Chip GDP Chained Price Index ("Chained Price Index") as a replacement for the Consumers Price Index ("CPI") that the Company used in the case. Mr. Fitzhenry argues that the basket of goods in the Chained Price Index is updated each year to reflect what people are actually buying. He goes on to say that this is unlike the CPI, which uses a fixed basket for a set period. He also provides an analysis showing that there is a higher correlation to the actual cost of gas meters for the Chained Price Index than the CPI. Ultimately, he recommends the Commission replace the CPI with the Chained Price Index indicating that the CPI

non-labor inflation rate is well above the consensus industry experts' opinion of the Chained Price Index.

Q. Please respond.

A. As will be illustrated, there are numerous issues with the conclusions drawn by Mr. Fitzhenry. The Commission should maintain its long-standing practice of approving the use of CPI in rate cases.

Q. Do you agree with Mr. Fitzhenry's assessment at page 18 of his direct testimony that the CPI is inferior to the Chained Price Index because the Chained Price Index is updated annually?

A. I do not. The CPI is updated periodically. The BLS indicates that these updates are made to "reflect more recent consumer spending patterns; this provides a logical opportunity to rework the item classification scheme so that it will recognize the emergence of new items, the changes to existing items and their relative importance, and the ways that people view consumer goods and services."[2] As such, the CPI should not be viewed as inferior to the Chained Price Index because the Chained Price Index is updated annually.

Q. Should Mr. Fitzhenry's correlation analysis be considered in deciding the appropriate inflation index for this case?

A. No. Starting on page 19 of his direct testimony, Mr. Fitzhenry did an analysis to find the correlation for one expense item, gas meters, to the CPI and the Chained Price Index finding that there was a higher correlation to the Chained Price Index. However, the nature of both of the indexes is to provide inflation rates for a basket of goods, not just one item. It is not

[2] https://www.bls.gov/cpi/additional-resources/revision-1998-item-structure.htm

appropriate to draw the conclusion that the Chained Price Index is more appropriate than the CPI based on a correlation review of one expense item.

Q. Mr. Fitzhenry ultimately concludes that the Commission should adopt the Chained Price Index for inflation in this case also indicating that its use is a consensus industry opinion. Does he explain what a consensus industry opinion represents?

A. No. Mr. Fitzhenry does not explain what a consensus industry opinion represents and provides no proof or support that this is true. This unsupported assertion should be disregarded.

Q. Is there a long standing practice for Commission approval of the CPI for use in rate cases?

A. Yes. The Commission has consistently approved the use of CPI. The Commission most recently approved the use of CPI in DTE Electric Company's rate case, Case No. U-21534. At page 76 of the January 23, 2025 Order the Commission stated:

> The Commission also rejects the proposal to switch to use of the Real GDP Chained Price Index. As the company points out, the CPI is the most widely used measure of inflation, and the Commission finds ABATE failed to show how the Real GDP Chained Price Index is superior to the CPI-Urban for either labor or non-labor costs or why the Real GDP Chained Price Index's customer substitution treatment is superior to the periodic updates made in the CPI's basket of goods.

The facts in this case are similar and Mr. Fitzhenry has not provided adequate support to move to the Chained Price Index. The Commission should approve the continued use of the CPI for inflation.

Voluntary Separation Program

Q. Can you summarize the testimony and recommendations of AG witness Coppola regarding the Company's 2023 VSP?

A. AG witness Coppola proposed adjustments in the amount of $7,989,000 related to the Company's 2023 VSP. On pages 181 and 182 of his direct testimony, he indicates that the Company did not provide any underlying calculations showing how the cost savings were calculated or any supporting schedules that would show the cost savings were actually included in the projected test year in each exhibit for the affected departments. His ultimate recommendation is for the Commission to remove the entire $7,989,000 of VSP savings from the Company's forecasted O&M expense for the projected test year.

Q. Please respond.

A. The Company did not provide a calculation of the savings because the savings provided are actual amounts. Through discovery, the Company disclosed the number of employees by area and the dollar value of the savings associated with these employees leaving the Company. The Company was also not able to provide specific workpapers that identify these VSP savings in each witness exhibit. However, this is for good reason. With the exception of Company witness Matthew J. Foster who sponsors corporate O&M expense, O&M witnesses include total projected O&M expense based on the forecasted needs in their business area. When considering those needs for the projected period of this case, each witness had knowledge and used the knowledge of the VSP savings when developing their O&M expense for the case. Company witness Foster does forecast corporate O&M by inflating historical O&M expense. However, he also removed VSP savings from the historical year prior to inflating the historical O&M expense. All of the VSP savings were

considered in the development of this case and have been properly incorporated. It is not appropriate to remove the VSP savings as recommended by Mr. Coppola.

Accounting For SAP S4/HANA

Q. Please describe AG witness Coppola's recommendations regarding the SAP S4/HANA project.

A. At page 91 of his testimony Mr. Coppola indicates that the project is too premature to include any capital expenditures in this rate case and to defer large forecasted O&M costs in a regulatory asset without firm plans for project execution. Again on page 180 of his direct testimony, he recommends the denial of the proposed regulatory asset accounts related to the SAP S4/HANA project relying on his assertions that the project is premature and inadequately justified and all requested approvals related to the project should be denied.

Q. Does the Company agree that SAP S4/HANA costs should not be included in this case?

A. No. Company witness Stacy H. Baker provides continued support for the inclusion of the SAP S4/HANA project in her rebuttal testimony.

Q. Do you agree with Mr. Coppola that the accounting requests related to the SAP S4/HANA project should be denied?

A. No. As explained in my direct testimony, approval of the deferral of the O&M expense associated with the project will allow the Company to spread the O&M costs of the project over the life of the assets resulting from this project tying the recovery of the expense to the time period over which the spending will be providing benefits. This is also true for the request to extend the amortization period over which the cloud implementation costs for the SaaS solutions to 15 years. These requests reduce the burden to customers, avoid spikes in

IT O&M expense and the need for customers to experience those spikes in rates. Mr. Coppola does not provide any critique of these accounting requests other than his assertion that the project is too preliminary for it to be included in this case. Company witness Baker has proven this to be incorrect. As such, the Commission should approve the inclusion of the SAP S4/HANA project and the associated accounting requests.

Riverside Storage Field

Q. Please describe AG witness Coppola's adjustments related to the Riverside Storage Field.

A. At pages 108 and 174 of his direct testimony Mr. Coppola has recommended removing the regulatory asset in working capital and amortization associated with the sale of the Riverside Storage Field indicating that the expected sale was terminated by the buyer.

Q. Does the Company agree with these adjustments proposed by Mr. Coppola?

A. Yes. However, if the amounts associated with the sale are removed from the case based on the assumption that there will not be a sale of the Riverside Storage Field, the plant assets should be added back into the case.

Q. Please explain further.

A. Consistent with Staff witness Robert F. Nichols' recommendation beginning at page 5 of his direct testimony, if the effects of the Riverside Storage Field sale are removed from the case the plant in service, depreciation reserve, depreciation expense, and property tax should be added back in. If the Riverside Storage Field assets are not sold, the cost associated with the assets should be included in rates. Mr. Nichols went on to support a recommendation provided by the Company in response to an audit question. This recommendation is to use any amount collected in rates related to the Riverside Storage Field assets as a reduction to

the established regulatory asset related to the sale, in the event that the Riverside Storage Field is sold. The Company agrees with Staff's position in the case related the Riverside Storage Field.

Q. How should the Commission treat Mr. Coppola's proposed adjustments?

A. The Commission should only adopt Mr. Coppola's proposed adjustments to working capital and amortization expense related to the Riverside Storage Field if there are also adjustments made to plant in service, depreciation reserve, depreciation expense, and property tax to add the Riverside Storage Field back into the case consistent with Staff's adjustments in the case.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

KRISTINE A. PASCARELLO

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Kristine A. Pascarello, and my business address is 1945 West Parnall Road, Jackson, Michigan 49201.

Q. Are you the same Kristine A. Pascarello that testified previously in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to address the capital reductions proposed by Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") witness Cynthia L. Creisher and the requested regulatory deferral mechanism for the Leak Detection and Repair program proposed by Staff witness Jacob G. Martus. Additionally, I will address the capital expenditure reductions for the Material Condition and Gas Operations Other programs proposed by Attorney General witness Sebastian Coppola, Association of Businesses Advocating Tariff Equity ("ABATE") witness Colin T. Fitzhenry, Citizens Utility Board of Michigan ("CUB") witness Ram Veerapaneni, Michigan Environmental Council ("MEC") and Sierra Club ("SC") (collectively, "MEC") witness Dr. Sol deLeon. I will also provide rebuttal testimony concerning proposed reductions to Consumers Energy Company's ("Consumers Energy" or the "Company") projected Gas Engineering and Supply Operating and Maintenance ("O&M") expenses recommended by Attorney General witness Coppola and CUB witness Veerapaneni.

Q. Are you sponsoring any exhibits with your direct testimony?

A. Yes. I am sponsoring the following exhibits:

Exhibit A-138 (KAP-8)	Discovery Response U21806-AG-CE-0431, Attachment 1;
Exhibit A-139 (KAP-9)	Discovery Response U21806-AG-CE-0426;

Exhibit A-140 (KAP-10) Audit Response U21806-SA-CE-0388;

Exhibit A-141 (KAP-11) Discovery Response U21806-MNSC-CE-0075, Attachment 2; and

Exhibit A-142 (KAP-12) EIRP Project List Detail.

I. STAFF WITNESS CREISHER

1. Material Condition – EIRP

Q. Please summarize Staff witness Creisher's recommendation regarding the Enhanced Infrastructure Replacement Program ("EIRP").

A. On page 8 of her direct testimony, Staff witness Creisher states that Staff generally supports the Company's proposed capital expenditures for the EIRP and the plan to reduce approximately 5% of vintage main per year, targeting program completion by 2035. Ms. Creisher also describes the Company's progress since Case No. U-21490, in reducing the cost per mile for plastic main pipe installation and encourages the Company to continue implementing measures to manage costs.

Q. While Staff is generally supportive of the Company's projected capital expenditures for EIRP, are you recommending any adjustments to the Company's filed projections?

A. Yes, I am. The Company discovered an error in the forecasted miles for the Northeast region caused by a feet to miles conversion error in the 2025 program year. This correction was included as an attachment to discovery response U21806-AG-CE-0431 and is provided as Exhibit A-138 (KAP-8). The corrected capital expenditures are $247,018,590 in the 2025 program year, with $204,611,703 in the 10 months ending October 31, 2025, and $250,809,975 in the test year ending October 31, 2026. This results in reductions of

$3,272,223 for the 2025 program year, which are made up of $2,710,465 for the 10 months ending October 31, 2025, and $561,759 for the test year ending October 31, 2026.

2. Material Condition - Non-Modeled

Q. Please summarize Staff witness Creisher's recommendation regarding the Material Condition Non Modeled ("MCNM") program.

A. Beginning on page 8 of her direct testimony, Ms. Creisher summarizes the Company's proposed capital expenditures for the MCNM program, which includes replacement projects to address emergent issues. She states that Staff does not support the proposed level of capital expenditure, based on preliminary actual costs for the Line 1010 project that the Company provided, which is included as Staff Exhibit S-22.1 and Exhibit S-22.2.

Q. In Exhibit S-22.0, Ms. Creisher shows a recommended reduction in the Company's proposed MCNM expenditures of $4,054,000 for the 10 months ending October 31, 2025, and $3,500,000 for the test year 12 months ending October 31, 2026. Do you agree with the recommendation?

A. Yes, I do. The reduction is based on Company provided adjustments to the Line 1010 project based on updated project estimates.

3. Compliance and Controls

Q. Please summarize Staff witness Creisher's recommendation regarding the Compliance and Controls – Advanced Methane Detection ("AMD") project.

A. Beginning on page 10 of her direct testimony, Ms. Creisher summarizes the various projects which are included in the Compliance and Controls program and projected expenditures referencing Table 10 on page 73 of my direct testimony. She continues that Staff does not support the proposed level of capital expenditures, noting that the Company

no longer projects to spend $265,000 on the AMD project in 2025 as provided in the Company's response to Attorney General's Discovery Request U21806-AG-CE-0422, which is included as Staff Exhibit S-22.3. On page 11 of her direct testimony, Ms. Creisher recommends capital expenditures in Compliance and Controls be reduced to $182,000 for the 10 months ending October 31, 2025. Additionally, Ms. Creisher provides information that an incorrect capital expenditure reduction of $295,000 was provided for Staff's revenue deficiency calculation. The impacts of this adjustment are not fully reflected in the testimony and exhibits of other Staff witnesses or in the Staff's revenue deficiency supported by Staff witness Robert F. Nichols II and will be adjusted in Staff's brief.

Q. In Exhibit S-22.0, Ms. Creisher shows Staff recommended reduction in the Company's proposed Compliance and Controls expenditures of $265,000 for the 10 months ending October 31, 2025. Do you agree with the recommendation?

A. Yes, I do. The reduction is based on the Company provided adjustments to the AMD project expenditures.

Q. Are there any other adjustments that should be made to the Compliance and Controls projects shown in Table 10 on page 73 of your direct testimony?

A. Yes, there is an adjustment required for the Damage Prevention and Miss Dig capital expenditure. As described on page 82 of my direct testimony, at the time of filing this case, the Company projected $954,000 for the Irth Solutions software used for damage prevention and 811 ticket management. As provided in discovery response U21806-AG-CE-0426, included as Exhibit A-139 (KAP-9), the Company has determined that only a portion of the software cost will be capitalized. The gas portion of the software cost has been reduced to $829,082, with $195,000 as capital and $634,082 as O&M. This change

will reduce the capital test year amount shown in Exhibit A-83 (KAP-5), line 4, from $4,168,000 to $3,409,000 and increase the O&M test year amount shown in Exhibit A-81 (KAP-2), line 12, from $1,231,000 to $1,865,082.

II. STAFF WITNESS MARTUS

Q. Please summarize Staff witness Martus' recommendation regarding the Leak Detection and Repair ("LDAR").

A. Beginning on page 4, Staff witness Martus' direct testimony discusses the Company's requested regulatory deferral mechanism for the LDAR rule and its intention to comply once published. He acknowledges the Company's plan to repair all known grade 2 and grade 3 leaks (Leak Backlog) regardless of the rules publication and the proposed $1,510,000 in capital expenditure detailed in Exhibit S-17.2. On page 5, Mr. Martus states that Staff supports repairs for safety and finds the cost reasonable, regardless of the LDAR rule publication. On page 6, he includes that Staff does not support the regulatory deferral mechanism for LDAR due to an executive order issued in January 2025, making the rule's publication unlikely during the requested deferral period.

Q. Do you agree with Staff witness Martus' recommendation?

A. Yes, I do.

III. ATTORNEY GENERAL WITNESS COPPOLA

1. Material Condition EIRP

Q. Please summarize Attorney General witness Coppola's recommendation regarding the EIRP.

A. Beginning on page 38 of his direct testimony, Attorney General witness Coppola discusses the history and changes in the EIRP. Beginning on page 39, line 16, Mr. Coppola

summarizes the 13 years of the EIRP historical installation and expenditures. On page 40, he provides additional information regarding the Transmission Operated by Distribution ("TOD") pipe installation. Mr. Coppola incorrectly calculates on line 11 that the Company has replaced 33.4 miles of TOD pipe with 58.3 miles of new main. The 58.3 miles of new steel main installed includes both TOD and high pressure ("HP") steel projects, which are also included in the totals and cost per mile calculations on page 39 of his direct testimony. After expressing his concerns regarding the growth of the EIRP and the project expenditure, beginning on page 40 of his direct testimony, Mr. Coppola describes two concerns regarding the capital spending plans for 2025 and 2026.

1. Uncertainty about seven EIRP projects scheduled for 2026 being completed in the test year based on the status of engineering design; and

2. Projected expenditures for 2025 and 2026 reaching a new peak level representing a 38% increase in less than three years. Mr. Coppola states on page 42 of his direct testimony that the Company is not meeting its commitment to refrain from spending, citing the settlement agreement in Case No. U-21490.

On page 43 of his direct testimony, Mr. Coppola recommends a maximum spending cap of $197 million for the 12 months ending October 2026, with future spending levels adjusted for the Consumer Price Index ("CPI") rate of inflation. He acknowledges that the proposed spending cap will reduce the number of miles the Company plans to retire and install. However, he argues that the spending cap would incentivize the Company to reduce the cost per mile and reduce competition for limited resources. He suggests a three-to-five-year extension of the program as a reasonable trade-off to balance against customer affordability concerns.

Q. How do you respond to Mr. Coppola's characterization of the "increasing spending trend" in EIRP?

A. The capital expenditures I am sponsoring are important to replace aged at-risk pipe intended to improve safety and reliability. The Company continues to look for additional cost reduction opportunities such as those described in my direct testimony on page 46. As shown in Exhibit A-138 (KAP-8) on lines 41 and 51, these opportunities resulted in the 2024 actual cost per mile to be $216,500 less than the 2023 actual cost per mile. Also, as stated in my direct testimony and shown in Exhibit A-138 (KAP-8), the Company is not projecting the regional cost per mile of plastic pipe for 2025 or 2026 above 2023 levels. The Company has made progress toward reducing the cost per mile for plastic main installation in the the EIRP. Reducing vintage main by 5% per year is a prudent and reasonable approach to enhancing safety and reliability. This strategy mitigates risks associated with aging infrastructure and ensures compliance with modern safety standards. It also improves the overall reliability of the gas distribution system and reduces maintenance costs. Systematically replacing older pipelines can prevent hazardous incidents, ensure a stable gas supply, and achieve long-term benefits.

Q. On page 45 of his direct testimony, Attorney General witness Coppola states that the Company has not provided evidence that the planned increase in spending is tied to any increase in safety risks. How do you respond?

A. While Attorney General witness Coppola asserts that most high-risk mains and services should have been replaced through the Company's risk-based approach over the past 12 years, it is crucial to recognize that the Company still has over 1,400 miles of vintage mains that have continued to age during this period. Despite the downward trend in gas

leak data, the presence of these aging pipelines poses ongoing risks to safety and reliability. As shown in Figure 20 of the Company's Natural Gas Delivery Plan ("NGDP"), Exhibit A-42 (NPD-1), many of these pipelines were installed in the 1950s or earlier. The Company provided several examples in discovery, included in Exhibit AG-9, of recent system incidents that have occurred. Vintage mains, particularly those installed before modern construction standards, are more susceptible to leaks, breaks, and other failures due to material degradation and outdated manufacturing practices. The continued aging of these pipelines necessitates a proactive replacement strategy to mitigate potential hazards and ensure the long-term integrity of the gas distribution system. Therefore, the assertion that most high-risk mains have been replaced does not account for the substantial volume of remaining vintage mains that still require attention to maintain safety and reliability.

Q. On page 45 of his direct testimony, Mr. Coppola recommends the disallowance of $84,889,000 from the Company's forecasted capital expenditures for the projected test year and recommends establishing a spending budget for the EIRP of $197 million to be adjusted for the CPI rate of inflation in future years. Do you agree with the recommendation?

A. No, I do not. First, I will address the seven projects which Mr. Coppola expresses uncertainty about being ready for construction in the test year, recommending a disallowance of $84,889,000. These projects are progressing through the design process during 2025 and have activities aligned with projects scheduled for construction in 2026. There is no reason to believe that these projects will not be constructed as planned, at the projected expenditures, in the test year. Company engineers manage projects for the upcoming year, which include pre-engineering tasks such as order creation, design

commencement, environmental reviews, and ordering long lead-time materials. Following this, they coordinate with gas control to determine the optimal timing for project execution based on other ongoing projects and system demands, finalizing the construction schedule. Company engineering follows a prudent and standard cadence prior to construction. All seven of the identified projects are on track for construction in the test year as planned. The seven projects are identified in a table on page 41 of Mr. Coppola's testimony and are included below.

Line # Page 3 Exh. A-82	EIRP Project Description	Projected Test Year Capex
17	SAG4 - Ph 1,2,3	17,749
18	BCY2 - Ph 2	7,344
19	ALM2 - Ph 1,7,8	9,303
20	ALM5 - Ph 2 Line 1070g	4,713
23	ROK10 - Ph 1,2,3,4,5,6	15,423
24	ROK7 - Ph 4,5,6,7,8	23,625
25	KAL3 - Ph 8,9,10	6,732
	Total	$ 84,889

As seen in the project descriptions, the proposed projects are individual phases of larger EIRP projects. If these phases are not constructed as planned, it could be detrimental to the cohesion of the larger project, including impacts on construction sequencing due to each phase typically designed to build upon the previous one, and wasted resources in permitting, planning, and initiating each phase. If essential phases are skipped, it can introduce new risks or exacerbate existing ones within the remaining vintage pipe and can result in delays in project deliverables such as tie-ins and service replacements. Therefore, Mr. Coppola's recommendation that these projects are too premature to include in the rate base should be rejected by the Commission, and the Company's projection for these

projects should be approved. The Commission should approve the funding for these projects to allow the Company to move forward with the projects and their associated benefits.

Q. How do you respond to Mr. Coppola's recommendation regarding implementation of spending caps on the EIRP?

A. Spending caps would likely lead to programmatic cuts and hinder the Company's ability to manage projects effectively, including maintaining the appropriate level of resources. Creating a spending cap would result in cuts to both the program and the workforce. Spending caps fail to address the evolving needs of the program, the economy, and other circumstances that may arise, requiring the Company to respond flexibly. Additionally, spending caps can have unintended consequences, such as disincentivizing process improvements. If a cap is reached before the end of the year, it could lead to layoffs or reduced production levels as projects may allocate funds to cover the entire year rather than optimizing efficiency. This scenario shifts the focus from improving processes and productivity to merely staying within budget constraints. The Company has reduced unit costs and the additional spending being requested is due to increased miles planned because of productivity improvements, not higher unit costs. The $215.3 million for the 12 months ending September 2025 from Case No. U-21490 was based on 113.1 miles, whereas the Company is now projecting that it will complete 138 miles in the Case No. U-21490 test year. And while Mr. Coppola notes that the projected test year spending level is 38% higher than 2023 levels, it is important to note that there is also a 37% increase in the number of projected miles from 108.9 in 2023 to 149 miles in the test year as shown in Table 7 on page 49 of my direct testimony. The Company's plan to retire 5% of vintage

mains each year is essential to mitigate the risks associated with aging pipelines. Therefore, the Commission should reject Mr. Coppola's recommended disallowances for the seven 2026 EIRP projects and the EIRP spending cap of $197 million.

2. Material Condition Non-Modeled Program

Q. Please summarize Attorney General witness Coppola's recommendation regarding the MCNM Program.

A. Beginning on page 45 of his direct testimony, Mr. Coppola summarizes the forecasted capital expenditures for the MCNM program and how this program differs from the EIRP. He also states that the Company is expanding the program to undertake four projects, the wrought iron main replacement, the high-pressure waterway crossings, leak mitigation, and replacing obsolete meters and included the projected expenditures for each program. On pages 46 through 48 of his direct testimony, Mr. Coppola provides an assessment of these four projects and the Line 1010 project. Based on his assessment of the five projects, Mr. Coppola is proposing a reduction of $8,121,000 for 2024, $7,108,000 for the 10 months ending October 31, 2025, and $20,525,000 in the test year for the MCNM program.

Q. What is your response to Mr. Coppola's proposed reduction to remove $1,250,000 for the 10 months ending October 2025 and $4,417,000 for the projected test year for the Wrought Iron Mains project?

A. I disagree with the proposed reduction. On page 45 of his direct testimony, Mr. Coppola states that the Company has expanded the MCNM program to supplement the EIRP and that this vintage material work should be done in the EIRP. His assertion is incorrect. The MCNM program, as described in my direct testimony on page 51, line 10, includes projects

based on operational improvements that may not be represented effectively in risk model results. Additionally, as described in my direct testimony on page 52, standard pressure projects primarily made up of cast iron have been completed within the MCNM program. Cast Iron is also a vintage material type included in the EIRP. According to the Company's discovery response on page 2 of Exhibit AG-10, the remaining 12 miles of wrought iron main is planned to be split between EIRP and MCNM. On page 54 of my direct testimony, I explain that due to the lower quality materials used to manufacture wrought iron pipelines, it is not possible to choose a welding procedure that ensures the quality of the finished weld is adequate for use on the gas system. Page 5 of Exhibit AG-10 further explains that the risk model used to select EIRP projects does not account for whether the main is weldable. Audit Response U21308-SA-CE-0388, included as Exhibit A-140 (KAP-10), details that the wrought iron main replacements planned to be completed in MCNM are small segments of pipe. These smaller segments may not be prioritized in the EIRP risk modeling and could result in a leak requiring an emergent project, similar to the example provided on page 5 of Exhibit AG-10. Since the wrought iron mains are part of the Company's medium pressure system, replacing the remaining miles of wrought iron pipe is prudent for reliability and safety and the Commission should reject Mr. Coppola's recommendation.

Q. What is your response to Mr. Coppola's proposed reduction to remove $500,000 for the 10 months ending October 2025 and $5,000,000 for the projected test year for the HP Waterway Crossings project?

A. I disagree with the proposed reduction. On page 47 of his direct testimony, Mr. Coppola argues that the projects planned for the test year are early in development and premature to be included in rate base for this case. However, like the EIRP projects described earlier in

this testimony, these projects are progressing through the design process during 2025 and have activities aligned with projects scheduled for construction in 2026, following the Company's engineering standard cadence prior to construction. The Company fully intends to complete the projects as presented in this case, and there is no reason to believe that these projects cannot be completed as planned. Therefore, Mr. Coppola's recommendation that these projects are too premature to include in rate base should be rejected by the Commission, and the Company's projection for these projects should be approved so that the Company can move forward with these important projects.

Q. What is your response to Mr. Coppola's proposed reduction to remove $2,970,000 for 2024, $208,000 for the 10 months ending October 2025, and $3,375,000 for the projected test year for the Leak Mitigation project?

A. I disagree with the proposed reduction. On page 47 of his direct testimony, Mr. Coppola states that my direct testimony is devoid of any explanation or supporting evidence to justify this spending. However, on page 51, line 23 of my direct testimony, I state that additional details on leaks and obsolete meters are included in the Material Conditions Renewals program. As noted on page 59, line 8 of my direct testimony and on page 4 in Exhibit AG-10, the Company confirmed that the key difference between the MCNM program and the Material Condition Renewals program is planned replacements are in MCNM and emergent field-initiated projects are included in the Material Condition Renewals program. The leak details included in the Material Condition Renewals program apply to this program as well. The leak mitigation included in the MCNM program is planned leak replacements, which have been completed within this program in the past. The increase in planned leaks, detailed on page 4 of Exhibit AG-10, highlights the higher

volume and costs compared to previous years. Consequently, the Company identified the leak mitigation work within the MCNM program as one of the drivers for increased expenditures in the program. The Company's projection for these projects should be approved to allow the Company the funding needed to address leaks in the MCNM program.

Q. What is your response to Mr. Coppola's proposed reduction to remove $3,083,000 for the projected test year for the Obsolete Meters project?

A. I disagree with the proposed reduction. On page 48 of his direct testimony, Mr. Coppola states there is no testimony supporting the forecasted capital spending in 2026. However, on page 51, lines 20 through 23 of my direct testimony, I state that the Company is planning to complete 5,500 obsolete meter replacements and that additional details on obsolete meters is included in the Material Conditions Renewals program. As noted on page 59, line 8 of my direct testimony and on page 4 in Exhibit AG-10, the Company confirmed that the key difference between the MCNM program and the Material Condition Renewals program is that planned replacements are in MCNM and emergent field-initiated projects are included in the Material Condition Renewals program. The obsolete meter replacement details included in my direct testimony on page 63, line 1 though page 64 line 8, which also references the Customer Metering section of the Company's NGDP, Exhibit A-42 (NPD-1), apply to the MCNM program as well. The obsolete meter replacements included in the MCNM program are planned meter replacements, which are intended to meet meter exchange requirements and minimize risks of extended customer outages during emergent meter exchanges while the Company evaluates meter technologies for future use. The increase in planned meter replacements, detailed on page 4 of Exhibit AG-10, also provides

details on volume and cost. Consequently, the Company identified the obsolete meter replacement work within the MCNM program as one of the drivers for increased expenditures in the program. Therefore, the Company's projection for these projects should be approved to allow the Company to meet meter exchange requirements and ensure all customers have the necessary meters.

Q. What is your response to Mr. Coppola's proposed reduction for the Line 1010 project of $5,150,000 for 2024, $5,150,000 for the 10 months ending 2025, and $4,650,000 for the projected test year?

