June 3, 2025

Ms. Lisa Felice
Executive Secretary
Michigan Public Service Commission
7109 West Saginaw Highway
Post Office Box 30221
Lansing, MI 48909

Re: MPSC Case No. U-21806 – In the matter of the application of Consumers Energy Company for authority to increase its rates for the distribution of natural gas and for other relief.

Dear Ms. Felice:

Enclosed for electronic filing in the above-captioned case, please find the **Redacted Official Exhibits of Consumers Energy Company**. The Confidential Official Exhibits will be filed under seal with the Executive Secretary.

This is a paperless filing and is therefore being filed only in PDF. Also included is a Proof of Service showing electronic service upon the parties.

Sincerely,

Digitally signed by Anne M. Uitvlugt
Date: 2025.06.03 09:35:15 -04'00'

Notes

{a} Transportation revenues related to MCV, the Jackson Plant, and others under ACT 9 contract have been omitted from the calculation of total revenue from the transmission of gas of others. These are Act 9 contracts and not tariff rates. These contracts remain in other revenue so that customers benefit from the revenue derived from the assets they pay for.

This exhibit demonstrates the projected break down for each program into the cost components shown above. The 2023 amounts are the actual amounts. The cost component projections for 2024 and beyond are based upon the 2023-2024 18 month (Jan 2023 - Jun 2024) average actual percentage of the breakdown of these components in these programs. The Company projects the program expenditures at a total dollar level based upon historical spending and known projects or other changes. Cost confidence levels were not used to develop these cost projections.

								$ 20,951	$ 580,003	$ 559,051	3.61%

[i] Offering Completion Date
[ii] Underwriting discount is calculated as the market price minus the offering price when not explicitly given in the prospectus.

The flotation cost adjustment is derived by dividing the dividend yield by 1 − F (where F = flotation costs expressed in percentage terms), or by 0.9639, and adding that result to the constant growth rate to determine the cost of equity. Using the formulas shown previously in my testimony, the Constant Growth DCF calculation is modified as follows to accommodate an adjustment for flotation costs:

$$k = \frac{D \times (1 + 0.5g)}{P \times (1 - F)} + g$$

Ties to 13-Month Average in Exhibit A-14 (MRB-2), Schedule D-1a, pg. 2

68 **Calculations:**
69 Column (i) = Yield formula based on inputs from column (b),column (c), column (d), column (d1), and column (h) calculated on an annualized basis.
70 Column (j) = Represents the average amount of debt outstanding for the test year.
71 Column (k) = column (i)*column (j).
72 Lines 27, 30, and 31 Coupon Rate = Projected SOFR Rate of 3.36% minus 0.30%.
73 Lines 37, 46, and 47 - As this is a partial year debt outstanding, pro-rata balance and pro-rata interest expense are used which would result
74 in the same cost rate as an annual analysis, but provides a more accurate average debt balance for the Test Year. This would make
75 the Total Debt balance line 64 tie to the debt balance shown on Exhibit A-14 (MRB-2), Schedule D-1a, page 2.
76 Line 58 - Amortization of losses on reacquired debt projected for the test year ending October 31, 2026.
77
78 Projected SOFR Rate — Test Year Avg.

Summary

Line No.	Facility	Agreement Date	Expiration	Facility Amount	Test Year Assumption: Less: Avg. Borrowings (A)	Less: Letters of Credit (B)	Amount Unused[a] (C)	Upfront Fee Amort (D)
4	1. JPMorgan Revolver	Jun. 2018	Dec. 2027	$ 1,100.0	$ -	$ 28.1	$ 1,071.9	$ 0.4
5	2. Commercial Paper Facility	Sep. 2014	N/A	$ 500.0	$ 201.4	$ -	$ -	$ -
6	3. Scotiabank Revolver	Nov. 2018	Nov. 2025	$ 250.0	$ -	$ 56.7	$ 193.3	$ 0.3

Cost of Short-Term Debt

(A) **Interest on Borrowings** - Calculated on the projected drawn balance at SOFR plus the spread on borrowings.

Facility	SOFR[b]	Plus: Spread	Projected Rate	Avg. Borrowings	Cost
1. JPMorgan Revolver	3.36%	0.850%	4.21%	$ -	$ -
2. Commercial Paper Facility	3.36%	0.000%	3.36%	201.4	6.8
3. Scotiabank Revolver	3.36%	0.800%	4.16%	-	-
					$ 6.8

(B) **Letter of Credit Fees** - Calculated on the projected letters of credit outstanding at a rate equal to the spread.

Facility	Letter of Credit Type	Projected Rate	Letters of Credit	Cost
1. JPMorgan Revolver	Regular Operating	0.850%	$ 28.1	$ 0.2
2. Commercial Paper Facility	N/A	N/A	-	-
3. Scotiabank Revolver	MISO Margin & Other	0.800%	56.7	0.5
				$ 0.7

(C) **Unused (Commitment) Fees** - Calculated on the unused portion of the revolver at a rate stated in the facility agreement.

	Projected Rate	Amount Unused[a]	Cost
1. JPMorgan Revolver	0.070%	$ 1,071.9	$ 0.8
2. Commercial Paper Facility	N/A	-	-
3. Scotiabank Revolver	0.075%	$ 193.3	$ 0.1
			$ 0.9

(D) **Amortization / Expense of Facility Fees** - Fees paid upfront at the inception or amendment to the facility, amortized over the life of the facility.

	Annual Cost
1. JPMorgan Revolver	$ 0.4
2. Commercial Paper Facility	-
3. Scotiabank Revolver	0.3
	$ 0.7

Total Cost of Short-Term Debt **$ 9.1**

[a] Commercial Paper drawn balances go against, or are "backstopped," by the Company's JPMorgan Revolver. To the extent amounts are borrowed under the Commercial Paper Facility, the availability of the JPMorgan Revolver are reduced. These borrowings do not, however, reduce the "unused" portion of the revolver in calculating the unused (commitment) fees.

[b] Projected SOFR rate per Exhibit A-14 (MRB-4), Schedule D-2. Forecasted SOFR assumed to closely approximate commercial paper rate.

C8. CUSTOMER ATTACHMENT PROGRAM

A. Purpose

The Company proposes to make extension of its gas mains and/or service lines from time to time, at its own cost, to serve applicants whose requirements will not disturb or impair the service to prior users or will not require an expenditure out of proportion to the revenue obtainable therefrom.

The Company reserves the right to delay or deny a request for service under this rule, if fulfilling such a request could, in the Company's opinion, create conditions potentially adverse to the Company or its Customers. Such conditions may include, but are not limited to, safety issues, system operating requirements or capital constraints. The provisions under this Rule are in addition to the existing rules and tariffs for customer gas service.

When relocation or modification of Company facilities to an existing structure with gas service is requested or made necessary by the customer, all costs for the relocation or modification shall be charged to the requesting party.

B. Customer Contribution

A customer contribution shall be required totaling the following components: Connection Fee, any Revenue Deficiency, any Excessive Service Line Fee, and any Direct Charges. Direct Charges include, but are not limited to, any specific license fees, inspection fees, or rights of way fees charged by any political subdivision for any construction provided under this rule and are to be paid directly to the Company. Direct charges shall also include an additional charge per foot for winter construction of all underground construction as installed, excluding conduit, applied to projects constructed during the period of December 15 to April 15, for installation of distribution or service facilities. This charge shall be based on periodic reviews of actual costs by the Company *and may be waived, in whole or in part, at the Company's discretion for certain changes in work schedule or when work conditions or site conditions enable efficient construction and resource deployment which permit the Company to not incur certain costs*.

Any written communication from the Company regarding construction activity and its associated contribution due from the customer, unless specified otherwise in the document, shall have an expiration date of 60 days from the date issued. If either the customer or the Company takes no action by that time, the Company shall have the right to withdraw the proposal or modify the conditions under which it was made.

The Company, at its sole discretion, may waive fees or extend the service line limit for attaching parties located at the Company's storage fields or gas well locations based on the economics of a proposed project, when provided for in writing by the Company. The Company, at its sole discretion, may also waive in writing, fees for select attaching parties or projects where work conditions or site conditions enable efficient construction and resource deployment which permit the Company to not incur certain costs.

C. Payment of Customer Contribution

The Connection Fee, Direct Charges and the Excessive Service Line Fee are payable in lump sum prior to construction. The Company may choose to collect these charges after construction, but prior to the meter being set, at the Company's discretion, when it allows the Company to better align the construction schedule with the customers' desired service dates. The Connection Fee is non-refundable. The Direct Charges and Excessive Service Line Fee are refundable if the service line has not been installed. If the service line has been installed, the Direct Charges and Excessive Service Line Fees are non-refundable. In the case of a lump sum default of payment, and after 180 days have passed, the account will automatically be set up as a fixed monthly surcharge payment.

(Continued on Sheet No. C-38.00)

(Continued From Sheet No. C-39.00)

C8. CUSTOMER ATTACHMENT PROGRAM (Contd)

I. Model Assumptions

Incremental Revenues:

The incremental revenues will be calculated based on current rates and a forecast of the timing and number of customer attachments as well as the customer's annual consumption levels.

Incremental Costs:

(1) Carrying Cost Rate

The carrying cost rate will be based on the weighted rate of debt, preferred stock, equity and associated taxes. The cost will be equal to and weighted in proportion to those authorized in the Company's most recent rate order. The carrying cost rate is equal to *9.11* ~~8.74~~%.

(2) Plant in Service

Plant in Service shall reflect the Company's estimated cost to construct distribution mains, customer service lines, meters and pressure regulators or regulating facilities for the Project. The timing of the facility investment, primarily service lines, will correspond with the projected timing of the customer attachments.

(3) Carrying Costs

The Carrying Costs will be the product of the average of beginning and end-of-year net plant, Plant in Service minus accumulated depreciation minus deferred taxes, multiplied by the Carrying Cost Rate, noted in paragraph 1 above.

(4) Depreciation

Depreciation expense will be the product of Plant in Service multiplied by the appropriate prescribed depreciation rates approved for the Company.

(5) Property Taxes and Other Operating Expenses

Property taxes will be the product of Plant in Service multiplied by the Company's average property tax rate. All other incremental operating expenses will be included as identified. Incremental O&M will at a minimum include a proportional cost for monthly meter reading, billing and mailing.

(6) Discount Rate

The discount rate will be a weighted rate of long-term debt, preferred stock and common equity. The cost will be equal to and weighted in proportion to those authorized in the Company's most recent rate order. Based on the Company's rate order in Case No. *U-21806* ~~U-21490~~, the discount rate is equal to *7.35* ~~7.07~~%.

J. Customer Attachment Project Areas

All gas sold in any area specifically listed below is subject to the following Customer Attachment Project (CAP) charges. CAP areas and charges shall be added to or removed from the list from time to time by the Company.

(Continued on Sheet No. C-41.00)

SURCHARGES

Each Rate Schedule may be subject to Rule No. C8., Customer Attachment Program.

Rate Schedule	Energy Efficiency [1] Program Surcharge (Case No. U-21321) Effective beginning the March 2024 Billing Month [2] [3]
Rate A	$0.3359/Mcf
Rate A-1	0.3359/Mcf
Rate GS-1	0.6638/Mcf

Rate LTT	*NA*
Rate XLTT	*NA*
Rate XXLTT	*NA*

(1) All surcharges shall be applied on a monthly basis. The customer's consumption will be reviewed annually in the January bill month. Following the annual review, the customer may be subsequently moved to the surcharge level for their applicable rate for the next billing period based on the customer's average consumption for the previous year. No retroactive adjustment will be made due to the application of EE surcharges associated with increases or decreases in consumption.

(2) An Energy Efficiency Program Surcharge amount may vary during specific months as authorized by the Michigan Public Service Commission. The Company will file a new tariff sheet to reflect any change in surcharges once the financial incentive recovery period has been completed.

(3) The Energy Efficiency Program Surcharge for each rate will be shown as above on the monthly utility bill under Other Surcharges for all customers.

SURCHARGES

Each Rate Schedule may be subject to Rule No. C8., Customer Attachment Program.

RESIDENTIAL SERVICE RATE A

Availability

Subject to any restrictions, this rate is available to any customer desiring gas service for any usual residential use in private family dwellings; tourist homes, rooming houses, dormitories, nursing homes and other similarly occupied buildings containing sleeping accommodations for up to six persons; or multifamily dwellings containing two households served through a single meter.

This rate is not available for resale service, multifamily dwellings containing more than two living units served through a single meter or for tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons or for any other Non-Residential usage.

Residences in conjunction with commercial or industrial enterprises and mobile home parks may take service on this rate only under the Rules and Regulations contained in the Company's Gas Rate Book.

Monthly Rate

Customer Charge

$*20.00* ~~15.00~~ per customer per month, plus

Income Assistance Service Provision:

When service is supplied to a Principal Residence Customer, where the total household income does not exceed 150% of the Federal Poverty level, a credit shall be applied during all billing months. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. A Home Heating Credit energy draft
2. State Emergency Relief
3. Assistance from a Michigan Energy Assistance Program (MEAP)
4. Medicaid

If a customer does not meet any of the above requirements, a low-income verification from will be provided by the Company for the customer to complete and return.

The monthly credit for the Income Assistance Service Provision (RIA) shall be applied as follows:

Income Assistance Credit: $(*20.00* ~~15.00~~) per customer per month

If a credit balance occurs, the credit shall apply to the customer's future gas utility charges.

Low Income Assistance Credit (LIAC):

Company selected Residential customers may receive LIAC for up to 12 consecutive months. The number of customers enrolled may be adjusted, at the Company's discretion, in order to dispense Commission-approved LIAC funding on an annual basis. Any shortfall in the dispensing of annual LIAC funds to qualified customers shall be carried over into the subsequent LIAC program year. LIAC customer selection will be based on highest need and with total household income that does not exceed 150% of the Federal Poverty level. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. Customers whose total household income does not exceed 150% of the Federal Poverty level within the last 12 months
2. Customers who have received assistance from a Michigan Energy Assistance Program (MEAP)
3. Customers who have received a Home Heating Credit energy draft
4. A State Emergency Relief program
5. Medicaid
6. Customers that have participated in a Supplementary Nutrition Assistance Program where the total household income does not exceed 150% of the Federal Poverty level within the last 12 months

If the customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for LIAC shall be applied as follows:

Low Income Assistance Credit: ($30.27) per meter per month

If a credit balance occurs, the credit shall apply to the customer's future gas utility charges. Re-enrollment, if applicable, and confirmation of qualification is required for each annual period of participation.

Customers selected for LIAC, will not be eligible for the RIA provision while enrolled in LIAC.

Consumers Energy Company

RESIDENTIAL SERVICE RATE A

(Continued From Sheet No. D-10.00)

Monthly Rate (Contd)

Distribution Charge

$ *5.8140* ~~5.1950~~ per Mcf for all Mcf purchased.

Gas Cost Recovery Charge

The gas cost recovery factors are shown on Sheet No. D-5.00.

General Terms and Surcharges

This rate is subject to all general terms and conditions shown on Sheet No. D-1.00 and surcharges shown on Sheet Nos. D-2.00 through D-4.00.

Minimum Charge

The Customer Charge included in the rate, adjusted for qualified service provision credit and any applicable non-consumption based surcharges.

Due Date and Late Payment Charge

The due date of the customer's bill shall be 21 days from the date of transmittal. A late payment charge of 2%, not compounded, of the portion of the bill, net of taxes, shall be assessed to any bill that is delinquent. A customer who participates in the Winter Protection Plan or who is 65 years of age or older and who has notified the Company the customer is 65 years of age or older, shall be exempt from a late payment charge as described in Rule B2., Consumer Standards and Billing Practices for Electric and Natural Gas Service, R 460.125, Late payment charges.

Term and Form of Contract

Service under this rate shall not require a written contract.

M.P.S.C. No. 3 - Gas **Sheet No. D-12.00**
Consumers Energy Company

MULTIFAMILY DWELLING SERVICE RATE A-1

Availability

Subject to any restrictions this rate is available to any multifamily dwelling installation containing more than two households served through a single meter and where, in the Company's opinion, it is impractical to provide gas service to each household through an individual meter. This rate is not available for multifamily dwellings containing two households served through a single meter.

Monthly Rate

Customer Charge

$ *20.00* ~~15.00~~ per month

Distribution Charge

$*5.8140* ~~5.1950~~ per Mcf for all Mcf purchased plus
$*0.1217* ~~0.0913~~ per Mcf of excess peak demand

Gas Cost Recovery Charge

The gas cost recovery factors are shown on Sheet No. D-5.00.

General Terms and Surcharges

This rate is subject to all general terms and conditions shown on Sheet No. D-1.00 and surcharges shown on Sheet Nos. D-2.00 through D-4.00.

Minimum Charge

The Customer Charge included in the rate, adjusted for qualified service provision credit and any applicable non-consumption based surcharges.

Due Date and Late Payment Charge

The due date of the customer's bill shall be 21 days from the date of mailing. A late payment charge of 2% of the unpaid balance outstanding, net of taxes, shall be assessed to any bill which is not paid in full on or before the due date shown thereon.

Determination of Excess Peak Demand

The Mcf used for billing the excess demand shall be equal to all usage in excess of 45 Mcf in the peak month. The peak month shall be that month in the latest 12 months in which the greatest consumption occurred.

If 12 months of historical data are not available for a premises, then the Company shall use an estimated peak usage while accumulating 12 months of data. If, during the accumulation of 12 months of data, any month's actual usage exceeds the original estimated peak usage, then the actual usage shall become the new peak demand. However, if after 12 months the estimated peak usage exceeds the actual peak month's usage, then the customer's bills shall be recalculated using the actual and any overcharge shall be refunded with interest.

Term and Form of Contract

Service under this rate shall not require a written contract.

GENERAL SERVICE RATE
(Rates GS-1, GS-2 and GS-3)

Availability

Subject to any restrictions, this rate is available to any customer desiring gas service for any Non-Residential usage which includes tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons. Gas shall not be purchased under any other rate for any equipment or process which uses gas under this rate.

This rate is not available for residential usage or for resale purposes.

Monthly Rate

	Service Category		
	GS-1	GS-2	GS-3
Principal Customer Charge	$*24.00* ~~18.00~~/meter	$*146.83* ~~133.32~~/meter	$*437.80* ~~324.50~~/meter
Contiguous Customer Charge	*21.00* ~~14.00~~/meter	*45.00* ~~40.00~~/meter	*125.00* ~~80.00~~/meter
Distribution Charge	$*5.1657* ~~4.9147~~/Mcf	$*3.6914* ~~3.5306~~/Mcf	$*3.3422* ~~3.3012~~/Mcf

Selection of Service Category and Rates

Customers may choose the Service Category under which they take service, consistent with the provisions of Rules C4.1, Classes of Service, and C4.2., Choice of Rates. When the Customer is selecting its initial Service Category, the Company must advise them that the estimated economic breakeven point between GS-1 and GS-2 is approximately 1,000 Mcf per year and the estimated economic breakeven point between GS-2 and GS-3 is approximately 10,000 Mcf per year. Economic breakeven points may vary based on the usage and number of customer contiguous accounts. After the initial selection is made, then it is the customer's responsibility to determine when it is appropriate to switch Service Categories, as permitted by Rule C4.2, Choice of Rates.

Gas Cost Recovery Charge

The gas cost recovery factors are shown on Sheet No. D-5.00.

General Terms and Surcharges

This rate is subject to all general terms and conditions shown on Sheet No. D-1.00 and surcharges shown on Sheet Nos. D-2.00 through D-4.00.

Minimum Charge

The Customer Charge included in the rate and any applicable non-consumption based surcharges.

Due Date and Late Payment Charge

The due date of the customer's bill shall be 21 days from the date of mailing. A late payment charge of 2% of the unpaid balance outstanding, net of taxes, shall be assessed to any bill which is not paid in full on or before the due date shown thereon.

Term and Form of Contract

Service under this rate shall not require a written contract.

This sheet has been cancelled and is reserved for future use.

~~GENERAL SERVICE OUTDOOR LIGHTING RATE GL~~

~~This Rate Is Not Open to New Business~~

~~Availability~~

~~Subject to any restrictions, this rate is available to any commercial or industrial customer for streetlighting or outdoor area lighting service for any system consisting of two or more gas luminaires where the Company has an existing gas distribution system.~~

~~Nature of Service~~

~~The customer shall furnish the necessary posts, luminaires and fixtures. The Company shall install this equipment and make all connections to its gas distribution system. The Company shall supply the gas, renew the mantles, clean the luminaires and paint all metal parts as needed; all other renewals and maintenance shall be paid for by the customer.~~

~~Monthly Rate~~

~~$6.00 per luminaire having a rated consumption of 2.5 cubic feet or less per hour.~~

~~$11.00 per luminaire having a rated consumption of more than 2.5 cubic feet but not more than 4.5 cubic feet per hour.~~

~~General Terms and Surcharges~~

~~This rate is subject to all general terms and conditions shown on Sheet No. D-1.00 and surcharges shown on Sheet Nos. D-2.00 through D-4.00.~~

~~Due Date and Late Payment Charge~~

~~The due date of the customer's bill shall be 21 days from the date of mailing. A late payment charge of 2% of the unpaid balance outstanding, net of taxes, shall be assessed to any bill which is not paid in full on or before the due date shown thereon.~~

~~Term and Form of Contract~~

~~Minimum term of three years on written contract and year to year thereafter until terminated by mutual consent or upon three months' written notice given by either party.~~

~~Special Terms and Conditions~~

~~The Company reserves the right to make special contractual arrangements as to term or duration of contract, termination charges, contributions in aid of construction, monthly charges or other special consideration when the customer requests service, equipment or facilities not normally provided under this rate.~~

TRANSPORTATION SERVICE RATE
(Rates ST, LT, XLT and XXLT)

Availability

Subject to any restrictions, service under this Rate Schedule is available to any customer that could otherwise purchase gas under another Company Rate Schedule. A customer selecting transportation service, is not eligible to receive Gas under any of the Company's firm Gas sales rates for a minimum period of one year from the date the customer commenced taking Transportation Service.

Service provided to Rate Schedule XXLT is available to customers with an annual minimum throughput of 4,000,000 Mcf, subject to an annual review to ensure the minimum requirement is met. Customers served under the XXLT Rate Schedule will be required to operate at a contracted Authorized Tolerance Level of 4% or less.

Under this Rate Schedule, the Company shall transport Gas for the customer to the interconnections between the Company's facilities and those of the customer (points of delivery) from the interconnections between the Company's facilities and those of a third party that delivers Gas to the Company for redelivery to the customer (points of receipt).

A producer or a broker may contract for service on this Rate Schedule for the transportation of Gas from a wellhead through the Company's system to another pipeline, for the transportation of Gas from one pipeline to another pipeline or for the transportation of Gas from a specified interconnection between the Company's facilities and those of a third party for delivery to a specific customer within the Company's integrated distribution system, provided that all Gas transported for a producer or broker pursuant to this Rate Schedule is consumed in and never leaves the State of Michigan after entering the Company's system.

All customers requesting transportation service under this Rate Schedule shall make written application for such service on a form provided by the Company.

Monthly Rate

*The XXLT Transportation Rate reflects a contracted Authorized Tolerance Level of 4%.

Selection of Service Category and Rates

A customer may choose the Service Category under which they take service, consistent with the provisions of Rules C4.1, Classes of Service, and C4.2, Choice of Rates. When the customer is selecting its initial Service Category, the Company must advise them that the estimated economic breakeven point between ST and LT is approximately 100,000 Mcf per year, the estimated economic breakeven point between LT and XLT is approximately 500,000 Mcf per year. The estimated economic breakeven points assume an 8.5% ATL for rates ST, LT and XLT and exclude contiguous customer charges and all surcharges. Economic breakeven points may vary based on the throughput, contracted ATL and number of customer contiguous accounts. After the initial selection is made, then it is the customer's responsibility to determine when it is appropriate to switch Service Categories, as permitted by Rule C4.2, Choice of Rates.

(Continued on Sheet No. E-9.00)

TRANSPORTATION SERVICE RATE

(Rates ST, LT, XLT and XXLT)
(Continued From Sheet No. E-9.00)

Monthly Rate (Contd)

Load Balancing Charge (Contd)

ST, LT and XLT customer's ATL shall be 8.5% of the Customer's ACQ unless the customer contracts for a different percent in accordance with the following table. The Transportation Charge shall be adjusted as follows except for Transportation customers served on XXLT, where service is offered at 4% ATL or less:

Authorized As a % of ACQ Tolerance Level	ST, LT and XLT Transportation Charge Adjustment	XXLT Transportation Charge Adjustment
2.0%	$(*0.0781* ~~0.0732~~) Per Mcf	$(*0.0240* ~~0.0225~~)/Per Mcf
4.0%	$(*0.0540* ~~0.0507~~) Per Mcf *	No Change*
6.5%	$(*0.0240* ~~0.0225~~) Per Mcf	N/A
7.5%	$(*0.0120* ~~0.0113~~) Per Mcf	N/A
8.5%	No Change	N/A
9.5%	$ *0.0120* ~~0.0113~~ Per Mcf	N/A
10.5%	$ *0.0240* ~~0.0225~~ Per Mcf	N/A

*For XXLT customers, the 4% ATL adjustment is reflected in their Transportation Rate, therefore there is no additional ATL adjustment required.

The monthly injection of Gas into the customer's ATL shall be at the customer's discretion except in September and October when any monthly injections in excess of 1.43% of the customer's ACQ, will be charged the Load Balancing Charge. A balance transfer between customers that does not directly result in any physical injection of gas into the Company's system may, in the Company's discretion, be exempted from the 1.43% monthly limit. Such a waiver may be granted once within any 12-month period.

Due Date and Late Payment Charge

The due date of the customer's bill shall be 21 Days from the date of mailing. A late payment charge of 2% of the unpaid balance outstanding, net of taxes, shall be assessed to any bill which is not paid in full on or before the due date shown thereon.

Metering Requirements

All eligible XLT and XXLT customers shall be required to provide, at no expense to the Company, a dedicated telecommunication line(s) as required for metering purposes, to a location specified by the Company. The communication link must be installed and operating prior to a transportation customer receiving service under Service Category XLT or XXLT. The customer shall be responsible for (i) ensuring that the communication links allow access to the meter data by the Company and are compatible with the Company's metering and billing systems, and (ii) all associated costs relating to the communication links including other accompanying equipment and monthly fees. The Company shall own and maintain the actual metering equipment and modem.

(Continued on Sheet No. E-11.00)

TRANSMISSION ONLY TRANSPORTATION SERVICE RATE ~~TOT~~

(Rates STT, LTT, XLTT and XXLTT)

Availability

Subject to any restrictions, service under this Rate Schedule is available to customers desiring to move gas through the Company's transmission system *only* ~~to a point of delivery off the Company's distribution system~~. *This rate is not available to power generation customers.*

Under this Rate Schedule, the Company will transport natural gas volumes for a customer on the Company's gas transmission system only. The Company, in its sole judgement, shall have the right to determine if capacity is available for transportation under this Rate Schedule.

All customers requesting transmission service under this Rate Schedule shall make written application for such service on a form provided by the Company. The point(s) of receipt and point(s) of delivery shall be mutually agreed upon by Company and Customer and set forth in the contract. Any rates, terms and conditions not covered by Tariff shall be as contained in Company's standard Contract for Transmission Only Transportation Service.

Monthly Rate

~~**Transmission Only Charge**~~

~~$0.4533 per Mcf~~

	Service category			
	STT	*LTT*	*XLTT*	*XXLTT*

Customer Charge:	*208.22/meter*	*1,384.54/meter*	*2,447.53/meter*	*20,365.47/meter*

Selection of Service Category and Rates

A customer may choose the Service Category under which they take service, consistent with the provisions of Rules C4.1, Classes of Service, and C4.2, Choice of Rates. The Company must advise the customer that the estimated economic breakeven point between STT and LTT is approximately 100,000 Mcf per year, the estimated economic breakeven point between LTT and XLTT is approximately 500,000 Mcf per year. After the initial selection is made, then it is the customer's responsibility to determine when it is appropriate to switch Service Categories, as permitted by Rule C4.2, Choice of Rates.

Operational Balance Agreement (OBA)

The aggregate quantity of gas delivered by the Company to the customer's delivery point(s), may be inadvertently greater or less than the aggregate quantity of gas nominated for delivery by the customer. This inadvertent over-delivery or under-delivery of gas by the Company to the customer relative to the nominated quantities shall be governed by a separate OBA with a delivery point operator.

The Company reserves the right to require the customer to balance nominations with physical deliveries on a daily basis, and to reduce the Operational Imbalance to the maximum thresholds identified in the OBA or to a level determined by the Company if no OBA is applicable upon notification, by the Company that such an action is required, and the customer agrees to take the action(s) necessary to reduce the imbalance. If the customer does not make a nomination to reduce the imbalance within 24 hours of such notification by the Company, the customer will pay a penalty of $10/MMBtu per day for each MMBtu of the daily Operation Imbalance.

Gas-in-Kind

Company shall retain 2.45% of all gas received at the Receipt Point(s) to compensate it for the allowance for company-use and lost-and-unaccounted-for gas on Company's system. This volume shall not be included in the quantity available for delivery to Customer. In no event will Customer pay Gas-in-Kind more than once on the same volumes.

(Continued on Sheet No. E-14.00)

TRANSMISSION ONLY TRANSPORTATION SERVICE RATE

(Rates STT, LTT, XLTT and XXLTT)

(Continued From Sheet No. E-13.00)

Monthly Rate (Cotd)

Due Date and Late Payment Charge

The due date of the customer's bill shall be 21 days from the date of mailing. A late payment charge of 2% of the unpaid balance outstanding, net of taxes, shall be assessed to any bill which is not paid in full on or before the due date shown thereon.

Metering Requirements

All eligible Customers metering requirements shall be in alignment with their delivery point operator according to their Interconnect Agreement.

General Terms and Surcharges

This rate is subject to all general terms and conditions shown on Sheet No. D-1.00 and surcharges shown on Sheet Nos. D-2.00 through D-4.00.

Term and Form of Contract

All service under this rate shall require a written contract with a minimum term of one year and month-to-month thereafter which must be approved by an authorized agent before it shall be binding upon the Company. Customers who choose to terminate their contract shall be required to give the Company a ninety (90) day written notice.

SECTION G
GROUP TRANSPORTATION SERVICE ~~PILOT~~ PROGRAM
STANDARDS AND BILLING PRACTICES

These General Rules and Regulations for Group Transportation Service customers are not to supersede but are in addition to Rule B1, Technical Standards for Gas Service. Under this program, a gas Supplier may aggregate the receipts and deliveries of gas transportation customers taking service under the Company's Gas Transportation Service Rate Schedules by establishing a Group with those transportation customers who have agreed to participate in the program. The Supplier will also establish a Group Administrator, who will enroll transportation customers into the Group, manage the Group, and take responsibility for all fees and penalties associated with the Group. The transportation customer will continue to be billed under the Gas Transportation Service Rate Schedule designated on its transportation service contract, except that, as a member of a Group, Authorized Gas is not available, and the transportation customer will not be subject to the Unauthorized Gas Usage Charge or Load Balancing Charge as set forth in the Gas Transportation Service Rate Schedule.

G1. GENERAL PROVISIONS AND DEFINITIONS

G1.1 Definitions.

As used in this section:

(a) "Account" shall mean transportation customer's facilities and operations directly connected with the individual facilities identified in the transportation service contract between the Company and the transportation customer. The gas for each account shall be measured by a single Company meter.
(b) "Allowance for Use and Loss" is defined in Rule G4.1.C. in Section G.
(c) "Business Day" means Monday through Friday, excluding Company holidays.
(d) "Cubic Foot of Gas" means the volume of gas which occupies one cubic foot when such gas is at a temperature of sixty degrees (60^{o}) Fahrenheit and at a pressure base of fourteen and sixty-five hundredths (14.65) psia dry.
(e) "Day" means a period of 24 consecutive hours (23 hours when changing from Standard to Daylight Time and 25 hours when changing back to Standard Time) beginning at 10:00 AM Eastern Clock Time or at such other time as may be mutually agreed.
(f) "Enrollment" means an identification of the transportation customers to be aggregated in a Group. The Enrollment will be in a form specified by the Company. All Enrollments must be received at least sixty days prior to the calendar month in which the transportation customer will become part of the Group, and an Enrollment will be effective for a period of at least twelve (12) months.
(g) "Gas" means natural gas, manufactured gas, or a combination of the two which meets the "quality" standards as specified in Rule G3, Gas Quality of the Company's Gas Rate Book.
(h) "Gas Rate Book" means the standard rules and regulations and rates governing the sale of natural gas service as approved by the Michigan Public Service Commission.
(i) "Group" shall mean an aggregation of transportation customers, enrolled by a Group Administrator, who take service under Transportation Service Rate Schedules ST, LT, XLT, or XXLT and have agreed to participate in the Program. All transportation customers in a particular customer Group must have the same Authorized Tolerance Level, as defined in Section E.1.1 of the Company's Gas Rate Book.
(j) "Group Administrator" shall mean the administrator of the Group.
(k) "Group Annual Contract Quantity" (GACQ) means the sum of the individual contracted transportation customer Annual Contract Quantities, as defined in section E1.1, enrolled by the Group Administrator in a Group.
(l) "Group Authorized Tolerance Level" (GATL) means the Authorized Tolerance Level (ATL) of the transportation customers in a Group. The GATL shall be established as 2.0%, 4.0%, 6.5%, 7.5%, 8.5%, 9.5%, or 10.5% of the Group's GACQ, and all transportation customers in a Group shall have the same underlying contractual ATL, as defined in section E1.1 of the Company's Gas Rate Book.

(Continued From Sheet No. G-1.00)

G1. GENERAL PROVISIONS AND DEFINITIONS (Contd)

G1.1 Definitions (Contd)

(m) "Group Maximum Daily Quantity" (GMDQ) means the sum of the Maximum Daily quantities of all transportation customers enrolled in the Group, as defined in section E1.1 of the Company's Gas Rate Book.

(n) "Group Minimum Daily Quantity" (GMinDQ) means the minimum amount of gas that should be delivered by the Group Administrator when required to do so at the Company's sole discretion. The GMinDQ will be calculated as a percentage of the GMDQ.

(o) "MMBtu" means one million Btu.

(p) "Month," except as provided with respect to billing, means a period beginning at 10:00 AM Eastern Clock Time on the first day of a calendar month and ending at 10:00 AM Eastern Clock Time on the first day of the following calendar month or at such other time as may be mutually agreed.

(q) "Nominations" means the process by which the Group Administrator notifies the Company of expected transportation quantities.

(r) "Supplier" means an entity who supplies natural gas to an end-use gas transportation customer on Consumers Energy's gas system.

(s) "Total Heating Value Per Cubic Foot" means the number of Btu produced by the combustion, at constant pressure, of one cubic foot of gas, with air of the same pressure and temperature as the gas, when the products of combustion are cooled to the initial temperature of the gas and air, and when the water formed by the combustion is condensed to the liquid state. This definition applies regardless of the equipment used to determine the total heating value per cubic foot.

(t) "Unauthorized Gas Usage Charge" is defined under the Monthly Fees Applicable to the Group Administrator section of the Group Transportation Service ~~Pilot~~ Program.

(Continued on Sheet No. G-3.00)

(Continued From Sheet No. G-2.00)

G1. GENERAL PROVISIONS AND DEFINITIONS (Contd)

G1.2 Application of Rules.

Unless otherwise provided for within this Section G, or under the transportation customer's contracted Transportation Service Rate Schedule, transportation customers and Group Administrators are subject to the provisions of the Company's Gas Rate Book. Transportation customers enrolled in the Group Transportation Service ~~Pilot~~ Program shall be considered customers of the Company.

G1.3 Possession of Gas.

A. Responsibility for Gas

The Company and the transportation customer shall each be responsible for its own equipment and facilities on its own side of a delivery point. The Group Administrator shall have good title or good right to make delivery and, further, shall warrant for itself, its successors and assigns that such gas shall be free and clear of all liens, encumbrances, and claims whatsoever. With respect to any such adverse claim that may arise to said gas or to royalties, taxes, license fees or charges thereon, the transportation customer and Group Administrator shall indemnify and hold the Company harmless from all suits, actions, debts, accounts, damages, costs, losses, and expenses arising from or out of the same.

B. Indemnification of the Company

In the absence of negligence, recklessness or willful misconduct on the part of the Company or of the Company's officers, employees or agents, the transportation customer and the Group Administrator waive any and all claims against the Company, its officers, employees or agents, arising out of or in any way connected with (1) the quality, use or condition of the gas after delivery from the Company's line for the account of such transportation customer; (2) any losses or shrinkage of gas during or resulting from transportation and (3) all other claims and demands arising out of the performance of the duties of the Company, its officers, employees, or agents.

G2. RECORDS, ACCOUNTING AND CONTROL

G2.1 Transmittal of Notices, Bills and Payments.

Transportation customers enrolled in a Group are required to enroll in the electronic billing program Business e-Bill or other electronic invoice delivery program as determined by Consumers Energy. It is the responsibility of the transportation customer to give access to the Group Administrator to view the transportation customer's bill.

G2.2 Nominations, Accounting and Control.

A. All nominations shall be submitted by facsimile, e-mail, or an available electronic nomination system.

B. **Daily**: The Group Administrator shall notify the Company's Transportation Services Department of the daily quantity of gas (in MMBtu) being nominated for delivery to the Company on behalf of the transportation customers in the Group. Such nominations shall be submitted by 2:00 PM Eastern Clock Time on the Business Day prior to the effective day of the proposed delivery. Nominations made after the 2:00 PM deadline shall be accepted at the sole discretion of the Company.

(Continued on Sheet No. G-4.00)

(Continued From Sheet No. G-4.00)

G4. SERVICE REQUIREMENTS

G4.1 Quantities.

A. The Group Administrator may deliver, or cause to be delivered, and the Company shall, subject to other provisions in the Company's Gas Rate Book, accept quantities of gas up to the GMDQ specified in the Group transportation service contract.

B. Deliveries to the Company may be made by or on behalf of the Group Administrator at existing interconnections between the gas transmission facilities of the Company and other pipeline systems. These points of receipt shall be those that are agreed to from time to time by the Group Administrator and the Company.

C. The Company shall retain 2.45 percent of all gas received for transportation customers in the Group to compensate it for the Company's use and lost and unaccounted for on the Company's system ("Allowance for Use and Loss"). This volume shall not be included in the quantity available for delivery to transportation customers in the Group.

D. The amount of gas available for use by the Group will be calculated as the amount of gas received by the Company less the allowance for gas-in-kind, plus the net effect of any balance transfers, plus any withdrawals from the Group's storage balance. For purposes of this calculation, gas transferred to or from another Group or transportation customer during the billing month shall not be considered.

If, in any month, the amount of gas available for use by the Group is more than the quantity of gas taken by the transportation customers enrolled in the Group at their points of delivery, then the difference shall be retained by the Company and delivered to the Group in those succeeding months when the amount of gas available for use by the Group is less than the requirements of those transportation customers enrolled in the Group. Such subsequent deliveries to the Group shall be subject to the withdrawal limitations identified under the Monthly Fees Applicable to the Group Administrator section of the Group Transportation Service ~~Pilot~~ Program. Should the amount of gas available for use by the Group at any month-end exceed the GATL, then the Company shall assess the Group Administrator a Load Balancing Charge for any month-end balance that exceeds the GATL.

E. In the event of the termination of a Group Administrator's contract, the Group Administrator must transfer any gas retained by the Company to another Group or to a transportation customer taking service under a Transportation Service Rate Schedule within 60 days. If the Group Administrator has not withdrawn or transferred all of the gas retained by the Company within 60 days, the Company will cash out the remaining balance at a rate of $1.00 per Mcf.

F. Upon joining a Group, any volumes in the transportation customer's Authorized Tolerance Level balance will transfer into the Group Administrator's Group Authorized Tolerance Level balance. Upon leaving a Group, the transportation customer's Authorized Tolerance Level will follow the transportation customer and the Group Administrator's Group Authorized Tolerance Level will be reduced by the transportation customer's Authorized Tolerance Level.

(Continued on Sheet No. G-6.00)

(Continued From Sheet No. G-5.00)

G4. SERVICE REQUIREMENTS (Contd)

G4.2 Delivery Pressure.