A. I disagree with the proposed reduction. On page 48 of his direct testimony, Mr. Coppola states that although this line was purchased from another utility, proper pressure test documentation is the Company's responsibility, and the customers should not have to pay the full cost to replace the line as a result of incomplete pressure test documentation and lack of other traceable, verifiable, and complete ("TVC") records from the original installation of the pipeline and recommends a disallowance of 50% of the cost to replace this pipeline. The Pipeline and Hazardous Materials Safety Administration ("PHMSA") TVC standard is a requirement that did not exist prior to the 2020 rule amendment. Pipeline segments installed prior to test record requirements implemented in 1970 were previously "grandfathered," or exempt, from original construction pressure test documentation requirements and allowed to operate at the highest actual operating pressure observed between 1965 and 1970. The updated 2020 rules limited this exemption to pipelines operating below 30% of the specified minimum yield strength ("SMYS"). As a result, the Company must reconfirm the maximum allowable operating pressure ("MAOP") for all pre-1970 pipelines operating above 30% SMYS. Additional details on the PHMSA TVC

compliance standards are included in the MAOP projects section of Company witness Lincoln D. Warriner's rebuttal testimony. The Company evaluated multiple scenarios including repressure testing the entire Line 1010. Unlike the lines on the Company's gas transmission system, which are designed to allow for isolation, Line 1010 is part of the distribution system, directly responsible for feeding customers. This limits the Company's ability to remove that line from service for pressure testing, and therefore, the retest option was determined to not be feasible for Line 1010. Replacing Line 1010 was the best evaluated alternative and allows the Company to include improvements that serve customers such as replacing an 8" steel high pressure section with a 12" steel high pressure pipe to meet customer demand. Knowing that retesting Line 1010 is infeasible while maintaining service to customers, and with the 2020 rule changes for TVC records, and considering the additional capital improvements included in the Line 1010 replacement project, excluding 50% of the projected expenditures is not reasonable and the Commission should reject this recommendation.

3. Material Condition Renewals

Q. Please summarize Attorney General witness Coppola's recommendation regarding the Material Condition Renewals Program.

A. Beginning on page 49 of his direct testimony, Mr. Coppola stated that he found the proposed expenditures to be reasonable. However, Mr. Coppola noted that the Company anticipated a new PHMSA LDAR rule in early 2025, potentially increasing leak repairs, and forecasted an additional $1.5 million for the test year. Since the rule is currently on hold due to a Presidential Executive Order, Mr. Coppola recommends that the Commission remove the $1.5 million from the forecasted capital expenditures for the projected test year.

Q. What is your response to Mr. Coppola's proposed reduction?

A. I disagree with the proposed reduction. As stated on page 65, lines 16 through 21 of my direct testimony, the Company is seeking this funding to address the known leak elimination requirements of the rule and plans to eliminate the backlog of known leaks regardless of when the LDAR rule is published. The elimination of the leak backlog is prudent to significantly reduce system risks and ensure public safety. By proactively addressing these issues, the Company can prevent potential hazards, protect communities, and enhance the overall reliability and efficiency of the distribution system. Therefore, Mr. Coppola's recommendation to reduce $1.5 million from the forecasted capital expenditures for the projected test year should be rejected by the Commission.

4. <u>Material Condition Vintage Service Replacement</u>

Q. Please summarize Attorney General witness Coppola's recommendation regarding the Material Condition Vintage Service Replacement ("VSR") Program.

A. Beginning on page 51 of his direct testimony, Mr. Coppola argues that the Company's forecasted increases of 64% for 2025 and 131% for 2026 compared to 2024 levels appear excessive and unsupported by recent trends. Mr. Coppola recommends a forecast of 2,564 replacements, which is the actual number of replacements in 2024. Therefore, he recommends that the Commission remove capital expenditures of $11,631,000 for the 10 months ending October 2025 and $23,875,000 for the 12 months ending October 2026.

Q. What is your response to Mr. Coppola's proposed reduction?

A. I disagree with the proposed reduction. As described in my direct testimony on page 69, vintage services are identified in the three categories: In-Grid, Proactive In-Grid, and Proactive Out-of-Grid. The In-Grid vintage services are replaced as part of EIRP project

work. The increase in the number of vintage services replaced in the VSR program is related to the reduction in vintage services replaced within the EIRP due to the decrease in large grid projects and the increase in smaller segment projects. The decrease in large EIRP grid projects means that more vintage services are classified as Proactive Out-of-Grid and are not designed and constructed with EIRP projects. On page 51 of his direct testimony, Mr. Coppola compares the number of VSR replacements to those completed in 2022-2024. A more appropriate comparison would be to use the replacement rates in years prior to 2022, during which time the EIRP was only completing smaller segment projects. As shown on Exhibit AG-11, page 2, prior to 2022, VSR program units range from 5,056 in 2021 to 9,381 in 2018. The decrease in vintage services in EIRP/Other Programs is also shown in the table included on page 2 of Exhibit AG-11. Therefore, the proposed reduction to 2,564 service replacements in the VSR program would result in an overall reduction in the number of replacements in 2025 and 2026, to 5,736 and 5,186 respectively, as the number of services completed by EIRP/Other Programs is lower in 2025 and 2026. This would reduce the total number of replacements to lower than 2024 actuals. Replacing the remaining vintage services is prudent for reliability and safety and the Commission should reject Mr. Coppola's recommendation.

5. <u>Gas Operations – Other - AMD</u>

Q. Please describe the proposed reduction for AMD capital expenditures within the Compliance and Controls program recommended by Attorney General witness Coppola.

A. Beginning at page 53 of his direct testimony, Mr. Coppola provides his assessment of the AMD project and argues that it produces only marginal benefits at best. He recommends

that the Commission reject the Company's proposed capital expenditures for the AMD system of $4,650,000 for 2024, $221,000 for the 10 months ending October 2025, and $3,181,000 for the 12 months ending October 2026. Additionally, on page 165 of his direct testimony, Mr. Coppola recommends that the Commission remove all related AMD O&M expense from 2021 through 2026 of $1,969,000, which includes $572,508 for the 12 months ending October 2026, from this rate case as well.

Q. What is your response to Mr. Coppola's proposed reductions for AMD?

A. I recommend that the Commission reject both the capital and O&M adjustments proposed by Attorney General witness Coppola. As described in my direct testimony beginning on page 73, AMD technology is designed to identify methane leaks with exceptional precision, detecting methane in parts per billion ("ppb") compared to traditional equipment that measures in parts per million ("ppm"). This heightened sensitivity allows for the identification of even the smallest leaks. While Mr. Coppola only focused on leak detection in his direct testimony, other key features of AMD include measuring emission rates, tracking the path of methane emissions (breadcrumbing), providing precise geospatial data, and time-stamped datalogging. These capabilities make AMD a powerful tool for monitoring and managing methane emissions more effectively. The technology enables the Company to prioritize high-risk leaks, improving public safety through the Super Emitter Program, which identifies and escalates remediation of the largest methane-emitting leaks. AMD is more effective at locating below-ground leaks, enhancing safety. Benefits to customers include enhanced safety, risk-based prioritization, increased detection sensitivity, and support for environmental goals, aiding the Company in achieving net zero methane emissions. Overall, AMD enhances the Company's ability to

manage methane emissions, contributing to improved public safety and environmental sustainability.

6. Gas Operations – Other - ECAP

Q. Please describe the proposed reduction for Enterprise Corrective Action Program ("ECAP") capital expenses recommended by Attorney General witness Coppola.

A. Beginning on page 56 of his direct testimony, Mr. Coppola argues that the program and proposed expenditures lack clarity on the specific benefits and achievements. Mr. Coppola recommends that the Commission remove all capital expenditures for ECAP from 2023 through the projected test year. He is proposing a reduction of the capital expenditures of $49,000 for 2023, $204,000 for 2024, $167,000 for the 10 months ending October 2025, and $33,000 for the projected test year based on his argument that the Company has not shown the value of the capital spending.

Q. What is your response to the proposed reduction for ECAP?

A. I disagree with the proposed reduction. As described in my direct testimony beginning on page 80, ECAP was initiated at Consumers Energy in 2020 to support safe and excellent operations through a structured platform for issue management and compliance. ECAP enhances transparency in reporting issues, identifying trends, and closing compliance and safety gaps with corrective actions based on risk thresholds. It aids in managing processes, analyzing data, and informing operational decisions to maintain the integrity of the energy infrastructure. Since 2022, ECAP has supported adherence to Gas Safety Management System ("GSMS") standards in Gas Operations, Engineering, and Regulatory. Resolving non-conforming conditions, reducing customer concerns, promoting continuous improvement, and standardizing problem-solving methods are all customer benefits. In

2025, Phase 4 expands the ECAP program to Corporate Safety & Health and Environmental, and improved performance here will directly contribute to cost savings for the customers through a reduction in lost time and expense. I recommend that the Commission reject the adjustment proposed by Attorney General witness Coppola.

7. Geospatial Inventory and Modeling Program

Q. Please describe the proposed reduction for the Geospatial Inventory and Modeling Program capital and O&M expenses recommended by Attorney General witness Coppola.

A. Beginning at page 58 of his direct testimony, Mr. Coppola argues that the Utility Network project involves only a marginal improvement in functionality and does not have a cost/benefit analysis, and recommends that the Commission remove $2,888,000 for 2024, $10,255,000 for the 10 months ending October 2025, and $7,513,000 for the projected test year from the Company's forecasted capital expenditures. Additionally, on page 181 of Mr. Coppola's direct testimony, he recommends disallowance of $517,000 in O&M expenses for the projected test year for the Utility Network project.

Q. What is your response to the proposed reduction for the Geospatial Inventory and Modeling Program?

A. I disagree with the proposed reduction. The Utility Network project is essential for transforming the Company's current GIS platform to the Esri Utility Network Model, establishing a unified data model for gas transmission, distribution, and stations. This transformation is crucial due to the growing business requirements for advanced analytics and regulatory mandates that necessitate granular geospatial insights. The current GIS platform will soon become unsupported as Esri shifts its product development focus to the

ArcGIS Utility Network Management extension, ArcGIS Enterprise, and ArcGIS Pro. The existing core technology of ArcMap and the geometric network has reached its capability limits, and Esri will no longer build additional functionality for these systems. Additionally, Esri utility solution partners are moving their product lines to support only the Utility Network. The Utility Network project mitigates risks associated with the end of product support, enables detailed asset management and location-based analytics, and provides real-time GIS capabilities. It increases productivity through shortcuts, templates, and streamlined workflows, offers extensive tracing tools, 3D visualization functionality, and robust editing tools that enforce data integrity. The project also supports long transactions, allowing future network model changes, and provides up-to-date network views and historical snapshots. These capabilities will result in greater insight, efficiency, and improved safety and delivery to customers in Michigan. The current geospatial platform supports a large variety of critical processes. At present, GIS is required, and in many cases foundational to the core regulatory required process including but not limited to:

- Annual DOT & National Pipeline Mapping System Reporting
- Material Verification & MAOP Analysis
- Leak, Corrosion & Regulation Inspections
- Inline Inspection/Direct Assessment
- Transmission, Distribution and Storage Risk Modeling
- System load analysis and emergency response
- Facility locating, damage prevention risk analysis
- Construction & Emergent location and system configuration awareness

- New customer and system improvement design
- Advanced methane detection

Allowing the platform to become technically obsolete and unsupported would put all these processes at significant risk of either hindering or completely halting the Company's ability to maintain safe operations. Additionally, the longer the Company goes unsupported, the more likely and impactful those issues become. The Company has already started to experience the impacts of having unsupported GIS systems with their Gas Transmission GIS and had to remediate incompatibilities with no vendor support options. Managing a major platform in this status is unsustainable. Therefore, the Utility Network project is a necessary investment to address technology obsolescence and ensure continued operational excellence. The Commission should reject the adjustment proposed by Attorney General witness Coppola.

8. <u>Gas Engineering and Supply O&M Expense</u>

Q. Please describe the proposed reduction for Gas Engineering and Supply ("GE&S") O&M expenses recommended by Attorney General witness Coppola.

A. Beginning on page 162 of his direct testimony, Mr. Coppola proposes reductions totaling $5,258,000 in projected GE&S O&M expenses included in this rate case. His proposed reductions include $1,513,000 in the System Integrity department, $1,259,000 in the Quality Lean department, $1,969,000 in the Regulatory and Compliance department for AMD O&M expenses, and $517,000 in the Geospatial Inventory and Modeling Program for Utility Network O&M expenses. The proposed reductions for AMD and Utility

Network are discussed earlier in this testimony with the proposed reductions in capital expenditures for these programs.

9. System Integrity O&M Expense

Q. Please describe the proposed reduction for System Integrity O&M expenses recommended by Attorney General witness Coppola.

A. Beginning on page 162 of his direct testimony, Mr. Coppola is proposing a reduction of $1,513,000 of projected O&M expenses in the test year for the System Integrity department based on the argument that the Company did not provide sufficient information showing cost changes resulting from departmental reorganizations and where costs were offset in other functions or areas.

Q. What is your response to the proposed reduction for System Integrity?

A. I disagree with the proposed reduction. The shift in O&M expenses is unrelated to any departmental reorganization or additional job duties. As detailed in my response to discovery request U21806-AG-CE-0381, included in Exhibit AG-57, page 4, this change involves reclassifying existing salaries and expenses as O&M costs due to inspection and remediation work, which includes capital replacements or O&M repairs. This reclassification does not result in an offset or removal of O&M costs in other areas, contrary to Mr. Coppola's suggestion. Instead, it represents a shift from capital to O&M. The removal of $1,513,000 in this salary and expense program is not prudent and would result in a reduction of necessary workforce to complete the federally and state-regulated integrity management work. I recommend that the Commission reject the adjustment proposed by Attorney General witness Coppola.

10. Project Management and Quality Lean O&M Expense

Q. Please describe the proposed reduction for Project Management and Quality Lean O&M expenses recommended by Attorney General witness Coppola.

A. Beginning on page 164 of his direct testimony, Mr. Coppola summarizes the expenses and responsibilities provided by the Company of the Quality Lean department and is proposing a reduction of $1,259,000 of projected O&M expenses in the test year for the Project Management and Quality Lean department based on his argument that the Company has not provided evidence showing significant benefits or cost reductions to justify the value of the department.

Q. What is your response to the proposed reduction for Project Management and Quality Lean?

A. I disagree with the proposed reduction. The purpose of the Lean Office is to accelerate value delivery by building lean capabilities in the organization – specifically leveraging the CE Way lean operating system to effectively manage and improve performance. The Lean Office mobilizes resources to support organizations in the application of lean tools (e.g., value stream mapping, data analysis, waste elimination, problem solving, standardized work development, etc.) to support performance improvement. Specific examples outlined in Case No. U-21806 of where the CE Way has been leveraged to achieve performance results include (1) Employee Incentive Compensation Plan operational performance measures – where $3,600,000 in benefits have been identified by Company witness Ashley E. Meschke in her direct testimony on page 11, lines 8 through 13, and (2) the EIRP plastic pipeline cost per mile reductions – where a $216,500 reduction per mile compared to the 2023 actual cost per mile as described earlier in this testimony.

The Quality Lean department supports quality implementation in planning and execution of work throughout the Company, and the Commission should approve the projected funding in order to continue to support overall business efficiency and continuous performance improvement.

IV. ABATE WITNESS FITZHENRY

1. Material Condition - EIRP

Q. Please summarize ABATE witness Fitzhenry's recommendation regarding the EIRP.

A. As summarized on page 10 of his direct testimony, Mr. Fitzhenry argues that there is no need to accelerate investment in EIRP and that the Company has historically completed less work than originally forecasted. He recommends reducing capital expenditures by $79.4 million in 2025 and $92.1 million in 2026.

Q. On page 9 of his direct testimony, ABATE witness Fitzhenry states that the Company has not demonstrated that there are excessive safety risks with the proposed main replacement projects. Do you agree with this observation?

A. No, I do not. On page 9 of his direct testimony, Mr. Fitzhenry states that the projects included in Table CTF-4 were risk ranked according to probabilistic risk modeling. The Company currently uses a relative risk model called the Distribution Risk Analysis Model ("DRAM") for ranking projects. Additionally, discovery request U-21806-AB-CE-0467 only requested information on the top 25 highest risk distribution main segments in the risk model, included as page 5 to Exhibit AB-5. Thus, Mr. Fitzhenry's argument is based on an analysis of only 25 out of 544,000 segments. This represents a mere 0.0046% of the total segments, which is not a statistically significant sample size to draw his conclusions about the overall safety risks of the proposed main replacement projects. His direct testimony

states that only 8 out of the top 25 segments have a risk score greater than the group average of 7.7. However, this fails to consider the broader context. Among the top 1,000 segments, the average risk score is 0.48, indicating that the top 25 segments are significantly higher risk compared to the majority of segments. The total risk score for all segments is 1,077, and, as shown in Exhibit AB-5, page 5, the 25 projects in question contribute a combined risk score of 192. This means these 25 segments account for roughly 18% of the total risk on the system. Addressing these high-risk segments is crucial for improving overall safety and reliability. Mr. Fitzhenry's direct testimony suggests that the Company can selectively replace only the highest risk distribution mains. However, this approach may overlook the cumulative risk posed by segments with lower individual scores but significant collective risk. A comprehensive replacement strategy is necessary to ensure long-term safety and reliability.

Q. How do you respond to Mr. Fitzhenry's recommended reduction in EIRP capital expenditures?

A. The Commission should reject the recommendation. First, the financial data used, as shown in Exhibit AB-5 on page 1, does not represent the entire annual EIRP capital expenditures. As included in the Notes section on the exhibit, the dollar amounts included only represent specific order types. A detailed summary of actual and projected capital EIRP expenses was provided in this case as Exhibit A-84 (KAP-6), and updated during discovery, included as Exhibit A-138 (KAP-8). Using the correct data, the five-year average is $171.5 million, not the $143 million included in Mr. Fitzhenry's direct testimony. And since 2021, the Company began completing larger projects using the grid approach, which plans for and constructs large scale EIRP projects. Using the three-year

average, the average capital expenditures increase to $220.3 million. Second, Mr. Fitzhenry uses the data provided on page 7 of Exhibit AB-5 to calculate that the Company planned 128 miles and $250 million for 2023. This was the EIRP plan as filed in the Company's 2023 EIRP Planning Report in Case No. U-21148. This amount was also included in my direct testimony in Case No. U-21308. While the settlement agreement reached in Case No. U-21148 states that the EIRP will continue with increased spending of $250 million for the 12 months ending September 30, 2023, it also states that Consumers Energy will review and address the length of the EIRP in the next NGDP, considering a program completion date beyond 2030. The reduction in the 2023 plan from $250 million and 128 miles to $182 million and 109 miles was related to the Company's decision to extend the program to 2035 after conducting the review agreed to in the U-21148 settlement. The Company divided the larger projects into phases to be completed across multiple years. These changes can be seen by comparing the 2023 EIRP Planning Report, filed in December 2022, to the 2023 Performance Report, filed in April 2024.

2023 Planning Report (U-21148)

Project Name	Total Est Cost	Total Installed (Feet)
KAL1	$13,671,221	43,787
MAC3	$35,138,479	75,886
MAC4	$25,342,863	80,604
FLT1	$12,058,882	34,268
FLT3	$24,514,185	84,646
BCY1	$42,643,780	115,316
LAN5	$40,550,692	133,068
ROK4	$21,478,123	63,585
ROK5	$3,407,328	8,976
EIRP Grid Projects Subtotal	**$218,805,554**	**640,136**
1070H (TOD)	$25,931,991	35,640
EIRP TOD Projects Subtotal	**$25,931,991**	**35,640**
		(miles)
EIRP Program Projects Total	**$244,737,544**	**675,776**	**128**
2022 Project Carryover Cost	**$5,262,456**	
Estimated EIRP Distribution Total	**$250,000,000**	

2023 Performance Report (U-21308)

Project Name	Total Est Cost	Total Installed (Feet)
KAL1 (phase 3)	$7,199,255	21,525
MAC3 (phase 2,3)	$13,496,841	42,700
MAC4 (phase 2,4-10)	$20,284,581	80,378
FLT1 (phase 2-5,6)	$14,555,890	35,459
FLT3 (phase 1-4)	$12,309,929	77,539
BCY1 (phase 3-7,9,10)	$35,089,086	110,711
LAN5 (phase 2-7,10)	$32,726,206	70,076
ROK4 (phase 4,7,9,10)	$9,897,937	38,675
ROK5 (phase 1-3)	$7,510,376	24,192
FLT4 (phase 1)	$880,801	11,055
MDL1 (phase 2)	$5,670,136	18,461
SAG3 (phase 1,5)	$1,072,240	2,836
LIV3 (phase 6)	$63,934	6,640
EIRP Grid Projects Subtotal	**$160,757,211**	**540,247**
1070H (TOD)	$10,230,205	34,948
EIRP TOD Projects Subtotal	**$10,230,205**	**34,948**
Retirements from Prior Years Install	**$5,565,075**	**0**
		(miles)
EIRP Program Projects Total	**$176,552,491**	**575,195**	**109**
2022 Project Carryover Cost	**$5,262,549**	
Future Year Project Costs	**$111,592**	
Estimated EIRP Distribution Total	**$181,926,631**	

In addition, as shown in my direct testimony, on page 50, the Company exceeded the installed miles requirement from the settlement agreement in Case No. U-21308, completing 126.1 miles compared to 110.8 miles for less than $214 million. Lastly, as discussed in my direct testimony and earlier in this rebuttal testimony, the replacement of vintage mains is prudent for reliability and safety and the Commission should reject Mr. Fitzhenry's recommendation to reduce these expenditures and slow the pace of replacements.

V. CUB WITNESS VEERAPANENI

Q. Please summarize the methodology used by Mr. Veerapaneni to calculate proposed reductions to the Company's projected capital expenditures and O&M expenses.

A. On page 8 of CUB witness Veerapaneni's direct testimony, he states that using 2023 and 2024 historical data is appropriate to project test year expenditures and that he used the two-year historical average for calculating the capital expenditures and O&M expenses for the test year.

Q. How does the test year capital expenditure amount proposed by Mr. Veerapaneni for the Gas Distribution – Material Condition program compare to the test year capital expenditure supported by your testimony and exhibits in this proceeding?

A. As stated on pages 12 and 13 of his direct testimony and shown in Exhibit CUB-10, Mr. Veerapaneni projected $287,898,000 compared to the Company's projection of $385,665,000 for the 12 months ending October 31, 2026, resulting in a $97,767,000 reduction.

Q. How does the test year capital expenditure amount proposed by Mr. Veerapaneni for the Gas Operations Other program compare to the test year capital expenditure supported by your testimony and exhibits in this proceeding?

A. As stated on page 13 of his direct testimony and shown in Exhibit CUB-10, Mr. Veerapaneni projected $10,555,000 compared to the Company's projection of $17,090,000 for the 12 months ending October 31, 2026, resulting in a $6,535,000 reduction.

Q. How does the test year O&M expense amount proposed by Mr. Veerapaneni for the Gas Engineering and Supply O&M expenses compare to the test year O&M expenses supported by your testimony and exhibits in this proceeding?

A. As stated on page 17 of his direct testimony and shown in Exhibit CUB-11, Mr. Veerapaneni projected $18,200,000 compared to the Company's projection of $22,195,000 for the 12 months ending October 31, 2026, resulting in a $3,995,000 reduction.

Q. What is your response to Mr. Veerapaneni's proposed reductions?

A. CUB's proposed methodology of projecting capital test year expenditures and O&M expenses using two years of historical actual data is unreasonable. For the Gas Distribution capital projects, Mr. Veerapaneni did not discuss the reasonableness of the projects proposed during the test year or the benefits the projects would provide to customers. For the Gas Engineering and Supply O&M test year expenses, Mr. Veerapaneni did not discuss the reasonableness of the department expenses and did not account for the Company changes described on page 7 of my direct testimony. The proposed reductions fail to account for the significant support I provided throughout my direct testimony for the benefits that are expected because of the planned spending and the reasonableness of the projected spending amounts. Therefore, the Commission should reject Mr. Veerapaneni's recommendations.

VI. MEC WITNESS DELEON

1. Material Condition EIRP

Q. Please summarize MEC witness deLeon's EIRP recommendation.

A. On page 40 of her direct testimony, Dr. deLeon recommends that EIRP reporting include risk-ranking information and narrative descriptions regarding the use of risk-ranking driving for remediation projects. Dr. deLeon recommends using probabilistic risk models and cost-effectiveness calculations when selecting EIRP projects and proposes changes to the EIRP reports to include summarizing examined remediations, their cost-effectiveness relative to alternatives, and reasons for selecting specific remediations. For future rate cases, Dr. deLeon recommends the Company significantly increase the use of probabilistic risk modeling and cost-effectiveness calculations for all asset classes, that these models should be accessible to stakeholders and the Commission, and that the Company should develop these models for the next rate case. On page 42 of her direct testimony, Dr. deLeon recommends the Commission should require the Company to implement probabilistic risk models for EIRP before increasing EIRP spending levels above the 2024 investment level of $195,587,000.

Q. What is your response to the proposed reduction for EIRP expenditures?

A. I disagree with the proposed reduction. First, although the Company did not include a risk rank narrative in the initial filing of this case, the risk ranking for each EIRP project was included in WP-KAP-3, and is provided as Exhibit A-142 (KAP-12). Additionally, in the Settlement Agreement of Case No. U-17643, an additional requirement to include risk rankings for all projects in a separate column was added to the Company's EIRP Performance Report, with which the Company has complied. The risk ranks for EIRP

projects are included in two separate MPSC reports that the Company files annually: the EIRP Planning Report and the EIRP Performance Report. As described on page 36 of my direct testimony, EIRP projects are selected by the gas engineering teams using a risk model that assesses the risks and threats of each pipe segment, according to the Company's Distribution Integrity Management Program ("DIMP"). The Company uses this risk-based approach, combined with subject matter expert input, to select EIRP replacement projects. The Company did provide the narrative for 2025 projects in discovery response U21806-MNSC-CE-0075_Pascarello_Attachment_2, included as Exhibit A-141 (KAP-11). The stated reason for selection of EIRP projects provided in Table 7, on page 36, of Dr. deLeon's testimony incorrectly identifies Transmission projects as EIRP projects.

Q. Should the Commission require the Company to perform the additional EIRP reporting discussed on page 40 of Dr. deLeon's direct testimony?

A. No. The Company already provides risk ranking information in both the EIRP Planning Report and the EIRP Performance Report by project.

Q. Should the Company be required to perform the probabilistic risk modeling and cost effectiveness analysis for EIRP prior to expenditures increasing above 2024 levels?

A. No. While probabilistic risk models offer an assessment of potential hazards, their implementation can be complex and time-consuming. The complexity of accurately modeling costs and benefits, especially in dynamic and uncertain environments, such as continued use of pipes made from vintage materials, can lead to oversimplified or flawed analyses. This is shown in Figure 5 on page 37 of Dr. deLeon's direct testimony. In this cost effectiveness example, the analysis only focused on the number of leaks remediated by the EIRP in the report year and did not address the footnote in the report stating that this

count is based on scheduled leaks that were remediated with the project as opposed to making a repair and the count does not include historical, permanently repaired leaks. Reported annual leak remediations falls short as a measure of cost effectiveness for vintage material pipes due to historical repairs, safety concerns, and reliability issues. Also, the purpose of the EIRP is not leak remediation; it is vintage material replacement to enhance safety and improve reliability. Leak remediation is a benefit of replacing vintage pipe but is not a good measure of cost effectiveness of the EIRP. Additionally, Dr. deLeon states on page 22 of her direct testimony that the proposed test year expenditures show nearly a 30% increase from 2024 expenditures levels but fails to discuss that there is a 71% increase in planned steel pipe replacement using the miles shown in Table 6 on page 45 of my direct testimony. Described on page 47 of my direct testimony, the 2026 cost for steel projects is $3.91 million per mile compared to $1.4 million per mile for plastic pipe installation. As described on page 37 of my direct testimony, EIRP projects have a defined scope focused on replacement of vintage material pipe and elimination of the standard pressure system. The current risk assessment methods used by the Company prioritize high-risk segments based on several factors including pipe material type, age, soil conditions, and leak history. While the Company is currently planning to begin implementing probabilistic risk modeling for distribution assets in 2027 to identify projects for 2030, the Commission should not cap EIRP spending at 2024 levels prior to this implementation. The EIRP projects enhance system safety, improve reliability, and reduce emissions by replacing vintage leak prone pipe. The Company's proposed increase in spending is essential to support the annual installed mileage required for timely program completion. Reducing the budget to the 2024 investment level of $195,587,000 could hinder progress and extend

the timeline, potentially leaving outdated and leak-prone pipes in service longer than necessary. The capital expenditures I am sponsoring are important to replace aged at-risk pipe intended to improve safety and reliability. Therefore, the Commission should reject Dr. deLeon's recommendations, and the focus should remain on the Company's plan of reducing vintage main miles by approximately 5% per year to meet the 2035 completion goal.