All deliveries of gas by the Group Administrator and the Company shall be made at a pressure sufficient to effect same, provided that neither party shall directly or indirectly cause the other to make such deliveries at a pressure in excess of that which would be a reasonably expected maximum.

G4.3 Shutoff of Service.

The Company shall not be required to perform service under a Group transportation service contract if the Group Administrator has failed to comply with any and all terms of the Group Administrator's contract and the Company's Gas Rate Book.

G5. BILLING

On or before the last Business Day of each calendar month, the Company shall endeavor to render a statement to the Group Administrator for service during the prior calendar month. Such statement will also include any Unauthorized Gas Usage Charges, failure fees, or Load Balancing Charges incurred by the Group.

G6. UNAUTHORIZED GAS USAGE CHARGE

If, in any month, the Group exceeds the amount of gas available for use by the Group, the excess amount will be treated as unauthorized use and be subject to the Unauthorized Gas Usage Charge as designated under the Monthly Fees Applicable to the Group Administrator section of the Group Transportation Service ~~Pilot~~ Program.

G7. CUSTOMER PARTICIPATION IN A GROUP

Transportation customers may elect to participate in the Group Transportation Service ~~Pilot~~ Program, and Group Administrators may solicit transportation customer participation at any time. However, transportation customer enrollments must be received by the Company, in a form acceptable to the Company, by the first business day of the calendar month 60 days preceding the customer's enrollment in the Group. Each Supplier may elect to have an unlimited number of Groups with a maximum enrollment of 200 contract accounts per group. A Supplier can select desired ATL for each group. A customer who is a transportation customer of the Company must comply with all requirements of the Transportation Service Rate Schedule on which it takes service, excluding any penalties for Unauthorized Gas Usage Charges or Load Balancing Charges, which will be the responsibility of the Group Administrator.

The transportation customer's enrollment in a Group shall remain in effect for a period of at least twelve (12) months from the date of the enrollment. During that time, gas delivered to the transportation customer shall be provided to the Company by the Group Administrator of the Group in which the transportation customer is enrolled. A transportation customer enrolled in a Group cannot be enrolled in more than one Group at any time and is not eligible to designate receipts from any source other than the Group in which it is enrolled. The transportation customer's selection of a Group shall be effective until: (i) terminated by the transportation customer or the Supplier, (ii) the Supplier becomes disqualified from participating in the Group Transportation Service ~~Pilot~~ Program, or (iii) the Company receives an enrollment for that transportation customer in another Group. The Company shall incur no liability for relying on information received from a transportation customer or a Group Administrator which the Company believes to be genuine.

Transportation customers may also request to de-enroll in the Group Transportation Service ~~Pilot~~ Program, and those requests for de-enrollment must be received at least 60 days prior to desired effective date. Enrollment will remain in effect through the last day of the calendar month. Customers will transfer to another group or return to the Gas Transportation program effective on the first day of the month following de-enrollment. Customers leaving a Group will not retain any portion of the Group's Authorized Tolerance Level Balance. Upon de-enrollment from the Group Transportation Service ~~Pilot~~ Program, the customer will be subjected to the Company's Transportation Service Rate Schedule.

(Continued From Sheet No. G-7.00)

G10. GROUP TRANSPORTATION SERVICE ~~PILOT~~ PROGRAM STANDARDS OF CONDUCT

This rule is intended to promote fair competition and a level playing field among all participants involved in transportation within the Company's regulated gas service territory. The Company will conduct its business to conform to the following Group Transportation Standards of Conduct:

A. The Company will apply any tariff provision relating to transportation service in the same manner without discrimination to all similarly situated persons.

B. The Company will not give its marketing affiliate or customers of its affiliate preference over any other non-affiliated gas marketers or their customers in matters relating to transportation service including, but not limited to, nominating, balancing, metering, billing, storage, standby service, curtailment policy or price discounts.

C. The Company will not communicate to any customer, Supplier, Group Administrator, or third parties that any advantage may accrue to such customer, Supplier, Group Administrator, or other third party in the use of the Company's services as a result of that customer, Supplier, Group Administrator, or other third party dealing with its marketing affiliate and shall refrain from giving any appearance that it speaks on behalf of its affiliate.

D. The Company will process all similar requests for transportation service in the same manner and within the same period of time.

E. The Company will not provide leads or provide market sensitive information regarding a current or potential customer or marketer to its marketing affiliate. If a customer requests information about marketers, the Company will provide a list of all marketers operating on its system, including its affiliate, but will not promote its affiliate.

F. If a customer makes a request in writing that its historic volumetric sales and transportation data be provided to a particular marketer or marketers in general, that request will be honored by the Company until revoked by the customer or after 5 years from the date of the request. To the extent the Company provides to its marketing affiliate a discount or information related to the transportation, sales or marketing of natural gas, including but not limited to the Company's customer lists, that is not readily available or generally known to any other marketer, Supplier, or Group Administrator, or has not been authorized by a customer, it will provide details of such discount or provide the information contemporaneously to all potential marketers on its system that have requested such information. A marketer may make a standing request for contemporaneous disclosure of such information.

G. The Company will not condition or tie its agreement to release interstate pipeline capacity to any agreement by a gas marketer, customer, Supplier, Group Administrator, or pipeline transporter relating to any service in which its marketing affiliate is involved.

H. The Company will not condition or tie an agreement to provide a transportation discount to any agreement by a marketer, customer, Supplier, Group Administrator, or pipeline transporter relating to any service in which its marketing affiliate is involved.

I. The Company's operating employees and the operating employees of its marketing affiliate will function independently of each other, be employed by separate business entities, and reside in separate offices.

J. The Company will keep separate books of accounts and records from those of its marketing affiliate.

(Continued From Sheet No. G-8.00)

G11. GROUP TRANSPORTATION SERVICE ~~PILOT~~ PROGRAM STANDARDS OF CONDUCT COMPLAINT PROCEDURES

If the Company receives a verbal complaint related to its Rules, Regulations and Rate Schedules Governing the Sale or Transportation of Natural Gas, M.P.S.C. No. 2, Section G10, Group Transportation Service ~~Pilot~~ Program Standards of Conduct, the Company will attempt to resolve the complaint on an informal basis. If the Company and the complainant are unable to resolve the complaint on an informal basis, the procedures outlined below will be followed:

A. Complainant will route all formal complaints in writing to:

Consumers Energy
One Energy Plaza
Jackson, MI 49201

Attention: Legal Department

B. The Company will acknowledge the receipt of the formal written complaint, in writing, within five working days of receipt by the Company.

C. The Company will confirm and amend the prepared written statement of the complainant to ensure the complaint includes the name of the complainant, relevant dates, and specific claims.

D. The Company will prepare a written statement communicating to the complainant the results of the Company's preliminary investigation within 30 days of the initial receipt of the complaint by the Company with a description of the action taken or proposed to be taken.

E. (1) If the complainant is satisfied with the action taken or proposed to be taken, complainant will acknowledge its agreement by signing and returning a copy of the Company's written statement addressing the action taken or proposed to be taken.

(2) If the complainant is not satisfied with the Company's response, then the complainant may address the complaint to the Commission.

F. If a transportation customer has a complaint against a Group Administrator or Supplier, the transportation customer should try to resolve it first with the Group Administrator or Supplier. If the complaint is unresolved, the transportation customer may address the complaint to the Commission. The Company shall have no responsibility for resolving disputes between transportation customers and Group Administrators or Suppliers but shall provide information as requested by the transportation customer or the Commission.

GROUP TRANSPORTATION SERVICE ~~PILOT~~ PROGRAM RATE

Availability

Subject to any restrictions, participation in the Group Transportation Service ~~Pilot~~ Program is available to any Supplier who wishes to aggregate the receipts and deliveries of transportation customers taking service under Transportation Service Rate Schedules. All transportation customers in a particular Group must have the same Authorized Tolerance Level, as defined in Section E.1.1 of the Company's Gas Rate Book. Furthermore, all transportation customers in a Group shall be enrolled by the Supplier's Group Administrator, utilizing a form specified by the Company.

Under this Program, the Company shall transport gas for the Group from the interconnections between the Company's facilities and those of a third party that delivers gas to the Company for redelivery (points of receipt) to the interconnections between the Company's facilities and those of the transportation customers within the Group (points of delivery). Each Group shall have a Group Administrator who will be responsible for all penalties associated with the aggregation of receipts and deliveries of the Group. Each Supplier desiring to establish a Group shall make written application for such service on a form provided by the Company. The Company will convert the transportation customer's consumption from Mcf to MMBtu using monthly system-average Btu content. The Company, at its discretion, shall issue operation flow orders, or take other action which is deemed necessary, to ensure system reliability. The Company will act as supplier of last resort under the Program.

A transportation customer who is part of a Group remains subject to the obligations of both the Transportation Service Rate Schedule under which it takes service and the transportation service contract between the transportation customer and the Company. The transportation customer will continue to be billed under the Transportation Service Rate Schedule designated on its transportation service contract. Members of a Group will not be subject to the Unauthorized Gas Usage Charge or Load Balancing Charge as set forth in the Transportation Service Rate Schedule. A transportation customer whose account is in arrears shall not be eligible to be part of a Group. Enrollment in a Group is voluntary.

Monthly Fees Applicable to the Group Administrator

Group Administrative Fee	$200/group
Customer Account Maintenance Fee	$5.00/customer account enrolled

Unauthorized Gas Usage Charge

The Group Administrator shall be billed for unauthorized usage at the rate for service under Transportation Service Rate ST plus an Unauthorized Gas Usage Charge. Such Unauthorized Gas Usage Charge shall be the highest Midpoint price reported for Michigan or Chicago LDC's during the applicable month as reported by Gas Daily or, in the event that Gas Daily discontinues its reporting of such prices, any comparable reporting service, plus $10 per Mcf for all gas taken by the Group in excess of the amount of gas available for use by the Group, as defined in Section G4.1D.

Monthly withdrawals from the Group's previous month-end storage balance during November through March will be limited to 3% of the Group's ACQ.

(Continued on Sheet No. G-11.00)

GROUP TRANSPORTATION SERVICE ~~PILOT~~ PROGRAM RATE

(Continued From Sheet No. G-10.00)

Monthly Fees Applicable to the Group Administrator (Contd)

Load Balancing Charge

Should the amount of gas available for use by the Group at any month-end exceed the Group Authorized Tolerance Level, then the Company shall assess the Group Administrator a Load Balancing Charge of $1.00 per MMBtu for the excess. In addition, there is a 2.0 percent gas-in-kind for fuel used for injection for any month-end balance of gas that exceeds the Group Authorized Tolerance Level and is in excess of the prior month-end storage balance.

The monthly injection of gas into the Group's ATL shall be at the Group Administrator's discretion, except in September and October when any monthly injections in excess of 1.43% of the Group's ACQ shall be charged the Load Balancing Charge.

Due Date and Late Payment Charge

The due date of the Group Administrator's bill shall be 21 days from the date of mailing. A late payment charge of 2% of the unpaid balance outstanding, net of taxes, shall be assessed to any bill which is not paid in full on or before the due date shown thereon.

Term and Form of Contract

All service under the Group Transportation Service ~~Pilot~~ Program shall require a written contract with a term of one year, and month-to-month thereafter, which must be approved by an officer of the Company or a duly authorized agent before it shall be binding upon the Company.

1	2023	Application Currency-Corporate Services-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increase in number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	197,073		-	-	-	-	-	-	-	-	15,664	-	15,573	-	9,043	49,821	1,227	-
2	2023	Asset Accounting Upgrade	Software(Intangible)	Corporate	The project will upgrade our current accounting asset management software to the latest version as required by the vendor and implement additional new features, ensuring continued support of a critical financial application and providing new functionality. In 2022, standard vendor support ends for the current on-premise software. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub ledger, it is necessary to perform an upgrade and maintain vendor support. In addition, the upgrade provides additional functionality to increase the frequency of financial accounting and to improve stability. The current monthly allocation process has limited visibility to Company financial performance, and the upgrade provides functionality that allows more frequent allocation processes. Additionally, implementing the vendor's regulatory module eliminates the time-consuming and labor-intensive process of manual data extracts for regulatory analysis used for Cost of Service modeling. This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) eliminating the labor intensive and time-consuming process of pulling data for regulatory analysis used for Cost of Service; (3) automating manual tasks; and (4) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support. The project scope includes: (1) upgrading the vendor software from the current version to the newer version; (2) implementing new functionality that includes features for the regulatory Cost of Service analysis, additional reporting jobs scheduling, and central load error processing; and (3) populating the data lake with data from the asset accounting system for improved reporting. Alternatives considered include: (1) Upgrade to the newest cloud version of PowerPlan. This is the preferred option as it will reduce hardware and select server costs, provide more frequent software upgrades, avoid database and server upgrade, provide weekly allocation functionality, and provide new features in job scheduling, automated regression testing, and central error processing. (2) Evaluate SAP options for leasing, asset, and tax management capabilities. While this option would eliminate the need for an interface between SAP and PowerPlan, it would likely be more complex, cost more, and may not provide all the required features. (3) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements.	2021-09-27	2023-12-25	-0.99	4,630,550	260,286		280,417	-	-	44,283	171,596	7,737	36,803	40,267	-	-	26,233	11,887	2,146	-
3	2023	Breakthrough Employee Experience Enablement	Software(Intangible)	Corporate	Prior period adjustment.							(1,888)	(1,888)	-	-	-	-	-	-	-	-	-	-	-	-
4	2023	EHS Compliance	Software(Intangible)	Corporate	Prior period adjustment.							(1,398)	-	-	(1,962)	46	558	-	-	-	-	-	-	-	-
5	2023	Enhancements-Corporate Services-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from review or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and Public Affairs. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	40,789		-	-	-	-	-	-	-	15,294	-	-	4,452	9,924	919	-
6	2023	HR Support Pack and Business Software Inc Upgrade 2022	Software(Intangible)	Corporate	Prior period adjustment.							-	-	-	-	-	-	-	6,257	-	-	8	5,880	369	-
7	2023	HR Support Pack and Business Software Inc Upgrade 2023	Software(Intangible)	Corporate	The HR Support Pack and IBS upgrade will update the SAP's system with HR Support Packs that are released annually by SAP to comply with HR and tax changes. SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax changes, resulting in the inability to calculate and distribute payroll. This project creates value for the Company by: (1) ensuring that its systems are in compliance with new financial rules and regulations, and (2) ensuring that it can calculate and distribute payroll. The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information by the Company. As this is an upgrade of an existing system, the alternative considered was to defer the upgrade. This alternative was not chosen due to the risk of not complying with financial rules and regulations.	2022-12-26	2024-01-22	0.00	-	664,262		-	-	-	-	-	-	-	368,417	327	-	30,212	202,704	15,174	-
8	2023	IT Access Controls Governance	Software(Intangible)	Corporate	This project replaces the current software tool that manages and monitors Sarbanes-Oxley Act (SOX) compliance for SAP transactions. To comply with SOX controls, standard SAP user access is reviewed on a semi-annual schedule; sensitive access is reviewed quarterly, and emergency access management is reviewed as needed. The current solution for validating these controls is SAP's GRC (Governance, Risk and Compliance) Access Controls software application. The SAP GRC system is the backstop for the Company's IT General Controls, which ensures legal compliance. Problems with the current implementation include: (1) increased risks as the current process is manually intensive and inefficient, and so add-ons to SOX audit deficiencies; (2) custom end-to-end role it difficult and costly to maintain, including the application of Segregation of Duties; (3) difficulty meeting SOX compliance when requirements change from auditors and the Public Company Accounting Oversight Board (PCAOB); (4) incomplete reports for segregation of duties and change logs; and (5) increased risks exist when elevated access is needed in SAP production. The project will add value through: (1) reducing hundred of manual tasks that provide higher levels of automation and access optimization; (2) decreasing maintenance and upgrade costs by implementing an out-of-the-box solution without customizations; (3) increasing the ability to meet requirement changes from auditors and the Public Company Accounting Oversight Board; and (4) creating complete and accurate report capabilities. The project scope includes: (1) automating the SAP periodic user access review; (2) automating the emergency access management process; (3) displaying areas of risk and identifying how to mediate that risk; (4) tracking mitigation; and (5) converting the current rule set into the new to-be. Alternatives considered include: (1) Continue using the current application suite as is, accepting the audit risks stemming from known issues. This alternative was not selected due to the risk associated with the SAP support ending on December 31, 2027. (2) Use robotic process automation in a limited scope to automate some manual tasks and reduce errors. This alternative was not selected as it would not mitigate risks and gaps in the current tool. (3) Develop a custom solution to perform some of the work. This alternative was not selected as it would be more costly and include higher maintenance and support costs. (4) Continue applying program patches and fixes from SAP for the current tool. This alternative was not selected as it does not address or fulfill all requirements, and requires support from main external vendor, which increases support costs. (5) Replace the existing tool with a new solution. This alternative was selected as it meets Company requirements, avoids hiring two additional resources, is more cost effective in the long term, adds more process automation, and increases SOX compliance.	2020-08-31	2023-09-31	-1.00	3,693,180	710,698		108,249	103,247	-	-	-	-	-	23,072	23,072	-	-	-	-	-
9	2023	Product Family Enhancements-Corporate Capital	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from review or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and Public Affairs. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	929,170	36,253		148,525	320	-	53,104	254,418	14,147	22,323	27,035	-	-	5,551	20,153	1,331	-
10	2023	Product Family Enhancements-Corporate-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from review or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	212,394		-	-	-	-	-	-	-	81,546	-	-	40,753	35,720	5,073	-
11	2023	ServiceNow Customer Service Management	Software(Intangible)	Corporate	Prior period adjustment.							(1,305)	(1,305)	-	-	-	-	-	-	-	-	-	-	-	-
12	2023	Talent Management Enablement	Software(Intangible)	Corporate	The project will deliver technology solution to enable best-in-class Talent Management programs and process set that are critical to achieve the Company's overarching Talent Strategy Plan. The Talent Strategy Plan is a key enabler of the company's Integrated Resource Plan (IRP), Electric Distribution Infrastructure Investment Plan (EDIIP), and Natural Gas Delivery Plan (NGDP). Effective Talent Management programs and processes are critical to develop the skills, capabilities, productivity, and experience necessary to successfully execute these plans that deliver clean, reliable, affordable energy through an exceptional customer experience. Significant technology investments are required to transform Human Resources (HR) to develop the skills and capabilities necessary to achieve the Company. This project will add value to the Company through technology that will enable: (1) fully functional integrated compensation module; (2) accelerated and targeted talent development of critical skills necessary to deliver on the Company Talent Management Enablement will deliver the best-practice technology to enable and enhance: (1) fully functional integrated talent compensation management; (2) Simplified and automated talent management process for employee lifecycle management from onboarding through Off-boarding; (3) Succession Planning and Business Continuity; (4) Career Development and Employee Retention. The scope will include: (1) implementation of each system/application; (2) integration with current systems, application and process as applicable; (3) retrofit current systems and applications to ensure a seamless end-to-end experience of HR processes; (4) delivery of mobile-capable functionality in scope processes; (5) reporting and analytics dashboards and report insights for in-scope processes. Three alternatives were considered for these Talent Management programs and processes: (1) Develop custom, internally built solutions that could meet most requirements. This alternative was not selected because a custom solution would result in higher overall costs, higher maintenance costs, fewer upgrades, and not leverage industry best practices implemented by vendor software tool. This alternative was not selected because it requires internal maintenance, increases infrastructure costs, and would have less frequent upgrades which would hinder the Company's ability to ensure processes are evolving alongside industry trends and best practices. (3) Evaluate and select cloud/SaaS solution(s) which would have lower maintenance costs, less internal maintenance than an on-premise solution, and would be built and evolved with upgrades based on industry best practices. Based on research, internal experience with successful best practice implementations, and vendor demonstrations, option three was selected.	2023-02-27	2025-12-19	-1.00	1,221,532	464,821		75,621	-	-	3,155	63,696	4,369	2,402	71,258	-	-	3,472	66,188	1,598	-
13	2023	Time Entry and Expense Reports Flash Remediation	Software(Intangible)	Corporate	Prior period adjustment.							(6)						(6)							
14	SUBTOTAL	2023 Corporate										775,658	99,376	-	100,542	487,750	26,299	61,691	588,808	36,972	-	115,724	418,376	27,856	-
15	2023	A/M Card Transaction Fees	Software(Intangible)	Customer	This project will implement a customer paid transaction in fee for all customer payments used using a credit or debit card across all Paymentus payment channels reducing generational costs associated with payment processing. The Company's customers have embraced card payment methods and at present credit and debit card payments account for 35% of payment transactions with adoption continuing to increase. Consequently, the Company incurs an annual expenditure of over $15 million to cover card payments. As customer adoption of credit and debit card payments increases, annual operating expenses will also continue to increase. This project creates value for the Company and customers by: (1) updating all payment channels to enable customers to pay a fee for debit and credit card transactions; (2) reducing operating costs for payment processing; and (3) removing card payment restrictions on small and medium business customers. The project scope includes: (1) creating new payment menu algorithms for credit/debit card payment fee charges; (2) updating auto pay functionality in all payment channels; (3) updating all payment channels to include a customer paid transaction fee when using card payment methods segmented by residential and business customers; (4) modifying billing integrations to support card transaction fee charges; and (5) educating customers regarding card transaction fee changes. Alternatives Considered include: (1) Implement a new Business Card Payment Portal which would allow the Company to distinguish between card types and charge a fee to non-residential customers who are utilizing high rebate card types. This alternative was not selected because it would require significant investment to create and maintain a separate business payment portal and the complex card rate which would minimize operating savings. (2) Implement a fee across all payment types, except autopay utilizing automated clearing house payments (ACH), in all payment channels for all customers. This alternative was not selected because implementing costs for ACH did not provide the optimal value and experience to customers. (3) Implement a fee for card payment transactions in all payment channels for all customers. This alternative was selected because it provides the best balance between achieving the project objectives, controlling costs, and optimizing value to customers.	2023-03-13	2023-12-22	35.42	1,064,704	342,156		148,597	-	-	76,064	228,457	15,501	21,535	119,755	-	-	49,439	63,342	5,666	1,317
16	2023	Application Currency-CX&O Capital	Software(Intangible)	Customer	The CX&O initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities as sociated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the CX&O adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the CX&O are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increase in number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	116,399		-	-	-	-	-	-	-	23,695	-	-	6,014	17,093	587	-
17	2023	Application Currency-CX&O-O&M	Software(Intangible)	Customer	The CX&O initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the CX&O adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the CX&O are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increase in number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	26,217		-	-	-	-	-	-	-	9,830	-	-	617	9,160	53	-