2. Material Condition VSR

Q. Please summarize MEC witness deLeon's VSR recommendations.

A. Dr. deLeon recommends that the VSR program should incorporate probabilistic risk models for distribution assets and that the Commission require the Company to implement these models before increasing VSR spending levels. Additionally, Dr. deLeon recommends capping the program at the 2024 investment level of $18,666,000.

Q. What is your response to the proposed reduction for the VSR program?

A. I disagree with the proposed reduction. First, as discussed above, while probabilistic risk models offer an assessment of potential hazards, their implementation can be complex and time-consuming. The VSR program began using the Company's DRAM in 2025. The current risk assessment methods have proven effective in prioritizing high-risk areas in other programs such as the EIRP. As discussed in the response to Attorney General Coppola earlier in this testimony, the proposed increase in the number of vintage services replaced in the VSR program is related to the reduction in vintage services replaced within the EIRP due to the decrease in large grid projects and the increase in smaller segment projects. The decrease in large EIRP grid projects means that more vintage services are classified as Proactive Out-of-Grid and are not designed and constructed with EIRP

projects. Capping the VSR program spending at the 2024 investment level of $18,666,000 is not advisable. The proposed increase in spending is essential to support the annual number of services required for timely program completion. Reducing the budget could hinder progress and extend the timeline, potentially leaving outdated and leak-prone services in use longer than necessary. The capital expenditures I am sponsoring are important to replace aged at-risk services intended to improve safety and reliability. Therefore, the Commission should reject Dr. deLeon's recommendations.

3. Material Condition Non-Modeled

Q. Please summarize MEC witness deLeon's MCNM recommendation.

A. Dr. deLeon recommends that the Company incorporate probabilistic risk models for distribution assets and that the Commission require the Company to implement these models. Additionally, Dr. deLeon recommends capping the MCNM program at the 2024 investment level of $38,256,000.

Q. What is your response to the proposed reduction for the MCNM program?

A. I disagree with the proposed reduction. The additional $18 million projected in the MCNM project is related to the four Company initiated projects described in my direct testimony beginning on page 54. The wrought iron main replacement at $5 million, the high-pressure waterway crossings at $5 million, leak mitigation at $4 million, and replacing obsolete meters at $3.7 million. The Commission should reject Dr. deLeon's recommendations to allow the Company to complete these important projects for the benefit of customers.

4. Alternatives to Pipe Replacements

Q. What is your response to MEC witness deLeon's testimony on alternatives to pipe replacements as they relate to the EIRP and MCNM programs?

A. Dr. deLeon's direct testimony, page 40, recommends that when probabilistic risk models are available for distribution assets, the Company should summarize in its EIRP reports remediations examined, cost effectiveness of projects relative to alternatives, and explanations of why the Company's remediation was selected. Additionally, Dr. deLeon's direct testimony, page 42, states that the Company does not consider pipe repair or non-pipe alternatives ("NPA") for the EIRP or the MCNM program, based on discovery responses indicating that repairs are not completed in either program. The EIRP and MCNM programs are focused on replacing infrastructure. Leak repairs, on the other hand, are managed through other dedicated programs. Replacing pipes made of vintage materials or due to emergent system issues is crucial due to inherent safety and reliability issues, such as corrosion, leaks, and breaks, which pose risks to public safety and service continuity. While NPAs like electrification and energy efficiency measures can reduce demand for natural gas, they would not address immediate and critical infrastructure problems. Modern pipes also reduce methane emissions, contributing to environmental sustainability, whereas NPAs might not fully mitigate emissions from existing leaks. Investing in pipe replacement ensures a reliable gas supply, and enhances public safety, making a comprehensive and effective solution.

Q. Does this complete your rebuttal testimony?

A. Yes, it does.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

(1) Reference: EIRP Annual Performance Report filing for each year

U21806-AG-CE-0426
Page **1** of **2**

Question:

139. Refer to page 82 of Ms. Pascarello's direct testimony on the Damage Prevention and MISS DIG software purchase. Please:
a. Explain how the new software will prevent damage to gas facilities.
b. Explain how the additional features, such as photo AI and augmented reality, work and how they will ensure safety.
c. If the $1.6 million is for a five-year subscription, is the Company capitalizing the $954,000 for the gas business or establishing a deferred debit and amortizing 1/5th to O&M expense each year? Explain why.

Response:

a. This software assists in preventing damages and reduce public safety risk through the following:

- Utilized as a ticket management solution which enables visibility into contractor and internal staking and locating performance data and as a backup work management solution if supplemental support is needed. The solution provides ticket execution performance analytics and reporting to ensure compliance with PA 174. This enables PA 174 required positive response to MISS DIG ticket requests.
- Provides analytics, reporting, and risk scoring to enable efficient and effective proactive field interventions supporting coaching and training of 3rd party excavators and associated performance and workload management capabilities. Solution enables automated workflows integrated with Damage Prevention programs and public awareness communications.

b. Additional capabilities supporting reducing damages and public safety risk include:

- AI – determines likelihood and impact of any incident that may occur to Company facilities through utilization of photo AI quality assurance audit processes to identify staking and locating anomalies that enables more rapid risk mitigation while utilizing machine learning for continuous improvement.
- Augmented reality will enable users to view underground assets onsite with support of site walks and quality assurance audit use cases.

c. At the time of filing this case, the Company projected $954,000 in capital expenditures for this software purchase based on the new functionality offered. The Company has now determined that only a portion of the software cost will be capitalized. The gas portion of the software cost has been reduced to a total of $829,082, with $195,000 as capital and $634,082 as O&M. This change will reduce the capital test year amount shown in Exhibit A-83 (KAP-5), line 4, from $4,168,000 to $3,409,000 and increase the O&M test year amount shown in Exhibit A-81 (KAP-2), line 12, from

$1,231,000 to $1,865,082. The entire subscription cost will occur in the test year of this case. The Company is not establishing a deferred debit or amortizing 1/5 to O&M.

Witness: Kristine A. Pascarello
Date: March 12, 2025

U21806-SA-CE-388
Requested By: Cindy L. Creisher (CLC-10)
Respondent: Kristine A. Pascarello
Date of Response: 3/18/2025
Page **1** of **1**

Question:

With reference to the direct testimony of Witness Kristine Pascarello on page 55, lines 1-7, provide a list of segments of wrought iron pipe that includes the length, location, and projected cost of replacement by year for the replacement work that is planned to be completed in 2025 and 2026. The projected replacement costs should include detail of capital expenditures that are projected to fall within the 12 months ending October 31, 2026.

Response:

The Material Condition Non-Modeled program plans to replace 7.64 miles of the remaining 12 miles of wrought iron. The remainder of the 12 miles are included in the 2026 EIRP KAL11 Bangor project. The replacement plan by year with related miles and capital expenditures planned in Material Condition Non-Modeled is:

Year	Miles Replaced	Location/Approx. Length	$
2025	1.3	Lawton: 4,499 ft Hartford: 1,905 ft	$1,500,000.00
2026	4.5	Several small pipe segments of various footage in Comstock, Schoolcraft, Vicksburg, Parchment, Paw Paw, and Galesburg totaling 4.5 miles	$5,000,000.00

To avoid construction during the heating season, projects are planned to for April through October, so the entire 2026 projection of $5 million will fall within the 12 months ending October 31, 2026.

PPN4122NESAG	20193	HP - Steel	NE - Saginaw	Saginaw	SAG6 TOD Line 1087G (TOD)	24,799	-	647	24,799	-	-	-	250	-	35,000	Contractor	TOD	1933 Bare steel 10" HP Pipe operating at >20% SMYS. Originally planned for 2024 but was rolled into plan for 2025. This is the #4 risk ranked TOD pipe segment. Moving this pipe from the RR ROW was an additional benefit into the road ROW.
PPN4109NESAG	21770	HP - Steel	NE - Saginaw	Saginaw	SAG8 (Junction Rd HP)	22,113	-	360	22,113	-	-	6	-	-	13,700	CE	#2 HP	1950 Bare Steel 6" HP Pipe that was risk ranked #2 for HP Segments
PPN4108NESAG	21771	HP - Steel	NE - Saginaw	Saginaw	SAG9 Ph 1 (Shields HP)	2,474	-	-	2,474	-	-	-	-	-	2,410	CE	#3 HP	1933 Bare Steel 10" HP Pipe that was risk ranked #3 for HP Segments. Additionally we added some MP pipe to remove some customer HP Stands.
PPN4094NESAG	21768,9	SP - Plastic	NE - Saginaw	Saginaw	SAG11 (Ph. 1,2)	8,337	3,758	2,489	2,090	-	-	-	-	11,372	-	CE	#3 SP/MP Segments	1960 Bare Steel 12" SP Pipe and 1940 Cast Iron 2", 4", 6" SP Pipe that was risk ranked #3 for MP Segments. Additionally we will be converting ~ 8,000' of SP plastic pipe to MP plastic pipe. This pipe is within SP/MP Grids #4, #127, #309
PPN4127NESAG	22650,1	SP - Plastic	NE - Saginaw	Saginaw	SAG12 (Ph. 1)	19,978	#####	1,629	-	-	-	135	-	5,280	-	CE	SP/MP Grids #220, #326	1920, 1930, 1940, 1950 Cast Iron 4", 6", and 8" SP Pipe. SAG12 Phases 1 and 2 were added to the 2025 plan to help reduce the amount of SP pipe on the system. They were not chosen as part of the risk ranking. We ended up pulling some of this work into 2024 and pushing some into 2026 to balance crew availability. The SP system in this area has had over +1,000 maintenance calls on this system in the previous two years before project selected. Also to the west of this project MDOT has work coming east in the upcoming years so we are replacing pipe ahead of their work.
PPN4032SEROK	19946,7,9,50	MP - Plastic	SE - Royal Oak	Royal Oak	ROK4 (2,3,5,6)	13,099	-	26,989	7,735	5,364	-	443	-	28,581	-	CE	SP/MP Grids #43, #408, #468	1920, 1930, 1940, 1950 Bare Steel and Threaded & Coupled 2" and 6" MP Pipe. ROK4 Project was started in 2023. Phases 4, 5 and 6 are carrying over from 2024 and Phase 3 was added to complete the work efficiently in one area.
PPN4036SEROK	19482	MP - Plastic	SE - Royal Oak	Royal Oak	ROK6 (Ph. 5)	160	-	17,595	-	160	-	85	-	17,763	-	CE	SP/MP Grids #141	1940, 1950 Bare Steel and Threaded & Coupled 2", 4" MP Pipe. This project was added to the 2025 plan as we had additional capacity for work and this phases had been scoped and planned early as a potential contingency project. This phase is part of a larger grid project started in 2024 but will be fully constructed in 2025, so it isn't listed as carryover. The risk rank in this report applies only to this phase, not the higher-risk phase the overall grid project was built around.
PPN4071SEROK	20561	SP - Plastic	SE - Royal Oak	Royal Oak	ROK13 (Ph. 1)	24,770	#####	1,305	3,631	-	-	3,179	-	21,729	-	CE	SP/MP Grids #13	1920, 1930, 1940 Cast Iron and Bare Steel 6", 8", 10", 12" SP Pipe. This project was added due to risk rank SP/MP Grid #13 and the companies goal to have all SP pipe retired by 2030.
PPN4058SEROK	20409	SP - Plastic	SE - Royal Oak	Royal Oak	ROK14	10,088	9,266	854	-	-	-	356	-	8,793	-	CE	SP/MP Grids #13	1900, 1910, 1920, 1930, 1940 Cast Iron 6", 8", 10", 16" SP Pipe. This project was added due to risk rank SP/MP Grid #13 and the companies goal to have all SP pipe retired by 2030.
PPN4097SEROK	21949,52,3,4	MP - Plastic	SE - Royal Oak	Royal Oak	ROK15 (Ph. 1-4)	3,913	-	3,158	3,535	378	-	39	3,735	6,618	-	CE	#4 SP/MP Segments	1920, 1950 Bare Steel and Threaded & Coupled 2" MP Pipe risk ranked #4 for SP/MP Pipe Segments. This pipe is within SP/MP Grids #20, #78.
PPN4098SEROK	21957	MP - Plastic	SE - Royal Oak	Royal Oak	ROK16 (Ph. 1)	1,108	-	318	1,108	-	-	61	-	1,130	-	CE	#1 SP/MP Segments	1940, 1950 Bare Steel 4" MP Pipe that was risk ranked #1 for SP/MP Pipe Segments. This pipe falls within SP/MP Grid #44.
PPN4099SEROK	21958	MP - Plastic	SE - Royal Oak	Royal Oak	ROK17 (Ph. 1)	441	-	-	441	-	-	82	-	500	-	CE	#10 SP/MP Segments	1950 Bare Steel 2" MP Pipe that was risk ranked #10 for SP/MP Pipe Segments. This pipe falls within SP/MP Grid #50.
PPN4117SWOWS	21989	HP - Steel	NE - Flint	Owosso	OWS1	7,700	-	280	7,700	-	-	-	-	-	8,050	CE	#12 HP	1933 Bare Steel 6" HP Pipe that was risk ranked #12 for HP segments.
PPN4125SWOWS	22607,8	MP - Plastic	NE - Flint	Owosso	OWS2 (Ph. 1,2)	13,224	-	7,382	1,239	11,985	-	1,287	11,841	23,300	-	CE	SP/MP Grid #55	1925 Bare Steel, T&C 6" MP Pipe that was selected as a SME Project to address 3 - 5 lb. MP system in Corunna
PPN4077NEMDL	20620	MP - Plastic	NE - Midland	Midland	MDL2 (Ph. 1)	12,680	-	13,180	-	-	-	-	6,225	13,190	-	CE	#5 SP/MP Segments	1920 Bare Steel 6" MP Pipe that was risk ranked #5 for MP Segments. We added additional footage to avoid tying into 1928 bare steel pipe. This project expands across SP/MP Grids #5, #235, #430. This work helps to retire pipe ahead of planned multi=phase civic work with Road Commission.
PPN4063SEMAC	20624,5,6,7,8 ,9,30,31	MP Plastic	SE - Macomb	Macomb	MAC12 (Ph. 1-8)	81,432	-	37,228	16,426	65,006	-	2,308	10,376	111,406	-	CE	SP/MP Grid #1	1900, 1920, 1930, 1940, 1950 Bare Steel and Threaded & Coupled 2", 4", and 6" MP Pipe. This pipe was the #1 Risk Ranked SP/MP Grid. Additionally over 2 miles of pipe not cathodically protected.
PPN4095SEMAC	21922	MP - Plastic	SE - Macomb	Macomb	MAC14 (Ph. 2)	14,837	-	2,096	-	14,837	-	320	4,730	19,860	-	CE	#6 SP/MP Segments	1920 through 1940 Threaded & Coupled 2", 4" MP Pipe that was risk ranked #6 for MP Segments. MAC14 is a larger Grid project to be completed in future years. The pipe is within the SP/MP Grid #117
PPN4106SELIV	22036	HP - Steel	SE - Livonia	Livonia	LIV6 (Ph. 1) Line 1019W (TOD)	-	-	5,050	-	-	-	-	-	2,778	5,050	Contractor	TOD	1960 C&W 10" HP Pipe operating at >20% SMYS. This is the 1st of three phases addressing pipe along Middlebelt Road. This is a SME Project for TOD addressing external corrosion concerns.
PPN4012SELIV	19186	MP - Plastic	SE - Livonia	Livonia	LIV3 (Ph. 5)	14,569	-	3,054	-	14,569	-	-	-	17,623	-	CE	SP/MP Grids #972	1940 Bare Steel 4" MP Pipe and 1950 Threaded & Coupled 2" MP Pipe. LIV3 Grid was started in 2024. To keep crews on the project make economical sense versus having them move to alternate projects. This phase is part of a larger grid project started in 2024 but will be fully constructed in 2025, so it isn't listed as carryover. The risk rank in this report applies only to this phase, not the higher-risk phase the overall grid project was built around.
PPN4050SELIV	20325,6,7,8,9 ,31	MP - Plastic	SE - Livonia	Livonia	LIV4 (Ph.1-5,7)	70,901	-	739	4,701	66,200	-	1,209	4,054	71,956	-	CE	SP/MP Grids #7	1950 Threaded & Coupled 2', 4", 6" MP Pipe. Phases 3,4,5 are in the 7th risk ranked grid for SP/MP Pipe. We decided to complete all of the phases for this LIV4 project in order to take advantage of crew efficiency working in one area.
PPN4114SWLAN	21985	HP - Steel	SW - Lansing/ Jackson	Lansing	LAN8 (Lk. Lansing/Larch)	4,736	-	1,227	4,736	-	-	-	-	-	5,840	Contractor	#8 HP	1940 Bare Steel 6" HP Pipe that was risk ranked #8 for HP Segments. The city has a Combined Sewer Overflow (CSO) Project and we have worked with them to coordinate this work.
PPN4113SWLAN	21986	HP - Steel	SW - Lansing/ Jackson	Lansing	LAN9 (Lk, Lansing Rd)	5,725	-	164	5,725	-	-	-	-	-	5,800	Contractor	#4 HP	1940 Bare Steel 6" HP Pipe that was risk ranked #4 for HP Segments. Additionally we added MP pipe to be installed to eliminate long sided HP services.
PPN4009SWLAN	19205,6,7,8,9	MP - Plastic	SW - Lansing/ Jackson	Lansing	LAN4 (Ph. 4-8)	33,735	-	34,002	10,319	23,416	-	1,586	7,863	83,105	-	CE	SP/MP Grids #33, #116, #135, #175, #200, #211, #423, #1538	1900, 1920, 1930, 1940, and 1950 Bare Steel and Threaded & Coupled 2" MP Pipe. LAN4 Project was started in 2024. Phases 4,5, are currently under construction and retirement will roll into 2025. Phases 6,7,8 were rolled into 2025 to keep crews working efficiently on this project.
PPN4017SWLAN	22576	MP - Steel	SW - Lansing/ Jackson	Lansing	LAN5 (Ph. 11)	155	-	412	-	-	-	-	155	1,270	-	Contractor	SP/MP Grids #22	1910 Bare Steel 6" MP Pipe. LAN5 Phase 9 which is under construction in 2024 had to have a portion of pipe split off and made into this Phase 11. This phase is handling the steel pipe in the Red Cedar River Crossing. Close work with the municipality on bridge work.

U21806-MNSC-CE-0075_Pascarello_Attachment_2

Parent Project Number (PPN)	DAPP #	Pipe Pressure	Headquarters	Project Location	Project Name	Total Vintage Retired	Cast Iron	Coated & Wrapped (C&W)	Bare Steel (BS)	Threaded & Coupled (T&C)	Wrought Iron	Plastic	Code 3 (Ft)	Install Plastic	Install Steel	Construct	Risk Rank	Selection Reason
PPN4102SWLAN	21973,4	MP - Plastic	SW - Lansing/ Jackson	Lansing	LAN7 (Eaton & Mason)	270	-	1,655	270	-	-	166	1,294	1,634	-	CE	#7 and #9 SP/MP Segments	1940 Bare Steel 2" MP Pipe and 1950 Coated & Wrapped Pipe that were risk ranked #7 and #9 for MP segments. These pipe segments are part of the SP/MP Grids #35 and #40.
PPN4042SWKAL	19657,8,60, 61,21010	SP - Plastic, HP - Steel	SW - Lansing/ Jackson	Kalamazoo	KAL2 (Ph. 1,2,4,5,10)	46,294	#####	4,385	2,485	-	114	2,167	-	47,930	2,345	CE	SP/MP Grid #138	1900, 1910, 1920, 1930, 1940, 1950 Cast Iron, Wrought Iron and Bare Steel 2", 4", 6", 8", and 10" SP Pipe. This grid was originally planned in 2024 but was removed for resource availability reasons. Plan to construct 1/2 of this grid in 2025 and replace a small segment of Vintage HP pipe. Additionally, due to Kalamazoo's permit restrictions which prohibit construction activities during winter months, it is important that we prioritize and complete this project within the limited construction window available. This ensures that we can effectively utilize the permissible construction period and avoid delays that could arise from seasonal restrictions.
PPN4100SWKAL	21969, 30156	HP - Steel	SW - Lansing/ Jackson	Kalamazoo	KAL6 (W. Main & W. Michigan)	6,569	-	362	6,569	-	-	-	-	-	9,994	Contractor	#9 HP	1950 Bare Steel 6" HP Pipe that was risk ranked #9 for HP Segments. Existing line has casing at Amtrak RR crossing, which is cathodically shorted and also punctured so additional piping was added. Compliance issue with this casing and this project will resolve.
PPN4090SEHWL	21618,21,22	HP - Steel	NE - Flint	Howell	HWL2 (Ph. 1,4,5)	5,755	-	1,766	5,755	-	-	10	-	-	6,595	CE	#7 HP	1928 Bare Steel 6" HP Pipe that was risked ranked #7 for HP segments. Adjacent to a CE Initiated Project to replace additional bare steel HP Pipe.
PPN4105NEFLT	22021	MP Plastic	NE - Flint	Flint	FLT6 (Ph. 2)	2,139	-	144	178	1,961	-	21	-	3,271	-	CE	SP/MP Grid #581	1940, 1950 Bare Steel and Threaded & Coupled 2" MP Pipe. This work was added to the FLT6 Phase 1 project to take advantage of crew availability and close proximity to FLT6 Phase 1. We would be causing a risk if we replaced the HP on PH1 and not replace this vintage pipe on PH2.
PPN4067NEFLT	20657,8,9	MP - Plastic, HP - Steel	NE - Flint	Flint	FLT5 (Ph. 1-3)	22,283	-	23,020	18,225	4,058	-	1,098	-	44,086	-	CE	#1 HP	1928 Bare Steel 6" HP Pipe that was risked ranked #1 for HP segments. Able to retire some HP-Steel and replace with MP-Plastic. The MP pipe expands across SP/MP Grids #90, #94, #103, #226, #299. By combining this work in one year less disruption to the municipality. By retiring this vintage pipe, we hope to help the city relive some traffic routing conditions with their future MDOT work.
PPN4105NEFLT	21855	HP - Steel	NE - Flint	Flint	FLT6 (Ph. 1) Line 1045	5,984	-	-	5,984	-	-	-	-	-	4,729	Contractor	#10 HP	1940 Bare Steel 12" HP Pipe that was risk ranked #10 for HP segments and was part of a request for SME replacement. Multiple couplings on this line.
PPN4107NEBCY	21807	MP - Plastic	NE - Midland	Bay City	BCY3 (Ph. 1)	3,333	-	56	3,333	-	-	2	-	1,000	-	CE	#2 SP/MP Segments	1946 Bare Steel 2" MP Pipe that was risk ranked #2 for MP Segments. This pipe expands across SP/MP Grids #34 and #46
PPN4044NEBCY	19914, 30349,50	SP - Plastic	NE - Saginaw	Bay City	BCY2 (Ph. 3,7,8)	31,179	#####	9,054	805	1,088	-	2,815	-	30,990	-	CE	SP/MP Grids #83, 119, 137,310, 316	1940 and 1950 SP Cast Pipe that has been coordinated with city work on multiple streets within the Bay City Area. By removing our vintage main ahead of city work we can avoid future disruption to completed road work. Phase 3 moves some pipe that the city is addressing a "sinking" road issue they are trying to address. This BCY2 project has been broken up into multiple phases to work around civic work, MDOT Bridge work, and traffic routing.
PPN4075NEALM	20617, 30218,9	MP Plastic	NE - Midland	Alma	ALM2 (4,6,7)	31,355	-	-	5,212	27,428	2,856	-	500	38,700	-	CE	SP/MP Grids #194, #300	1900, 1940, 1950 Wrought Iron, Bare Steel, and Threaded & Coupled 2" and 4" MP Pipe. This project was added to the plan as the city (St. Louis) had planned civic work and we took advantage of removing the vintage pipe ahead of their work so that we would not need to come back and tear up newly paved roads.
PPN4111NEALM	21667	HP - Steel	NE - Midland	Alma	ALM5 (Ph. 1) Line 1070G	14,681	-	-	14,681	-	-	-	-	125	14,000	CE	TOD	1945 Bare Steel 6" HP Pipe that was selected as a SME Project due to multiple incidents of line being struck by outside parties. (Shallow pipe within a farm field)
PPN4110NEALM	21767	MP - Plastic	NE - Midland	Alma	ALM4 (Ph. 1)	3,909	-	2,085	3,909	-	-	346	-	4,900	-	CE	#8 SP/MP Segments	Pre 1930 Bare Steel 2" MP Pipe that was risk ranked #8 for MP Segments. This pipe is located within the SP/MP Grid #76. Completing this work will help with future civic work in the city (Ithaca).

The 2026 EIRP projects listed in this workpaper were internally approved on August 20, 2024. EIRP projects do not have completed business cases since the projects are selected using the Company's Distribution Risk Analysis Model ("DRAM") to target highest ranked risk pipe segments and include other factors such as project size, location, system characteristics, and municipality planned projects, such as road reconstruction, sanitary or water main projects, or other local, state, and federally funded projects.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REDACTED

REBUTTAL TESTIMONY

OF

JAMES P. PNACEK, JR

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is James P. Pnacek, Jr., and my business address is 1945 West Parnall Road, Jackson, Michigan 49201.

Q. Are you the same James P. Pnacek, Jr. who previously filed direct testimony in this case on behalf of Consumers Energy Company ("Consumers Energy" or the "Company")?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony?

A. I will discuss the withdrawal of the Company's request for Leak Detection and Repair ("LDAR") deferred expense considerations from my direct testimony. I will address recommendations made by Attorney General witness Sebastian Coppola involving operating and maintenance ("O&M") expenses, specifically related to Gas Line Staking and Locating, Leak Survey and Repair, and Enhanced Infrastructure Replacement Program ("EIRP") Training. I will also address recommendations made by Citizens Utility Board ("CUB") witness Ram Veerapaneni involving adjustments to various Gas Operations O&M expenses including Leak Survey and Repair. I will also address recommendations made by Association of Businesses Advocating Tariff Equity ("ABATE") witness Colin T. Fitzhenry involving Leak Repair and Survey O&M expenses.

Q. What exhibit are you sponsoring in connection with your rebuttal testimony?

A. I am sponsoring the following exhibits:

Exhibit A-143 (JPP-5) CONF	Staking Bid Analysis;
Exhibit A-144 (JPP-6) CONF	Staking Bidder List and Summary; and
Exhibit A-145 (JPP-7)	EIRP OM&C Headcount Analysis.

Leak Repair and Survey

Q. In your direct testimony, you indicated that the Company expected final LDAR rules to be published in January 2025 and to go into effect six months later. Has there been any new development related to the LDAR rules since you filed your direct testimony?

A. Yes. The Pipeline and Hazardous Materials Safety Administration ("PHMSA") sent the Final Rule for LDAR to the Federal Register in mid-January. However, the Federal Register was unable to formally publish the rule prior to the change in Presidential administrations and the issuance of President Trump's Executive Order: Regulatory Freeze Pending Review. Based on the submitted final rule, which has not yet been published, the general compliance date for O&M activities that require capital and O&M funding is January 1, 2028.

Q. How has this development impacted the Company's requested relief in this case?

A. With this new compliance date, the Company will no longer be requesting the Michigan Public Service Commission ("MPSC" or the "Commission") to approve the Company's proposal to defer any test year O&M expense that occurs as a result of the requirements of the final rule that are above the requested funding in this case, as previously requested on page 10, lines 9 through 16, of my direct testimony. The Company agrees with the recommendation of MPSC Staff ("Staff") witness Jacob G. Martus that the LDAR deferral mechanism should not be approved in this current rate case.

Q. Several parties' witnesses (Attorney General witness Coppola, ABATE witness Fitzhenry, and CUB witness Veerapaneni) recommended that the Commission disallow the $1.3 million of O&M included in your direct testimony for Leak Repair and Survey due to the delay in publishing final LDAR rules. Do you agree with those recommendations?

A. No. As I state in my direct testimony, the Company plans to eliminate the backlog of known leaks on the system at an accelerated rate as part of its work plan, regardless of the timing of the LDAR rule publication. The Company plans to spend $1,300,000 to address the anticipated leak backlog on the system for the test year in the Leak Survey and Repair program section of my testimony. (See my direct testimony, starting at page 39, line 6, through page 40, line 2.) The Company's decision to reduce the leak backlog was independent of the publication of the LDAR rule. The delay in the LDAR rule publication is not a basis for not including the $1,300,000 for the leak backlog. The Company is accelerating the reduction of leaks on the leak backlog for customer safety, risk reduction, and emissions reduction to serve all of the Company's customers and increase public trust. Staff witness Martus took the correct approach in his testimony when he proposed that the Commission should not approve any deferral for LDAR work beyond the $1.3 million to address the backlog but did not propose any reduction of the money needed to address the backlog. The Commission should reject the recommended reductions proposed by Attorney General witness Coppola, ABATE witness Fitzhenry, and CUB witness Veerapaneni.