19	2023	Business Customer Interval Web Portal	Software(Intangible)	Customer	Prior period adjustment.							(16,567)	-	-	-	-	-	(10,567)	-	-	-	-	-	-	-
20	2023	Click to Chat	Software(Intangible)	Customer	This project will implement a click to chat platform, whereby customers can engage in a chat conversation with customer service agents. This solution will engage agents and customers to measure customer engagement interest and agent performance in handling chat(s) via the Consumers Energy website. The company currently does not offer live chat on our website. Today, more than 41% of customers expect live chat and more than 50% who use mobile phones expect it. That number is only rising each year. 10. Power found that live chat has become the leading digital contact method for online customers; 42% of customers prefer live chat compared to just 28% for email. Currently, the only way customers can connect with the company are through phone, email, fax, or digital forms. These options are just not efficient enough and longer. This project creates value for the Company and it's customers by: (1) determining customer take rate and interest in leveraging chat as an engagement channel for Business Units of WCC and BCC originating from the owner website; (2) determine owner's customer service staff capacity to handle more than one chat's session (customer interaction over chat) at a time. Capacity may be up to 4 sessions at a time; and (3) survey customer experience. The project scope encompasses: (1) chat offer managed based on statistics and state on agent availability and wait time; (2) robust reporting; (3) customer data push based on interactions; (4) agent experience - all interactions (chat, voice, SMS) can be received via a software and allow for escalations; (5) monitoring of agent available by cross all channels (ex. voice, chat); and (6) full integration across software and backend systems. Alternatives considered include: (1) continue use of the current communication methods. This alternative was not considered because customers prefer to chat with someone in real-time and online, rather than current communication channels (Telephone and Email). (2). Develop a message response story. This alternative was not considered because it is not cost effective and does not address the problem of having the customers' requirements for instant/real-time communication. This alternative could take upwards of 12-24 hours for a response. The recommended alternative of a Click to Chat platform, described in this entry, will involve utilizing industry best-practice vendors for a purpose-built solution to meet the requirements of our customers.	2021-07-26	2024-05-27	-1.00	911,602	10,504		45,681	-	-	4,013	26,812	292	14,565	375	-	-	-	351	24	-

22	2023	Customer Self-Service Mobile Application	Software(intangible)	Customer	Prior period adjustment.							(3,509)	(3,509)	-	-	-	-	-	3,827	3,829	-	-	-	(2)	-	-
23	2023	Customer Self-Service Online Work Scheduling	Software(intangible)	Customer	The Online Work Scheduling project will implement online, self-service work order scheduling for various types of short-cycle work to enable customers to schedule work online, rather than contacting the contact center. Currently customers must call the contact center to schedule work and obtain updates given a lack of online self-service capabilities. To stay informed customers are required to contact the contact center, and often requires multiple calls per work request. In addition, once work is completed customers do not receive confirmation that the work has been completed or what work was completed, which may also result in additional inbound customer calls. This inefficiencies require multiple inbound calls, which often results in customer dissatisfaction. The Company and its customer will see value through this project by: (1) implementing self-service capabilities for customers to schedule service work, (2) reducing calls into contact centers, (3) improving the digital experience within the Company's customer portal, (4) improving quality of utility service work through timely customer surveys based on work completed, (5) improving work efficiency by supplying blocks of time for specific work order types, (6) improving overall customer experience as customers can utilize channel of choice, and (7) enabling future initiatives supporting customer site work by developing the technical and business process foundation for other initiatives to expand upon. The project scope includes: (1) updating the online customer self-service portal to include work order scheduling, (2) establishing channel of choice options for scheduled work order confirmation notifications, and (3) automating scheduling of work orders in SAP and other back-end systems. Alternatives considered include: (1) developing a form on the Company's web portal for customers to complete and send to a monitored email box, (2) purchasing a third-party cloud solution to host a portal for customers to schedule work orders, (3) displaying a map of service areas with a number for customers to call their local dispatch area, and (4) enhancing the current customer self-service portal to include scheduling work orders. The first and third alternatives were not selected because they will degrade the customer experience and require additional manual process steps and work, introducing waste to manage additional processes to schedule the work order. The second alternative was not selected due to the high cost of integrating a new solution with the existing customer platform and back-end systems and increasing ongoing maintenance and support costs. The fourth alternative was selected because it improves customer experience through self-service, utilizes the existing customer self-service portal, increases process efficiency for scheduling work orders, and minimizes increases for ongoing maintenance and support costs.	2021-06-28	2024-08-29	-1.00	1,846,364	279,779		6,346	6,346	-	-	-	-	-	5	5	-	-	-	-	-
24	2023	EnergyAssistance Enhancements and Maintenance Annual Updates	Software(intangible)	Customer	The Energy Assistance Enhancements and Maintenance Annual Updates project, formerly known as Consumers Affordable Resource for Energy (CARE) project, will implement software changes to offer energy assistance to low-income customers and streamline the process for the assistance payment. This is accomplished through improved user interface and updates to SAP to process various requests. Upcoming modifications will be identified following an ongoing and annual review of requests to prioritize the list of changes. Each grant year, Department of Health and Human Services (The project will provide the following value: (1) complete modifications to internal SAP application and Agency Portal to receive LIHEAP funding, which can be used to provide customers the bill credits and arrears forgiveness; (2) improve the data within the assistance agencies portal, thereby making it easier to assist customers in need of LIHEAP funding; and (3) complete modifications to customer facing platforms. The project scope includes: (1) updating the enrollment and status process; (2) allowing for flat monthly bills; (3) improving reporting; (4) updating the amount to give new plans; (5) satisfy legislative/regulatory requirements for the annual grant rule changes required by the Department of Health and Human Services and Michigan Public Service Commission; (6) updating PC #96 (funding process); and (7) updating CE PA 58 Funds to Utility to enhance Agency Self-Service. Alternatives considered included: (1) continue with current process, which would lead to loss of grant funding, thus decreasing or eliminating energy assistance dollars for customers; (2) transfer administration of Energy Assistance Programs to a third party organization, which would remove ownership and stability into the health of the program while increasing administrative costs; and (3) make annual updates to the application, which will allow agencies to easily enroll customers on assistance programs and allow placement of hold to stop or prolong credit activity until assistance decisions are granted. Option 3 was selected since it provides customers more proactive energy assistance to customers and prevents loss of grant funds. All the changes are internal to SAP and Agency Portal related, therefore a cloud or third party alternative is not viable. Additionally, enhancing existing Agency Portal for a new application would increase costs beyond that of the routine upgrades.	2023-01-01	2023-12-31	0.00	-	221,945		-	-	-	-	-	-	-	85,213	-	-	41,703	38,606	4,904	-
25	2023	Enhancements - Customer Experience and Operations- Cap	Software(intangible)	Customer	The CX&O Initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the CX&O Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-scale software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software applications investments for CX&O. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience Operations, Applications Support and Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund/grant governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	798,924	75,876		225,419	-	8,668	96,022	89,878	10,065	20,810	26,557	4,480	-	3,315	18,040	722	-
26	2023	Enhancements- CX&O-Capital	Software(intangible)	Customer	The CX&O Initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the CX&O Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-scale software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software applications investments for CX&O. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund/grant governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	895,691	146,167		287,138	497	-	29,383	171,699	13,508	72,251	51,868	709	-	5,935	40,798	3,579	847
27	2023	Enhancements- CX&O-O&M	Software(intangible)	Customer	The CX&O Initiative will utilize O&M funding to make enhancements to existing technology and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort technology changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation. Failure to make these changes or to update aging technology can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of technology enhancements in the CX&O Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-scale technology efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT technology investments for CX&O. The scope of technology enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund/grant governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	146,302		-	-	-	-	-	-	-	56,171	-	-	17,610	36,100	2,461	-
28	2023	Flexible and Advanced Payment Options	Software(intangible)	Customer	The project will address customer concerns regarding existing payment plan options. The effort will create payment plans for customers to increase successful payments and accommodate specific needs of customers requiring assistance paying their energy bill. Currently, the Company payment arrangement offerings are insufficient or lack flexibility to support the needs of customers. On average, Hello Pay Customers account for 87%, 000 call into contact centers to resolve payment plan related concerns. Existing payment plan options have a 5% success rate. In order to increase customer satisfaction, reduce calls to contact centers, and reduce payment plan defaults the Company needs to offer payment challenged customers easier and more flexible payment options. The project creates value to both the Company and its customers through: (1) improved customer experience by ensuring customers can set up payment programs within the channel of their choice (2) reduced default on for repeat callers by enabling customers to be successful in payment programs, (3) reduced active arrears by removing unnecessary risk and offering options based on customers The scope of this project includes: (1) identifying changes for new and existing payment plans to increase successful customer payments, (2) update IVR/SP with eligibility rules for payment plans, (3) updating the customer self-service portal and IVR to align with available payment options and self-service capability, (4) reviewing customer feedback to determine the right payment plans to support their needs, (5) implementing an installment plan quick on the digital platform enabling customers to self-serve and select the best plan for them, and (6) improving input screens for Customer Service Representatives (CSR) surrounding payment plans. The alternatives considered include: (1) Enable only CSR resources to set up customized payment plans. This was not selected as the customer would still have to call in, preventing call reduction in our contact centers. (2) Utilize a third-party program for all customers needing payment assistance. This was not chosen as the pilot completed also need limited success as a small portion of customers chose to stay on the program. (3) Implement changes to Payment Assistance plans. This was selected as it provides the customer with multiple options to pay their bill while supporting the Company's cost savings goals.	2021-07-26	2023-10-12	-0.95	1,342,617	368,734		210,698	-	-	13,662	167,051	12,567	7,378	18,803	-	-	4,549	13,212	1,041	-
29	2023	Product Family Enhancements-Customer-Capital	Software(intangible)	Customer	The Customer Initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Customer Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-scale software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software applications investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. 32	2023	SiteCore Secondary Upgrade 2023	Software(intangible)	Customer	The SiteCore Upgrade project will refresh all components of the website hosting, delivery, search, and analytics applications to add new features and improve search capabilities. Sitecore is the content management application for consumersenergy.com website, a channel many customers use for accessing account information and bill payment. The application requires regular upgrades to ensure system reliability, take advantage of new application features, and improve the customer's website experience. The Sitecore upgrade provides these four benefits: (1) maintains currency with the web hosting application framework; (2) allows business users to make use of new features and functionality; (3) neutralizes continually evolving cyber threats; and (4) continuously improves customer experience using consumersenergy.com. The project scope includes: (1) upgrading the Sitecore core, three management software components, and delivery and allowing the use of new features and functionality; (2) upgrading the Mongo database, which provides the analytics functionality within Sitecore. Alternatives considered included: (1) implement a two-year upgrade cycle. This alternative was not chosen due to the rapidly changing features set being developed by the vendor, as well as not being able to position the Company to keep up with constantly changing cyber threats; (2) Purchase an existing cloud solution. The cloud solution was not chosen as the cost/benefit analysis revealed this option is not viable at the time of filing; and (3) Annually upgrade the existing Sitecore platform. This alternative was chosen as it provides the functionality and stability needed, is cost effective compared to alternatives, and mitigates cyber security risks.	2022-01-03	2023-10-20	-1.00	-	81,264		-	-	-	-	-	-	-	10,470	-	54	19,788	8,760	1,869	-

35	2023	Application Currency-Electric & Gas Shared-Capital	Electric & Gas Shared		The Electric and Gas operations initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risks/impacts of performing the upgrade ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Electric and Gas operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	71,191	1,596		22,838	-	-	10,586	8,568	1,160	2,529	559	-	-	195	333	30	-
36	2023	Application Currency-Electric & Gas Shared-O&M	Software(intangible)	Electric & Gas Shared	The Electric and Gas Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risks/impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Electric and Gas Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. 42	2023	Application Currency-TEOS-O&M	Software(intangible)	Electric & Gas Shared	The TEOS initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor support that version, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the TEOS adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protection; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the TEOS are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	78,242		-	-	-	-	-	-	-	30,040	-	-	9,627	19,657	757	-
43	2023	Enhancements-Operations-Capital	Software(intangible)	Electric & Gas Shared	The Operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software applications changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Operations Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software applications and investments for Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering, Customer Energy Management, Electric Grid Integration, and Fleet. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	598,611	27,679		139,817	-	2,758	44,383	80,459	7,257	24,960	9,688	-	-	6,369	2,636	501	181
44	2023	Enhancements-Operations-O&M	Software(intangible)	Electric & Gas Shared	The Operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Operations Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software applications and investments for Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering, Customer Energy Management, Electric Grid Integration, and Fleet. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. 46	2023	Enhancements-TEOS-O&M	Software(intangible)	Electric & Gas Shared	The TEOS initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the TEOS Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for TEOS. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering, Customer Energy Management, Electric Grid Integration, and Fleet. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund rigure governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	128,877		-	-	-	-	-	-	-	48,323	28	-	11,631	33,345	3,248	72
47	2023	Field Contractor Work Management Technology Enablement	Software(intangible)	Electric & Gas Shared	The project provides the ability to electronically manage contractor work and increases accuracy and timeliness of information processing for field work deliverables. This project additionally creates new opportunities to measure and optimize field service processes supporting customer on-time delivery goals. Contractor field employees use manual, paper-based processes and generic communication technologies (phone, radio, email, collaboration sites) to perform work for the Company. Due to the non-electronic format, inaccuracy, and delay of information processing there are negative impacts to the availability and accuracy of work status. This limits the opportunity to measure and optimize field work processes that support customer on-time delivery and other goals. The project will add value by: (1) improving on-time delivery of customer work by providing electronic work order information to contractors; (2) improving customer satisfaction through efficiency in scheduling work and reporting on the progress electronically; (3) increasing safety by tracking work and contractor status providing visibility into the last known location of the contractor; (4) improving material management; (5) making it easier to reweemergent work to contractors to balance workloads and meet customer commitments; and (6) enabling real-time updates to work order information, increasing data accuracy and reducing invoice reconciliation time. The project scope includes: (1) identifying requirements for a Bring Your Own Device (BYOD) field contractor work management technology solution and process; (2) developing, configuring, and testing interfaces, hardware, and software for the solution; (3) implementing the solution and process for the following work groups: Electric High Voltage Distribution (HVD), Electric Low Voltage Distribution (LVD), Mutual Assistance, Forestry, Distribution Gas Code Compliance, and Substation Operations Construction Work; (4) updating the following vendor contract types to support BYOD field contractor work management: zone, specific bid, and fiery, electric storm, and mutual assistance; and (5) training field contractors and the new technology and processes. The alternatives considered included: (1) Continue with the current paper-based process. This alternative was not selected because this approach does not allow for the timely, data-driven work management metrics required to improve service to customers. (2) Use the current Company mobile application. This alternative was not selected because the solution is not expected to receive long-term investments by the vendor and the mobile application would require more upfront investment than the proposed option. (3) Use a third-party platform options such as ServiceNow. This alternative was not selected because contractors would not be able to leverage the benefits and integrations with the existing platforms and it would require additional new integrations. (4) Provide Company-owned devices to contractors. This alternative was not selected because the investment in hardware and procurement of on-boarding and off-boarding of devices to contractors, and training and change management is cost prohibitive and introduces a risk of the loss of control of information security and corporate assets. Leveraging the existing field work management solution was chosen because it uses existing well-developed functionality while leveraging cloud-based, BYOD capabilities to move short-term and long-term contractor/fo mapper process assto the established, hardened work management system.	2021-05-24	2024-12-31	-0.93	2,168,316	624,732		130,188	-	-	31,091	62,050	5,727	11,315	8,187	-	1,002	274	6,464	448	-
48	2023	Field Mapping and Graphics	Software(intangible)	Electric & Gas Shared	The project will implement a solution for the mobile field mapping and data collection that can search and view facility map data, view work order designs, and create work order as-built construction drawings in the field. This software technology increases process efficiency by consolidating field graphics functionality, reducing IT complexity and testing, and increasing adoption in the field through ease of use. In addition, it allows the Company to move to a supported application platform and retire the unsupported ArcPad solution. The current mapping and graphics application was implemented in 2002 and is no longer sold or supported in any capacity, and the custom solutions developed for the application cannot be changed. Due to the imposed accuracy of the CE landbase (streets, political boundaries, etc.), the outdated electric maps that are referencing that data causes the map to be unreadable which causes a safety issue. Additionally, field employees have considerable challenges when attempting to use the software due to awkward, arrugid interface, and dated processes. The project will add value by: (1) providing more accurate geospatial data, including facility map data, pre-construction designs, and as-built construction drawings; (2) consolidating daily tasks into a more simplified process; (3) validating data to ensure quality issue; (4) enabling the adoption of the Geographic Information System (GIS) standard; and (5) making mapping and graphics data available on field devices. The project scope includes: (1) installing a new mobile field mapping and graphics application; (2) creating the ability to search and view the facility map data in GIS format along with the ability to search by address; (3) viewing pre-construction work order designs in GIS format; and (4) creating as-built construction drawings and (5) format for assigned work orders. Four alternatives were evaluated and three were determined no viable for the project: (1) Continue maintaining the current ArcPad application. This option was not selected because the Company is no longer able to make changes to the ArcPad application to mitigate issues if the application has critical defects. A total failure of the application could prevent field crews back to paper-based facility maps, risking safety using stale, outdated data, or requiring the creation of as-built construction drawings on paper documents. (2) Use the Adobe or Snagit applications for creating as-built construction drawings. This option was not selected because field users would have to use one solution for viewing facility maps and use rudimentary drawing tools like Ads Be or Snagit for creating as-built construction drawings. This option was also not selected because it introduces additional costs due to the complexity and customization needed to integrate the applications. (3) Build a custom Mapping and Graphics solution. This option was not selected as existing industry solutions are available at a much lower cost with much less risk. (4) Implement right the new field mapping and graphics software was selected as this option will consolidate field graphics functionality into an efficient process and provide a current, supported solution	2020-11-30	2025-08-25	-0.71	4,400,537	70,897		280,798	372	-	91,829	115,430	9,881	63,297	13,853	-	-	9,069	4,116	668	-
49	2023	Field Network Director	Software(intangible)	Electric & Gas Shared	Design, develop, test and implement Cisco's Field Network Director (FND). FND is a network management solution for Field Area Network (FAN). The solution is necessary for the management of the modems that have been selected as the new Company standard for modems, as the previous standard modem is no longer being manufactured. The modems used for Electric and Gas Field device deployments have been discontinued by the manufacturer and the existing inventory will be exhausted by September 2021. After an extensive analysis of 6 modems, a modem was selected as the new standard, replacing the discontinued device. Configuring and managing modems manually is an ongoing, time consuming and labor intensive effort with tasks that include: modems configuration, firmware updates and modems status analytics, exasperated by the need to apply cyber security requirements. With no centralized software to manage the modems: 1) every modem will need to be manually configured, resulting in deployment delays and/or head-count increases; 2) lack of centralized over the air device management will introduce increased cyber security risks. Modem management software is required in order to effectively introduce, monitor and manage the new modem type. Support modems configuration, operations and management with a solution that provides capability to manage the new field based communications devices from a central and platform. Purchase, install, configure and integrate Cisco's Field Network Manager (FNM) software. Alternative 1, Stock and install selected modems without implementation of the FND. This alternative was not selected as manual management of modems will require: 1) Additional FTEs (+1 in 2022, +1 in 2024); 2) cyber security vulnerabilities will not be mitigated. 3) quality will be degraded with many manual steps. Alternative 2, evaluate other hardware vendors was not selected because of the immediate need to replenish modem stock as the previous modem is no longer manufactured and current stock is expected to be depleted in September 2021, Alternative 3, to utilize Cisco Field Network Manager (FNM) Software, which is the most cost effective approach to support existing inventory of modems; support the new standard modems; automation in configured on and management upgrades in firmware, modem status analytics, and cyber security requirements through a centralized platform.	2021-09-01	2024-05-27	-1.00	1,071,760	182,548		137,172	-	-	26,793	84,777	3,361	22,841	20,454	-	-	1,529	18,820	105	-

51	2023	Product Family Enhancements-Electric & Gas Shared-Capital	Software(Intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge. From review or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Electric and Gas operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operate ns Performance, Operations and Financial Reporting and Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives fro meach area that routinely evaluates and prioritizes the work and to assess requests for value using a ranked benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	113,252	-		16,338	-	-	-	8,818	23,179	2,072	2,063	-	-	-	-	-	-	-	-	-	-
52	2023	Product Family Enhancements-Electric & Gas Shared-O&M	Software(Intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Electric and Gas Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operate ns Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a ranked benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	28,534		-	-	-	-	-	-	-	10,955	-	-	3,837	6,388	730	-
53	2023	Service Suite Upgrade	Software(Intangible)	Electric & Gas Shared	The project will: (1) implement a new version of Service Suite Work Management that allows for easier distribution of work orders to the field, and (2) maintain a current version on a vendor supported platform for this critical enterprise application used across Operations and Engineering. The Service Suite Application is the mission critical work management software delivering work orders for customers. The current solution lacks an integrated view of traffic and a realizable dispatch work schedule. The upgrade will improve application performance by leveraging the application's current to maintain vendor support. The project will add value by: (1) implementing a new version that provides the appropriate level of vendor support for this 24x7 critical solution that provides over 100,000 work orders to the field weekly; (2) implementing Service Suite Workforce Management and migrating to cloud-based configurations that will simplify support and speed deployment of future changes; (3) providing the new feature of live traffic display on the Dispatch Application which will further improve dispatch decision making and (4) improving the readability and usability of the Dispatch Application schedule view, which will allow for a better comprehension of employees' work schedule. The scope of the project includes: (1) implementing the new version of Service Suite Workforce Management; and (2) integrating to a mobile mapping and driving directions application with Service Suite for mobile mapping on the field device to improve safety, response, usability, and supportability of the system. The alternatives considered included: (1) remaining on the current Service Suite version, which requires additional manual steps in the emergency response and work assignment; (2) creating a custom-developed solution, which increases waste and inefficiency, without the same level of Enterprise Resource Planning integration; or (3) changing the current vendor, which was not selected due to the increased complexity of migration and organizational change management. Upgrading Service Suite Field Service Management was chosen because it allows the Company to stay on the supported and familiar platform already being used in the field and provides additional business value and benefits to operations.	2022-12-26	2023-12-31	-1.00	1,077,410	103,381		345,638	-	-	-	103,445	191,196	18,730	32,102	36,183	-	-	9,915	24,448	1,820	-
54	2023	Spatial Asset Management	Software(Intangible)	Electric & Gas Shared	This initiative will implement SAP's Spatial Asset Management module. It will allow users to view assets, notifications, and orders geospatially using a map. The module will allow us to create and maintain asset maintenance plans for each segment of our gas and electric distribution networks (linear assets). We will create linear assets as technical objects (such as functional locations and equipment) and store linear data. We will enable creation of maintenance plans for these technical objects which result in notifications, maintenance orders, and measurement documents. We will enable monitoring of the condition of our linear assets, identify where there is damage or a defect (using the start point and end point and offset), and manage all types of maintenance tasks (planned, unplanned, and preventative). Currently Consumer Energy lacks spatial visualization and spatial awareness of work and assets impacting requirements for first time quality and planning the ability to plan, bundle and execute nearby work. The lack of a linear asset management capability affects the full work management value stream resulting in overproduction of asset maintenance activity such as assessments, surveys, and inspections. This project creates value for the company by: 1) providing capability in SAP to view assets, notifications, and work orders on a map, 2) providing location awareness in SAP for assets and work, 3) establishing linear asset management capability in SAP for gas and electric delivery networks, 4) enabling end-to-end map-based workflows. The scope of this project encompasses implementation in SAP of the Spatial Asset Management module. Alternatives considered include: 1) A Cloud-based risk-based asset integration between GIS and SAP. This alternative was not selected as it proves ineffective in addressing needs of the end-to-end work management value stream while increasing the technical footprint of customization. There are also performance concerns with cloud to on-premi migrations. 2) Work group centric approaches to viewing work on a map. This alternative was not selected as it does not support asset information thru the entire asset management value stream. 3) Do nothing. This alternative was not selected as this would result in increasing costs and inefficiencies in gas and electric work management. 4) The alternative to implement the Spatial Asset Management module in SAP was chosen as it expands use of a core technology investment, supports current investment in our work management value stream, and is compatible with our GIS technology.	2023-12-04	2025-11-30	-1.00	3,158,109	206,194		440,622	408,157	-	-	51,232	-	1,253	-	-	-	-	-	-	-	-
55	2023	Work Management Scheduling Analytics and Reporting	Software(Intangible)	Electric & Gas Shared	The project will implement a solution to optimize the key components of the Distribution Planning and Scheduling functions including executing, workorder intake, resource identification, work schedule creation, workhesvaluation preparation and associated work order analytics. Three primary alternatives were considered for this project: (1) Automating manual data movement across excel and current systems through Robotic Process Automation. This option was not selected because it will not meet base requirements and will not provide desired insights into whether the schedule supports operating priorities and metrics, financial scenarios, first time completion of work, and daily goals; (2) Integrating an off-the-shelf planning and scheduling system. This option is not preferred due to associated upfront and long-term costs; and (3) Implementing a hybrid of an off-the-shelf planning component with custom built scheduling functions. This is the preferred option to provide a more cost-effective and targeted fit for the organization.	2022-01-26	2024-11-20	-0.71	2,283,004	176,667		305,292	5	83	58,581	201,798	17,727	27,068	16,183	11,188	-	-	4,195	476	323	-
56	**SUBTOTAL**	**2023 Electric & Gas Shared**							**2,020,031**	**412,146**	**22,011**	**402,893**	**902,204**	**74,305**	**205,482**	**293,674**	**14,971**	**25,238**	**83,460**	**108,095**	**12,754**	**286**
57	2023	Gas Operations Field Devices For Gas Construction Employees	New Computers / Hardware	Gas	Prior period adjustment.				4	-	-	-	-	-	-	4	-	-	-	-	-	-	-	-	-
58	2023	Application Currency-Gas-O&M	Software(Intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Gas Engineering and Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Gas Engineering and Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and reducing failures, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	30,780		-	-	-	-	-	-	-	30,780	213	-	24,626	4,120	1,821	-
59	2023	Compression Digital Mobility	Software(Intangible)	Gas	Prior period adjustment.				(1,206)	-	-	-	(810)	(51)	(283)	1,194	-	-	-	870	51	273
60	2023	Corrosion Control Modernization	Software(Intangible)	Gas	This project will modernize the Corrosion Control measurement, documentation, and analysis process for Gas Transmission and Gas Distribution Corrosion Control. It will also automate the Corrosion Control process and eliminate manual data entry and paper for mthe process. The current gas pipeline corrosion control field data collection and monitoring process is antiquated and manually intensive. The existing process requires that technicians take readings from the corrosion control devices using a handheld DAH (Digital Voltmeter) and then record these readings on paper, followed by manual data entry into Inspection Manager. The results can then be further stored, processed and analyzed. This process is labor intensive and error prone, which could result in compliance issues, issues rework, and drive up labor costs. This project creates value for the Company and its customers by: (1) maximizing the entire gas pipeline corrosion control field data collection and monitoring process; (2) eliminating the manual paper process of taking and recording measurements on corrosion control devices attached to gas pipelines; (3) automating the entire process from measurement through documentation and analysis; (4) providing an integrated solution that takes the measurements and records the results in one step; (5) implementing geographical location (latitude, longitude) for every test point recorded; (6) improving accuracy and timeliness of the data collected by passing the data directly to the system of record. The project's scope includes: (1) purchasing hardware and software with related licenses needed to establish a modern electronic corrosion measurement and documentation system; (2) interfacing with the existing GIS system for test-point location data; (3) a data transfer to the new system from the work inputsystem of record, Inspect on Manager; and (4) training users in the use of the new system and deploy to all corrosion control technicians. Alternatives considered include: (1) continue with the current manual process. This option was not selected as it does not solve the issues associated with the paper-based manual process; (2) develop Consumers Energy's solution that would interface with a standard DAH and automate the current paper process using custom in-house solution. This option was not selected as it would be far too costly and time-consuming to develop in-house and a standard solution is available in the marketplace; and (3) purchase and implement a COTS (Common Off The Shelf)hardware and software solution to provide an electronic means of data measurement and collection then interface that system with the existing system of record. This option was selected as it meets the goal of automating the data collection and documentation process and eliminates the existing paper process.	2022-08-23	2024-12-27	-0.45	1,309,838	34,613		488,935	6,419	47,303	98,207	245,406	23,571	68,019	18,005	-	9,656	2,347	5,452	499	52
61	2023	ECM Project Wise	Software(Intangible)	Gas	Prior period adjustment.				-	-	-	-	-	-	-	23	-	-	-	-	-	23
62	2023	Gas Compression Digital Work Management	Software(Intangible)	Gas	The project provides work management software and digital forms for Gas Compression facilities. The current work management process for Gas Compression locations is cumbersome and largely paper based outside of desktop tasks. This manual system leads to excess waste, rework, and human error. This project provides value to the Company through: (1) increased productivity by reducing the need to return to the desktop kiosk for updates; (2) improved quality through increased accuracy of updates completed at the time and place of the work; and (3) improved safety through real-time information used at work sites rather than printed procedures. The scope of the project includes: (1) purchasing licenses to add Gas Compression users to the company's existing mobile work management software, and (2) configuring changes in SAP and the mobile work management software to replace the paper-dependent work management process with the ability to access and update maintenance, operations, and safety information at Gas Compression locations. Alternatives considered include: (1) Utilize an SAP work management solution is not preferred since it is a new solution and requires additional project and support cost. (2) Continue the manual paper-based process. Continuing the manual paper base process was not chosen because of process waste, rework, and human error. (3) Customize the existing electronic Shift Operations Management (eSOMS) mobile application to add work management functions. As a custom eSOMS mobile application was not chosen because it would require additional project cost and ongoing support budget for a custom solution that the eSOMS product was not intended to support. (4) Utilize the existing Service Suite solution currently deployed for Gas and Electric Distribution. The Service Suite solution is the preferred option because it is a proven solution at the Company and provides the mobility and digital benefits at a lower cost.	2023-06-19	2024-12-06	-1.00	878,080	142,712		-	-	-	-	-	-	-	3,474	-	-	1,727	1,496	251	-
63	2023	Gas Construction Operations Enablement	Software(Intangible)	Gas	The project will implement an electronic work management solution that will enable Gas Construction Operations employees to assign, manage, and complete field work orders, eliminating the manual processes used. The work management system will also enable improved real-time tracking and reporting. The Gas Construction Operations department has operated on a paper process for work order completion since their initiation. Originally the work group was to be a temporary workforce, however ongoing improvements for the gas network have extended the need for the department. The current paper process creates additional work to produce and distribute to field operations. Also, the return of the completed paper process has a risk of human errors, lost paperwork, data lags, and readability. These manual processes often require additional contacts to field leaders and Field employees to post-verify information. This project will allow the electronic system to automatically process master orders in SAP, improving accuracy for Customers. The project will add value by: (1) improving visibility to work location of crews and job status updates in real time, (2) standardizing employee time-sheet management, (3) reducing closeout time by reducing data entry, (4) eliminating efforts to hand off paper copies of meter work orders, (5) reducing billing processing lag time for customers through direct updates to electronic forms, and (6) improving customer satisfaction with more timely meter installations dates. The scope of the project includes: (1) implementing an electronic work management solution for Gas Construction Operations, (2) enabling Gas Construction employees to assign, manage, and complete field work orders, and (3) developing the interfaces for management of the Gas Construction business unit. Alternatives considered include: (1) continuing with the existing paper process, and (2) SAP direct forms order entry and completion. These two alternatives were not chosen because manual workarounds will not improve safety or reduce job and administrative time, and SAP does not support entry of information without cellular connectivity. In addition, with direct SAP, a method of work assignment would need to be developed. The electronic work management solution was chosen because it will improve safety and reduce job and administrative time, while supporting information entry without cellular connectivity. This solution is a Company standard which simplifies the implementation and keeps ongoing maintenance costs down.	2021-01-25	2023-01-30	-0.40	1,856,304	151,939		3,138	-	-	-	-	-	-	3,192	-	-	-	-	-	-
64	2023	Gas Distribution Project Wise	Software(Intangible)	Gas	Project Wise is a suite of project collaboration software for engineering projects currently in use as the Company's gas transmission and generation engineering teams. It is capable of bundling, managing and handling the versions of records and documents related to designs, proposals, contract resources and record keeping. The Gas Distribution Project Wise project will expand the implementation of the software to gas distribution and be used to facilitate a management of change process for gas engineering design and gas system configuration changes. SharePoint and a centralized Company data store are currently used as a data warehouse for gas distribution engineering design documentation. The current solution has limited ability to meet the functional requirements for managing and approving the files and drawings that are unique to engineering design work. Gaps include: (1) inability to track design edits and document design change authorization approval; (2) inability to manage multiple outage windows and potential impact of planned projects; (3) inability to track gas system configuration changes, both temporary and permanent; (4) no current standards and structure of project documents for ease of view/upload/tag; and (5) no current dashboard for tracking as-built/final record completion. In addition, the engineering teams lack an effective tool to centralize the management of change processes for gas engineering design and gas system configuration, leading to unapproved changes to projects without proper knowledge and authorization. Without the proper controls and versioning in place, the opportunity for rework is enhanced causing extended project time for completion, negative impacts on other projects and increased costs. Completion of this project will provide value to the Company through: (1) comprehensive documentation of all design review changes from key technical Subject Matter Expert (SME) groups, ensuring that the final design is inclusive of all approved changes; (2) end to end workflow tracking and approval sign-off from initial design and engineering through field operations and final sign-off, providing for a controlled historical record that is traceable and verifiable; (3) consistent gas technical records across project and asset lifecycle; (4) increased public and employee safety and regulatory compliance with complete and accurate records that are easily accessible and easily searchable; (5) providing visibility to and improving tracking for system outage windows and to limit temporary pressure changes/reductions providing the ability to align outage schedules with distribution construction schedules; (6) tracking temporary and permanent gas distribution system configuration changes in a controlled repository; (7) maintaining spatial relationships with the drawings and documents such that all documents pertinent to a geographic location can be quickly accessed and retrieved; (8) providing a universal system of record for complete operating procedures; (9) creating a universal system of record for all construction prints; (10) centralizing tracking of Supervisory Control and Data Acquisition (SCADA) commissioning and decommissioning activities; (11) tracking project as-built and final project record completion; and (12) providing a centralized repository for document retention, archival and version tracking, resulting in records that are traceable and retrievable. Collectively, these items support the Company's implementation of the American Petroleum Institute (API) Recommended Practice 1173 Pipeline Safety and adherence to regulatory requirements. The project provides additional value by implementing a management of change tool with capabilities that can be replicated in other organizations, including gas engineering, metering and regulation, gas system integrity, and gas transmission. The scope of this project encompasses implementation in SAP of Project Wise software modules for use by Gas Distribution Engineering. The project will: (1) configure the software modules within the application, and (2) design and develop integrations with other Company systems. Alternatives considered include: (1) Continue with current SharePoint and shared data store warehousing solution for version report Gas Engineering designs and gas system outage windows. This alternative was not selected because it does not resolve the identified problems. (2) Develop and implement an in-house solution. This alternative was not selected due to cost and lack of expertise in developing a custom solution. (3) Implement Project Wise software. This alternative was selected for the following reasons: (1) Project Wise is available in a Software as a Service (SaaS) solution with out of the box capabilities, and (2) Project Wise aligns with the Company direction as it has been implemented and in use in other areas of the Company including Generation and Gas Transmission.	2022-02-28	2025-01-31	-1.00	861,663	239,185		699,197	-	-	-	90,668	540,638	24,215	43,690	36,351	-	-	9,306	24,996	2,049	-
65	2023	Gas Leak Asset and Work Management	Software(Intangible)	Gas	The project will implement functionality to automate gas leak compliance tasks and track all gas leak activity in the Gas Geographic Information System (GIS), creating a single system of record for gas leaks data, and providing a spatial display of leak data to improve leak management visibility. The gas leak process utilizes two systems to complete work and monitor gas leak compliance: SAP and Inspection Manager. Gas leak information is manually transferred between SAP and Inspection Manager and vice versa by compliance technicians. An internal audit identified 18 181 leak orders, resulting in a 6% defect rate, with inconsistent information recorded between SAP and Inspection Manager. Lack of quality control to help ensure accurate leak information across systems may inhibit management's ability to effectively monitor gas leaks and could result in leaks not being re-classified or repaired in a timely manner. This has regulatory compliance and safety impacts such as missed compliance dates which may result in fines and increased public safety risk resulting from untimely or missed leak repairs. The project provides value to both the Company and its customers, including: (1) improving productivity and leak location accuracy; (2) enabling near-real-time reporting and automated metric reporting to open leak backlog; (3) creating one system of record for all leak assets in GIS; (4) implementing quality improvements for scheduling and routing of leak crews; (5) reducing risk of future audit findings or non-compliance resulting from duplicate open leak orders; (6) optimizing resource allocation for gas service postingsteps by eliminating manual posting of leak repairs in GIS; (7) optimizing resource allocation for the gas compliance team by eliminating the posting of leak repairs in Inspection Manager; and (8) streamlining the leaks survey workflow to improve the human struggle cause id by use of paper maps and manual processes for leak order tracking. The scope of this project includes: (1) design and implementation of an integration between the asset system and the work management system to create, update, and manage leak maintenance, repair, and emergent orders and inspection schedules through the Enterprise Service Bus (ESB) or similar; Five alternatives were considered for the project: (1) Implement a Quality Assurance/Quality Control (QA/QC) process to ensure data is consistent between both SAP and Inspection Manager. This alternative was not selected because it requires an increase in labor costs for manual reporting and data checks. In addition, as demonstrated by the audit, manual processes, even manual QA/QC processes, are subject to human error, and each error creates safety and noncompliance risk. (2) Implement a Robotic Process Automation (RPA) to sync data. This solution was explored but is not viable because the business processes are too complex. (3) Implement a new GIS based compliance solution that can be integrated with SAP. This alternative is too costly, given recent investment in the current Inspection Manager solution. (4) Defer project implementation. The alternative selected is to implement this project now, rather than later, as a result of recent gas leak red audit findings. (5) Implement functionality to automate gas leak compliance tasks and track all gas leak activity in the GIS. This alternative was selected because it leverages existing solutions in a new way, optimizing resources and technology investment. The use of Cloud technology was not considered due to the enhanced functionality being added to systems and applications that are already on-premise.	2023-08-24	2024-12-27	-1.00	50,000	6,225		-	-	-	-	-	-	-	2,797	-	-	2,511	121	166	-