Q. On page 17, lines 3 through 11, of his direct testimony, ABATE witness Fitzhenry presents Table CTF-7 and claims that this data supports his conclusion that the Company does not have a leak backlog. Do you agree with this claim?

A. No. Mr. Fitzhenry incorrectly concludes that there is no backlog based on his observation that the number of known leaks repaired in 2023 was 27% below the average number of leaks repaired over the last five years. However, the data presented in Table CTF-7 is not useful for determining whether a leak backlog exists. It only shows and can only represent the number of leaks eliminated according to the data in the Company's Department of Transportation ("DOT") report annual filings. The data from Table CTF-7 does not show how many identified leaks were in the backlog before the Company made those repairs. It also does not show the number of new leaks found in each of those years. For example, if more leaks are found in a year than are repaired, then it results in a leak backlog addition. The Company's leak backlog represents any open leak that is currently on the system and has not yet been repaired. It is illogical and incorrect to conclude that a leak backlog does not exist based solely on data showing a decline in the leaks being repaired in Table CTF-7. Contrary to Mr. Fitzhenry's claim, the Company does have a leak backlog, and the Commission should disregard ABATE witness Fitzhenry's incorrect claim to the contrary.

Q. What is the Company's recent leak backlog?

A. The Company ended 2023 with a leak backlog of 5,618 leaks and ended 2024 with a leak backlog of 5,480 leaks.

Q. On page 16, lines 13 through 21, of his direct testimony, CUB witness Veerapaneni recommends that the Commission should base the spending level for Leak Repair and Survey on his 2023 and 2024 average O&M approach. Do you agree with this recommendation?

A. No. The Company believes that the methodology used by CUB is unreasonable. CUB witness Veerapaneni did not review the reasonableness of the proposed work being undertaken during the test year or the benefits that would be provided to customers.

As I state in my direct testimony starting at page 10, line 5 to line 14, the Company plans to eliminate the backlog of known leaks on the system at an accelerated rate as part of its work plan, regardless of the timing of the LDAR rule publication. The Company plans to spend $1,300,000 to address the anticipated leak backlog on the system for the test year in the Leak Survey and Repair program section of my testimony. The Company is accelerating the reduction of leaks on the leak backlog for customer safety, risk reduction, and emissions reduction to serve all of the Company's customers and increase public trust. The Commission should reject Mr. Veerapaneni's alternative methodology for calculating Leak Repair and Survey expense, which is not based on the Company's actual plans.

Attorney General Witness Coppola - Gas Staking and Locating O&M Expenses

Q. With regard to Staking and Locating expenses, on page 167, lines 14 through 18, of his direct testimony, Attorney General witness Coppola states that typically gas utilities share the cost of locating underground facilities when MISS DIG is requested to locate underground facilities by customers, contractors, and other parties. Do you agree with this statement?

A. No. The word "typically" implies the Shared Resource Model for the State of Michigan is the standard for gas utilities. This is not an accurate statement. In fact, Consumers Energy has been an outlier among Michigan utilities in recent years for using a Shared Services Model of staking. The Commission has been aware of that for at least three years. In Case No. U-21148, Consumers Energy's 2022 gas rate case, Staff witness David Chislea (Director of the Commission's Gas Safety and Operations Division) testified: "Consumers Energy is the only gas utility in Michigan that attempts to use contractors for initially marking of gas distribution facilities. DTE Gas Company employs locating technicians in its operations group and supplements that team with contractors in the large metropolitan areas during times of peak ticket volumes. To Staff's knowledge, all other gas distribution utilities are utilizing Company technicians for marking facilities." See Mr. Chislea's Direct Testimony in Case No. U-21148, page 17, line 19, through page 18, line 2 (filed April 8, 2022). The Company's transition from the Shared Resource Model to the Dedicated Resource Model moves Consumers Energy in line with other Michigan gas utilities. Mr. Coppola's statement is not accurate, since Consumers Energy, DTE Gas, SEMCO, and MGU all use a dedicated asset-staking model. The Commission should disregard Mr. Coppola's inaccurate claim.

Q. On page 168, lines 1 through 6, of his direct testimony, Attorney General witness Coppola characterizes the Company-only dedicated staking and locating program in Oakland and Kent Counties as an experimental program to establish whether the incremental benefits justified the incremental cost of a dedicated program. Do you agree with this characterization?

A. No. The Company never characterized its dedicated staking approach in Oakland and Kent Counties as "experimental" in its testimony in Case Nos. U-21308, U-21490, or the current case. The Company does not view this as an "experimental" program nor did the Company intend to only evaluate the incremental benefits against incremental cost to decide whether it should potentially return to the Shared Resource Model. Mr. Coppola's statement implies that the Company has put a financial value on public safety. That is not accurate. The Company has not put a financial value on public safety. The use of dedicated staking contractors in Oakland and Kent Counties was not a test-case for justifying the Dedicated Staking Model in other parts of the Company's service territory.

Q. Why did the Company consider transitioning its entire service territory to a Dedicated Staking Model?

A. I discuss some of the key reasons for moving to a Dedicated Staking Model approach on pages 48 and 49 of my direct testimony. Given the lower level of performance that the Company observed as the result of its prior use of the Shared Resource Model, the Company views the changes to the staking and locating program, originating in Oakland County Gas-Only program, as an initiative to improve public safety by meeting timeliness obligations within Public Act 174 of 2013, improve staking accuracy, and improve excavator communication while pursuing the lowest cost approach that yields the intended

benefits of the staking and locating program. Furthermore, as discussed in my direct testimony and later in my rebuttal testimony, the Dedicated Resource Model is the lowest average unit cost staking option. There is no incremental cost associated with the Dedicated Resource Model when compared to the Shared Resource Model. Continuing with the Shared Resource Model, and not transitioning to the Dedicated Resource Model, would increase the program cost by $3,667,000 for the Company's remaining gas service territory in the test year.

Q. On page 168, line 7 through line 14, of his direct testimony, Attorney General witness Coppola states that the Company didn't attempt to work with the Shared Resource Model staking and locating contractors to "resolve whatever problems with performance existed and in turn minimize the cost of staking and location." Do you agree with this statement?

A. No. First, it is incorrect to claim that Consumers Energy did not work with its Shared Resource Model Contractor to resolve problems that arose during the course of its service. The Company conducted quarterly performance reviews with the Shared Resource Model Contractor to review ongoing performance and continuous improvement. These reviews were executed throughout the three-year agreement ending March 2025 with performance issues being identified and communicated to the Shared Resource Model Contractor. Despite these reviews, the Shared Resource Model Contractor did not resolve all of the performance issues identified by the Company during the contract life cycle. Second, it is incorrect to imply that the Company transitioned to a Dedicated Resource Model solely because of unresolved performance issues with its previous Shared Resource Model

Contractor. I have already discussed the variety of valid reasons why the Company transitioned to a Dedicated Resource Model for its staking work.

Q. On page 168, lines 15 through 19, of his direct testimony, Attorney General witness Coppola states that the Company did not provide any evidence that there was a "serious problem with staking and locating . . . that cannot be resolved in other ways." Do you agree with this statement?

A. No. Again, Attorney General witness Coppola ignores the numerous other reasons the Company transitioned to a Dedicated Resource Model and continues to falsely claim that the Company's sole reason for making the change was to address "serious problems" with its Shared Resource Model Contractor. As stated on page 50, lines 6 through 9, of my direct testimony, the Company plans to expand the program to "continue to improve public safety, reduce damages, mitigate communication risks with excavators, improve quality, and comply with timeliness requirement within Public Act 174." Additionally, the staking contract with the contractor that the Company uses for its Shared Resource Model expired in the first quarter of 2025. See page 50 of my direct testimony. In anticipation, the Company sent out a request for proposal ("RFP") in the third quarter of 2024 for staking services for the Company's remaining gas service territory that at the time was under the Shared Contractor resource model. The request included options for both shared and dedicated services. The Company only received one bid from a contractor willing to provide services under a Shared Resource Model, but several willing to provide services under a Dedicated Resource Model. The bids yielded an average unit cost for the Dedicated Resource Model that was below the average unit cost of the sole Shared Resource Model Contractor staking model bid. To clarify, the Shared Resource Model Contractor's bid

came in at a significantly higher rate than the previous contracted rate it had with the Company. In other words, the results from the RFP showed that the Company no longer had an option to simply continue its prior Shared Resource Model contract on the same terms or at the same price. The bid from the Shared Resource Model Contractor also came in higher than the bid from the lowest Dedicated Resource Model Contractor. Thus, the statement in my direct testimony remains accurate: the bids yielded an average unit cost for the Dedicated Resource Model Contractor that was below the average unit cost of the Shared Resource Model Contractor was relative to the new higher bid received from the Shared Resource Model Contractor. In short, of the available options after the previous Share Resource Model contract ended, the least expensive option available to the Company was a Dedicated Resource Model contract. As stated in my direct testimony, the analysis shows the Dedicated Contractor model is on average $10.90 less on a per-unit basis when compared to the Shared Contractor model. Continuing with the Shared Contractor model, and not transitioning to the Dedicated Contractor resource model, would increase the program cost by $3,667,000 for the Company's remaining gas service territory in the test year. The decision to expand the use of the Dedicated Resource Model to the remainder of the Company's service territory was based on the improved performance and lower unit cost of the Dedicated Resource Model compared to the Shared Resource Model. In summary, the Dedicated Resource Model aligns the Company to the approach of other gas utilities in the state, improves staking performance, increases public safety, while using the lowest cost option. Continuing with a Shared Resource Model would have meant using a less effective, higher cost option. That is clearly not reasonable. The Commission should disregard the arguments made by Attorney General witness Coppola.

Q. On page 168, line 20, through page 169, line 4, of his direct testimony, Attorney General witness Coppola argues that the Company's claim that the Dedicated Resource Model is lower cost than the Shared Resource Model is "counter to the historical evidence presented by the Company." Do you agree with this statement?

A. No. The "historical evidence" that Mr. Coppola is referring to is the contract price under the Company's expired contract for shared-resource staking. That price is no longer available. This project was competitively bid, and the Company has been transparent providing the bid analysis, the actual bids received, and the staking contracts to the Attorney General during discovery. Exhibit A-143 (JPP-5) CONF shows the bid analysis and Exhibit A-144 (JPP-6) CONF shows the contractors requested to bid and those who responded. While previously the Shared Resource Model Contractor unit cost was below the Dedicated Resource Model unit cost, historical pricing is not a guarantee of future pricing. As shown in Exhibit A-143 (JPP-5) CONF, the Shared Resource Model Contractor unit cost is higher than the Dedicated Resource Model Contractor's bid. Although the Company provided the information in Exhibits A-143 (JPP-5) CONF and A-144 (JPP-6) CONF to the Attorney General in discovery, Mr. Coppola ignores this information in his testimony. The Commission should disregard Attorney General witness Coppola's incorrect statements.

Q. On page 169, line 4 through line 9, of his direct testimony, Attorney General witness Coppola claims that the Company's bidding process cannot be relied upon because the Company has publicly expressed its preference in at least the last two rate cases to move to a Dedicated Resource Model and that contractors have limited their bids based on that preference. Do you agree with this claim?

A. No. The transition to the Dedicated Resource Model supports public safety and customer value. It was necessary for the Company to disclose its staking and locating approach in the rate case process and all bidding contractors would have access to the same information provided in the cases. This project was competitively bid, and the Company has been transparent providing the bid analysis, the bids received, and the staking contracts to the Attorney General's witness during discovery. The Company indicated in the RFP that it would likely move to the Dedicated Resource Model in 2025 at least for Kalamazoo and Ingham Counties. The Company indicated that the final determination about which counties would transition to a Dedicated Resource Model in this contract would be made after the bid review. At the time of the RFP, the Company was not planning to transition all the counties in its service territory from the Shared Resource Model to the Dedicated Resource Model. As shown on Exhibit A-144 (JPP-6) CONF, 22 suppliers were invited to submit proposals. All bidders were given the opportunity to submit a proposal for: (i) only the Dedicated Resource Model, (ii) only the Shared Resource Model, and/or (iii) both models for all territories excluding Oakland and Kent counties. The Company received five bids. Four of those bids were to supply service for the Dedicated Resource Model only and one bid was to supply service for the Shared Resource Model only. No contractor bid on both approaches. [**BEGIN CONF**] [redacted]

[redacted] [**END CONF**]. The winning staking contractor was determined based on a transparent, competitive bidding process resulting in the selection of the contractor with the lowest overall average unit cost and best value being selected to perform the staking activities to ensure public safety. The Commission should disregard Attorney General witness Coppola's claims to the contrary.

Q. On page 169, line 12, through page 170, line 2, of his direct testimony, Attorney General witness Coppola recommends that the Commission remove the incremental O&M expense of $11,184,000 included by the Company in the projected test year. Do you agree with this disallowance?

A. No. For the reasons discussed above, there is no valid reason to reduce the Company's forecasted staking and locating expenses for the test year, which are based on the Company's new contract for staking services. The Company competitively bid the staking activities, performed a bid analysis to evaluate the bids, and selected the lowest overall average unit cost contractor with the best value to perform the staking activities and ensure public safety. Adopting Mr. Coppola's proposal would significantly understate the Company's expected costs for its staking and locating work during the test year. The Commission should reject Mr. Coppola's recommendation to disallow the Staking and Locating incremental O&M.

Attorney General Witness Coppola – Staking and Locating Deferred Accounting

Q. With regard to Staking and Locating Deferred Accounting, on page 194, line 15, through page 195, line 4, of his direct testimony, Attorney General witness Coppola recommends that the Commission reject the staking deferral request the Company proposed in the test year. Do you agree with this recommendation?

A. No. As I discussed in my direct testimony, there are valid reasons to anticipate more volatility in the number of staking requests during the test year than in prior years, meaning there is greater uncertainty about the accuracy of staking forecasts. With staking requests increasing due to fiber optic and other infrastructure work, the actual staking demand the Company experiences in 2026 could be above the Company's historical staking volume

forecast. The Company has requested the deferral mechanism to cover O&M expenditures associated with expected fluctuations in the volume of staking tickets. The Company based its deferral request mainly on two high-speed internet infrastructure grant programs administered by the Michigan High-Speed Internet Office. The first program is Realizing Opportunities with Broadband Infrastructure Networks ("ROBIN"). According to the State of Michigan's Labor and Economic Opportunities website, the ROBIN program includes $250.6 million to expand high-speed internet service to unserved locations in the state. All program funds must be expended by the end of the 2026 calendar year. The second program is the Broadband Equity, Access, and Deployment Program ("BEAD"). According to the State of Michigan's Labor and Economic Opportunities website, as of 2023, close to 500,000 households are unserved or underserved by high-speed internet infrastructure. BEAD is designed to ensure that every one of Michigan's unserved and underserved homes and businesses can get connected to reliable high-speed internet infrastructure. Approval of Michigan's final list of subgrantees and the locations to be served is anticipated to occur in mid-2025. After final approval, subgrantees will have four years to complete their infrastructure projects and begin delivering service. These two infrastructure projects have the potential to significantly increase staking volumes above forecasted levels. The deferral mechanism benefits both the Company and customers as it allows for refund and recovery without building the unknown cost into rates. Attorney General witness Coppola's recommendation should be rejected by the Commission and the Commission should approve the recommendation made by Staff witness Martus related to the staking and locating deferral.

Attorney General Witness Coppola - EIRP Training Expenses

Q. On page 170, lines 7 through 17, of his direct testimony, Attorney General witness Coppola claims that the Company did not explain the increase in its EIRP training expense. Do you agree with his statements?

A. No. The reason for the increased training expense is explained on pages 86 and 87 of my direct testimony. The Attorney General simply ignores the testimony, which explains that the EIRP workforce continues to experience employees transferring to other operating departments within the Company and that this movement results in the need for hiring and training to allow for appropriate staffing as the Company implements the Natural Gas Deliver Plan. Mr. Coppola's claim that EIRP is a "mature program" is irrelevant to the issue because, no matter how mature a program is, when employees leave the program for other opportunities within the Company, their replacements will still need to be trained.

Q. On page 170, lines 15 through 17, of his direct testimony, Attorney General witness Coppola claims that the Company stated in discovery that the increased EIRP expense was needed because "the EIRP workforce continues to grow." Is that an accurate reflection of the Company's discovery response to the Attorney General?

A. No. Exhibit AG-58, which shows the Company's response to discovery request U21806-AG-CE-0561-Revised, repeats my direct testimony. The response does not state that the EIRP workforce continues to grow, in fact the EIRP workforce has been declining as shown in Exhibit A-145 (JPP-7). The additional training expenses are for new hire and step promotion training caused by movement in the existing workforce. Attorney General witness Coppola's mischaracterization of my testimony and discovery response presents a fallacious strawman argument.

Q. What is the Company's historical experience related to employee turnover in EIRP?

A. As shown in Exhibit A-145 (JPP-7), the Gas Construction EIRP Program had a headcount of 495 Operating, Maintenance, and Construction ("OM&C") employees at the end of 2020. From the end of 2020 to the end of 2024, the program lost 116 employees due to headcount reductions but also needed to hire 216 new OM&C employees to replace some of the 379 OM&C employees that remained after the headcount reductions. This means a total of 332 employees left Gas Construction during this time period. As Exhibit A-145 (JPP-7) shows, this is a turnover rate of 76%.

Q. Given the turnover history and the Company's future plans for EIRP, what additional hiring does the Company plan to do to maintain the appropriate staffing for the program?

A. As shown on Exhibit A-145 (JPP-7), the Company plans to hire a total of 145 OM&C employees for 2025 and 2026. The hiring is necessary to support the increase in the EIRP work plan miles from 118.1 miles of plastic in 2025 to 136.2 miles of plastic in 2026 as shown in the Exhibit A-138 (KAP-8). As previously stated, the Company needs to expend an incremental $1,656,000 for new-hire and step-promotion training, which is necessary to support the forecasted increase in the EIRP Capital work plan. Attorney General witness Coppola's recommendation to disallow the EIRP Training O&M should be rejected by the Commission. Attorney General witness Coppola has also recommended scaling back the EIRP capital program. The Commission should reject that proposal also. Company witness Pascarello discusses the reasons for rejecting that proposal in her rebuttal testimony.

CUB Witness Veerapaneni - Test Year Calculation

Q. With regard to Gas Operations expenses, on page 16, lines 2 through 10 of his direct testimony, CUB witness Veerapaneni proposes a decrease to the Company's O&M expenses for the Gas Operations Division based on the concept of using a two-year historical average. Do you agree with this approach?

A. No. The Company believes that the methodology used by CUB is unreasonable. CUB witness Veerapaneni did not review the reasonableness of the proposed work being undertaken during the test year or the benefits that would be provided to customers. The Commission should reject this recommendation.

Q. With regard to Gas Operations – Other expenses, on page 17, lines 10 through 15, of his direct testimony, CUB witness Veerapaneni proposes an increase to the Company's O&M expense for the Gas Operations-Other Programs based on the concept of using a two-year historical average. Do you agree with this approach?

A. No. The Company believes that the methodology used by CUB is unreasonable. CUB witness Veerapaneni did not review the reasonableness of the proposed work being undertaken during the test year or the benefits that would be provided to customers. The Commission should reject this recommendation.

Q. With regard to Gas Storage expenses, on page 18, lines 10 through 19, of his direct testimony, CUB witness Veerapaneni proposes an increase to the Company's O&M expense for Gas Operations - Storage based on the concept of using a two-year historical average. Do you agree with this approach?

A. No. The Company believes that the methodology used by CUB is unreasonable. CUB witness Veerapaneni did not review the reasonableness of the proposed work being

undertaken during the test year or the benefits that would be provided to customers. The Commission should reject this recommendation.

Q. On Exhibits CUB-9, line 3, and CUB-11, line 3, CUB witness Veerapaneni proposes a decrease to the Company's O&M expense for the Gas Operations – Field Ops Services program based on the concept of using a two-year historical average. Do you agree with this approach?

A. No. The Company did not find any discussion on this proposed decrease in CUB witness Veerapaneni's testimony. Reference for the decrease was found only in Exhibits CUB-9 and CUB-11. The Company believes that the methodology used by CUB is unreasonable. CUB witness Veerapaneni did not review the reasonableness of the proposed work during the test year in the O&M Programs or the benefits the O&M Programs would provide to customers. The Commission should reject this recommendation.

Q. Does this conclude your rebuttal testimony?

A. Yes.

REBUTTAL TESTIMONY

OF

HEATHER L. RAYL

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Heather L. Rayl, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same Heather L. Rayl who previously presented direct testimony in this case?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to: (i) present an adjusted revenue deficiency reflecting the rebuttal positions of Consumers Energy Company's ("Consumers Energy" or the "Company") witnesses; and (ii) address certain arguments and recommendations related to the revenue requirement made by Sebastian Coppola on behalf of Attorney General Dana Nessel ("Attorney General"), and the Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") witnesses Justin J. Hecht, Robert F. Nichols, Charles E. Putnam, and Timothy G. Witt.

Q. Have you prepared any exhibits in conjunction with your rebuttal testimony?

A. Yes. I am sponsoring the following exhibits:

Exhibit A-146 (HLR-52)	Adjusted Revenue Deficiency for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-147 (HLR-53)	Adjusted Rate Base for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-148 (HLR-54)	Adjusted Utility Plant for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-149 (HLR-55)	Capital Spending Reconciliation for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-150 (HLR-56)	Adjusted Working Capital for the Projected 12-Month Period Ending October 31, 2026;

Exhibit A-151 (HLR-57)	Adjusted Net Operating Income for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-152 (HLR-58)	Reconciliation of Adjusted Net Operating Income for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-153 (HLR-59)	Adjusted Operations & Maintenance Expenses for the Projected 12-Month Period Ending October 31, 2026;
Exhibit A-154 (HLR-60)	Income Tax Effect of Interest for the Projected 12-Month Period Ending October 31, 2026; and
Exhibit A-155 (HLR-61)	Interest Synchronization Adjustment for the Projected 12-Month Period Ending October 31, 2026.

ADJUSTED REVENUE DEFICIENCY

Q. Please describe Exhibits A-146 (HLR-52) through A-155 (HLR-61).

A. Exhibits A-146 (HLR-52) through A-155 (HLR-61) present the calculation of the Company's adjusted revenue deficiency for the projected 12-month period ending October 31, 2026. As shown on line 8, column (e), of Exhibit A-146 (HLR-52), the Company has recalculated a test year revenue deficiency of $217.7 million, a reduction of $30.3 million from the Company's original filing in this case.

Q. Why is the Company proposing an adjusted test year revenue deficiency?

A. Based on certain facts and circumstances revealed subsequent to filing the case, the Company believes it is appropriate and necessary to make the adjustments.

Q. Please summarize the proposed adjustments to the revenue deficiency.

A. The Company has made the following adjustments to its originally filed revenue deficiency:

1. Decrease to net utility plant of $40.3 million, depreciation expense of $11.3 million, and property tax expense of $0.9 million. A list of the individual

adjustments, with descriptions and sources, is provided on Exhibit A-148 (HLR-54) and Exhibit A-149 (HLR-55);

2. Increase to unamortized manufactured gas plant of $0.5 million and associated amortization expense of $0.1 million as discussed by Company witness Matthew J. Foster;

3. Decrease to working capital of $143.5 million. A list of the individual adjustments, with descriptions and sources, is provided on Exhibit A-150 (HLR-56); and

4. Increases to gross margin of $1.1 million and operating and maintenance ("O&M") expenses of $0.5 million and a decrease to amortization expense of $3.0 million and general tax expense of $0.5 million. A list of the individual adjustments, with descriptions and sources, is provided on Exhibit A-152 (HLR-58).

WORKING CAPITAL

Q. Attorney General witness Coppola proposed adjustments to reduce the Company's working capital deferred debits balance to: (1) correct for an error made in the calculation of the S4/HANA cloud implementation adjustment (direct testimony page 106, line 5 through page 107, line 4) and (2) correct for an error in the calculation of the prepaid cloud computing adjustment (direct testimony page 107, line 5 through page 108, line 5). Do you agree with these adjustments?

A. Yes. Based on the rebuttal testimony of Company witness Stacy H. Baker, the Company agrees with the Attorney General's reduction of the Company's working capital deferred debits balance for the correction of the S4/HANA cloud implementation and the prepaid cloud computing adjustments of $1.7 million and $1.0 million, respectively.

Q. Attorney General witness Coppola (direct testimony page 108, line 6 through line 16) and Staff witness Nichols (direct testimony page 5, line 21 through page 6, line 14) proposed an adjustment to reduce working capital and associated amortization expense as the sale of the Riverside Storage Field was not completed as originally anticipated. Do you agree with this adjustment?

A. Yes. Based on the rebuttal testimony of Company witness Heidi J. Myers, the Company agrees with the Attorney General witness Coppola's and Staff witness Nichols' $7.4 million reduction of the Company's working capital deferred debits balance and a $3.0 million reduction of amortization expense. As supported by Company witness Myers and Staff witness Nichols, the effects of the Riverside Storage Field sale have been removed from the revenue deficiency calculation and the plant-in-service, depreciation reserve, depreciation expense, and property tax balances related to the Riverside Storage Field have been added back to the case.

Q. Attorney General witness Coppola (direct testimony page 108, line 17 through page 109, line 11) and Staff witness Hecht (direct testimony page 6, lines 7 through line 14) proposed an adjustment to increase accrued taxes. Do you agree with this adjustment?

A. Yes. The Company inadvertently made an error in its calculation of accrued taxes and agrees with the Attorney General witness Coppola's and Staff witness Hecht's $127.8 million decrease in working capital.

Q. Staff witness Hecht (direct testimony page 5, line 14 through line 21) proposed an adjustment to reduce the Company's working capital deferred debits balance to remove a non-utility account. Do you agree with this adjustment?

A. Yes. The Company agrees with Staff witness Hecht's $0.2 million reduction of the Company's working capital deferred debits balance and the removal of the non-utility account from working capital.

GENERAL TAX EXPENSE

Q. Staff witness Putnam proposed an adjustment to reduce the Company's general tax expense balance (direct testimony page 7, line 18 through page 9, line 2). Do you agree with this adjustment?

A. Yes. The Company based its projected payroll tax expense on its historical 2023 expenses, adjusted for inflation through December 31, 2026, which is incorrect. The inflation adjustment should have ended at the October 31, 2026 test year date. In addition, the Company used its 2023 historical sales and use tax expenses as the basis for projecting sales and use taxes for the test year. Historical sales and use tax expense included an audit settlement related to activity predating 2023. Although paid in 2023, the audit settlement activity should have been excluded from the calculation of projected sales and use tax. Therefore, the Company agrees with Staff witness Putnam's $0.5 million reduction of general tax expense.

DEPRECIATION RESERVE AND DEPRECIATION EXPENSE

Q. Staff witness Witt proposed an adjustment to reduce the Company's depreciation reserve (direct testimony page 6, line 2 through line 19) and depreciation expense balances (direct testimony page 7, line 17 through page 8, line 9). Do you agree with these adjustments?

A. Yes. The Company inadvertently used the incorrect depreciation rates in the calculation of depreciation reserve and depreciation expense and agrees with Staff witness Witt's $20.4 million reduction of the depreciation reserve balance and $8.9 million reduction of depreciation expense.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

MUSTAFA A. SHERWANI

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Mustafa A. Sherwani, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. By whom are you employed?

A. I am employed by Consumers Energy Company ("Consumers Energy" or the "Company").

Q. Are you the same Mustafa A. Sherwani who filed written direct testimony in this proceeding?

A. Yes. My name appears differently now (previously Mustafa Ahmed). There was an error in certain documents when I immigrated that temporarily required me to use my middle name as my last name for official business. The error has now been corrected.

Q. Please explain the purpose of your rebuttal testimony in this proceeding.

A. I am responding to the portion of the direct testimony filed by Paul R. Ausum and Elaina M. Braunschweig on behalf of the Michigan Public Service Commission ("MPSC" or the "Commission") Staff ("Staff") and rebutting the portion of direct testimony filed by Alice Napoleon on behalf of Michigan Environmental Council ("MEC") and Sierra Club ("SC") (collectively, "MEC") and Sebastian Coppola on behalf of Attorney General Dana Nessel ("Attorney General").

Q. Are you sponsoring any exhibits supporting your rebuttal testimony in this case?

A. No.

PART I – RESPONDING TO STAFF WITNESS AUSUM

Q. On page 4, lines 13 through 19 of his direct testimony, Staff witness Ausum recommends that the Commission order the Company to include all raw data and inputs used to construct forecast models. Do you agree with this recommendation?

A. Yes, the Company agrees to include this raw data as part of workpapers for future filings.

PART II – RESPONDING TO STAFF WITNESS BRAUNSCHWEIG

Q. On page 6, line 20 and page 7, lines 1 and 2 of her direct testimony, Staff witness Braunschweig suggests that the Company should work with Staff to improve exhibits and testimony related to Residential Income Assistance ("RIA") credits for the next filing. Do you agree with this statement?