66	2023	Gas Measurement, Regulation, Pipeline, and Storage (MRPS) Field Work Management Software (Intangible)	Gas		The project will move gas MRPS work orders from the current paper process to an electronic solution that includes work management, compliance scheduling and tracking, mobile dispatch and work completion functions. The current field processes and activities within Transmission Operations are hindered by lack of technology. MRPS does not currently have a technology solution for work order processing, parts ordering, dispatch and scheduling, GPS routing, and access to Company applications. As a result, employees rely on manual paperwork processes, handoffs, and work order management. The current field device could be better utilized if not for technology limitations that hindering customer benefits and employee engagement. The project will add value by: (1) increasing efficiency of order entry and management reporting through a digital solution rather than paperwork handoffs; (2) maintaining key compliance records without depending on paper processes and records; (3) improving productivity by eliminating the duplication waste of managing asset and compliance records management using paper binders; (4) reducing risk of MPSC non-compliance by digitizing systems data, making it readily available for review and analysis by leadership; (5) increasing ability to assist field using data available from a digital system to enable reporting and analysis; and (6) improving Safety by reducing risks to gas storage assets and adherence to standards by moving to digital systems and data. This enables future Safety initiatives such as a monthly well monitoring program that ensures accurate and timely data capture for identification and mitigation of areas at risk, analysis, and data trending. The project scope includes: (1) SAP updates to enable gas MRPS work processes; (2) prioritization methodology to evaluate and convert paper forms (upto 75 for compliance work, up to 75 for work order completion); (3) alignment of use with the compliance schedule and tracking solution on routing and documenting work, tracking time, and work order costing; and (4) development of Training materials and train-the-trainer activities. Alternatives considered include: (1) utilize an SAP module to migrate field work orders to an electronic platform; (2) implement a new solution - Field Manager Solution, Go Canvas, ESRI, and Smart Sheet were evaluated; (3) continue manual paper-based process currently used by the gas planning work force; and (4) implement a Service Suite solution. The first alternative was not selected because it did not offer a scheduling solution or support information entry in offline setting, location and time tracking required added integration, and a method of assignment and dispatch would need to be developed. The second alternative was not selected because the ad hoc applications that were evaluated were significant deviations from the field work management standard solution, reducing field crew usability through lack of integration and user adoption while increasing support complexity and cost. The third alternative was not selected because it does not eliminate the current process waste, rework, and human error risk. The alternative to implement the Service Suite solution was selected because it is the current field work management standard, providing work management scheduling capabilities, real time validation of field work order forms, and proven field crew adoption and usability resulting from four years of Service Suite usage by 3000+ Company field crews.	2020-12-28	2022-12-26	-0.92	2,635,822	11,646		878	-	-	-	-	-	873	-	-	-	-	-	-
67	2023	Gas SCADA Software Solution	Software (Intangible)	Gas	The Gas Supervisory Control And Data Acquisition (SCADA) software solution project will replace the current Gas SCADA Software with a more standardized software package enabling the Company to more efficiently meet Federal and MPSC requirements. The current Gas SCADA software solution was originally implemented in 2000 and was based on its gas system requirements at that time. While the solution has been maintained since its implementation, the Company's gas system has outgrown the current capabilities. As the solution ages, there is increased effort required to address obsolete application and database software architecture, and enhancements to the system are limited. To address the capability gaps, custom interfaces and integrations have been developed where each requires maintenance and support. This environment adds complexity and cost to solution upgrades and troubleshooting issues. The current Gas SCADA solution will limit the ability to invest in digital solutions for increased system health monitoring and preventative maintenance capabilities due to the complexity to integrate these future capabilities with it. The project will add value by: (1) reducing its IoT non-compliance by improving the ability to document and follow State and Federal requirements, improving customer safety; (2) improving efficiency and reliability when performing routine activities are upgrades, because standards out of the box software has less risk of breaking during upgrades, as opposed to more custom coded software; (3) reducing maintenance costs due to fewer individual software programs and less custom code; (4) improving Gas Control management capabilities that support the Federal and MPSC requirements for gas pipeline and Gas Control's ability to operate and monitor gas system operations; (5) improving reliability by using proven gas industry standard and software with configuration features, rather than a fully custom and system that has the possibility of being impacted by the next version update; (6) purchasing standard, out-of-the-box software that meets a high percentage of requirements and avoids multiple custom applications and specially coded programs to achieve results; (7) improving Natural Gas Delivery Plan efficiencies; and (8) providing a basis for capturing data required for use in computer-based preventative maintenance programs and more predictive technologies. In addition, implementing industry-specific software helps the collective gas industry users to encourage the vendor development of future version enhancements, which adds more value to the gas industry users. The comprehensive Gas SCADA system is used to monitor and control the operating conditions of the transmission and distribution gas system. The Gas SCADA system includes remote terminal units (RTUs), field devices (i.e. valves, meters, odorizers), and computers running SCADA software. This scope covers the Gas SCADA software solution only. The project scope includes the following: (1) significant planning, including consulting assistance, to define the implementation strategy for the effort, given the magnitude of the technology effort; (2) selection and implementation of a new Gas SCADA software solution; (3) planning of a phased roll out of new hardware and software; and (4) retirement and decommissioning of the legacy gas SCADA solution and equipment once the new system is fully tested and operational. Alternatives considered include: (1) continue to maintain the current solution, at the risk of increasing reliability issues that result in controlling and monitoring the Company's gas system; (2) invest in enhancing the existing Gas SCADA software solution which would introduce additional custom development and more specialized functionality that may not be supported in future vendor releases; and (3) replace the solution with a gas SCADA software solution that meets requirements to support the Natural Gas Delivery Plan. Alternative three has been selected to ensure sustainability for this critical solution. The current legacy system is operating at well beyond its original design specifications, so the potential points of failure are not fully known or understood. If the SCADA project is not completed, the legacy system could become unstable and impact Gas Control's ability to operate and monitor real-time system conditions, maintain safe operations, and compliance with regulatory requirements. It could also impact the ability to commission new facilities with require remote monitoring or control or cause the need for 24/7 manual field monitoring of certain facilities.	2022-04-18	2025-12-31	-0.96	18,016,040	2,305,237		1,949,568	708,742	966,193	53,782	219,056	4,241	17,212	161,360	-	-	149,361	1,788	10,211	-
68	2023	Gas Storage Probabilistic Risk Model	Software (Intangible)	Gas	The Gas Storage Probabilistic Risk Model project will implement a risk analysis model for comprehensive predictive risk analysis and modeling on gas storage wells. The current Gas Storage model is a relative risk model that equates risk to dollars from input information using qualitative data and risk scales to produce a risk ranking. In simple terms, the relative risk model is not capable of creating a statistically significant result. The risk assessment used in the current model provides a ranking for likelihood, consequence, and risk that is extremely only in comparison to other rankings. While the outputs provide a sense of relative risk when comparing one well to another, the ranks do not provide anything qualitative that relates to the failure of wells. Also, the current transmission model does not meet the requirements of the MPSC, as indicated in a letter of noncompliance (dated January 15, 2019), and rule making for storage systems has historically followed transmission rule-making. Lastly, the current model introduces risk in PHMSA findings as a non-probabilistic model. Completion of this project will provide value to both the Company and its customers. Each party will benefit from safety improvements and risk mitigation through statistically-based risk modeling that leads to more informed well improvement projects and improved targeted plug and abandonment projects. Implementing probabilistic risk modeling supports the changes planned for in the Company's Natural Gas Delivery Plan (NGDP), including the Company Gas Management Safety System (GSMS). GSMS incorporates the Company's plan to implement the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems). Additionally, the implementation of a probabilistic risk model will: (1) calculate quantitative risk scores that include measures of probability, frequency, or expected loss of events, and (2) configure multiple data sources, to make advanced statistical calculations for interacting threats, both of which allow the Company to make more informed financial and strategic decisions based on risk. The probabilistic risk model will rank the wells in risk associated data by making it easier to interpret risk results for the purpose of making business decisions. Furthermore, the Pipeline and Hazardous Material Safety Administration (PHMSA) has identified the probabilistic risk model as a potential best practice for storage operators over other risk models (PHMSA Pipeline Risk Modeling white paper, dated May 9, 2018), so the project adds value by aligning with industry best practices. The project scope encompasses the implementation of a probabilistic risk model for gas storage wells. The project will: (1) install and configure risk model; (2) configure multiple data sources; and (3) develop reports and dashboards. Alternatives considered include: (1) continue the use of the relative risk model, but invest in substantial effort to continually manually managing data inputs and quality checks; (2) implement a custom, Excel-based probabilistic risk model through a consulting effort; (3) implement an on-premise probabilistic risk model, and (4) implement a cloud-based model. The first alternative was not selected because although the manual effort is possible, it is becoming increasingly difficult to complete as the model utilizes more data sources that need to be annually updated and validated. The second alternative was not selected because although the effort minimizes the IT cost of the project, the model requires the creation of a secondary data sources, leading to multiple "sources of truth". The on-premise solution is analyzed are not mature and have not been widely tested with transmission operators. The third alternative was not selected because it is the most cost-effective long-term implementation approach, providing commercial, off-the-shelf capabilities, industry proven and upgradable technology, and ongoing vendor support.	2023-04-14	2024-12-24	-1.00	1,577,860	145,522		907,902	531,730	-	2,460	351,042	911	21,760	115,363	-	-	474	114,750	140	-
69	2023	Gas Transmission Probabilistic Risk Model	Software (Intangible)	Gas	The project will implement a risk analysis model for comprehensive predictive risk analysis and model region gas transmission pipeline assets. Pipeline risk models are unit-less measures of risk derived from input information using qualitative data and ordinal scales to produce risk index scoring. In simple terms, the relative risk models does not provide true statistical measures. The risk assessment used in the current risk model provides a sense for likelihood, consequence, and risk that is relevant only in comparison to other scores. While the outputs provide a sense of relative risk when comparing one pipeline with another, the scores do not provide quantitative scores for probability, frequency, or expected loss of events. Although pipeline operations commonly use relative risk models, the quality of the relative risk ranking relies on subject matter expert inputs, human inferences, and opinions. Furthermore, the current model does not meet the requirements of the MPSC, as indicated in a letter of noncompliance (dated January 15, 2019), citing gaps in the model with respect to known failure data and well-aged fabrication threats, inadequate depth of cover calculations, level of corrosion, and inability to provide statistical validation. Inability to mitigate these non-compliances will be at a probabilistic risk model or through significant manual workarounds will likely result in continued non-compliances. Completion of this project will provide value to both the Company and its customers. Each party will benefit from safety improvements and risk mitigation through statistically-based risk modeling that leads to more informed pipeline replacement or improvement projects. Implementing probabilistic risk modelling supports the changes planned for in the Company's Natural Gas Delivery Plan (NGDP), including the Company Gas Management Safety System (GSMS). GSMS incorporates the Company's plan to implement the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems). Additionally, the implementation of a probabilistic risk model will: (1) calculate quantitative risk scores that include measures of probability, frequency, or expected loss of events; and (2) configure multiple data sources to make advanced statistical calculations for interacting threats, both of which allow the Company to make more informed decisions based on improved quality inputs in a measurable model; and (3) provide information for better decisions on Capital project improvements and integrity management. Unlike the current unit less relative model a probabilistic model will be a unit based risk score, specifically in the unit of dollars, improving efficiency in interpreting risk results for business decisions. The project scope encompasses the implementation of a probabilistic risk model for gas transmission. The project will: (1) install and configure risk model; (2) configure multiple data sources; and (3) develop reports and dashboards. Alternatives considered for the project include: (1) Continue the use of the relative risk model, but invest in a substantial effort to build customization to bring the model into compliance. This alternative was not selected because although custom workarounds can make the model into compliance, the work-arounds still result in arbitrary, relative rankings and do not provide confidence in the ability to provide statistical validation of results. (2) Implement a custom, Excel-based probabilistic risk model through a consulting effort. This alternative was not selected because although the effort minimizes the IT cost of the project, the model requires the creation of secondary data sources, leading to multiple sources of truth. (3) Implement an on-premise probabilistic risk model. This alternative was not selected because the on-premise solution is analyzed are not mature and have not been widely tested with transmission operators. The option of implementing the cloud-based probabilistic risk model was chosen because it is the most cost-effective long-term implementation approach, providing commercial, off-the-shelf capabilities, industry proven and upgradable technology, and ongoing vendor support.	2020-12-28	2024-07-29	-1.00	1,064,124	257,685		178,998	345,050	-	1,084	(211,835)	3,824	42,891	2,806	-	-	208	2,423	175	-
70	2023	Product Family Enhancements-Gas-Capital	Software (Intangible)	Gas	The Gas Engineering and Operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, new or revised regulations, customer feedback, and other improvement ideas. Enhancement requests require a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's value of software enhancements in Gas Engineering and Operations. The value of software enhancements in Gas Engineering and Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a ranked benefits criteria. The annual enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project funds the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	309,283	-		309,283	-	-	82,176	185,930	12,782	28,395	-	-	-	-	-	-	-
71	2023	Product Family Enhancements-Gas-O&M	Software (Intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Gas Engineering and Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a ranked benefits criteria. The annual enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project funds the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. 73	2023	800 MHz Modernization	Network	IT Digital Foundation	Project not allocated.							276	-	276	-	-	-	-	-	-	-	-	-	-	-
74	2023	ARP-Local Area Network	Network	IT Digital Foundation	This project will upgrade the Company's entire Local Area Network (LAN) and a significant portion of the Wireless Local Area Network (WLAN). At some Company locations, LAN equipment has been in service since 2011. If the LAN/WLAN hardware and software are not routinely refreshed, the Company will lose the manufacturer support needed for equipment bug fixes, security vulnerability patches, and enhancements. In addition aging equipment cannot accommodate the increasing demand for wireless devices necessary for performing-to-day operations that rely on wireless enabled devices, such as rugged field devices, cell phones, barcode scanners, tablets, and other mobile devices. As equipment ages, it is at risk of higher failure rates, which increases the risk of unplanned outages. In the event of unplanned outages, business services would not be able to access services in the corporate network including email, SAP, Internet, and phones. The project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; (4) ensuring equipment is vendor supported, thereby ensuring support for bug fixes, security vulnerability patching, and enhanced features; (5) providing consistent wireless coverage across Company locations; (6) increasing user productivity through a higher performing wireless network, which increases the productivity and efficiency of office and field employees serving customers; and (7) improving support for wireless Internet Protocol (IP) phones, Internet of Things (IoT) and field devices. The project scope includes: (1) refreshing the LAN equipment and wireless access at Company sites; (2) identifying the required features for the new equipment; (3) implementing the new equipment according to industry best practices; (4) replacing wireless networks with upgraded infrastructure and verifying wireless coverage is as expected; and (5) decommissioning old equipment. Alternatives considered include: (1) Replace the existing units with new units from other radio and modem manufacturers; (2) purchase new radio subscriber units from existing manufacturers, but invest in system-level work to ensure requires replacement of existing management systems with a new vendor specific and would need to duplicate effort if the Company were to move to different equipment. This would result in a significantly higher investment. Option 2 was selected as this has the least disruption to radio and mobile data system users and delivers the highest value and lowest cost solution to meet the objectives of this Business Case.	2023-01-01	2023-12-31	-1.00	4,845,746	113,699		2,138,252	124,497	1,776,877	115,910	73,215	7,926	29,757	39,795	-	303	12,718	25,492	1,281	-
75	2023	ARP-Radio	Network	IT Digital Foundation	This project will refresh hardware to include; 800MHz Radios, cellular modems, plant radios and systems, cellular amplification devices and vehicle consoles in service trucks. This equipment supports mission critical voice and data communications for plant and field service personnel and dispatch personnel. 800MHz radios and Plant radio systems are upgraded on a scheduled 7-year lifecycle basis. Cellular modems are refreshed on a 5-year life cycle basis. Amplification systems are refreshed on a 10-year life cycle. Vehicle consoles are typically retired with the vehicle but are salvaged for reuse in new vehicles when possible. 800MHz, mobile, and portable radios, Plant radio systems, and vehicle consoles are refreshed, the Company will lose the manufacturer support needed for equipment bug fixes, security vulnerability patches, and enhanced features; (5) providing consistent wireless coverage across Company locations; (6) increasing user productivity through a higher performing wireless network, which increases the productivity and efficiency of office and field employees serving customers; and (7) improving support for wireless Internet Protocol (IP) phones, Internet of Things (IoT) and field devices. The project scope includes: (1) refreshing the LMR equipment and wireless access at all Company sites; (2) identifying the required features for the new equipment; (3) implementing the new equipment according to industry best practices; (4) replacing wireless networks with upgraded infrastructure and verifying wireless coverage is as expected; and (5) decommissioning old equipment. Alternatives considered include: (1) Replace the existing units with new units from other radio and modem manufacturers; (2) purchase new radio subscriber units from existing manufacturers, but invest in system-level work to ensure requires replacement of existing management systems with a new vendor specific and would need to duplicate effort if the Company were to move to different equipment. This would result in a significantly higher investment. Option 2 was selected as this has the least disruption to radio and mobile data system users and delivers the highest value and lowest cost solution to meet the objectives of this Business Case.	2023-01-01	2023-12-31	-1.00	734,859	62,731		322,790	-	304,364	25,965	9,388	2,221	(18,203)	21,956	175	9,222	6,083	5,557	918	-
76	2023	ARP-Collaboration	New Computers / Hardware	IT Digital Foundation	This project will replace the Company's obsolete or out-of date audio, visual, telephony and other communication collaborative tools and equipment. When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value by: (1) ensuring that the Company's audio, visual, telephony, and other communications systems are stable and reliable; and (2) retiring the legacy enterprise Avaya telephone systems that have reached end of mainstream manufacturer support. The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for evolving business requirements. The following alternatives were considered: (1) refresh a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only. These alternatives were not chosen due to the risk inherent with a partial replacement of assets, which include: (1) a reduced supply of equivalent replacement Avaya parts that are no longer be produced; and (2) an erosion of the knowledge technicians possess on discontinued systems.	2023-01-01	2023-12-31	-1.00	1,839,809	146,132		593,211	893	515,310	12,925	36,117	1,784	2,081	51,146	-	6,997	12,276	30,377	1,496	-
77	2023	ARP-Core Network	New Computers / Hardware	IT Digital Foundation	This project will refresh the Data Center network equipment. When network assets that are used to support customer interactions and ensure the stability of mission critical business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project will create value by: (1) increasing network availability; (2) adding new functionality; (3) increasing network performance; and (4) standardizing network infrastructure across Data Centers. The project scope includes the replacement of all core network devices with next generation devices. The alternative considered was to continue running in the current state or delay the replacement of network devices and accept the risk of further business and customer impact when more equipment failures occur.	2023-01-01	2023-12-31	-1.00	26,320	-		8,446	-	-	6,050	-	3	2,391	-	-	-	-	-	-	-
78	2023	ARP-Field Device Asset Management (FDAM)	New Computers / Hardware	IT Digital Foundation	This project will replace field devices according to a four-year refresh cycle that is based on industry standards, hardware failure, security patches, and software compatibility. When Field Device Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and can be very difficult to keep current with Security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular four-year refresh cycle. This project creates value for the Company: (1) improving stability and availability of business-critical applications by proactively replacing workstations prior to increasing hardware failures; and (2) allowing field workers to complete their jobs tasks. The project scope consists of replacing field device assets according to the four-year refresh cycle. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for field devices; and (2) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the assets that need refreshing in future years based on the number of devices that were not replaced during the four year refresh cycle; and (4) it could cause an inability to apply security patches. Waiting longer than the four-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and harm its reputation. The Company selected a four-year refresh cycle to alleviate these concerns.	2023-01-01	2023-12-31	-1.00	3,273,840	2,491		1,030,148	-	1,004,596	4,597	-	-	1,056	872	-	-	551	321	-	-
79	2023	ARP-Operational Technology Support Gas	New Computers / Hardware	IT Digital Foundation	The As set Refresh Program (ARP) - Operational Technology (OT) Support Gas project will replace datal and o bsolete servers and storage infrastructure. When Operational Technology assets that are used to ensure the safety and reliability of technology that supports critical gas operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates and runs the risk of failure. If the Company does not adhere to a regular refresh cycle. The project creates value by maintaining the currency of the Company. The programs scope consists of: (1) the annual replacement of compute hardware under the program; and (2) installing additional new compute capacity to account for new kingdoms requirements. The alternatives considered include: (1) operate server and storage infrastructure beyond a five to seven-year refresh cycle or (2) refresh server and storage infrastructure based on a five to seven-year refresh cycle along with evaluating the health of the asset and evolving business needs. The alternative to operate hardware beyond a five to seven-year refresh cycle was not selected due to the risk that these hardware component failures would cause system reliability and safety issues for customers, as most vendors do not provide extended support after seven years. The Company chose the alternative to refresh this server and storage infrastructure based on a five to seven-year refresh cycle along with evaluating the health of the asset and evolving business needs to reduce the risk of impacts to critical infrastructure that supports systems such as Gas SCADA and Gas Compression control systems.	2023-01-01	2023-12-31	-1.00	244,997	16,579		246,997	187,593	46,009	6,108	2,998	599	1,703	16,579	10,496	-	2,909	2,736	438	-

80	2023	ARP-Printer Asset Management (PAM)	New Computers / Hardware	IT Digital Foundation	This project will replace and install select printers, plotters, and multi-function printing devices based on printer replacement assessments and a five year refresh cycle. Printer service and usage history is evaluated and a determination is made if a printer can be repurposed instead of ordering a new one. When Printer Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and more difficult to keep current with firmware and security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improving the dependability of these printer devices for employees; (2) exerting increased costs due to hardware repairs; and (3) ensuring compatibility with enterprise print applications. The project's scope consists of the annual replacement of printer assets according to a five-year refresh cycle. The alternatives considered for the project included looking at refresh cycles from three to seven years as well as running the assets to failure. The selection of a five-year cycle was deemed to be the best solution since anything less than five years would increase the likelihood of unneeded expense for replacement of assets that were still in good operating condition. Anything greater than five years is assessed monthly to ensure it is not run to failure, including running the asset to failure, resulting in additional expense for maintenance of the equipment and downtime, negatively affecting employee productivity. The Company has optimized printer needs based on the shift to a hybrid work model during and after the pandemic. The Company anticipates an increase in co-workers returning to in-person work in 2023, resulting in a need to refresh printers that are at risk of failure.	2023-01-01	2023-12-31	-1.00	332,691	19,064		119,737	-	107,264	4,146	-	(5,569)	897	6,672	-	-	5,972	260	440	-
81	2023	ARP-Server	New Computers / Hardware	IT Digital Foundation	Prior period adjustment.							(15,930)	(13,749)	(2,181)					17,806	15,000	2,380	426	-	-	-
82	2023	ARP-Server and Storage	New Computers / Hardware	IT Digital Foundation	The Asset Refresh Program (ARP)"Server and Storage will replace or augment server and storage infrastructure for the Company. When Server and Storage Hardware Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and can be very difficult to keep current with security updates. The Company also runs the risk of failure of these assets if impacting customer interactions and business operations if it does not adhere to a regular five to seven-year refresh cycle. This project creates value for the Company through: (1) improved stability and availability of business critical applications by proactively replacing server and storage hardware assets prior to the likelihood of increasing hardware failures; and (2) ensuring that adequate resources are available to support application demands after five to seven years of actual use. The scope of this program encompasses: (1) replacement of server and storage hardware assets; and (2) installation of additional new computers and storage capacity to accounts for evolving business requirements. The alternatives considered were to purchase extended maintenance, move some of these assets to the cloud with the Digital Hybrid Cloud and Data Center Migration project, or to replace the assets in the current cycle. The option to purchase extended maintenance was not selected because full support would not be offered after seven years and maintenance costs would increase. The preferred option is to move some of these assets to the cloud in the Digital Hybrid Cloud and Data Center Migration project while refreshing the remainder up to the five-to-seven-year cycle as it is the most cost effective option. If the Digital Hybrid Cloud and Data Center Migration project is not approved as part of this rate case, the Company plans to continue to refresh these critical technologies at the current level based on a five- to seven-year refresh cycle to mitigate the risk of failure.	2023-01-01	2023-12-31	-1.00	2,267,206	273,289		727,510	-	274,339	199,301	39,215	31,510	(28,414)	11,179	99,651	-	5,582	13,666	52,119	20,553	-	3,932	-
83	2023	ARP-Workstation Asset Management (WAM)	New Computers / Hardware	IT Digital Foundation	This project will replace and install new desktops, laptops, and tablets on a four year refresh cycle based on industry standards, hardware failures, security patches, and software compatibility. Monitors will be replaced every eight years based on Company data related to its typical failure rates. When Workstation Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and can be very difficult to keep current with security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improving stability and availability of business critical applications by proactively replacing workstations prior to increasing hardware failures; and (2) allowing business partners to complete their job tasks. The project scope consists of: (1) replacing workstation assets; and (2) installing new units for new resources. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for all desktops and laptops; (2) extend the replacement cycle only on desktops from four years to five years; and (3) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the ARP in future years based on the number of devices that were not replaced during the four year refresh cycle; and (4) it could cause an inability to apply security patches. Waiting longer than the four-year cycle would increase hardware failures, security patch issues, and hardware compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle for desktops, laptops, and tablets, and an eight-year cycle for monitors to alleviate these concerns.	2023-01-01	2023-12-31	-1.00	6,152,454	119,140		1,973,707	-	1,873,153	76,753	-	5,477	18,123	41,699	-	2,770	4,186	21,114	1,654	11,975	
84	2023	Digital-Hybrid Cloud and Data Center Migration	New Computers / Hardware	IT Digital Foundation	This project will optimize data center assets and asset replacement project purchases by migrating or retiring applications out of existing Company and co-location data centers into cloud services, reducing operational costs for running IT services and leveraging increased cloud capabilities to improve the efficiency, quality, and speed-to-market of customer-facing and internal IT services. The technology currently deployed in the Company's data centers meets many customers' needs today. However, the pace of digital transformation is increasing rapidly, and requirements for applications are evolving faster than the technology in the Company's data centers can respond in a cost-effective manner. This data center constraints lead to longer implementation times, missing capabilities, or reduced functionality in the applications that the Company can deploy. This project will create value by ensuring the Company's technology requirements are met through a comprehensive and cost-effective combination of data centers and public cloud services. Specifically, by migrating applications to cloud services, the project will: (1) reduce capacity, hardware maintenance, and security device costs at the co-location data center; (2) reduce hardware maintenance and security device costs at the Parnall data center; (3) enable the ability to scale infrastructure quickly up or down without costly upfront hardware purchases; (4) reduce application risk through cost-effective, scalable infrastructure redundancy and availability; (5) reduce ongoing server and storage asset replacement costs; (6) reduce ongoing networking equipment replacement costs; (7) reduce managed service operational support costs; and (8) enable the use of a variety of cloud services to support Company applications. The project scope includes: (1) promoting the co-located Grand Rapids Main co-location data center to become the primary data center for on-premises IT services; (2) demolishing the Company's Parnall data center to the data center recovery data center for on-premises IT services; (3) analyzing applications for migration to cloud or retirement; (4) migrating applications from on-premises to cloud; (5) transforming applications to use cost-effective cloud services; (6) altering network architecture and deploying base infrastructure to allow each location (on-premises or in cloud) to function independently; (7) deploying cloud and on-premises cost management tooling and processes; (8) simplifying and optimizing backup and disaster recovery resources and processes using cloud services; (9) implementing additional automation for application deployment and management; (10) changing the operations model to support all cloud based applications; (11) educating and increasing the skillset of IT and other employees in leveraging public clouds services; and (12) transforming IT to become the broker of cloud services for the Company. Alternatives considered included: (1) migrating to public cloud services faster. This alternative was not chosen because the Company's ability to absorb new technologies coupled with the investments the Company has already made in data center equipment would prevent a faster move from being efficient and effective, introducing additional financial risk; (2) migrating to public cloud services slower or not at all. This alternative was not selected because delaying public cloud services and capabilities could limit requiring an extension of the life of existing data center equipment creates increased financial and operational risk; and (3) contracting with an outside vendor to provide cloud services for some applications for the Company. This alternative was not selected because industry information shows the option as not yet as cost effective or not providing a maturity level that the Company would be able to easily consume with limited in-house experience and expertise in public cloud. The alternative to migrate to a hybrid cloud and data center model was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.	2023-02-01	2025-12-30	0.12	6,876,180	5,887,409		898,507	419,429	121,481	73,234	226,838	19,633	20,956	185,091	-	-	50,182	124,139	10,648	122	
85	2023	Ransomware Recovery	New Computers / Hardware	IT Digital Foundation	This project will implement a multi-layered security approach to our production data center backups to mitigate data loss risk to ransomware attacks. A severe ransomware attack could leave the Company without access to critical data and unable to recover the data. In a best case scenario, a successful ransomware attack would likely result in prolonged system outages for up to a week and months of work to recover remaining systems. The project will add value to the Company and its customers by: (1) implementing a 3-2-1-1 (3 copies, 2 media, 1 offline, 1 immutable) strategy to protect the production data center data and backups. This strategy will protect the Company from production data center data to from a broader scope of cyber threats including ransomware. (2) Providing various restoration options to reduce data loss and improve recovery time. (3) Mitigating the risk of complete data loss with a maximum security backup store a weekly copy of production data center data offline and in a format that cannot be changed. (4) Defining a ransomware response plan that the Company can use to respond to a wide array of cyber attacks with a practiced process. (5) Providing the ability for OT to sever all communications to the public internet and protect the Company's OT network. The scope of this project is to deliver one cloud hardware storage level snapshots, local immutable copies of production and OT data center data, public cloud third copy of 100% of production data center data, and a ransomware recovery plan with a scenario-based approach to ransomware response including plans for monitoring, containment, malware clean up and recovery. The project team looked at a number of alternatives to provide a ransomware recovery plan including paying the ransom, using tape backup, restoring to the public cloud, and buying a third datacenter. The project team looked closely at tape backup but with Company's heavy investment in their current solution for backup and the ability of the current solution to provide immutable copies the team felt that the current solution's scalability better met the requirements and at a lower cost and faster delivery. Restorations to the public cloud was also considered, but the recovery would have been extremely complex and likely would have taken 3-5 years to get in place. Lastly the project team looked at setting up a third data center that would be used as an offline copy of production. The cost was too high and it didn't provide any value over our current public cloud and on-premises backup copies of production and OT data center data.	2021-01-04	2024-09-30	-1.00	3,178	888		1,039	-	-	576	-	57	386	311	-	-	289	-	22	-	
86	2023	SAP HANA Database Migration	New Computers / Hardware	IT Digital Foundation	In preparation for SAP's planned end of support for its Business Suite product in 2027, the Company will migrate its existing SAP databases from Oracle to SAP HANA in advance of the required move to S/4 HANA. The Company's SAP applications currently utilize Oracle's relational database management system as their underlying database storage technology. SAP has informed its customers that standard support for its legacy Business Suite (ECC) product will end in 2027, along with support for all non-SAP database platforms. SAP has also informed customers that the future direction for their enterprise solution is S/4 HANA, a solution built explicitly for their HANA database platform. To prepare for these upcoming events, the company will migrate all of its SAP databases off of Oracle and onto SAP HANA. This project lays the groundwork for the company's eventual shift to SAP's HANA-based solutions by: (1) proactively migrating SAP databases to a database technology that is fully supported by SAP beyond 2027; and (2) mitigating the risk of a complete loss of support for the current Oracle database technology in 2027. Project scope includes: (1) procurement of HANA software licensing to cover all migrated SAP applications; (2) data migration for all SAP applications from the Oracle database to SAP HANA; and (3) implementation of new application support policies, procedures and tools required to manage the newly migrated SAP HANA applications. Given SAP's announcement regarding the end of support for its ECC product in 2027, all customers running SAP on database software other than HANA will also lose support for their associated database software in 2027. SAP is offering one option for databases other than HANA beyond 2027. While there is no alternative to the HANA database for SAP going forward, the Company has considered multiple options: (1) Perform a direct migration from SAP Business Suite on Oracle to S/4 HANA. A direct migration to S/4 HANA brings greater operational risk to the Company as both the underlying database technology and the SAP application functionality would change simultaneously, so this alternative was not selected. (2) Remain on the current SAP Business Suite product but competitively bid support services to a third-party provider instead of SAP. This alternative was not selected because moving to a third-party support model forces the Company to remain on outdated SAP software and eliminates any possibility of benefitting from new business functionality provided by S/4 HANA. It will also require the Company to accept significant risk due to the fact that SAP, as the product's technical owner, will not be available upon termination of the SAP maintenance agreement. (3) Migrate to SAP's Software as a Service (SaaS) implementation of S/4 HANA. This alternative was not selected because an S/4 HANA SaaS migration is a much more disruptive option as the Company's business processes would require adjustments to accommodate functionality differences between ECC and S/4 HANA. The risk of negative business impact is significantly greater than simply changing the underlying database technology. The selected alternative to migrate the SAP databases to HANA prior to implementing S/4 HANA gives the Company several years to solidify its HANA database infrastructure before into during the substantial business process changes required with S/4 HANA.	2023-04-24	2025-12-31	-0.72	6,491,044	1,352,658		767,217	713,092	-	12,654	33,056	3,087	5,330	63,293	11,318	-	21,714	27,079	3,182	-

88	2023	Application Currency-EPS-O&M	Software(intangible)	IT Digital Foundation	The EPS (formerly IACI) initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the EPS adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the EPS are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	84,880		-	-	-	-	-	-	-	32,588	-	-	17,284	13,198	2,106	-	
89	2023	Application Currency-IT/Digital Foundation-Application Platforms-O&M	Software(intangible)	IT/ Digital Foundation	The Application Platforms initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Application Platforms area are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	39,373		-	-	-	-	-	-	-	15,117	-	-	11,863	2,244	1,009	-	
90	2023	Application Currency-IT/Digital Foundation-Infrastructure Platforms-O&M	Software(intangible)	IT Digital Foundation	The Infrastructure Platforms initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Infrastructure Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Infrastructure Platforms are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	-	7,037		-	-	-	-	-	-	-	2,639	2,617	-	-	22	-	-	
91	2023	Cloud Virtual Desktop	Software(intangible)	IT Digital Foundation	Prior period adjustment.							-	-	-	-	-	-	-	(60,166)	(68,027)	-	7,383	-	476	-
92	2023	Digital-Cloud Data and Analytics Platform	Software(intangible)	IT Digital Foundation	This project is a data-led transformation that will accelerate and scale Artificial Intelligence (AI) and analytics in the cloud across the business to uncover new paths to value, faster, allowing the organization to make better decisions and enable delivery outcomes for the Natural Gas Delivery Plan, Electric Grid Integration, customer programs, and other business needs. The project will additionally establish data governance roles and responsibilities, processes, and implement tools to support best practices across the enterprise. Consumers Energy faces several challenges in the ongoing data modernization journey, which include: (1) legacy data platform operations; (2) high lead times for data exploration and identification of data assets; (3) lack of data ownership and quality; (4) limited data governance best practices across data ownership, access control & security; and (5) new development environment for business intelligence report and analytics. Despite the growing importance of data and analytics in business decision-making, Consumers Energy struggles to modernize and transform data and analytics platforms because multiple business units are working in silos. The siloed approach to data and analytics that is preventing organizations from taking advantage of economies of scale and achieving a positive return on investment (ROI). Each business unit operates independently with its own data projects, leading to duplication of effort, increased costs, and missed opportunities for collaboration. The lack of coordination and integration across business units also makes it challenging to develop a comprehensive understanding of the organization's data, resulting in missed opportunities for insights and strategic decision-making. As a result, the organization is unable to realize the full potential of their data and analytics investments, which can limit their ability to compete effectively in today's fast-paced business environment. To address this problem, it is essential to break down silos and establish a unified data and analytics platform that leverages economies of scale to generate value across the organization. The project will add value by accelerating the data modernization journey to cater for evolving business needs by: (1) optimizing data platform operations costs with workflow based platform infrastructure deployment using prebuilt terraform modules and templates; (2) reducing data operations build complexity and data engineering cost through automation; (3) improving data quality, lineage, tools and ownership through data governance that leads to reduce cost of data provisioning, data duplication, and improved data veracity; (4) streamlining data access requests, management, and governance to reduce risks and support efficiency; and (5) increasing the speed to deliver new data and data capabilities, improved productivity, and reduced lead time for data consumers through data democratization. The project scope includes: (1) developing and modernizing the analytics platform in the Azure cloud to allow Consumers Energy teams to implement new use cases leveraging simplified infrastructure configuration and automated deployment processes; (2) build and deployment of a data management capabilities, controls, cataloging, assets, and data lineage; (3) developing data ordering workflows and data access management controls; (4) continual prioritization and onboarding new datasets; (5) simplifying infrastructure configurations; (6) automating deployment processes; (7) enabling data governance tool and processes. Alternatives considered include: (1) Address current pain points in existing on-premise analytics platform. This alternative was not selected because the existing platform requires new investment in licensing and infrastructure, delivery for new capabilities cannot keep pace with demand, and still requires investment to address accruing legacy system technical debt. (2)Continue to build analytics in the cloud based on the current foundation. This alternative was not selected given learnings gained from two projects where lack of maturity on the current platform created significant delays in delivery. Additionally, this alternative limits the Company's ability to have required data and analytics capabilities to solve business goals or reducing the cost to deliver new capabilities. (3) An alternate data platform and governance modernization that leverages new data and analytics platform in the cloud. This alternative was selected because it provides the best speed to delivery for analytics capabilities, provides faster access to data that is critical to optimizing business process and achieving business goals, provides a path to more rapidly resolving technical debt, and reduces delivery costs for future analytics projects.	2023-04-17	2024-12-27	-1.00	12,263,186	1,683,500		1,072,128	207,967	-	206,205	579,737	19,784	58,430	69,087	-	-	28,966	36,740	3,381	-	
93	2023	Digital-Data and Analytics in the Cloud	IT/ Digital Foundation	IT/ Digital Foundation	This project will extend the Company's current data and analytics environment into a cloud environment, which will enable data and analytics at-scale and enable the delivery of outcomes for the Natural Gas Delivery Plan, Electric Grid Integration, customer programs, and other business needs. The Company currently has an on-premise data and analytics platform, Data Lake, that houses multiple data attributes ranging from customer, grid, and operations. As the Company requires more predictive and prescriptive analytical use case outcomes, the current environment is insufficient to handle the data analytics at-scale for multiple use cases. Also, the current solution lacks the libraries of advanced ML, AI tools, and industry-Standard Big Data Ingestion tools, which are standard offerings as part of Cloud environments, such as Amazon Web Services (AWS), Azure or Google Cloud Platforms. The project will add value by: (1) providing the ability to perform data analytics at-scale; (2) allowing the ability to leverage the leading ML and AI tool to enable predictive and prescriptive analytics at-scale; (3) providing the ability to provision infrastructure at-scale rapidly, Vulnerability pay for use; and (5) empowering faster prototyping, testing, and deployment of analytics solutions. For example a ML model is used to predict Estimated Time for Restoration (ETR). This model needs to be trained with a large amount of data about past outages. Procuring the compute on-premise for just this one use-case does not make sense from the project and need new skills to support and a separate maintenance cost and agreement because the IDPU hardware is different from the rest of our existing compute. The process is much simpler and faster if we setup our analytics platforms on the cloud. The project scope includes: (1) the execution of data analytics without scalability constraints; (2) flexible transition with technology platforms as they evolve; (3) the use of out-of-the-box ML and AI tools provided by cloud vendors; (4) new services and innovations in the cloud platform; (5) capacity pay per use; and (6) the foundation for future cloud migration and maintenance. The alternative considered to a cloud solution is to expand the on-premise infrastructure and purchase multiple tools to solve individual capability gaps. The Company did not choose this alternative because it is more costly than cloud due to higher infrastructure costs and a larger workforce required for implementation.	2022-06-20	2023-11-27	-1.00	501,545	168,524		180,896	4,559	-	42,071	86,566	4,832	22,868	43,764	207	-	31,228	9,330	2,999	-