A. The Company acknowledges that there are some opportunities to improve the quality of its filing in this area. The Company plans to work with Staff and make changes to its presentation going forward to address Ms. Braunschweig's concerns.

Q. On page 18, lines 2 through 4 of her direct testimony, Staff witness Braunschweig proposes to base RIA count projections on three-year historical averages. Do you agree?

A. The Company agrees with this approach.

PART III – REBUTTAL OF MEC WITNESS NAPOLEON

Q. On page 6, lines 1 through 3 of her direct testimony, MEC witness Napoleon states that the Company should explain and document the relationship of the new connections forecast to the load forecast. Would it be appropriate to compare the two forecasts?

A. No, new service connections represent work associated with the installation of new services; the customer load forecast, on the other hand, is a forecast of the numbers of customers for which a bill for natural gas consumption is expected. The customer forecast that is part of the load forecast is based on regression analysis (a Commission approved methodology), as noted in my direct testimony on page 4, lines 10 through 14. It is possible for some period of time to elapse after completing a new service connection before any customer begins being billed on it. Likewise, an existing connection might remain active even if no customer is currently occupying the location. Similarly, if the Company has 1,000 new customers, it doesn't necessarily translate to 1,000 new gas connections. For example, a service installation may provide gas service to a single customer in a single-family home, or it may provide service to multiple customers in an apartment or condominium building. In theory, new service connections are a subset of the gas load customer forecasts. Given that the number of customers billed is a different measure of business activity than the number of new service installations, it is possible for there to be differences in the rate of growth over any particular time period. Therefore, it should be noted that the customer connection forecast and the customer forecast that is part of the gas load forecast each represent a different measure of business activity and should not be conflated by relating the two in terms of historical growth and trend.

Q. On page 33, lines 4 through 6 of her direct testimony, Ms. Napoleon states, "the Company should clarify why it does not incorporate information from its new customer connection forecast into its total customer load forecast". Why does the Company forecast total customer counts the way it does?

A. Customer counts fluctuate monthly and often follow a cyclical pattern of move ins and move outs. A regression that looks at the most recent 12 months does a better job than a model that uses multiple other variables. For the total Company forecast Consumers Energy is much less concerned about which customers are new and much more concerned about accurately forecasting total customers.

Q. On page 31, lines 3 through 5 of her direct testimony, Ms. Napoleon expresses concern with the regression model not incorporating the effects of Public Act 229 of 2023 ("Act 229"). Do you agree?

A. No, Act 229 creates a framework for electric utilities to encourage electrification by adopting an electrification program but does not mandate utilities to have an electrification program. Consumers Energy anticipates greater adoption of electrification by customers in the future, regardless of the impact of Act 229, and plans to assess possible projected impacts of electrification in future gas rate cases. However, the Company has no information available at the time of this rate case to indicate that Act 229 has had any impact on customer electrification behavior or that it will have any measurable impact during the test year of this case. At the time of filing the rate case the Company felt that it

was too premature to include any new assumptions about electrification attributable to Act 229 or for any other reason in this rate case.

Q. On page 32, lines 10 through 11 of her direct testimony, Ms. Napoleon claims that "customers should be able to save more gas" through the incorporation of the effects of Act 229. Do you agree?

A. In theory, customers would use less natural gas if they invested in electrifying their appliances. However, Act 229 does not mandate that customers electrify any natural-gas-fueled appliances that they currently use. As discussed above, it does not even mandate that electric utilities adopt an electrification program. The Company needs to see data supporting the savings through an electrification program adopted under Act 229 to be able to accurately forecast reductions in deliveries to customers as a result of that new statute.

Q. Does Act 229 quantify targets for reduction of natural gas service due to space heating electrification?

A. No, it does not.

Q. What does incorporation of out-of-sample data mean?

A. This means that the Company should have evaluated whether its regression model, based on the most recent 11 years of data, would have yielded accurate predictions for results from earlier periods.

Q. On page 31, lines 3 through 5 of her direct testimony, Ms. Napoleon expresses concern with the lack of incorporation of out-of-sample data in the regression model. Do you agree with this belief?

A. No, the Company uses the most current data that is available. In this case, I used the most recent eleven years of data. Out-of-period testing would only test the model's ability to

accurately forecast data from over a decade ago and would not necessarily be useful for testing the validity of the model for the future. The most current data is often the most relevant for making predictions. Using the latest data ensures that the model is trained on the most up-to-date information, which can improve its accuracy and relevance.

Q. On page 31, lines 18 through 20 of her direct testimony, Ms. Napoleon states that the regression models do not "demonstrate great performance relative to actual historical data as it is within the regression data sample". Do you agree?

A. No, as noted in my direct testimony on pages 6 through 8, the regression is built using historical data and tested against historical data and has proven to be an effective and accurate model. Arguing that a model can't be good at forecasting actual data because it uses historical data is illogical.

PART IV – REBUTTAL OF ATTORNEY GENERAL WITNESS COPPOLA

Q. On page 158, lines 6 through 8 and page 160, lines 2 through 5 of his direct testimony, Attorney General witness Coppola proposed an increase of 1.3 Bcf over the Company's commercial transport forecasted deliveries, do you agree with that proposal?

A. No, I disagree that an increase to the Company's commercial transport forecasted deliveries is appropriate.

Q. Did Mr. Coppola use MPSC-approved methodologies for forecasting deliveries?

A. No, Mr. Coppola used a very simplistic approach that takes one data point and applies a historical Compound Average Growth Rate ("CAGR") to forecast the future. On page 156, lines 2 through 8 of his direct testimony, Mr. Coppola details how he calculated the three-year CAGR and applied it to the 2024 calculated average use per customer to derive

the forecasted test year commercial transport deliveries as shown in his Exhibit AG-54, line 15.

Q. Is the methodology of using one historical year and applying a historical CAGR to derive a forecasted year a reasonable approach?

A. No, this is an unsound approach to forecasting. This oversimplified methodology assumes that customers' future behavior will be identical to behavior during the last three years. Mr. Coppola's approach applied a simple historical CAGR to the 2024 historical results without consideration for any econometric data. Mr. Coppola did not provide any information about forecasted conditions that would explain the need for these adjustments to the proposed forecast that used the long-standing regression modeling methodology. As described on pages 5 through 10 of my direct testimony, the Company used the standard approach of regression modeling and incorporating economic data to develop a robust forecast that has typically resulted in accurate forecasts.

Q. On page 157, line 3 through 9 of his direct testimony, Mr. Coppola compares the commercial transport decline of 0.5% with the increase in industrial transport of 2.6% and states that the same economic indicators apply to both classes of transport. Do you agree with this statement?

A. No, commercial transport should not be compared to industrial transport as they are different classes of customers and behave differently. For example, a gas station or convenience store does not respond to the economy in the same way as a large auto manufacturer does. More importantly the model variables are different for commercial and industrial transport and work independently of each other.

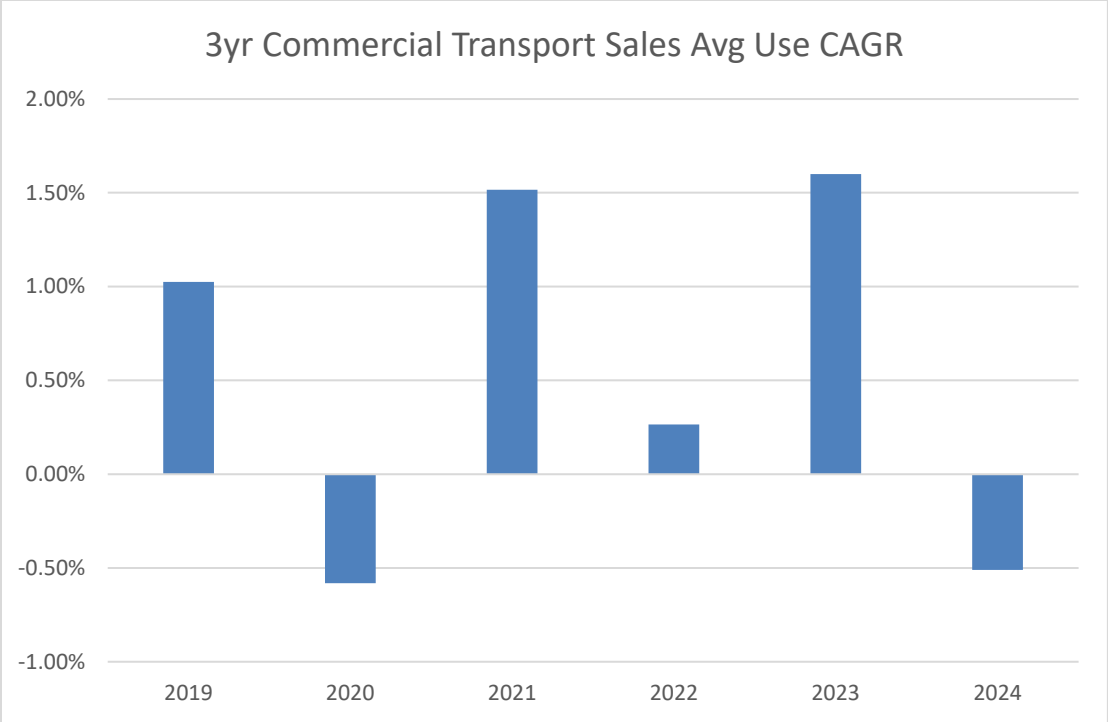
Q. On page 159, line 19 of his direct testimony, Mr. Coppola claims that the regression models use "stale customer usage data from 11 years ago." Do you agree with this claim?

A. No, it is important to use an adequate amount of historical data when training a regression model as too few datapoints can generate unrealistic forecasts. Eleven years of data is adequate to develop the formula while maintaining data that is current.

Q. Are there other factors that give you pause in using Mr. Coppola's suggested methodology?

A. Yes, Mr. Coppola's simplistic approach not only deviates from the historically reviewed and approved methodology, it also completely rejects the validity of the regression modeling process and accuracy. Most utilities in the country use regression modeling to forecast their deliveries. Furthermore, Itron's MetrixND (the software that Consumers Energy uses for regression analysis) is considered an industry standard, as more than 150 utilities, Independent System Operators, municipal utilities, cooperatives, and other energy service providers use Itron's MetrixND.[1] Mr. Coppola's approach also discounts the value and impact of Energy Waste Reduction ("EWR") by ignoring the Company's EWR filings and the impact of EWR on natural gas deliveries. There's also the high likelihood that using Mr. Coppola's methodology would cause the forecasts to fluctuate substantially from year to year causing possible rate instability. The three-year CAGR for commercial transport sales for the years 2019 through 2024 can be seen below. The fluctuation in CAGR and the lack of EWR inclusion makes the Attorney General's proposed approach inferior to the MPSC-accepted regression methodology.

[1] https://na.itron.com/o/commerce-media/accounts/-1/attachments/3828543



Q. On page 156, line 19 through page 157, line 7 of his direct testimony, Mr. Coppola refers to discovery responses U21806-AG-CE-0313 and U21806-AG-CE-0746 and states that the Company's explanation for the decline in transportation deliveries does not fit the evidence shown in his Exhibit AG-53. Do you agree with this comparison?

A. No. As I discussed above, Mr. Coppola's CAGR methodology fails to account for any econometric data and uses an insufficient number of years of data to be reliable. In contrast, the test year transportation deliveries shown in Exhibit A-15 (MA-14), Schedule E-10 on line 13, column (h) results from the Company's regression calculation using 11 years of data. This figure essentially captures the impact by economic indicators and usage patterns. The Company provided all of the inputs used in the regression model in this case, so Mr. Coppola could have used the data to answer his own question about what inputs drove the Company's test year transportation deliveries forecast. Instead, Mr. Coppola focused

on the "change in determinants" value shown on line 13, column (e) of that exhibit. He asked the Company to explain how that value was calculated. That value was simply calculated by taking the weather-normalized 2023 transportation deliveries (Exhibit A-15 (MA-14), line 13, column (a) plus column (d)) and subtracting the Company's regression results from line 13, column (h) to show the difference between those values. Mr. Coppola appears to believe the Company independently calculated the "change in determinants" value in order to subsequently use it as an input to determine its test year forecast, but it was done exactly the other way around. As a result, asking how the "change in determinants" number was calculated would tell you nothing about how the Company's test year transportation deliveries forecast was determined or what the drivers of that forecast were. If that's what Mr. Coppola meant to do, he asked the wrong question in discovery. The Company answered the question he asked and did not recognize until Mr. Coppola filed his testimony what he thought he was asking. In any case, the Company has already explained in detail how the test year forecast was calculated, so there was no reason Mr. Coppola could not have determined the driver of the test year forecast despite the clear confusion caused by his poorly stated discovery question. Mr. Coppola's comparison between the reduction in commercial transportation deliveries suggested by his simplistic CAGR method calculated in Exhibit AG-53 and the Company's regression approach is inappropriate because the Company's method takes econometric data into account and uses an appropriate number of years of data while the three-year CAGR method fails to do either.

Q. On page 159, lines 5 through 11 of his direct testimony, Mr. Coppola notes that the Company forecast accuracy was within 0.6% with a 2.6 Bcf standard deviation over the last eight years and implies that the model is not sufficiently accurate. Do you agree with this assessment?

A. No. The gas forecast has been incredibly accurate over the last eight years. The accuracy is better than it was ten years ago. Over the past eight years, the standard deviation decreased to 2.6 Bcf and the Mean Absolute Percentage Error ("MAPE") decreased to 0.6%. MAPE is a statistical test used to measure model errors in which smaller values suggest better model performance. From a statistical perspective, these are very accurate model results, which have provided very accurate sales and deliveries forecasts for the gas business through many rate cases.

Q. On page 158, lines 6 through 8 and lines 15 through 18 of his direct testimony, Mr. Coppola proposes an increase to the Company's commercial transportation forecast of 1.3 Bcf, citing the use of three-year CAGR as a suitable metric for projecting future performance. On page 159, lines 5 through 15, he also cites the standard deviation ranges to support his adjustment. Do you accept this logic?

A. No, the 1.3 Bcf increase to the forecast is inappropriate. Mr. Coppola arrived at this number by using a very simplistic approach and justified it, in part, by noting the standard deviation limits. It is important to note that the standard deviation limits mentioned in my direct testimony are for all classes combined and should not be used exclusively for commercial transport sales. More importantly, it should not be used to justify the increase in commercial transport volumes based solely on a three-year CAGR.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

S. AUSTIN SMITH

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is S. Austin Smith, and my business address is One Energy Plaza, Jackson, Michigan 49201.

Q. Are you the same S. Austin Smith who previously submitted testimony in this case on behalf of Consumers Energy Company ("Consumers Energy" or the "Company")?

A. Yes, I am.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to respond to rate design proposals raised in the direct testimony of Michigan Public Service Commission ("MPSC" or "the Commission") Staff ("Staff") witness Nancy C. Rademacher, Association of Businesses Advocating Tariff Equity ("ABATE") witness Jessica A. York, Attorney General witness Sebastian Coppola, and Citizens Utility Board of Michigan ("CUB") witness Joshua W. Denzler.

Q. Are you sponsoring any exhibits in connection with your rebuttal testimony?

A. Yes. I am sponsoring Exhibit A-156 (SAS-9), which is a discovery response from CUB witness Denzler.

Q. Staff witness Rademacher, on page 4, lines 4 through 8, of her direct testimony supports updating the Excess Peak Demand threshold from 45 Mcf to 92 Mcf for Rate A-1 customers. Do you agree?

A. Yes.

Q. Staff witness Rademacher, on page 5, line 20, through page 6, line 5, of her direct testimony proposes adjusted rate stability targets. Do you find these adjusted rate stability targets to be reasonable?

A. Yes.

Q. Staff witness Rademacher, on page 5, lines 1 and 2, of her direct testimony testified that the Company's proposed Transmission-Only Transportation Service rates do not reflect the breakeven points of the associated rate schedules. Do you agree?

A. No. This appears to mirror the stance Staff witness Rademacher took in the last case, when the Company did fail to include Customer Charges and associated breakeven points with the four proposed rate schedules. But in the instant case, the rates are set according to the same breakeven point thresholds used by the Transportation class rate schedules. This is discussed on page 15, line 23, through page 16, line 3, of my direct testimony.

Q. Staff witness Rademacher, on page 5, lines 3 through 8, of her direct testimony testified that the service provided to Transmission-Only Transportation Service customers has not been shown to differ in a way that supports separate rates for the breakeven-based classes. Do you agree?

A. No, I do not agree. In the last gas rate case, Case No. U-21490, the Company did not fully align its Transmission-Only Transportation Service rate design with the breakeven methodology used for other transportation classes. The Company has now developed and applied breakeven points for Transmission-Only customers consistent with how rates are designed for end-use transportation customers. This approach ensures internal consistency across all transportation rate classes and better reflects cost-causation principles. The use of breakeven analysis in designing these rates helps determine appropriate fixed and variable components while supporting rate stability for customers.

Q. What do you make of Staff witness Rademacher's argument on page 5, lines 6–8, of her testimony that the Company should design rates for Transmission-Only customers consistent with DTE?

A. Other regulated utilities' rate designs should not prevent the Commission from approving a different rate structure for Consumers Energy, where justified by the Company's cost-of-service analysis and customer usage patterns.

Q. Attorney General witness Coppola, on page 196, line 13, through page 198, line 3, of his direct testimony, recommended the Company not increase the residential and GS-1 customer charges. Do you agree with this recommendation?

A. No. The Attorney General's recommendations regarding the customer charges are not based on any cost study. If the final Commission-approved Cost-of-Service Study supports a residential customer charge greater than $15.00 and a GS-1 customer charge greater than $21.00, then these customer charges should be designed to reflect that higher cost. Both the Company and Staff have independently calculated the residential customer charge using a methodology that limits the charge to costs directly associated with supplying service, such as metering, service laterals, and customer billing. These calculations support a higher charge than currently assessed, and the Company's calculation is even higher than it has proposed, indicating that the increase is justified by the actual Cost-of-Service Study. Further, as expressed by Staff witness Krause in his direct testimony, previous rate cases have resulted in smaller increases or no increase in customer charges due to settlements, which has widened the gap between calculated and approved charges over time. The proposed increase aims to address this growing disparity.

Q. Does an increase in the Customer Charge negatively impact low-income customers on the residential income assistance ("RIA") provision?

A. No. A higher customer charge is beneficial for low-income customers on the RIA provision. As I noted in my direct testimony, the customer charge is completely offset by the RIA credit. Further, when a larger portion of the proposed revenue is collected via a fixed charge (i.e. customer charge), a smaller portion of the proposed revenue is collected via a variable charge (i.e. distribution charge). A lower variable charge results in a lower monthly bill for the most vulnerable customers; especially during the winter when customer use is at its highest. The following example illustrates how a low-income residential customer on the RIA provision would have a *lower* monthly bill with a $20.00 customer charge using the proposed rate design methodology as compared to a $15.00 customer charge using the same proposed methodology.

Table 1
Customer Charge Impact to RIA Customers

			$20.00 Customer Charge		$15.00 Customer Charge	
Description	**Quantity**	**Units**	**Rates**	**Revenue**	**Rates**	**Revenue**
Delivery						
Customer	12	Mthly	$ 20.00	$ 240.00	$ 15.00	$ 180.00
Distribution Mcf/mth[1]	78	Mcf	5.8140	453.49	6.4430	502.55
Provisions						
Income Assistance - RIA	12	Mthly	(20.00)	(240.00)	(15.00)	(180.00)
Total Delivery				453.49		502.55
Fuel						
GCR Sales	78	Mcf	3.296	257.09	3.296	257.09
Total Annual Expense				$ 710.58		$ 759.64
Average Monthly Expense				$ 59.21		$ 63.30
Percent Increase/(Decrease)						6.9%

Notes
[1] Based on the 2023 average annual use for RIA customers of 78 Mcf

Q. CUB witness Denzler, on page 32, line 12, through page 35, line 14, of his direct testimony, has said he opposes increasing the customer charge for four reasons: 1) customer charges are regressive and harm low-to-moderate income ("LMI") customers; 2) higher customer charges do not send good price signals; 3) customers prefer lower customer charges; and 4) the Company's current fixed charge is high compared to other Michigan utilities. How do you respond to Mr. Denzler's first reason?

A. The assertion that fixed customer charges are inherently regressive and harms LMI customers oversimplifies both the nature of utility cost recovery and the broader tools available to support affordability. As provided in Table 1 above, low-income customers receiving the RIA credit benefit from a higher customer charge. The Company acknowledges that all low-income customers may not receive the RIA credit and recognizes that affordability is a valid consideration, particularly for LMI customers, but affordability issues are better addressed through targeted low-income assistance programs (e.g. RIA and LIAC) and energy efficiency investments provided by the Company's Energy Waste Reduction programs.

Q. What is the impact to customers who do not receive the RIA provision credit?

A. Even without the RIA provision credit, this means that any customer (LMI or otherwise) paying a $20.00 Customer Charge and consuming 8 Mcf or more per month actually experiences a *lower* bill. In addition, usage is not a reliable proxy for income, as many LMI households (e.g. those with larger families or in less efficient homes) may have higher usage than financially advantaged, single-occupant households.

Q. How do you respond to Mr. Denzler's second reason?

A. By removing fixed costs from the volumetric rate, the remaining usage-based rate more closely reflects the marginal cost of delivering gas. This allows customers to see the real cost of additional usage, improving the accuracy and efficiency of the price signal for conservation or behavioral response. Customer Charges do not eliminate price signals that prompt conservation, as a majority of a residential customer's typical bill is composed of a volumetric rate for gas delivery and commodity supply. Therefore, even with a higher Customer Charge, those volumetric charges and commodity prices have a consequential influence on energy efficiency programs, weatherization, and consumption-based decisions.

Q. How do you respond to Mr. Denzler's third reason?

A. Mr. Denzler's testimony relies on the position of the National Association of State Utility Advocates ("NASUCA"), but it is not clear if they have conducted a survey of Consumers Energy's customers. NASUCA's position represents a broad policy stance and does not seem to account for the unique circumstances of individual utilities or regions. It does not reflect a detailed analysis of Consumers Energy's specific cost structures or regional characteristics.

Q. How do you respond to Mr. Denzler's fourth reason?

A. Comparing fixed charges across utilities without examining the underlying cost-of-service studies, system configurations, and customer demographics is an oversimplification that can lead to flawed conclusions. Each utility's customer charge is based on the unique costs it incurs to serve a residential customer—such as meter installation and maintenance, service lines, billing, call center operations, and customer information systems. In response

to discovery, Mr. Denzler conceded that he has not evaluated whether other Michigan utilities' service areas or customer demographics contributed to their different customer charges. Exhibit A-156 (SAS-9). Rate design should be based on the utility's actual cost to serve its customers, not on simplistic benchmarking against other utilities whose cost structures may differ. The Company's fixed customer charge is based on its own cost-of-service study, which reflects the actual costs incurred to maintain safe and reliable service for each customer.

Q. ABATE witness York, on page 13, line 12, through page 17, line 6, of her direct testimony, proposes a revenue apportionment methodology to design rates. Do you agree with this approach?

A. No. ABATE witness York proposes a revenue apportionment methodology to adjust rate design outcomes to reflect her preferred Version 3 cost-of-service study, which utilizes an Average and Excess Demand ("AED") allocator. However, she simultaneously concedes that if the Commission adopts the Company's Version 2 COSS, her apportionment approach could be used to approximate the results of her Version 3 COSS. Rather than using a COSS to guide revenue allocation, witness York is relying on revenue apportionment—essentially shifting revenue between classes without a supporting cost basis. Revenue apportionment that shifts cost recovery between rate schedules to reflect a rejected cost-allocation method undermines the very purpose of conducting a COSS in the first place.[1]

[1] In Case No. U-21291, the Commission rejected ABATE's proposed AED allocation method. See MPSC Case No. U-21291, November 7, 2024 Order, pages 224, 228-229.

Q. ABATE witness York, on page 37, line 8 through line 19, of her direct testimony, opposed the Company's transportation service rate design, which is based on economic breakeven points. Ms. York argues that the Company has not provided evidence to show that frequent rate shifting and revenue volatility would occur if rates for all Transportation rate schedules were based on the class COSS rather than a desire to maintain economic breakeven points. How do you respond?

A. The Company is justifiably concerned about rate shifting—a concern grounded in both experience and sound ratemaking principles. Current approved breakeven points reflect economic thresholds that guide how customers evaluate their rate class alignment. If the Company were to abruptly shift transportation rates to align precisely with the current class COSS without considering these breakeven points—or without re-running the full forecasting and cost-allocation process—there is a material risk of distorting cost recovery. Specifically, the Company could experience customer migration between rate classes or changes in usage patterns, leading to either over-recovery or under-recovery of authorized revenues. Rate design and customer class assignment are part of a cyclical, iterative process. If these thresholds were altered midstream—without adjusting load forecasts, usage patterns, and cost allocations accordingly—it would invalidate the assumptions embedded in the class COSS and result in rates that no longer align with actual cost causation.

Q. ABATE witness York, on page 37, lines 10 and 11, of her direct testimony, notes that minimal rate shifting has occurred over the last several years. What does this show?

A. This shows that the Company has appropriately set breakeven points.

Q. ABATE witness York, on page 39, line 8 through line 16, of her direct testimony, describes her proposed rate design calculated in Exhibit AB-4, which recommends the Commission set LT & XLT Customer Charges at the cost of service and establish new breakeven thresholds. Do you agree with this proposed rate design?

A. No. Exhibit AB-4 does not consider the impact that changing the breakeven points has on sales determinants—and the related rate revenue. A much more thorough analysis would be needed to properly calculate rate impacts with ABATE witness York's proposed breakeven points. Modifying the breakeven points requires a new forecast of sales determinants. This is a cyclical process in that the Company would need to develop the cost of service and rate design using today's breakeven points, calculate the new breakeven points, and then reforecast the sales to align with the new breakeven points and rerun the cost of service and rate design. Additionally, changing breakeven points provides an incentive for customers to switch rates. The Company would need to communicate to customers that they may be better off on a different rate, and if customers do not shift to the most economical rate in response, it could lead to an over- or under-recovery of costs. The Company has engaged in collaborative discussions with ABATE and Staff to explore options for studying breakeven points, alternative rate designs, and aligning customer charges with the cost of service. This collaborative approach ensures that any changes to rate design are informed by stakeholder input and aligned with broader regulatory objectives.

Q. Does this conclude your rebuttal testimony?

A. Yes.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

EXHIBIT

OF

S. AUSTIN SMITH

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

21806-CE-MNSC-0005

On pages 34-35 of Mr. Denzler's direct testimony, he compares Consumers Energy's customer charge with other Michigan utilities' customer charges.

a. Does Mr. Denzler agree that a utility's service area and customer demographics (e.g., the number of urban and rural customers in the utility's service territory) can affect its costs of providing service to customers?

Response:

I agree that the service area and customer demographics are among many factors that can influence the cost of service and note that what "can" affect cost of service and what actually *does* affect cost of service are two different things.

b. Concerning the utilities that Mr. Denzler named on pages 34-35 of his testimony, did he evaluate whether these utilities' service areas or customer demographics contributed to the different customer charges? If so, what did his evaluation show? Please produce all documents and communications supporting the evaluation if one was performed.

Response:

I did not complete this analysis.

Respondent: Joshua W. Denzler

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

BRIAN M. SNYDER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Brian M. Snyder, and my business address is 11801 Farmington Road, Livonia, Michigan 48150.

Q. In what capacity are you employed?

A. I am employed as Principal Mechanical Engineer for Consumers Energy Company ("Consumers Energy" or the "Company").

Q. What is your educational background?

A. I earned a Bachelor of Science in Mechanical Engineering from the University of Michigan – Dearborn. I am a licensed engineer in the state of Michigan.

Q. What have your job responsibilities entailed with Consumers Energy?

A. I began working for Consumers Energy in 2009 on the Facilities Engineering and Design Team. In 2016, I accepted the Assessment Planning Engineer role in the Transmission Integrity Management Program ("TIMP"). I am currently in this same role. The role entails managing the TIMP work plan, aligning that plan with both federal regulation and risk prioritization, selection of assessment methodology, and long term financial planning.

Q. Please summarize your experience with Probabilistic and Relative risk models.

A. I have been working with the risk models utilized by the Company since I started in this role in 2016. I am responsible for the post-modeling results analysis and work plan alignment. I worked with the relative risk model through 2022 and then moved to working with the current Transmission Probabilistic Risk Model upon the retirement of the relative model.

Q. Please summarize your experience with the use of, administration, and development of the Company's Transmission Probabilistic Risk Model.

A. I was one of the supporting team members from the beginning of the Transmission Probabilistic Risk Model adoption. I worked on the team which selected the vendor and model as well as helping to establish the Company's requirements for the project. I work with the Company's risk engineer during the data upload process, through the modeling process, and support and develop most of the post modeling analytics for work planning alignment.

Q. Have you previously testified before the Michigan Public Service Commission ("MPSC" or the "Commission")?

A. No, I have not.

Q. Are you sponsoring any exhibits?

A. Yes. I am sponsoring the following exhibit:

Exhibit A-157 (BMS-1)	Response to Discovery Requests U21806-MNSC-CE-80, and U-21806-MNSC-CE-218 through 285.

Q. Were these exhibits prepared by you or under your direction or supervision?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to provide rebuttal testimony concerning proposals around the inclusion of cost effective calculations in the Company's risk modeling brought forth by Michigan Environmental Council ("MEC") and Sierra Club ("SC") (collectively, MEC) witness Dr. Sol deLeon.

I. MEC WITNESS DELEON

Q. Beginning on page 28, line 6, through page 42, line 6 of her direct testimony, MEC witness deLeon discusses risk modeling and cost-effectiveness to maximize safety impacts of ratepayer expenditures. Do you have an overall comment to make concerning her analysis?

A. Yes, I do. The Company provided to MEC in discovery request U21806-MNSC-CE-0080 the uses and limitations of the Company's current risk models. I am including that response as Exhibit A-157 (BMS-1). As stated in her direct testimony, the Company has a probabilistic risk model in place for certain transmission assets and is in the process of making use of a probabilistic risk model on more assets in the future. Overall, the Company agrees with Dr. deLeon that they are a valuable tool. However, the fundamental problem with Dr. deLeon's analysis and recommendation is her lack of acknowledgment of the nature and limitations of the Company's current Transmission Probabilistic Risk Model and risk models in general.

Q. At page 29 of her direct testimony, MEC witness deLeon discusses how utilities can utilize probabilistic risk models and calculate the cost effectiveness of various safety investments. Do you agree with her assessment?

A. No, I do not. The Transmission Probabilistic Risk Model was developed for the TIMP with the purpose of calculating the total risk of an asset, the threats of which are listed in ASME B31.8S, which are driving that risk, and the consequence of a failure (nine different failure modes) at any location along those pipe assets. The work plan developed within TIMP first must comply with federal regulation for assessment compliance dates, assessment methodology, and remediation. The plan is built first to comply with the

assessment compliance dates and then prioritized by the results from the risk model. Any cost analysis must be done outside the model and would require substantial further development of the model, using Artificial Intelligence to predict the future repairs, where they are, how many, and the cost of remediation. That functionality is not likely to be available in the near future.

Q. Can you explain the annual time frame cadence of the risk model?

A. Yes, I can. The probabilistic risk model is run once per year. The data Extract, Transformation, and Load ("ETL") process takes up to 90 days to complete and commences in the first quarter of the year. This is the Company's process of updating the data information on the transmission system in preparation for the Company's vendor to upload into their software. After this is completed, the model requires up to three months to configure and then perform the analysis on the vendor servers. Results are returned to the Company during the third quarter. Those results are then reviewed in the Geospatial Information System, and other Company systems, and a thorough quality assurance review is performed by Company subject matter experts ("SMEs"). The risk model results are targeted for acceptance for use by the fourth quarter and then the TIMP work plan is adjusted based on findings from the model. The work plan is prioritized by compliance with federal regulation and by risk. The TIMP work planning engineers next selects an assessment methodology, which is the process or technology utilized to assess the threats on the segment. The federal code is prescriptive as to which methods can be utilized to assess each threat and options include Direct Assessment ("DA"), In-Line Inspections ("ILI"), and Pressure Testing. It is well known in the industry that some methodologies provide greater risk reduction than others. ILI is generally regarded as the most effective

method of assessing threats on a pipe asset. The Company utilizes ILI where feasible and supplements with DA where a segment is not ILI capable. Hydrostatic Pressure Testing is not typically utilized by the Company because it creates environmentally hazardous waste to dispose of, is very costly, and provides no information about the defects present on the segment.

Upon completion of the inspection, an assessment of the results is performed and dig locations are selected. The remediation team uncovers the pipe segment and performs a field inspection of the defect, and a decision is made as to the best option for remediation. Options include a cut-out, a mechanical sleeve, or a recoat and return to service. Customer impact, system resilience, reassessment intervals/methodology, permanent verses temporary repair, and cost are considered when determining which mitigation to implement. This occurs in the summer and fall of the year.

Results from the inspection, assessment, and remediation are gathered and prepared for the ETL process for the next risk model run in the last quarter of the year. The modeling process is performed, and when results are returned, the Company can analyze the actual reduction in risk achieved based on the actions performed. Part of the TIMP requirements is to ensure that the work performed is effectively lowering the risk for each segment. Pipe assets which continue with favorable risk trending support that the TIMP work is effective for that asset. An asset with trending that is less favorable can then be investigated for other work such as retirement, replacement, pressure lowering, or other operational changes. Design options for these projects consider cost, effectiveness, deliverability, system resilience, and customer impact.

The probabilistic risk model is designed to calculate current state risk. To calculate mitigation effectiveness, the model requires the data collected post project to perform the analysis. This data is not available during the design phase so the model cannot calculate a mitigation effectiveness value. This is not unique to the model used by the Company. What some models use for an effectiveness value is industry averages. These values are not accurate for analysis on individual assets which leads to over or understating of mitigation effectiveness. The Company uses the model to understand the risk and threats to an asset and then selects the methodology to mitigate that threat based on industry knowledge, cost, system reliability, and customer impact.

Q. Does the Company compare risk results to understand the impact of work performed?

A. Yes, it does. The Company compares previous year risk results to current year risk results to understand the full impact of work performed in the previous year. Multiple years of risk cannot be compared at this point because of the migration from a relative to a new probabilistic risk model. Comparing long-term risk results for overall reduction values is not appropriate with integrity related asset models because the threats in the model are time dependent. Upon the completion of a project and the data being loaded into the model from that point forward the risk due to time dependent threats increases until another mitigation is performed. This aligns with federal regulation requiring the assessment of these assets on a prescriptive interval.

Q. Beginning on page 28, line 9, through page 29, line 2 of her direct testimony, MEC witness deLeon discusses the definition of cost-effectiveness in relation to safety related programs. Do you agree with her analysis?

A. No, I do not. Cost-effectiveness and risk reduction are just two of several factors that need to be considered when evaluating various mitigative measures. Additional items like customer impact, system resilience, reassessment intervals/methodology, and permanent verses temporary repair all need to be considered when determining which mitigation to implement.

Q. Does the Company undertake efforts to ensure its project spending is reasonable?

A. Yes, it does. In the Pipeline Integrity Program, which is primarily O&M expense, the Company competitively bids materials, sets up multi-year fixed rate contracts to ensure lower costs, and utilizes one contractor for multiple projects in order to lower mobilization/demobilization costs. Additionally, for capital projects being conducted for other purposes outside of the federally mandated Pipeline Integrity Program, (i.e., for customer requested work and to ensure reliability and deliverability), the Company also competitively bids materials and contractors and has a system planning group that aligns projects within common time frames to limit outages, blowdowns, and methane emissions.

Q. At page 29 of her direct testimony, Dr. deLeon proposes how a utility could calculate the cost-effectiveness of various safety investments. Is this an effective way to calculate cost-effectiveness?

A. No, not for the Company, nor the models the Company is familiar with. What some models use for an effectiveness value is industry averages. These values are not accurate for analysis on individual assets which leads to over or understating of mitigation

effectiveness. The Company's model is used to understand the risk and threats to an asset and then selects the methodology to mitigate that threat based on industry knowledge, cost, system reliability, and customer impact. For Pipeline Integrity inspections, the Company has a seven-year mandated inspection cycle, so even in the case of a low risk scored project, the Company must perform the work to comply with regulations.

Q. Could cost-effectiveness be included in the Company's probabilistic risk model in the manner suggested by MEC witness deLeon?

A. It could not. The risk model is intended to provide insight into threats on the system and is not intended to be a financial evaluation tool. Further, it is neither prudent nor practical for the reasons stated above.

Q. Does the Company agree with Dr. deLeon, on page 30 of her direct testimony, that the value in risk modeling is to "allow stakeholders to examine the level of risk reduction expected from Consumers' proposed remediations, the cost to achieve this, and an ability to assess alternatives that could better maximize risk reduction and minimize costs."?

A No, it does not. The Transmission Probabilistic Risk Model was developed with the purpose of calculating the total risk of an asset, the threats listed in ASME B31.8S which are driving that risk, and the consequence of a failure (nine different failure modes) at any location along those pipe assets. The model can help provide insight into the threats on segments as a tool to validate the correct inspection methods and mitigative measures are part of the mandated pipeline assessments. This tool was not intended to be a financial tool used to evaluate project selection and does not have the capabilities or the years of historical data to do so with meaningful results. The risk model is an important tool used

to ensure we take the appropriate actions from a pipeline integrity perspective to provide safe and reliable gas service.

Q. On page 30, line 15 of her direct testimony, MEC witness deLeon discusses the relationship between risk modeling, cost effectiveness, and the energy transition. Considering the "energy transition," she argues that the Company should minimize spending on irreversible and long-lived investments. Does the Company agree with these ideas?

A. No, it does not. Please see the rebuttal testimony of Company witness Neal P. Dreisig, describing how the Company's gas system infrastructure is becoming more critical.

Q. Beginning at page 31, line 16, of her direct testimony, MEC witness deLeon provides examples of how utilities use risk modeling and cost-effectiveness in their decision-making. Are these examples relevant to this case?

A. No, they are not. As described in Dr. deLeon's testimony concerning Washington Gas, the ranking is *a basic prioritization* and then may *be modified* with SME input based upon various factors. Further, Washington Gas only utilizes their model on distribution assets and primarily for that utility's distribution main replacement program, which is vastly different from utilization of the probabilistic risk model on transmission assets as done by Consumers Energy. As I have previously stated, the probabilistic risk model used by the Company indicates the threat, consequence, and risk of the asset allowing companies to prioritize the integrity projects. Cost-effectiveness and Risk Spend Efficiency ("RSE") would be calculated outside the model. It is worth noting that enhanced risk modeling, integrity measures, and stricter enforcement of pipeline regulations were a result of

incidents like that at San Bruno. Cost-effectiveness is not a part of the Pipeline and Hazardous Materials Safety Administration's recommendation around risk modeling.

Q. Do these examples demonstrate that risk modeling and cost-effectiveness should be adopted in the manner proposed by Dr. deLeon?

A. No, they do not. I have described the purpose and limitations of probabilistic risk models. There are other limitations with risk modeling. This was acknowledged in a presentation concerning risk modeling for utility investments by Synapse Energy.[1] These include the need for a history of data collection (which the Company does not currently possess), the sharing of confidential and critical information, the fact that they do not directly address affordability, and that they do not address what is an acceptable level of risk. In the Company's case, given the recent and emerging implementation of probabilistic risk models, there is not any significant history. Further, there is an inherent vulnerability and security risk with providing this type of information in the public domain. Not to mention the financial and reputational liability the Company could face were it not to address a known threat for financial reasons.

Q. Beginning on page 34, lines 6 through 16 of her direct testimony, MEC witness deLeon discusses her understanding of` relative risk models compared to probabilistic models. Do you agree with her assessment?

A. No. The definitions used by Dr. deLeon are blending multiple types of models together as opposed to properly describing each type of model. The first definition concerning a relative model is not accurate. The description given is that of a qualitative model which

[1] https://www.nasuca.org/wp-content/uploads/2023/03/Risk-Presentation_Eric Borden_Synapse_NASUCA_6.18.23.pdf

does not calculate a numerical score for likelihood, consequence, or risk. A relative model can be qualitative, semi-quantitative, or quantitative. The defining characteristic of a relative model is that the failure calculation is a likelihood and not a probability. The relative model can use these numerical scores to compare one asset within the model to another or to the system as a whole which is a relative comparison. A probabilistic model calculates a probability of failure based on the confidence of the data provided. This probability is independent of anything else within that model and does not rely on being compared to other assets to determine the severity of the threat or the resulting risk. Neither of these models inherently calculates mitigation effectiveness values but instead are run with new data to calculate a new risk score after project completion. Models that do calculate mitigation effectiveness do so using industry averages that make individual asset evaluation for risk mitigation and cost benefit unreliable.

Q. Beginning on page 40, lines 5 through 8 of her direct testimony, MEC witness deLeon recommends that the Company report on a regular basis transmission-level projects that demonstrate how Consumers Energy utilizes cost-effectiveness, where applicable, to maximize safety impacts for the ratepayer dollars spent. Calculations and assumptions should be available to stakeholders upon request. Do you agree with this recommendation?

A. No, I do not. I have explained above how the Company uses the probabilistic risk model and how the other projects in the transmission programs are selected. The Company has provided an explanation as to why it is not practical to provide the results of the relative risk model along with other information pertaining to the model to MEC in discovery

requests that are included in Exhibit A-157 (BMS-1). The Company offered MEC an opportunity to review the Company's models. They did not respond to this offer.

Q. On page 41, lines 1 and 2, MEC witness deLeon recommended that the Company's future rate case applications should utilize probabilistic risk modeling and cost-effectiveness calculations to a much greater extent for all asset classes. Is this possible?

A. No, it is not. As acknowledged by Dr. deLeon, the Company is in the process of rolling out probabilistic risk modeling for the different asset classes. Developing the models is a tremendous undertaking and the Company will in all likelihood not have probabilistic models for all asset classes prior to its next rate case. The Company is developing a model for storage wells which it expects to begin utilizing in 2025 and the Company expects to develop a probabilistic distribution asset risk model by 2027. However, as I have explained the problems with cost-effectiveness calculations and further, these models are not developed with cost-effectiveness capabilities.

Q. Beginning on page 41, lines 1 through 21 of her direct testimony, MEC witness deLeon makes recommendations concerning future rate case applications. Do you agree with this recommendation?

A. No, I do not. As I have explained above, the Company will not have probabilistic risk models on all assets prior to its next rate case filing. Further Dr. deLeon's recommendation that the Company calculate the risk reduction, cost, and RSE for all of its expenditures is not possible for the reasons I have stated above. The Company has and will continue to provide robust rate case filings that comply with all MPSC filing requirements, which do not include the proposals made by MEC. Dr. deLeon's recommendations are not possible

with the risk model currently in use and the results would not be obtainable. I have described above how the Company uses the current model. These recommendations would be unduly burdensome and unnecessary as the Company currently operates the system in a safe and effective manner taking into consideration safety and affordability.

Q. Beginning on page 41, line 13, MEC witness deLeon suggests the Commission should order the Company to provide an estimate of the impact prior year's expenditures have had to reduce risk on the system. Do you agree with this recommendation?

A. No, I do not. As I have explained above, the Company compares previous year risk results to current year risk results to understand the full impact of work performed in the previous year. Multiple years of risk cannot be compared at this point because of the migration from a relative to a new probabilistic risk model. Comparing long-term risk results for overall reduction values is not appropriate with integrity related asset models because the threats in the model are time dependent. Upon the completion of a project and the data being loaded into the model from that point forward the risk due to time dependent threats increases until another mitigation is performed.

Q. Does this conclude your rebuttal testimony?

A. Yes, it does.

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

EXHIBIT

OF

BRIAN M. SNYDER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Question:

75. Witness Griffin testimony at page 14 states "The Company is updating its risk ranking methodology and transitioning its current relative risk model into a probabilistic risk model to ensure investments are concentrated on the right assets." Regarding the most current version of the inputs and results of the probabilistic risk model used by Consumers to develop its testimony:
a. Is this risk model used only to assess risk of Consumers' transmission pipe?
i. If yes, why doesn't Consumers have a similar risk model for the distribution system or specific assets (e.g. regulators)? Please explain.
b. Please provide an explanation of how the probabilistic model estimates risk including but not limited to the likelihood of failure, consequence of failure, and mitigation effectiveness.
i. Please provide all documents and presentations that explain how the risk model derives key inputs, assumptions, and results (e.g. likelihood/probability, consequence/impact, and total risk score).
ii. Please explain what level of granularity is assessed by this risk model. For example, how does Consumers' determine the number of miles of each pipeline or pipeline segment on which it assesses the probability and consequence of failure? Please explain.
iii. Please provide mitigation effectiveness descriptions and calculations specific to the activities discussed in Witness Griffin's testimony.
c. In Excel with supporting data, calculations, and assumptions, please provide the annual risk reduction (in percentage and risk units) accomplished by safety-related activities from 2018-2024. Please provide separately for the transmission system, distribution system, and asset-specific risk models.
i. Please provide a general explanation of how risk reduction was calculated.
ii. Please explain how prior year risk reduction informs Consumers investment and mitigation plan for 2026.
d. In Excel with supporting data, calculations, and assumptions, please provide the forecast annual risk reduction expected to be accomplished by safety-related activities in 2025 and 2026. Please provide separately for the transmission system, distribution system, and asset-specific risk models, which may or may not be supported by Witness Griffin.
e. In Excel with supporting data, calculations, and assumptions, please provide the forecast annual risk reduction expected to be accomplished by safety-related activities from 2027-2035. Please provide separately for the transmission system, distribution system, and asset-specific risk models, which may or may not be supported by Witness Griffin.
f. In Excel, please provide all primary data, assumptions, inputs, and results of the probabilistic risk model for all transmission pipeline segments with working formulas where applicable, including but not limited to the following information. Each row should contain information for one transmission pipeline segment, with corresponding columns containing the following information:
i. Pipeline segment ID.
ii. Miles of pipeline segment.
iii. Likelihood of failure (including supporting data and calculations in separate tabs).
iv. Consequence of Failure (including supporting data and calculations in separate tabs).
v. Total risk score of the pipeline segment.
vi. Mitigation proposed (if any) in 2025, 2026, 2027, 2028, and/or 2029 (e.g. asset relocation).
vii. Mitigation effectiveness of the proposed mitigation(s).
viii. Total risk reduction from the proposed mitigation(s).
ix. Total estimated cost of the proposed mitigation(s).

g. In Excel, please provide the data provided in part (f) for all other risk models (distribution system, asset-based risk models, etc.).
i. Please explain whether the risk scores of these models can be directly compared.
ii. If not, please explain why the model has correctly calculated a risk score.
h. Please demonstrate and explain how the risk model provided above utilized the probabilistic risk model to determine what pipeline to remediate in 2025 and 2026, respectively.
i. Does Consumers seek to prioritize the highest risk assets first?
1. Where it has not, why is this the case?
ii. Please describe any practical or logistical challenges in mitigating other pipe segments than the ones indicated in the response above.

Response:

a. Currently only the Transmission and Transmission Operated by Distribution ("TOD") pipe are included in the probabilistic risk model. A model for Storage Wells is scheduled for use in 2025 and a distribution model is under development and is scheduled for use in 2027. These assets currently utilize a relative risk model.
b. The risk model uses collected data from the Company as well as industry established equations for calculating the magnitude of threats on the pipeline assets. The model the uses Bayesian Statics to calculate a failure rate per unit of length and year. This provides a probability of failure projected out ten years from the date of the model run. The consequence of failure is calculated using building and population data around the assets along with federal insurance equations for consequence. Risk is these two values multiplied. The risk is analyzed across 28 different threats and 9 different modes of failure. The risk models don't currently calculate mitigation effectiveness.
    i. ii. The risk model is run on the entire transmission system annually for the likelihood of failure and consequence of failure. The inspections scheduled are determined by federal regulatory requirements and prioritized by the model results.
    iii. Post assessment analysis by inline inspection and direct assessment analysts determines the effectiveness of the mitigation. This data is then an input to the risk model to inform the model of the overall asset health to provide a future risk profile for the system by asset.
c. This model is not used on the other assets so it is not possible to compare with distribution and other asset groups.
    i. The Company utilizes likelihood of failure thresholds and overall risk to prioritize work. The inputs and results are too large to utilize or view in Excel. CE uses graphical visualization software to monitor risk. Inputs are updated to include new data from projects which impacts the overall risk results. Changes in risk can be seen in the visualization. The threats are time dependent, so these results constantly change. The data visualization allows CE engineers to track the overall risk of each asset.
    ii. Post assessment analysis by inline inspection and direct assessment analysts determines the effectiveness of the mitigation. This data is then an input to

the risk model to inform the model of the overall asset health to provide a future looking risk profile.

d. The risk model currently cannot forecast mitigation due to work performed. Pipeline inspections are required by federal regulation so the work must be completed regardless of the risk mitigation.
e. The risk model currently cannot forecast mitigation due to work performed. Pipeline inspections are required by federal regulation so the work must be completed regardless of the risk mitigation.
f. The confidential attachment U21806-MNSC-CE-0080-CONF_ATT_1 provides the primary data inputs including current risk results that are currently in the model. The consequence of failure can only be viewed within the model and cannot be exported to excel. The model doesn't recommend mitigation measures. The Company selects the mitigation method depending upon the threats.
g. Currently only the Transmission and TOD pipe are included in the probabilistic risk model. The other asset classes are relative risk models.
    i. As these are different types of risk models, they cannot be compared. The assets are prioritized within each asset classification.
    ii. The risk model calculates the best risk score based on inputs and information provided. It is a tool used to prioritize work and requires consistent tuning and updating.
h. The model does not determine remediation but informs the Company on which segments to inspect. The results of the inspection will determine if or where remediation is required on that asset. The is model is only one factor in determining which segments require assessment. Federal regulation is the first guideline utilized. The risk model ensures that they are prioritized correctly and that the correct threats are being assessed.
    i. Yes. The Company's baseline assessment plan was developed in conformance with PHMSA requirements which required ranking from highest to lowest risk
    ii. The Company has inspected most of the gas transmission system. This is a cyclic work; segments are reassessed based on federal regulatory requirements and escalating risk in the risk model. The Company uses competitive bidding to manage project costs.

Witness: MICHAEL P. GRIFFIN

Date: February 3, 2025

U21806-MNSC-CE-0281
Page **1** of **1**

Question:

1. Witness Griffin's response to U21806-CE-0080 (question 75) part (a), states "A model for Storage Wells is scheduled for use in 2025 and a distribution model is under development and is scheduled for use in 2027. These assets currently utilize a relative risk model."

a. Please define "scheduled for use" – how will these models be used?

b. Please provide explanations and supporting documentation for information contained in the "relative risk models" in use for storage wells and distribution assets.

c. Please describe in detail how Consumers utilizes the relative risk models for distribution assets and storage wells.

d. Please provide all results of the relative risk models in Excel, including pipe segment ID, risk rank, total risk score, and other major outputs. Please include all supporting data and calculations, with assumptions and inputs clearly documented and formulas intact (if applicable).

   i. Please add a column for the assets targeted in 2024-2025 for remediation, and the forecast or actual cost of this work for each pipeline segment.

Response:

a. Scheduled for use is the "go live" date for these models transition from the current risk models to the new probabilistic models. These models are still in development with the vendor. These models will be used to identify threats, risk, and prioritize work plans for storage wells and the gas distribution system.

b. Relative Risk Model is a modeling type which uses industry trends to calculate risk on an asset. The scores are unitless numbers which are used to compare assets within the model. These models use similar data as a probabilistic model but usually require less information and is a less detailed analysis.

c. The relative risk models calculate risk scores to compare assets within the model. The distribution model compares grids of distribution pipe and the storage model compares storage wells. It allows a risk-based prioritization for work planning.

d. The comprehensive information request cannot be adequately shared in the format requested. The Company is willing to schedule a meeting and review the information at one of Consumers Energy's office locations.

   i. The risk model will indicate the riskiest segments and assets which could lead to projects in the future but does not categorize projects and the costs of prospective projects.

Witness: MICHAEL P. GRIFFIN
Date: March 10, 2025

U21806-MNSC-CE-0282
Page **1** of **1**

Question:

2. Regarding Witness Griffin's response to U21806-CE-0080 (question 75) part (b) states "the risk models don't currently calculate mitigation effectiveness." Consumers also did not provide any mitigation effectiveness information in part (f) of this question. Please provide mitigation effectiveness (percent risk reduction) estimates or calculations in Consumers possession for each type of mitigation in Witness Griffin's testimony, at minimum for replacement, repair, and asset relocation. This may include historical estimates of mitigation effectiveness or any other applicable data. Please provide in Excel with supporting calculations and workpapers if applicable, with assumptions and inputs clearly documented and formulas intact (if applicable).

Response:

The risk model is used to identify risk and threats to our pipe segments. It is an aid in project selection and prioritization. The risk models do not calculate a mitigation effectiveness. The results from the inline inspection and post inspection remediation work determines the overall health of that pipe segment and ensures it can operate safely until it is scheduled for reassessment.

The Company focuses on analyzing the health of an asset instead of the mitigation effectiveness. Knowing that the asset is safe for operation is the primary driver for the integrity actions taken on an asset. The risk model calculation will show that the overall risk of that asset due to threats has lowered due to the work performed. Some threats to a gas asset are time dependent so that asset is continuously monitored for risk and assessment compliance dates to ensure safe operation.

Witness: MICHAEL P. GRIFFIN
Date: March 10, 2025

U21806-MNSC-CE-0283
Page **1** of **1**

Question:

3. Witness Griffin's Direct Testimony at page 11 states "Federal Regulation, 49 CFR Part 192, Subpart O, specifies how pipeline operators must identify, prioritize, assess, evaluate, repair, and validate the integrity of natural gas transmission pipelines that could, in the event of a leak or failure, affect High Consequence Areas ("HCA")."

a. Does Consumers apply the requirements from 49 CFR part 192 to non-HCA pipelines? Please explain.

b. What PHMSA regulations are applicable to non-HCA pipelines? Please list and explain.

c. Please explain whether Consumers has discretion of when, whether, and how to remediate non-HCA pipelines according to federal regulations.

d. Please explain whether Consumers has discretion of when, whether and how to remediate HCA pipelines according to federal regulations.

Response:

a. Yes, the Company follows the requirements in 49 CFR 192 for segments non-HCA.

b. Regulations contained within 49 CFR 192 outline requirements to design, construct, operate, test, inspect, and maintain pipe segments in HCA and non-HCA areas. Subpart O outlines requirements for an integrity program within HCA segments. One example of additional requirements is to perform inspections on pipe segments considered "Outside of HCA" in 49 CFR 192.710. The segments in the work plan contain a mix of HCA, 49 CFR 192.710 miles, and non-covered pipe. The Company applies the appropriate regulations to the pipe segment to ensure safe operation.

c. The Company must remediate all "HCA" and "Outside of HCA" covered pipe segments per regulation. The Company performs remediation on all non-covered pipelines to ensure safe operation. This work is typically performed within a single outage to optimize efficiency. The Company performs remediation in accordance with 49 CFR 192.933 and 49 CFR 192.714.

d. See response to Part c.

Witness: MICHAEL P. GRIFFIN
Date: March 10, 2025

U21806-MNSC-CE-0284
Page **1** of **3**

Question:

4. Regarding Witness Griffin's response to U21806-CE-0080 (question 75), attachment U21806-MNSC-CE-0080-CONF_ATT_1.

a. Please provide a definition and description of each column header other than column A. This should include, for applicable column headers, how the values are calculated and what units they are in.

b. Please explain why some high-risk pipeline segments are not in an HCA. For example, the first segment, 2800-1, is not in an HCA. Why is this segment so high risk?

c. It appears there is a calculation of residual risk in column K. Does this indicate the amount of risk remaining after a mitigation? If yes, how was the mitigation determined? If not, how is this defined?

d. In Excel, please add the following information to this attachment in separate columns for each pipeline segment where there is forecast work:

   i. Pipeline program where the cost is included (e.g. TIMP, Pipeline Integrity, Capacity/Deliverability etc.);

   ii. Mitigation proposed or forecast (e.g. repair (please specify), replacement, etc.);

   iii. Cost (Estimated or actual).

e. Please explain why Consumers forecasts remediation of pipelines with near-zero risk, such as row 234,131, and some of the least risky pipeline segments above this last pipeline segment row.

f. Please explain whether Consumers prioritizes transmission and TOD segments for inspection (and/or remediation) by total risk or risk per mile. Please explain this choice and provide supporting documentation.

Response:

a. Name: Pipe segment designation
HCA: 0=No, 1=Yes
FromMeasureFT: odometer reading down the pipe where that data set starts. Measured in Feet
ToMeasureFT: odometer reading down the pipe where that data set ends. Measured in Feet
Length_Ft: The physical length of the data set (to – from) measured in feet
Length_miles: The physical length of the data set (to – from) measured in miles
FromForecastYear: The start of the time period of that risk score (Sets the integral time period for the risk analysis. This is a Bayesian statics model)
ToForecastYear: The start of the time period of that risk score (Sets the integral time period for the risk analysis. This is a Bayesian statics model)

RiskTotal_RU_YR: the total risk score for this year. The model calculates a probability and a consequence per threat. That is the risk per threat and then each risk per threat is aggregated into a total risk. This is a unitless score.
RiskTotal_Ru_yr_Actionable: Risk due to threats which can be mitigated via inspection and remediation or an engineering in-ditch replacement project. This is a unitless score.
RiskTotal_Ru_yr_Residual: Risk due to threats which cannot be mitigated. These are environmental risks which cannot be lowered with an inspection, remediation or in-ditch replacement. This is a unitless score.
Risk___External_Corrosion__Ru_yr: Risk value for external corrosion. This is a unitless score.
Risk___Internal_Corrosion__Ru_yr_: Risk value for internal corrosion. This is a unitless score.
Risk___Stress_Corrosion_Cracking__Ru_yr_: Risk value for Stress Corrosion Cracking. This is a unitless score.
Risk___Manufacturing_Defects__Ru_yr_: Risk value for manufacturing defects. This is a unitless score.
Risk___Construction_Defects__Ru_yr_: Risk value for construction defects. This is a unitless score.
Risk___Third_Party___Mechanical_Damage__Ru_yr_: Risk value for third party damage. This is a unitless score.
Risk___Equipment_Failure__Ru_yr_: Risk value for equipment failure. This is a unitless score.
Risk___Incorrect_Operations_Procedure__Ru_yr_: Risk value for incorrect operations. This is a unitless score.
Risk___Weather_Related_and_Outside_Force__Ru_yr_: Risk value for weather related and outside forces. This is a unitless score.

b. Total Risk = Probability of Failure x Consequence of Failure. Some segments have risk driven by probability and other segments by consequence. HCA could indicate a higher consequence of failure but has no impact on the probability of a failure. The first row, 2800-1, the elevated risk score is driven by probability of failure due to threats present and not consequence.

c. The probabilistic models do not calculate a mitigation effectiveness, and this is not a mitigation calculation. The residual risk in column K is calculated by combining the threats: 3rd Party Damage, Weather and Outside Force, and Incorrect Operations. These threats are managed with operational preventative measures.

d. The information from the risk results cannot be organized into the categories suggested in this interrogatory. The risk model analyzes segments of pipelines though dynamic segmentation, so when there is any change in a data property the risk model will perform segmentation for all the data points provided on a given line segment. Thus, the risk model will indicate the riskiest segments which could lead to projects, primarily in Pipeline Integrity or Asset Relocation in the future but does not categorize projects and costs such that they would translate to the capital projects and programs. Further, besides not indicating specific projects, the model does not calculate the cost of prospective projects.

e. This row is a piece of Dx1087b pipe segment. In this pipe system there are areas which are HCA which requires assessment and those of higher risk score. The model calculates risk scores on the entire transmission system. A row of data does not indicate work or remediation is being performed at that location.

f. The Company prioritizes segments for planning based upon total risk. Risk per mile will over-inflate the prioritization of smaller assets and skew the modeling results. That value is used for generalized mapping and not for work planning. Inspection Segments are ranked by total risk. The threats contributing to the risk score are evaluated to determine the type of inspection and the technology selected to inspect that asset. Additionally federal regulation provides requirements for the timing and methodology of these assessments.

Witness: MICHAEL P. GRIFFIN
Date: March 10, 2025

U21806-MNSC-CE-0285
Page **1** of **1**

Question:

5. Regarding Witness Griffin's response to U21806-CE-0081(question 76):

a. Please explain why Consumers does not consider cost-effectiveness or RSE metrics to evaluate different mitigations for transmission or TOD projects.

b. Please explain why Consumers does not consider cost-effectiveness or RSE metrics to evaluate different mitigations for distribution projects.

c. Please explain whether Consumers believes cost-effectiveness is a relevant criterion for choosing what mitigation to deploy for pipeline remediation, including why or why not.

Response:

a. The Company's current processes prudently address system risk in a cost-effective manner. The probabilistic model is designed to inform the operator of the overall risk of an asset and the threats that are present on that asset. This allows for the selection of the proper method and technology to assess those threats. The results from the inspection and post inspection remediation work determines the overall health of that pipe segment and ensures it can operate safely until it is scheduled for reassessment. The risk model is used to identify risk and threats to our pipe segments. It is an aid in project selection and prioritization. Cost effectiveness is factored into the remediation methodology selected for each individual project as well as complying with all applicable regulations and industry standards.

b. The Company's current processes prudently address system risk in a cost-effective manner. The distribution relative model is designed to inform the operator of the overall risk of the asset and the threats that are present on that asset. This allows for the selection of grid-based projects to address those threats. The risk model is used to identify risk and threats to our pipe segments. It is an aid in project selection and prioritization. Cost effectiveness is factored into the remediation methodology selected for each individual project as well as complying with all applicable regulations and industry standards.

c. The Company inspects the pipe anomalies found during the inspection process. There are multiple permanent repair options available. The Company selects the most appropriate method of remediation based on multiple considerations (i.e. cost effectiveness, operational considerations, system demand, and environmental constraints).

Witness: MICHAEL P. GRIFFIN
Date: March 10, 2025

S T A T E O F M I C H I G A N

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the distribution of natural gas and for other relief.	)))))	Case No. U-21806

REBUTTAL TESTIMONY

OF

LINCOLN D. WARRINER

ON BEHALF OF

CONSUMERS ENERGY COMPANY

May 2025

Q. Please state your name and business address.

A. My name is Lincoln D. Warriner, and my business address is 1945 West Parnall Road, Jackson, Michigan 49201.

Q. Are you the same Lincoln D. Warriner who previously submitted direct testimony in this proceeding?

A. Yes.

Q. What is the purpose of your rebuttal testimony?

A. The purpose of my rebuttal testimony is to formally accept certain capital expenditure adjustments recommended by Attorney General witness Sebastian Coppola related to New Business and Asset Relocation capital expenditures, and to rebut certain assertions and recommendations made by the following witnesses regarding Consumers Energy Company's ("Consumers Energy" or the "Company") gas distribution capital investments:

a. Michigan Environmental Council and Sierra Club ("MEC") witness Alice Napoleon's proposed disallowance of projected New Business program capital expenditures and various recommendations regarding the Company's Energy Waste Reduction ("EWR") programs, line extension policies, and new connection forecasts;

b. Citizens Utility Board of Michigan ("CUB") witness Ram Veerapaneni's proposed disallowance of projected test year capital expenditures for the Company's distribution system capital expenditures related to New Business, Asset Relocation, Regulatory Compliance, and Capacity/Deliverability program capital expenditures;

c. MEC witness Sol deLeon's proposal to limit projected capital expenditures to 2024 levels;

d. Association of Businesses Advocating Tariff Equity ("ABATE") witness Colin T. Fitzhenry's proposal to disallow $15.8 million of 2023 capital expenditures for Asset Relocation – Civic Improvement projects; and

e. Attorney General witness Coppola's proposed disallowance of distribution system capital expenditures related to Large New Business projects, and Regulatory Compliance project capital expenditures.

Q. Are you sponsoring any exhibits in connection with your rebuttal testimony?

A. No, I do not have any exhibits in connection with this rebuttal testimony.

Q. Please summarize the proposed adjustments in capital expenditures that you are accepting on behalf of the Company?

A. I am accepting capital expenditure adjustments totaling approximately $46 million in the Company's New Business and Asset Relocation programs. The amounts that I am accepting by sub-program are detailed in Table 1 below:

Table 1: Gas Distribution Programs and Sub-Programs: Accepted Capital Expenditure Adjustments

Line No.		2024 Adjustment	1/1/25-10/31/25 Adjustment	Test Year Adjustment	Total Adjustment
	New Business				
1	Mains Services & Meter Stands - Dist	(3,067,000)	(5,714,000)	(8,018,000)	(16,799,000)
2	Large New Business Projects - Dist	(1,948,000)	(685,000)	(4,819,000)	(7,452,000)
3	Customer Attachment Program - Dist				
4	**Total New Business**	**(5,015,000)**	**(6,399,000)**	**(12,837,000)**	**(24,251,000)**
	Asset Relocation				
5	Asset Relocation - Civic Improvement		(9,408,000)	(9,913,000)	(19,321,000)
6	Asset Relocation - Reimbursable		(203,000)	(1,919,000)	(2,122,000)
7	**Total Asset Relocation**	-	(9,611,000)	(11,832,000)	(21,443,000)
8	**Total Capital Expenditure Adjustments**	**(5,015,000)**	**(16,010,000)**	**(24,669,000)**	**(45,694,000)**

I. MICHIGAN ENVIRONMENTAL COUNCIL AND SIERRA CLUB WITNESS NAPOLEON

Q. On page 11, line 6 of her direct testimony, Ms. Napoleon indicates that it is puzzling that the Michigan decarbonization study does not include demand-side measures such as demand response to reduce emissions. Can you explain the reasons for the Company not planning for demand response programs at this time?

A. Yes, the Company conducted demand response program pilots during the 2020/2021 and 2021/2022 winter seasons. The results of the Company's pilots indicate that a full-scale customer program for natural gas demand response would not provide enough benefits to be cost effective. The results of the Company's natural gas demand response pilots are

documented in evaluation reports, specifically (1) the Smart Thermostat Winter Pilot Program Evaluation Report, 2021 Program Year, dated August 27, 2021, and (2) the Smart Thermostat Winter Pilot Program Evaluation Report, 2022 Program Year, dated October 5, 2022.

Q. On page 34, lines 2-3 of her direct testimony, Ms. Napoleon's testimony indicates that the Company's forecast of new customer connections contradicts the historical trend of customer connections. Is this an accurate assessment of the Company's service installation forecast?

A. No, there is no contradiction between the Company's service installation forecast and the historical trend. Ms. Napoleon's analysis of the historical trend is inaccurate because she did not account for Customer Attachment Program service connections that were installed by the Company in 2014. During 2014, the Company was actively marketing natural gas service to households using propane for space heating. 3,028 services were installed in 2014 for these propane conversions. Reducing the 2014 historical installations for these propane conversions results in a comparable service installation count of 8,515 service installations in 2014. Compared to the 2023 actual service installation count of 6,870 units, the actual annual average decline in service installations from 2014 to 2023 is 183 services per year. Over this period, the construction of new homes in Michigan has not kept pace with demand, resulting in shortages of available and affordable housing options. The Company's projection starts with the 2023 actual value of 6,870 units and grows to 7,800 units. Over the course of 10 years (2024-2033), the Company's projected growth in service installations ranges from -70 installations to +200 installations and averages out to a growth rate of 93 service installations per year. It is reasonable to anticipate modest long-term

growth in annual new service connections given the ongoing shortage of available and affordable housing units.

Q. On page 35, line 5 through page 37, line 5 of her direct testimony, Ms. Napoleon indicates that the Company's forecast of new customer connections does not reflect market trends or policies as reported by the U.S. Census Bureau's American Community Survey. Do you agree with Ms. Napoleon's analysis of the American Community Survey?

A. No. As I explain in detail below, the American Community Survey data does not logically support Ms. Napoleon's conclusions regarding electric space heating and gas space heating growth between 2014 and 2023.

Q. Please explain your analysis of the American Community Survey data.

A. The raw data reported for Michigan estimates of house heating fuel is displayed in Table 2 below. The data for house heating fuels are only estimated for occupied housing units. The American Community Survey does not provide house heating fuel estimates for vacant housing units.

Table 2: American Community Survey house heating fuel estimates for Michigan

	2023 Estimate	2014 Estimate	Change	Percent Change
Occupied Housing Units	**4,107,809**	**3,834,574**	**273,235**	**7%**
Utility Gas	3,039,167	2,942,704	96,463	3%
Bottled, tank, or LP gas	372,796	314,434	58,362	19%
Electricity	523,137	342,353	180,784	53%
Fuel oil, kerosene, etc.	32,099	47,572	-15,473	-33%
Coal or coke	1,733	1,408	325	23%
Wood	88,484	129,455	-40,971	-32%
Solar energy	1,302	906	396	44%
Other fuel	28,300	38,130	-9,830	-26%
No fuel used	20,791	17,612	3,179	18%

Q. Is the exclusion of vacant housing units significant in understanding the trends reported in Table 2?

A. Yes, I believe that it is significant for this analysis. The American Community Survey estimates that vacant housing units declined by 170,366 units, from 705,514 vacant units in 2014 to 535,148 vacant units in 2023. Given that occupied housing units increased by 273,235 units over that same time period, it is logical to conclude that a good portion of the increase in occupied housing units after 2014 were previously existing vacant units. Total housing units are estimated to have grown by 2%, but occupied housing units are estimated to have grown by 7% and vacant housing units are estimated to have declined by 24% as shown in Table 3.

Table 3: American Community Survey housing occupancy estimates for Michigan

	2023 Estimate	2014 Estimate	Change	Percent Change
Total Housing Units	**4,642,957**	**4,540,088**	**102,869**	**2%**
Occupied Housing Units	4,107,809	3,834,574	273,235	7%
Vacant Housing Units	535,148	705,514	-170,366	-24%

When viewed within the context of the American Community Survey housing occupancy estimates for Michigan (in Table 3), the following observations can be made regarding the house heating fuel estimates (in Table 2):

1. The increase in occupied houses heated by electricity of 180,784 units is very similar to the 170,366 reduction in vacant housing units, therefore I believe that a large portion of the increase in electrically heated occupied housing units were classified as existing vacant housing units in 2014. Other sources of increase in houses heated by electricity are likely wood, fuel oil/kerosene, and other fuel categories.

2. The increase in occupied housing units heated by utility gas of 96,463 units (in Table 2) is similar to the 102,869 increase in total housing units (in Table 3), therefore I believe that a very large portion of the total housing unit additions since 2014 are heated by utility gas.

Q. Have you reviewed any additional data when evaluating Ms. Napoleon's conclusion that the Company's forecast of new customer connections does not reflect market trends or policies?

A. Yes, I have reviewed MPSC Form P-522 Annual Reports available for each natural gas utility on the Michigan Public Service Commission's website to see if any growth or decline in natural gas residential customer counts is apparent from 2014 through 2023. The results of that review are summarized in Table 4 below:

Table 4: MPSC Form P-522 Average Number of Customers per Month for Michigan Natural Gas Utilities

	2023 Actual	2014 Actual	Change	Percent Change
Total Residential Customers	**3,302,335**	**2,984,296**	**318,039**	**11%**
Consumers Energy Company	1,683,982	1,595,561	88,421	6%
DTE Gas Company	1,148,660	964,491	184,169	19%
SEMCO Energy Gas Co	275,632	253,584	22,048	9%
Michigan Gas Utilities	152,191	131,736	20,455	16%
Seven Other Gas Utilities	41,870	38,924	2,946	8%

It is interesting that the growth of 318,039 Michigan gas utility residential customers exceeds the American Community Survey's estimates of both total housing unit growth

(102,869) and occupied housing unit growth (273,235) in Table 3. These reports further support the conclusion that a large portion of housing unit additions are heated by utility gas.

Q. What is your conclusion regarding the use of the American Community Survey data by Ms. Napoleon?

A. I have concluded that Ms. Napoleon's statement on page 36, line 7 through line 10, that "… the number of gas-heated homes increased by approximately 96,000, while electric-heated homes increased by about 180,000…" is based on an incomplete analysis of the American Community Survey data and does not accurately reflect actual trends in household selection of space heating fuels. It appears more logical to conclude that natural gas continues to be the preferred heating fuel for residential utility customers in Michigan.

Q. Does the American Community Survey provide any data that would be useful for the Commission to consider in determining whether the Company's tariff Rule C.8. "Customer Attachment Program" 20-year net present value calculation is unfair to existing natural gas customers as discussed by MEC witness Napoleon at pages 24 through 25 of her direct testimony?

A. Yes. The Census Bureau tracks an indicator named "Median Year Structure Built," and that indicator is available for the state of Michigan. The American Community Survey data indicates that the median year of structures built during the 2014 survey was the year 1969. This would mean that the approximate median age of Michigan housing structures in 2014 was about 45 years. The 2023 survey reported that the median year of structures built was 1972. Therefore, the approximate median age of Michigan housing structures in 2023 was about 51 years. Given that residential structures exceed a median age of 50 years,

and appear to be trending older over time, the use of 20-year revenue and cost projections in the net present value calculation does not seem to create a subsidy for new customer connections.

Q. Does Ms. Napoleon make any statements in the content of her testimony that contradict her criticism of the 20-year revenue and cost projections used in the net present value calculation that are used to determine new customer connection contributions?

A. Yes. On page 15, lines 6 through 9, her testimony states "Many gas appliances, and many of the gas energy efficiency measures incentivized by the EWR programs, have long useful lives. For example, a new natural gas furnace typically lasts 20 or more years. For some existing heating equipment such as boilers, the useful life is longer." This statement seems to support the C8. Customer Attachment Program assumption that new gas customers will remain customers on our system for more than 20 years.

Q. On page 5, lines 21 and 22 of her direct testimony, Ms. Napoleon recommends that the "Commission should order the Company to set the growth rate in new connections to zero…" Do you agree with that recommendation?

A. No, this request of the Commission is unusual and vague and should not be adopted for several reasons, including:

1. The Company's Customer Energy Management department provides the estimates for new service connections and manages the creation and completion of capital expenditure work orders to connect new customers. Within the Customer Energy Management department, staff members have regular interaction with builders in our service territory and are therefore the most logical source for projections related to the service connection workload for the Company.

2. The Company's forecast in this proceeding included projections of 6,800 units in 2024 and 2025, which reflect no growth between the two projected years, and are less than the 6,870 service installations installed during 2023.

3. The Company has evaluated recent trends within the New Business Mains, Services, and Meter Stands sub-program and has decided to adopt the recommendation of Attorney General witness Coppola, which projects 2025 and 2026 service installation volumes with no growth from 2024 actual.

4. The determination of longer-range forecasts as used within the Natural Gas Delivery Plan are reviewed by the Company periodically for changes in actual activity and future expectations and should remain the responsibility of the Company to monitor and adjust.

Q. What proposal has MEC witness Napoleon made regarding the Company's investments in New Business Mains, Services, and Meter Stands?

A. Ms. Napoleon has recommended New Business capital expenditures in the test year of $35.947 million dollars, which she claims includes a recommended customer contribution of 50% of total construction costs and the elimination of projected growth in service installations. Given that the Company is accepting a $12.837 million test year adjustment for New Business proposed by Attorney General witness Coppola, Ms. Napoleon is recommending an additional reduction in the test year of $17.861 million.

Q. What decision should the Commission make regarding MEC witness Napoleon's proposal to reduce the projected test year Gas Distribution capital expenditures?

A. I recommend that the Commission find that Ms. Napoleon's reduction is unreasonable given her unsupported claims that residential customers prefer electric heating options over natural gas. Her claim that existing natural gas customers are subsidizing new service connections should also be rejected as new buildings that connect to the Company's gas system will likely remain natural gas customers well beyond the 20-year projection embedded in the Company's Net Present Value model. Ms. Napoleon has not made any specific recommendation on what adjustments to the customer contribution calculation could actually achieve the 50% level of contribution she is seeking, so there is considerable doubt that her recommended outcome can actually be realized. Therefore, I recommend

that the Commission disregard Ms. Napoleon's recommendation to reduce capital expenditures by increasing customer contributions. The revised capital expenditure projections included in the rebuttal exhibits of Company witness Heather L. Rayl should be adopted.

II. CUB WITNESS VEERAPANENI

Q. Please summarize the overall reductions to the Company's projected capital expenditures that are proposed by CUB witness Veerapaneni.

A. CUB witness Veerapaneni presents one paragraph of testimony concerning the Gas Distribution New Business, Asset Relocation, Regulatory Compliance, and Capacity/Deliverability programs presented in my direct testimony and exhibits. He recommends that test year capital expenditures be set at the average of 2023 and 2024 actual capital investments and recommends a test year value of $206.716 million.

Q. How does the test year capital expenditure amount proposed by Mr. Veerapaneni compare to the test year capital expenditure supported by your testimony and exhibits in this proceeding?

A. The Company's original test year projection in this proceeding was $321.119 million, which I am revising to $296.450 million as part of my rebuttal testimony to reflect certain acceptable adjustments recommended by Attorney General witness Coppola. Mr. Veerapaneni's recommended test year value of $206.716 million is $89.734 million, or 30.3%, lower than the revised capital expenditure projection for the 12 months ending October 31, 2026.

Q. What is your response to the adjustment to the Company's projections that Mr. Veerapaneni has proposed in his direct testimony?

A. CUB's proposed methodology of projecting test year expenditures using two years of historical actual investments for Gas Distribution capital projects is unreasonable. Mr. Veerapaneni did not review the reasonableness of the individual Gas Distribution programs and projects proposed during the test year or the benefits that customers would experience from the Company's investment in those projects. For example, on page 9, starting on line 13, through page 10, line 2, my testimony identifies five specific projects that make up the difference between the projected test year and the 2023 historical year and 2019 to 2023 historical average Gas Distribution capital projects. Forecasted expenditures for the Company's Regulatory Compliance program are necessary to comply with recently adopted Pipeline and Hazardous Materials Safety Administration ("PHMSA") regulations regarding pipeline safety. My direct testimony explaining the planned Maximum Allowable Operating Pressure ("MAOP")-Distribution projects begins on page 46, line 17 and concludes on page 60, line 8, yet Mr. Veerapaneni claims I have provided no valid explanation for the increases in capital expenditures. Mr. Veerapaneni's testimony is contradictory because he claims on page 14, line 6 that these projects have no valid explanation, then states on page 14, line 7 that these projects are required to comply with federal and state pipeline safety regulations. He also claims that the Company is "long overdue" in compliance with these safety regulations. This claim specifically contradicts my testimony on page 47, lines 6 through 11, that identifies the specific compliance milestones required by 49 CFR 192.624. The Company is planning to comply with the required compliance milestones and is not overdue. The Company has an obligation to

operate its gas distribution system in a manner that complies with existing PHMSA gas safety regulations and the Company's customers also expect the gas distribution system to be operated in a manner that provides reliable service. As a result, the Company does not believe the recommended adjustment to the test year capital expenditures proposed by Mr. Veerapaneni is prudent.

Q. What decision should the Commission make regarding CUB witness Veerapaneni's proposal to reduce the projected test year Gas Distribution capital expenditures?

A. I recommend that the Commission include the Company's revised projected test year Gas Distribution capital investments when determining customer rates in this proceeding. The revised capital expenditure projections are included in the rebuttal exhibits of Company witness Rayl.

III. ABATE WITNESS FITZHENRY

Q. Please summarize the overall reductions to the Company's 2023 actual capital expenditures that are proposed by ABATE witness Fitzhenry.

A. ABATE witness Fitzhenry presents approximately three pages of testimony concerning the Asset Relocation – Civic Improvement projects completed during the calendar year 2023. He recommends that the Commission disallow $15.8 million of actual capital expenditures for the Mound Road project, the Atlas Iron Belle Trail Project, and the 9 Mile Road Eastpoint projects. These three projects are highlighted on page 29 of my direct testimony, as well as in Table 9, which appears on page 30 of my direct testimony. Mr. Fitzhenry's rationale for recommending this disallowance is that the Company disclosed a variance from the Company's 2023 budget, and he alludes that these variances are associated with poor project management and the Company was therefore imprudent in the execution of

projects. He indicates the variances could be due to reasons such as extended project duration, poor project planning, labor cost overruns, or project scope creep.

Q. On page 12, lines 5 through 16, Mr. Fitzhenry claims that the Company's response to requests for cost variance explanations during discovery is limited. Do you agree with that assessment of the response?

A. No, Mr. Fitzhenry's assessment of the response provided by the Company is not accurate. The Company's response as reflected on Exhibit AB-5, pages 6 and 7, begins with a quantification of budget program level actual and budget values, then provides additional detail on the variances for Asset Relocation – Civic Improvement and for the Enhanced Infrastructure Replacement Program. The cover sheet associated with those two pages of Exhibit AB-5, which was not included in Mr. Fitzhenry's exhibit, provided a link to the 2023 Gas Enhanced Infrastructure Replacement (EIRP) - Annual Performance Report. Attachment 9 of the 2023 EIRP Annual Performance Report details the work completed for 122 individual Asset Relocation – Civic Improvement projects. These details include the number of services replaced for each project and the footage of plastic main and footage of steel main installed.

Q. What is your response to Mr. Fitzhenry's claims that the cost variances are associated with poor project management, imprudent execution of projects, extended project duration, poor project planning, labor cost overruns, or project scope creep?

A. I do not believe those claims to be true. My understanding of the replacement of utility infrastructure associated with civic improvement projects is that these projects can be complex, involving the coordination of work scope and schedules with municipal project administrators and construction crews who may have project requirements that are specific

to their local community. The Company rarely has complete information to compile a detailed project estimate for civic improvement projects at the time our annual budget projections are developed. The large civic improvement project estimates used for our 2023 budget were not intended to be precise estimates that would allow for the specific quantification of the root cause of variances. Also, it should be noted that the Company's actual 2023 Civic Improvement expenditures of $83.5 million is only slightly higher than the 2019 to 2023 annual average capital expenditure of $81.6 million. This would be an indicator that the Company was reasonable and prudent in managing its investments in Civic Improvement projects during 2023.

Q. What decision should the Commission make regarding ABATE witness Fitzhenry's proposal to reduce the 2023 actual calendar year Asset Relocation – Civic Improvement capital expenditures?

A. I recommend that the Commission find that the Company's variances disclosed on page 6 of 12 in Exhibit AB-5 do not support a disallowance of the actual capital expenditures incurred during the historical year of 2023, and that those capital expenditures were prudently incurred.

IV. MEC WITNESS DELEON

Q. What capital expenditure recommendations are proposed by MEC witness deLeon?

A. On page 7, Ms. deLeon recommends that the Commission should cap additions to plant in service in the projected test year at 2024 investment levels.

Q. What is your assessment of Ms. deLeon's recommendation?

A. I am concerned that capping the additions to plant in service would severely restrict the Company's ability to comply with MAOP reconfirmation requirements as described on page 46, line 17 through page 60, line 8 of my direct testimony. The annual capital

additions for the MAOP program are provided on page 48 of my direct testimony in Table 17. The 2024 projected amount of $9.3 million is followed by projections of $69.1 million in 2025 and $127.9 million in 2026. The Company has an obligation to operate its gas distribution system in a manner that complies with existing PHMSA gas safety regulations and the Company's customers also expect the gas distribution system to be operated in a manner that provides reliable service. As a result, the Company does not believe the recommended cap to the test year capital expenditures proposed by Ms. deLeon is prudent.

IV. ATTORNEY GENERAL WITNESS COPPOLA

Q. What are the capital expenditure adjustments proposed by Mr. Coppola with respect to the Company's New Business program?

A. Mr. Coppola discusses the New Business capital expenditure program starting on page 19 and concluding on page 25 of his direct testimony. His discussion includes two sub-programs: (1) Mains, Services, and Meter Stands on page 19 through line 10 of page 23, and (2) Large New Business Projects starting on page 23, line 12 through the end of page 25.

For the Mains, Services, and Meter Stands sub-program, Mr. Coppola recommends that the Company's 2024 projection be reduced to match the actual capital expenditures incurred by the Company in 2024, and that the 2025 and 2026 capital expenditures projections be reduced so that the number of projected service installations are the same as what the Company installed in 2024.

For the Large New Business Projects sub-program, Mr. Coppola recommends that the Company's 2024 projection be reduced to match the actual capital expenditures incurred by the Company in 2024; that the 2025 capital expenditures be reduced for the

Lansing Board of Water & Light Delta Energy Park project and the industrial site redevelopment project in Flint; and that the 2026 capital expenditures be fully eliminated from the Company's projections.

Q. Do you agree with the New Business program adjustments proposed by Mr. Coppola?

A. I have reviewed Mr. Coppola's New Business capital expenditures program testimony and the supporting documentation provided in Exhibit AG-2. I did note what appears to be a typographical error on page 23, line 13 that states the Company projected $8.7 million for 2024 Large New Business Projects. Mr. Coppola identifies the correct amount of $9.7 million on page 25, line 7. Therefore, I think the $8.7 million amount on page 23 was a simple typographical error that had no impact on his analysis of the Company's projections. I have also reviewed additional external sources of current economic activity, including the NAHB/Wells Fargo Housing Market Index ("HMI") for April 2025, and have also discussed the adjustments proposed by Mr. Coppola with the Company's new business subject matter experts. The results of this analysis confirm that 2025 calendar year service connections are tracking closely with 2024 and there is no evident growth to support the Company's original projections for service connection volumes. I have also confirmed that the industrial site redevelopment project in Flint is currently on hold awaiting a decision from the customer that requested service on the Company's contract. Currently, the Company still anticipates the development of large projects in 2026 but does not have contracts with specific projects to support the projected capital expenditures for 2026. The only specific adjustment that the Company strongly disagrees with is the proposed adjustment related to the contract status of the Lansing Board of Water & Light Delta Energy Park project. Exhibit AG-2, page 6, indicates that contract signatures were in

progress at the time of my response to AG-CE-0346. Contract signatures were completed in mid-April and construction is expected to be completed by November 1, 2025. As a result, the only proposed adjustment that the Company is not including in the rebuttal exhibits of Company witness Rayl, and in Table 1 on page 3 of my rebuttal testimony, is the proposed adjustment for the Lansing Board of Water & Light Delta Energy Park project.

Q. What decision should the Commission make regarding Attorney General witness Coppola's proposal to reduce the 2024, 2025, and 2026 New Business program projections?

A. I recommend that the Commission accept Mr. Coppola's New Business program capital expenditure projection adjustments, except for the adjustment related to the Lansing Board of Water & Light Delta Energy Park project. The Company's revised projections for the New Business program are summarized as follows:

Mains, Services, and Meter Stands – Distribution
1. 12 Months Ending 12/31/2024: $52.271 million (a reduction of $3.067 million)
2. 10 Months Ending 10/31/2025: $43.882 million (a reduction of $5.714 million)
3. 22 Months Ending 10/31/2025: $96.153 million (a reduction of $8.781 million)
4. 12 Months Ending 10/31/2026: $53.664 million (a reduction of $8.018 million)

Large New Business Projects – Distribution
1. 12 Months Ending 12/31/2024: $7.761 million (a reduction of $1.948 million)
2. 10 Months Ending 10/31/2025: $2.517 million (a reduction of $0.685 million)
3. 22 Months Ending 10/31/2025: $10.278 million (a reduction of $2.633 million)
4. 12 Months Ending 10/31/2026: $0.143 million (a reduction of $4.820 million)

Q. What are the capital expenditure adjustments proposed by Mr. Coppola with respect to the Company's Asset Relocation program?

A. Mr. Coppola discusses the Asset Relocation capital expenditure program starting on page 26 through page 31, line 6. His discussion includes two sub-programs: (1) Civic Improvement projects, and (2) Reimbursable projects.

For Civic Improvement projects, Mr. Coppola concludes that the 2025 capital expenditures should be reduced to $65.0 million and 2026 capital expenditures should be reduced to $73.7 million. He estimates a reduction for the 10 months ending October 31, 2025 of $9.4 million and a reduction for the 12 months ending October 31, 2026 of $9.9 million.

Q. Do you agree with the Asset Relocation program adjustments proposed by Mr. Coppola?

A. I have reviewed Mr. Coppola's Asset Relocation capital expenditures program testimony and the supporting documentation provided in Exhibit AG-3 and Exhibit AG-4. Page 4 and page 5 of Exhibit AG-3 describe how the estimates of Civic Improvement workload were determined for my original testimony and page 3 of Exhibit AG-4 describes how the projections of Reimbursable program investments were determined. Asset Relocation projects do represent a substantial portion of the Company's annual capital investments in the natural gas distribution system, and projects are performed at the request of federal, state, and local governmental units as well as at the request of the Company's natural gas customers. Numerous projects are completed over the course of a calendar year, and can range from very small meter stand and service upgrades to the relocation of large distribution mains and are generally not known far enough in advance to provide extensive footage and unit cost details in support of the Company's capital expenditure programs. The projections of workload provided in my direct testimony are indicative of the corresponding projected capital expenditures included in my original testimony and exhibits. Mr. Coppola's analysis reflects that there are some unknowns regarding the actual work that will be accomplished in 2025 and 2026, and he makes assumptions about activity

and costs that result in a lower capital expenditure estimate than what has been provided by the Company. I have evaluated the adjusted sub-program dollar projections that result from his calculations against historical Asset Relocation capital expenditures and have consulted subject matter experts within the Company on Asset Relocation program capital expenditures. Mr. Coppola's 2025 and 2026 projections are comparable to average annual expenditures for Asset Relocation projects from 2020 through 2024, and the Company accepts those projections for the purpose of determining customer rates in this proceeding.

Q. What decision should the Commission make regarding Attorney General witness Coppola's proposal to reduce the 2025 and 2026 Asset Relocation program projections?

A. I recommend that the Commission accept Mr. Coppola's Asset Relocation program capital expenditure projection adjustments. The Company has reflected those adjustments in the rebuttal exhibits of Company witness Rayl, and included those adjustments in Table 1 on page 3 of this rebuttal testimony. The Company's revised projections for the Asset Relocation program are summarized as follows:

Asset Relocation – Civic Improvement
1. 12 Months Ending 12/31/2024: $64.148 million (no reduction)
2. 10 Months Ending 10/31/2025: $54.204 million (a reduction of $9.408 million)
3. 22 Months Ending 10/31/2025: $118.352 million (a reduction of $9.408 million)
4. 12 Months Ending 10/31/2026: $72.249 million (a reduction of $9.913 million)

Asset Relocation – Reimbursable
1. 12 Months Ending 12/31/2024: $22.690 million (no reduction)
2. 10 Months Ending 10/31/2025: $12.023 million (a reduction of $0.203 million)
3. 22 Months Ending 10/31/2025: $34.713 million (a reduction of $0.203 million)
4. 12 Months Ending 10/31/2026: $14.728 million (a reduction of $1.919 million)

Q. What are the disallowances proposed by Mr. Coppola with respect to the Regulatory Compliance program?

A. Mr. Coppola recommends $93.340 million of capital expenditure reductions for the Company's Regulatory Compliance program. This recommended adjustment includes the following components:

Table 5: Regulatory Compliance Program Recommended Adjustments	
Reference: S. Coppola direct testimony page 35, line 1	**Amount**
MAOP Distribution – 2023 Actual	-$0.804 million
MAOP Distribution – 2024 Forecast	-$4.648 million
MAOP Distribution – 10 Months Ending October 31 2025	-$29.982 million
MAOP Distribution – 12 Months Ending October 31 2026	-$57.906 million
Total proposed reduction	**-$93.340 million**

Q. Please summarize the rule changes that caused the Company to evaluate existing pressure test records for compliance with PHMSA traceable, verifiable, and complete compliance standards.

A. Mr. Coppola's Exhibit AG-6 on page 2 of 79 indicates that PHMSA revised the existing Federal Pipeline Safety Regulations to address congressional mandates, National Transportation Safety Board recommendations, and public input. The requirements include required actions for pipeline operators to reconfirm the MAOP of natural gas transmission pipelines. These requirements are outlined as follows:

a. Reconfirmation of the MAOP for pipeline segments installed after implementation of test record requirements in 1970 is required if original construction test records are not traceable, verifiable, and complete (or "TVC"). The TVC standard is a new requirement that did not exist prior to the 2020 rule amendment.

b. Pipeline segments installed prior to test record requirements implemented in 1970 were previously "grandfathered," or exempt, from original construction pressure test documentation requirements and allowed to operate at the highest actual operating pressure observed between 1965 and 1970. The updated 2020 rules limited this exemption to pipelines operating below 30% of the specified

minimum yield strength (or "SMYS"). The requirement to substantiate the MAOP with records that meet the revised TVC standard for pipelines operating above 30% SMYS is identified on page 3 of 79 of Exhibit AG-6.

As a result, the Company must reconfirm the MAOP for all pre-1970 pipelines operating above 30% SMYS.

Q. Does Exhibit AG-6 support the Company's conclusion that the TVC record documentation standard is a new requirement compared to prior record keeping requirements.

A. Yes. Exhibit AG-6, page 4 of 79, states that the final rule "clarifies and expands recordkeeping requirements to ensure operators have and retain the basic physical and operational attributes and characteristics of their pipelines."

Q. What is the purpose of the rule changes that caused the Company to evaluate existing pressure test records for compliance with PHMSA traceable, verifiable, and complete compliance standards?

A. Mr. Coppola's Exhibit AG-6 identifies the purpose of the rule changes on page 3 of 79, where it states that "The purpose of this final rule is to increase the level of safety associated with the transportation of gas."

Q. Are there other aspects of the new TVC documentation requirement for line segments subject to pressure test records requirements that need to be factored into the Company's determination that existing documents comply with the new standards?

A. Yes. In addition to the minimum pressure test record requirements instituted in 1970, the Company now needs to evaluate if each test record is TVC.

a. For a test record to be considered traceable, it must be able to be linked to a specific pipeline segment. If the test record cannot be traced to a specific pipeline segment, then it cannot be considered TVC.

b. For a test record to be considered verifiable, there must be complementary, but separate documentation available that confirms the test record for that specific pipeline segment. If a test record is not verifiable by other records or documentation, it cannot be considered TVC.

These are two examples of additional record requirements that did not exist prior to the 2020 rule amendment requiring that pressure test and material properties records be TVC. Examples of projects that are planned to replace segments to establish TVC test records include:

a. Line 1009 Huron Park to I-94
b. Line 1022f Vermontville
c. Line 1009/1009c I-94 to Little Mack, 10 Mile to 11 Mile
d. Line 1002f Macomb ITC Corridor
e. Line 1020 Greenfield Rd.
f. Line 1087b E Isabella Rd.
g. Line 1009c, 9 Mile to 10 Mile
h. Line 1041 Lapeer Rd.
i. Line 1026f Mt. Hope
j. Line 1026i MSU PP
k. Line 1090n Davis St.

Q. Are there operational benefits associated with the replacement of pipeline segments that have their MAOP grandfathered and operate above 30% SMYS?

A. Yes, pipeline segments are going to be replaced by thicker and stronger pipeline materials in order to operate below 20% SMYS and will be subject to distribution pipeline integrity management requirements after replacement. Examples of projects that are planned to replace line segments that have their MAOP grandfathered and are currently operated above 30% SMYS include:

a. Line 1002c Coolidge to 11 Mile & Dequindre

b. Line 1022 Airport CG to State Rd & State Rd to W Grand River

c. Line 1093 Shattuck Rd

d. Line 1006 Groebel Dr to Mound Rd.

Q. On page 31, line 18, through page 32, line 2, Mr. Coppola claims that "the genesis of the problem requiring the replacement or remediation of pipelines to re-establish the MAOP is the lack of traceable, verifiable, and complete (TVC) records that should have been maintained by the Company." Do you agree with that claim?

A. No. As indicated previously, the TVC records standard was published in 2019. The Company has several pipeline segments that were constructed prior to test record requirements implemented in 1970 and had their MAOP grandfathered. Grandfathered pipeline segments that operate above 30% of SMYS are now required to have the MAOP reconfirmed because of the new PHMSA rules. Pressure test records for line segments constructed after 1970 are now required to be TVC, which wasn't required previously. The Company was required to thoroughly review its available records and identify line segments that don't have test records that meet the standards defined by the 2019 published rule. The Company's plan to replace various pipeline segments, as opposed to other reconfirmation options, best balances the need to maintain service to customers while complying with the new requirements.

Q. On page 33, line 1 through line 5, Mr. Coppola restates his claim that MAOP replacement projects are "the direct result of the Company not having the appropriate records to verify that the pipelines can operate at the designed pressure level and not knowing their material properties and attributes that would assist in that verification. These are basic records that the Company should have in its possession from when the pipeline was installed." Do you agree with that claim?

A. No. As described above, the Company was required to review its historical records and evaluate compliance considering the new PHMSA standards. The new TVC requirements revise the minimum standard for MAOP records.

Q. On page 33, line 13 through line 16, Mr. Coppola states that "The PHMSA rules enacted in 2019 simply require that pipeline operators do now what they should have been doing all along." Do you agree with that claim?

A. No. Exhibit AG-6 indicates that pipelines installed before 1970 had been operating under "grandfathered" MAOP documentation provisions based on actual operations during the 1965 to 1970 period. Pipelines operating above 30% SMYS are required to now have MAOP records that meet the new TVC standards. Therefore, Mr. Coppola's statement is inaccurate because it does not recognize the new requirement placed on pipeline operators to obtain TVC MAOP records after the rule change.

Q. On page 34, line 3 through line 6, Mr. Coppola claims that the Company is unable to pressure test Line 1080 due to "the lack of records to allow it to establish the pipeline design MAOP" and that the project "would not exist but for the Company's lack of traceable, verifiable, and complete records for Line 1080." Do you agree with that claim?

A. No. Mr. Coppola does not provide any source reference for these statements, and they are contradicted by the information contained in my direct testimony. On page 51 of my direct testimony, I describe how the Line 1080 segment does not require reconfirmation of MAOP. Because the line segment was constructed prior to 1970, and operates at less than 30% SMYS, the new requirements for TVC records do not apply to this line segment. The available records support the operation of this line segment at 325 psi but the line has operated for several years at 400 psi. In order to comply with regulations that require pipeline segments to be operated at their documented MAOP, the Company must reduce the operating pressure on that segment. Reducing the operating pressure on that line creates risk that some of the customers in that area would be unable to receive enough gas volume to operate their natural gas appliances. The Company plans to enhance the gas volume available to the customers on that line to prevent customer outages. The Line 1080 project will also enhance the resilience of that line segment by adding additional gas volume capacity.

Q. Are the revised PHMSA TVC record requirements a root cause for the need for the Line 1080 project?

A. No. Line 1080 record requirements are grandfathered and do not need to be reconfirmed as TVC records because the line was constructed before 1970 and operates below 30% SMYS. Because Line 1080 currently operates at 400 psi, but has a documented MAOP of 325 psi, the Company would need to reduce the pressure on that line segment independent of any the rule changes published by PHMSA in 2019. The Line 1080 project enables the Company to reduce the operating pressure to 325 psi while balancing the need to plan for adequate supply volume on that line segment.

Q. Does Exhibit AG-6 document any reasons why a pipeline operator would find pressure testing to be an undesirable approach to reconfirming MAOP on existing pipelines?

A. Yes. On page 7 of Exhibit AG-6, the content of the exhibit indicates that "Hydrostatic pressure testing can result in substantial costs, occasional disruptions of service, and substantial methane emissions due to the routine evacuation of natural gas from pipelines prior to tests. Further, many operators prefer not to use hydrostatic pressure tests because it can be destructive."

Q. Does the pipeline replacement option offer any additional benefits that merit consideration beyond compliance with new TVC record standards?

A. Yes. The Company plans to upgrade the pipelines on all the MAOP projects using thicker and stronger materials such that pipeline segment replacements will be operated below 20% SMYS, which will enhance the safety of the line segments replaced.

Q. On page 35, line 2 to line 5, Mr. Coppola recommends a capital expenditure disallowance of $93.340 million, or 50% of the Company's 2023 through the test year ending October 31, 2026 expenditures for MAOP-Distribution projects. His testimony claims that a 50% recovery of these projects is reasonable given the age of the pipelines being replaced. Do you agree with his recommended disallowance for those projects?

A. No, I do not agree that Mr. Coppola's recommended 50% recovery of MAOP compliance expenditures is reasonable. The Company is reasonably planning for investments in distribution MAOP projects prior to and during the projected test year in this proceeding to comply with PHMSA regulations. Mr. Coppola's recommendations are based on

assumptions regarding the Company's historical pipeline records and PHMSA's 2019 rule changes that are factually incorrect. The Line 1080 project accounts for approximately $17.359 million[1] of the total recommended disallowance, and the need for additional main in that area has nothing to do with TVC MAOP records requirements as claimed on page 34 of his direct testimony. Excluding or delaying the inclusion of 50% of all projected expenditures for MAOP-Distribution projects in the Company's projected rate base is not a reasonable recommendation. I recommend the Commission adopt the Company's projections as reasonable and prudent investments to include in capital expenditures for the projected test year.

Q. On page 38, line 1 to line 9, Mr. Coppola claims his recommended disallowance of 50% of MAOP project capital expenditures is reasonable because it is not clear how thorough the Company's review process was that led to the conclusion that replacement is the best reconfirmation method. Do you agree with his claim that the Company's discovery response in AG-5, page 2 of 7, is vague about the review process?

A. No, I do not agree that the Company's response to discovery regarding the decision making process is vague. The Company has a process to evaluate all the reconfirmation methods and select the option that is most appropriate for compliance depending on the circumstances of each line segment. The evaluation process for MAOP-Distribution projects is the same as the evaluation process for MAOP-Transmission projects and involved multiple subject matter experts in the decision. Replacement is the is the best compliance option for the Company given the goal of also maintaining or improving

[1] Line 1080 from Exhibit AG-5 page 6 of 7: (383 + 3,829 + 29,945 + 561) = 34,698 x 50% recommended adjustment = 17,359.

deliverability for customers. The other compliance methods are either infeasible or introduce risk to system operations which could result in customer outages or project execution failures. The Company believes the planned replacements are reasonable and recommends that the Commission disregard Mr. Coppola's proposed 50% disallowance.

Q. What are the disallowances proposed by Mr. Coppola with respect to the Tracking and Traceability technology project?

A. Mr. Coppola provides testimony regarding the proposed disallowances for the Company's Tracking and Traceability technology project on page 85, line 11, through page 87, line 6, of his direct testimony. He proposes disallowances of $7.513 million of capital expenditures and $0.509 million of O&M expense from the projected test year as detailed on page 87, lines 4 through 6, of his direct testimony.

Q. What is your response to Mr. Coppola's recommendations regarding the Company's Tracking and Traceability technology project?

A. The Company still expects to incur the Tracking and Traceability amounts provided in this case. The project is required to meet PHMSA proposed regulatory requirements (PHMSA-2014-0098), also known as the Plastic Pipe rule, as described in my direct testimony on pages 76 and 77. As a part of the Investment Planning phase of this project, the Company conducted a Request for Information process and received nine responses. This information was used to estimate the cost for this project. Please reference the rebuttal testimony of Company witness Stacy H. Baker for further details on the strict business case process followed for a project to get to the Investment Planning phase.

Q. Does this conclude your rebuttal testimony in this proceeding?

A. Yes.

Capital	MEC	Deleon	Consumers' projects an increased number of vintage service replacements in 2024, 2025, and 2026, and through 2035. The VSR program spend increases 128 percent from $18.6 million in 2024 to a projected $42.5 million for the test year. Recommends capping at 2024 level.	Yes	Pascarello
Capital	MPSC Staff	Creisher	Disallowance due to reduced projected costs for 2025 AMD capital expenditures provided by audit/discovery	No	Pascarello
Capital	MPSC Staff	Creisher	Disallowance due to reduced projected costs for Line 1010 provided by audit/discovery	No	Pascarello
Capital Structure	ABATE	Walters	ABATE recommends a 50% equity ratio versus the 50.75% proposed by the Company consistent with prior Commission orders.	Yes	Marc Bleckman
Capital Structure	AG	Coppola	AG recommends that the equity ratio should be set at 50.0% consistent with the Commission's order in the Company's most recent rate cases.	Yes	Marc Bleckman
Capital Structure	MPSC Staff	Megginson	Staff recommends a 50% equity ratio versus the 50.75% proposed by the Company. Staff references prior Commission orders which reflect its desire for the Company to reach a 50/50 equity ratio.	Yes	Marc Bleckman
Capital Structure	MPSC Staff	Megginson	Staff recommends a lower cost of long-term debt (4.33% versus 4.35%) as a result of assuming a lower credit spread on projected long-term debt issuances (1.00% versus 1.36%).	Yes	Marc Bleckman
Capital/O&M	AG	Coppola	SAP S/4HANA - AG is recommending disallowance of this project as it sees this project being forced obsolecence by the vendor in order to sell new software, services, and technology. Additionally, the project is not financially justified. Indicating that the current ERP system still functions well and meets the operating need of the Company and could continue to operate the system into 2030 and potentially . In reference to the O&M disallowance, the AG indicates that these costs should be disallowed as the projec is premature and unnecessary.	Yes	Baker
Capital/O&M	AG	Coppola	AG is recommending disallowance based on the conclusion that new software is not necessary due to the service improvement in the past year.	Yes	Baker
Capital/O&M	AG	Coppola	AG is recommending disallowance based on the project being in the investment planning phase and indicating that resolving the water infiltration risk and and aging climate equipment would be a lower cost.	Yes	Baker
Capital/O&M	AG	Coppola	AG is recommending disallowance based on the project not providing any cost savings or financial benefits.	Yes	Baker
Capital/O&M	AG	Coppola	Gas Facilities Tracking and Traceability - AG is recommending disallownce of this project indicating that the project is not economically justified and the project is the preliminary stage of development.	Yes	Warriner/Baker
Capital/O&M	CUB	Veerapaneni	Not evaluating projects on merits but instead relying on historical	Yes	Myers

Capital/O&M	MPSC Staff	Klocke	Staff recommends disallowance as they feel the project offers technology that is redundant and nor worth the cost. Additionally, Staff is concerned that the Company's website redsign has been put on hold and that the website updates would essentially provide the same kind of information and accessibility the Web Chat AI tool would provide. Staff also thinks that the examples of things that the chat bot would provide are things that should already easily be found on the Company's website. Additionally, Staff takes issue with the fact that no reduction in overall costs is anticipated from the Web Chat AI.	Yes	Byrom/Baker
Capital/O&M	MPSC Staff	Klocke	Consistent with positions in prior cases, Staff is recommending full disallowance of costs for Self-Service Mobile Application enhancements. Additionally, Staff has concerns for requested costs for 2025 and 2026 are unspecified and classified as emergent and makes comparison to contingency, specifically the App Support Center and App Login enhancements.	Yes	Byrom/Baker
Capital/O&M	MPSC Staff	Klocke	Staff is recommending full disallowance of the LMI Customer Support project and the associated enhancements. Staff feels strongly that the Company update their website to make information such as this standard.	Yes	Byrom/Baker
Capital/O&M	MPSC Staff	Zichi	Staff is recommending this adjustment to correct an error that was found through discovery.	No	Baker
Capital/O&M	MPSC Staff	Zichi	Staff is recommending this adjustment to correct for an error that was identified through discovery.	No	Baker
Capital/O&M	MPSC Staff	Zichi	Staff is recommending this adjustment to correct for a change in the project that was discovered during audit of the Company's projects.	No	Baker
Capital/O&M	Staff	Rueckert	Staff position is to disallow the LIBA benefit awards for rate recovery including O&M and Capital. The Staff is also wanting the 2024 capitalization amount disallowed. Shannon Rueckert testimony page 3 to 5.	Yes	Grob
Cost of Service	ABATE	York	Reccomends replacing the current Average and Peak allocation with an Average and Excess Demand ("AED") allocation because it prevents double counting of peak day volumes and better reflects cost causation principles by recognizing the variability in load between customer classes	No	Geller
Cost of Service	ABATE	York		No	Geller
Cost of Service	CUB	Bunch	reccomends allocating uncolectibles based on Cost of servce plus gas rather than the current approved method, because it better reflects each rate class's contribution to uncollectible expenses	Yes	Geller
Cost of Service	LWBL-MSU	Lyons	Recommended functionalizing Other Distribution Plant accounts 773, 375 and 378 between High Pressure and Non-High Pressure before allocating to each rate class because it more accurately allocates costs to Rate XXLT. End result would be using existing allocator 217.	Yes	Geller
Cost of Service	MPSC Staff	Krause	Staff recommends allocating uncollectible expenses based on revenue rather than the current approved method, because it better reflects each rate class's contribution to uncollectible expenses	No	Geller

Category	Intervenor	Intervenor Witness	Intervenor Position	Disagree?	CE Witness
O&M	CUB	Denzler	Witness alleges insufficient detail is provided concerning Fleet Responsibility costs, how they are derived, and where they settle in the business. Witness recommends a 20% disallowance of all Responsibility costs basically on the notion that no one within the Company can confirm where these costs manifest and therefore they should simply be taken out of Fleet since this is the only specific place these expenses are recognized as existing. The witness' logic continues . . . because no one can demonstrate where these costs manifest and for what purpose they are ultimately expended no one therefore can definitely state that these costs are "reasonable and prudent" .	Yes	Guinn
O&M	CUB	Veerapaneni	Recommending the use of the adjusted two-year average for the test year	Yes	Griffin
O&M	CUB	Veerapaneni	Recommending the use of the adjusted two-year average for the test year	Yes	Joyce
O&M	CUB	Veerapaneni	Recommending the use of the adjusted two-year average for the test year	Yes	Pascarello
O&M	MPSC Staff	MCMILLAN-SEPKOSKI	Staff recommends disallowance of the operational measures portion of EICP for the top 5 officers.	Yes	Conrad
O&M	MPSC Staff	Zichi	Staff is recommending this adjustment to correct an error discovered during audit. The Company provided O&M costs that were inadvertently overstated and did not account for optimization in contractor costs.	No	Baker
O&M	MPSC Staff	Zichi	Staff is recommending this adjustment to correct an error discovered during audit. The Company provided O&M costs that were inadvertently overstated and did not account for optimization in contractor costs.	No	Baker
O&M	MPSC Staff	Zichi	Staff is recommending this adjustment to correct an error that was discoveryed during its audit of the Company's projects.	No	Baker
O&M	ABATE	Fitzhenry	Witness states the company doesn’t have a leak backlog.	Yes	Pnacek
O&M	ABATE	Fitzhenry	Proposed disallowance of $1.3M for leak backlog due to the LDAR rule not being published yet	Yes	Pnacek
O&M	ABATE	Fitzhenry	Do not approve the LDAR deferral mechanism because the rule is on-hold page 17	No	Pnacek
O&M	AG	Coppola	Corporate O&M: General Activities Labor is unusual and excessive	Yes	Foster
O&M	AG	Coppola	Increasing expense not supported	Yes	Griffin
O&M	AG	Coppola	Reduce MAOP records review (SEA) O&M by 50%	Yes	Griffin
O&M	AG	Coppola	Based on the Company's methane emission reduction goals, there should be a reduction in the LAUF.	Yes	Joyce
O&M	AG	Coppola	Recommends the Commission remove all VSP cost savings from the Company's projected O&M expense because the Company cannot provide certainty the cost savings were incorporated in the test year O&M exoebse for each of the affected departments.	Yes	Myers
O&M	AG	Coppola	AMD is too expensive. There has been no evidence presented by the Company that the existing leak detection is missing serious and dangerous gas leaks that is placing customers and the public in danger or that large quantities of natural gas are escaping into the atmosphere that pose a large financial loss or environmental hazard.	Yes	Pascarello

Consumers Energy Company's
Table of Disputed Issues
MPSC Case No. U-21806

Category	Intervenor	Intervenor Witness	Intervenor Position	Disagree?	CE Witness
O&M	AG	Coppola	Did not provide any evidence that the cost paid by customers for this function is having a significant beneficial impact, reducing costs or achieving other financial benefits. Without that information, it is not possible to assess the value created by the Quality Lean Office.	Yes	Pascarello
O&M	AG	Coppola	Mr. Pnacek's direct testimony does not explain this increase in expense for EIRP Training. And then discovery response is misrepresented	Yes	Pnacek
O&M	AG	Coppola	No evidence of a high turnover in employees has been presented to justify the training of a larger number of employees or contractors. Furthermore, as I proposed in the Capital Expenditures section of my testimony, the EIRP should be scaled back beginning with the projected test year to stay within a reasonable cost budget. This reduction in spending will require fewer resources, Therefore, I recommend that the Commission remove the increase of $1,656,000 from the Company's forecasted O&M expense.	Yes	Pnacek
O&M	AG	Coppola	Do not approve the LDAR deferral mechanism because the rule is on-hold page 195	No	Pnacek
O&M	AG	Coppola	Proposed disallowance of $1.3M for leak backlog due to the LDAR rule not being published yet	Yes	Pnacek
O&M	AG	Coppola	The word "typically, gas" implies it is the standard. We as no major gas utility uses the shared model. Page 167, line 14-18	Yes	Pnacek
O&M	AG	Coppola	Charactization as an experimental program to establish whether the incremental benefits justified the incremental cost of a dedicated program. Page 168, line 1-6	Yes	Pnacek
O&M	AG	Coppola	Company didn't attempted to work with the shared model staking and locating contractors to resolve whatever problems with performance existed and in turn minimize the cost of staking and location. Page 168, line 7-14	Yes	Pnacek
O&M	AG	Coppola	The Company did not provide any evidence that a serious problem with staking and locating exists in those counties that cannot be resolved in other ways. Page 168, line 15-19	Yes	Pnacek
O&M	AG	Coppola	Mr. Pnacek states that based on recent bids received from contractors the cost per unit is lower for the dedicated model than the shared model. This is counter to the historical evidence presented by the Company. Page 168, line 20 to Page 169 line 4	Yes	Pnacek
O&M	AG	Coppola	The bidding process that the Company went through in 2024 cannot be relied on. Page 169 line 4-9	Yes	Pnacek
O&M	AG	Coppola	Recommends that the Commission remove the incremental O&M expense of $11,184,000 included by the Company in the projected test year. Page 169 line 12 Page 170 line 2	Yes	Pnacek
O&M	CUB	Bunch	Limit O&M and capitalized labor costs to historic levels plus productivity adjusted inflation. Limit Other O&M and capital costs to inflation less productivity.	Yes	Myers