94	2023	Enhancements -Cloud Automation	Software(intangible)	IT/Digital Foundation	The Enhancements - Cloud Automation project provides funding for small changes and improvements to existing software to address requests needed due to changing business requirements. The Company's existing cloud automation platform consists of a number of scripts that automate the build of infrastructure such as servers, operating systems, databases, and application installations in minutes or hours. These scripts include security hardening and application of the latest patches. This project will maintain and improve these scripts to ensure they meet the latest security policy requirements, and any changes to the way the operating systems, databases, or applications are configured. The value of this enhancement project is the implementation of small changes and functionality improvements to existing IT software application investments for Cloud Automation to make hard cost savings, cost avoidance, safety, achieving corporate goals, and mitigat ng risk. The scope of the enhancement includes requests that will be fulfilled to provide functionality for areas such as IT infrastructure provisioning. The alternative would be to continue as is with existing scripts; however, this introduces security risks and additional manual steps to build infrastructure, which in turn, will lead to increased costs and risk of manual errors.	2023-01-01	2023-12-31	-1.00	314,721	130,501		110,198	-	52,452	51,666	(41,948)	5,536	33,257	66,675	-	-	8,529	57,376	771	-
95	2023	Enhancements -IT-Capital	Software(intangible)	I T Digital Foundation	The I T initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	168,145	75		59,941	730	-	14,284	18,388	1,677	18,862	26	-	-	17	-	-	8
96	2023	Enhancements -IT-O&M	Software(intangible)	I T Digital Foundation	The I T initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	73,027		-	-	-	-	-	-	-	28,038	1,687	-	3,512	21,703	1,137	-
97	2023	Enterprise Service Bus Application 2020-2021 Upgrade	Software(intangible)	I T Digital Foundation	This project will upgrade and migrate the Business Works developer application to the next version. Newer Enterprise Service Bus (ESB) software versions offer improved integration with cloud-based services and applications. As the Company increasingly migrates to cloud-based infrastructure, Platform- and Software-as-a-Service solutions, it is critical that it has the vital data tool or pathway, be more scalable, secure, and capable of working in a cloud-based environment. In addition, the messaging and event modules within the ESB are currently outside of their standard support windows. While IT sees ble to continue to get extended support by paying an estimated premium of $45,000, this is just temporary coverage and serves only to delay the need for an upgrade. The value in this project provides the Company the capabilities to: (1) accelerated productivity; (2) continuous delivery and integration; (3) an open ecosystem for improved operational visibility; (4) real-time integration with web, mobile apps, and application programming interfaces; and (5) improved administrative and operational efficiencies. The project scope includes: (1) implementing new versions of all applications that are part of the TIBco ESB software suite ™ TIBnimeWeb 4x, Enterprise Messaging Service, Business Events, API Exchange, and Hawk; and (2) a server refresh. The new products will be implemented on the latest version of the SUSE Enterprise Edition operating system. Alternatives considered included: (1) Absorb the annual $40,000 maintenance cost and live as supportability. Given the critical nature of this application, it is not recommended to lose mainstream support for any of the applications involved. Any sustained ESB product deficiency would impact many areas of the Company, such as billing, revenue collection, and remote meters. The current implementation of the ESB platform was built with 5 years of growth in mind. This alternative is not chosen for these reasons, and the additional expense. (2) Replace the platform by moving this to cloud. Migrating the ESB to the cloud would be too risky in the Company's strategy for cloud adoption, which may cause issues with operational stability and incur additional expenditure. A cloud migration would also take longer to plan, which would put the Company at risk of falling outside of the current vendor support window for its product's current version. (3) Upgrade the existing application. This option was selected because it best suits customer and Company needs for the near future by restoring vendor support for hot fixes and patches, and enables product scalability to the measure required of the business.	2020-10-26	2024-08-29	-0.97	5,423,110	1,670,313		498,961	287	-	145,377	210,658	24,457	114,186	365,358	-	58,333	104,964	183,305	18,590	166
98	2023	I T Operations Management - Service Operations	Software(intangible)	I T Digital Foundation	This project will implement an application service mapping tool to effectively manage business-critical services through identification of infrastructure components and application interactions. This tool automates the mapping process to create a complete, up-to-date, and accurate record of the mapped application service in the Database. Application service mapping works hand-in-hand with asset discovery, building on discovered infrastructure data to identify all the assets that support a service, and along with their service specific relationships. As the IT systems steadily increase in complexity and evolve faster than the IT organization can respond to system issues in an optimized and cost-effective manner, the current configuration of the system does not provide the clarity needed in order to understand how the infrastructure interacts with the applications within the IT business. It supports and in order to respond to emergent IT incidents in the most rapid and cost-effective manner. These constraints can lead to lengthy response and implementation times; negligible or ineffective resolutions; reduced functionality; and elevated outage times in the infrastructure and applications in the system. This project will create value for the Company by mapping critical applications through discovery of the underlying infrastructure associated with application services and its relationship to parent business applications. Specifically, by creating application service maps, this project will: (1) increase visibility and understanding between Information Technology (IT) infrastructure and Configuration Items; (2) improve accuracy through real-time, automatically updated infrastructure and component changes; (3) reduce IT Subject Matter Experts time on emergent IT issues; (4) Utilize of IT Service Management processes; and (5) Reduce downtime by identifying dependencies and impact analysis. The project scope includes: (1) implementation of On-Premise application service maps which have significant business impact; (2) establishment of process roles needed to support service maps built. Alternatives considered included: (1) Choose an alternate IT Operations Management System with Cloud capabilities. This alternative was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. This alternative was not chosen as there would be a correlation gap between application services and the underlying infrastructure and would not address the ever-increasing resolution costs. (4) Develop and implement an on-premises service mapping and process solution. This alternative was chosen due to the value in Information Technology (IT) Operations Management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can utilize the Configuration Management Database (CMDB) and work hand-in-hand with asset discovery.	2023-10-01	2024-08-30	-1.00	3,012,243	699,524		902,130	889,961	-	410	2,865	221	8,663	221,782	198,873	-	105	22,742	63	-
99	2023	Nimbus Phase 5	Software(intangible)	I T Digital Foundation	Prior period adjustment.							(3,146)	(875)	-	-	-	-	(310)	9,185	7,047	-	2,138	-	-	-
100	2023	Operational Technology - Service Management Upgrade	Software(intangible)	I T Digital Foundation	This project will implement Operational Technology service management capabilities. Service management provides automated asset tracking, maintenance, and incident management for the assets. The Company's Internal Audit team conducted an audit of the Operational Technology (OT) assets environment and identified significant gaps in the patch management program. The patch management operating model is decentralized, has limited and inconsistent standards, doesn't have a company-wide governance structure to monitor all business areas of the Company and lacks a complete and accurate asset inventory. Due to the lack of a complete asset inventory, as well as a significant number of gaps identified in the patch management governance, operating model, processes, and controls to manage all assets within the Company's environment, an unknown magnitude of risk exists that critical patches were not installed timely, which could create the potential for increased security vulnerabilities. The project provides value to the Company in three ways: 1. It establishes a complete and accurate asset inventory. 2. Creates a Company-wide governance structure with documented standards and processes to manage the assets and 3) It defines a comprehensive patch management operating model with clearly defined roles and responsibilities. The project scope includes: (1) the implementation of an asset management tool (2) the implementation of an incident management tool, (3) and the establishment of processes to support the assets. Alternatives considered included: (1) Choose an alternate asset management system. This option was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. Continue to manually track or not track Operational Technology (OT) digital assets and the associated risk at the Company, which will not address the need to effectively track OT Digital assets and plan for their support. (4) Develop and implement an asset management and incident management tool and process. This alternative ultimately chosen has strengths in Information Technology's support for current version of Oracle; upgrade to Version 12c and beyond supported until those systems are upgraded.	2023-10-01	2024-08-29	-1.00	892,455	192,305		239,737	213,693	-	7,354	9,809	1,209	1,652	51,939	47,752	-	1,245	2,823	118	-
101	2023	Oracle Server Database Upgrade 2023	Software(intangible)	I T Digital Foundation	This project will upgrade Oracle server databases to the next version to support all business portfolios. The Company is currently managing Oracle server databases that run on multiple versions of Oracle 8i, 9i, 11g and 12c; all of which are currently unsupported as of 12/31/2020. Version 12c recently lost vendor support in July of 2019 and is eligible for extended support. Relying on extended support for Version 12c increases operational costs by $12,000 annually. Extended support is not available for version 11g and older. Without vendor support, the databases no longer receive security patches, bug fixes, or functional by support which creates security, stability, and reliability risks. This project will create value for the Company and its customers by (1) reducing the risk of system failure and the resulting impacts to business partners and customers; and (2) ensuring that systems are secure, supported, and have the latest features and functionality; and (3) will do what we can to be compliant with Cyber Security Published standards, when possible. Many of the Cyber Security requirements are application dependent. The scope of this project includes upgrading to the next version of Oracle across all impacted business systems. Systems that cannot support current version of Oracle, will be upgraded to the highest supported version. Alternatives considered were: (1) delay database upgrades. This option was not chosen because, as stated, it would introduce significant security, stability and reliability risks; (2) Upgrade only to Version 12c and pay extended support. This option was not chosen, where possible, to avoid increased operational costs. The alternative chosen is to upgrade to the next version of Oracle and where systems do not support the current version of Oracle, upgrade to Version 12c and pay extended support until those systems are upgraded.	2022-12-26	2023-11-27	-1.00	-	171,941		-	-	-	-	-	-	-	35,001	-	-	10,320	22,545	2,135	-
102	2023	Product Family Enhancements-Application Platforms Services-O&M	Software(intangible)	I T Digital Foundation	The I T initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	340		-	-	-	-	-	-	-	131	-	-	122	-	9	-
103	2023	Product Family Enhancements IT/Digital Foundation-Capital	Software(intangible)	IT/Digital Foundation	The I T initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	267,996	47,830		85,975	9,072	31,410	26,644	11,556	2,499	4,794	16,740	972	329	7,740	6,858	843	-
104	2023	Product Family Enhancements IT/Digital Foundation-O&M	Software(intangible)	I T Digital Foundation	The I T initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. 105	2023	Public Key Infrastructure (PKI) Upgrade	Software(intangible)	I T Digital Foundation	Replace on-premises Public Key Infrastructure (PKI) that is no longer supported by the manufacturer with a system that is supported by the manufacturer. The existing Public Key Infrastructure (PKI) that issues certificates to IT systems for secure communications is out of support from the manufacturer. In the event of a system failure the Company would not have support in recovering. All IT systems requiring secure communications via certificates would go offline within three days. Replace existing Public Key Infrastructure with new Public Key Infrastructure that is supported by the manufacturer. The project will build and configure the servers necessary to provide Public Key Infrastructure services, put in place physical token management for maintaining security, migrate certificates using and management to the new system and decommission the old system. The alternative is a limited use service use for Public Key Infrastructure on the internet only. (1) The Company is locked into expanding the service to include usage on the Company network but found the solution to not be economically viable. (2) The Company also looked at full Cloud solutions, but did not meet the security standards currently being used around physical token use. (3) The Company looked at continuing extended support however the continuing extended support is not available by the Vendor. (4) The Company elected a hybrid solution of part Cloud and part On-Premise to meet all operational and security compliance requirements. The opportunity is to retain ownership of the keys on premise prior to evaluating ownership through the cloud	2023-10-02	2024-12-31	-1.00	1,818,198	423,977		49,398	49,224	-	-	-	-	134	29,550	18,206	-	5,152	5,551	642	-
106	2023	SAP Data Archiving	Software(intangible)	I T Digital Foundation	This project will move outdated data from an online database to offline storage. The SAP Enterprise Resource Planning Central Component database is 37 terabytes in size and growing at a rate of 0.3 terabytes to 0.5 terabytes per month. If the database is not archived, SAP system performance will degrade, and IT staff will affect customers and employees who are completing tasks within the system. The project will create value for the Company by: (1) increasing system stability by controlling online data storage levels; and (2) controlling maintenance costs associated with data storage. Annual data storage costs are $7,465 per terabyte only including the primary production system. Data back-up costs are $400 per terabyte per week for full back-ups. The project scope includes: (1) archiving data based on the fastest growing and largest archiving objects in SAP (an archiving object defines the structure and context of the data in the SAP database from an archiving perspective); (2) building and archiving solutions that allow retrieval of archived data in the required form; and (3) setting up a solution that meets compliance standards. Three alternatives were explored and determined non-viable for the project: (1) allow the database to continue to grow, which puts system performance at risk and must be prohibited as soon as possible; (2) decrease the overall scope and archive fewer objects, which would result in a significant cost increase over shorter time period. After considering each of these options, it was determined that the current scope of the project was the best strategy to address the problem while balancing annual spending.	2020-09-28	2023-05-29	-1.00	751,857	701,712		6,861	-	-	775	58	-	6,029	651	-	-	-	613	38	-
107	2023	SAP Support Pack Upgrade 2023-2024	Software(intangible)	I T Digital Foundation	The SAP Support Pack Upgrade project is to maintain the currency levels of all SAP applications. This will ensure the applications are at version levels that are supported by SAP, have the latest patches and bug fixes, and provide cross-application compatibility for our business partners. In the past, the SAP enhancement packs were applied to Company systems to ensure these problems were addressed in a timely manner. However, SAP is no longer releasing enhancement packs. To continue to maintain SAP application version currency, across all applications, the support packs released by SAP must be routinely applied. Without maintaining application currency, the core business applications running on the SAP platform are at risk of losing vendor support, resulting in the inability to apply bug fixes and patches, including security patches, and maintain application interoperability and stability. The project will add value by: (1) maintaining application stability of SAP applications; (2) mitigating system security, stability and reliability risks by ensuring the applications are up-to-date with the most current patches and bug fixes released by SAP; and (3) ensuring ongoing cross-application compatibility. The scope of this project includes routine support pack upgrades to all SAP applications, which include: Enterprise Core Component (ECC), Customer Relations Hip Manager (CRM), Enterprise Portal, Process Orchestration (PO), Business Warehouse (BW), Business Objects (BOBI), Data Services (DS), Governance, Risk and Compliance (GRC), Solution Manager, Data Quality Manager (DQM), Graphical User Interface (GUI), Single Sign On (SSO), System Landscape Directory (LD) and other related SAP applications. Alternatives considered include: (1) Divide the scope into individual projects by SAP application. This alternative was not selected because the efforts are interrelated and so replacing them separately could lead to duplication of work, especially testing efforts, and therefore potentially higher costs. (2) Migrate to SAP S/4HANA. This option was not selected at this time because it is part of the long-term digital plan and requires substantial planning and investment. (3) Balance the project scope through regular support pack upgrades. This alternative was selected because it provides the best balance of minimizing cost and maintaining support by combining multiple application upgrades through a single support pack upgrade effort.	2023-10-30	2024-10-31	-1.00	-	169,421		-	-	-	-	-	-	-	3,952	-	-	-	385	3,274	292	-

109	2023	Software As set - Service Management Upgrade	Software(Intangible)	IT Digital Foundation	This project will optimize the software asset management process by systematically monitor, assess and oversee software licenses and compliance using Software Asset Management Professional. The on-premises software asset management technology currently used in the Company lacks compatibility to automate license reclamation, cost optimization, and license forecasting. These software asset management constraints lead to the inability to optimize software license purchasing and effective license demand management. This project will create value by leveraging the Company's technology requirements are met through a comprehensive and cost-effective software asset management process and workflow. Specifically, by replacing the on-premise application, the project will: (1) streamline the software request workflow including license reclamation and software deployment; (2) help ensure compliance with software license agreements; (3) identify cooptunities of license optimization leading to cost optimization; (4) mitigate risk related to software asset management; (5) optimize future forecasting and (6) increase asset visibility. The project scope includes: (1) the implementation of software asset management tools; (2) the establishment of the process and process roles needed to support the assets; and (3) retirement of the on-premise software asset management tool. Alternatives considered included: (1) Choose an alternate Cloud based as set management system. This alternative was not chosen as it would require introducing and migrating a second vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain similar capabilities and to integrate the custom solution would not be fiscally or cost effective. (3) Do nothing. This alternative was not selected as the current Software Asset Management tool that lacks integration and automation and will not address optimizing and effective management of licenses and purchases. (4) Develop and implement an on-premises software Asset Management solution. This alternative ultimately shows on has strengths in software as set management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can helps license compliance, optimization and automation.	2023-06-01	2024-08-15	-0.80	1,120,674	260,229		336,878	211,920	-	23,163	92,580	4,167	5,067	63,036	47,256	-	785	14,827	68	-
110	2023	Software Platform Refresh	Software(Intangible)	IT Digital Foundation	This project will upgrade several operating systems, hypervisors (virtual machine monitors), and databases to retain low-cost, unlimited vendor support. For systems that go beyond their normal manufacturer support ending, there will be increased support and maintenance fees of 20% to 100% above current support and maintenance depending on vendor. Completing this project allows the organization to (1) avoid high support costs; (2) provide for system security; and (3) stay current to promote seamless interoperability among servers, applications, and databases. Aging servers are more susceptible to security vulnerabilities and performance issues that ultimately could affect the business and customers. The project will add value for the Company by: (1) avoiding costs for special maintenance agreements required at the end of normal manufacturer support; (2) ensuring reliability and compliance with Information Security requirements; (3) improving data center environment stability; and (4) avoiding the need for high risk upgrades that cross multiple versions. The project scope includes: (1) upgrading operating systems and databases on servers that are near end of support with its given vendor; and (2) maintaining servers on the current version for stability and performance. A funding options matrix was completed to review the potential alternatives. The alternatives identified were: (1) Complete the full scope of the solution for $1 million in order to eliminate the need for ongoing extended support; (2) Reduce the scale of the solution, which requires $1.6 million in ongoing extended support; (3) Reduce the scale of the solution even further, which requires $2.4 million in ongoing extended support; (4) Do not complete a software platform refresh, which requires $3.7 million in ongoing extended support. Alternative 1 was selected as the most cost effective solution to ensure ongoing system stability, seamless integration, and mitigation of cyber security risks without the significant cost of extended support necessary for End of Life software systems.	2023-01-01	2023-12-31	-1.00	-	138,217		-	-	-	-	-	-	-	53,067	-	-	33,981	15,996	3,089	-
111	2023	SolarWinds Performance Monitoring Expansion Upgrade	Software(Intangible)	IT Digital Foundation	This project will develop an IT observability and monitoring solution that provides an aggregate view of IT system availability and performance. The current IT enterprise monitoring approach doesn't provide a comprehensive view of application and infrastructure health resulting in unplanned service interruptions, extended service interruptions, and system performance degradation. In addition, unplanned service interruptions have a negative impact on business partners ability to provide reliable services to utility customers. The SolarWinds Expansion project will allow IT to reduce the number of monitor rigids and consolidate end-to-end view of IT performance metrics to a single pane of glass. These actions will prevent major service interruptions, reduce Major Incident Mean Time to Restore (MTTR), improve IT system stability, and ultimately reduce O&M labor cost. This project scope includes: i) Perform proof of value (POV) assessment for the following SolarWinds modules, Hybrid Cloud Observability (HCO)/Database Performance Analytics (DPA)/AppOptics/Pingdom; (2) Transition applications monitored by AppDynamics to SolarWinds. 1) Deploy set configure agent base infrastructure monitors for applications and infrastructure 4.) Retire AppDynamics 5.) Transition critical applications not monitored by AppDynamics to SolarWinds 6.) Create performance monitoring rigids/boards for critical systems 7.) Define monitoring templates for rapid deployment of new monitoring services 8.) Training of the product/Platform Transition user and management of SolarWinds. Several monitoring tools were considered to manage alerts and escalation on Consumers Energy IT application and infrastructure ecosystem. Other considerations included our ability to consolidate other monitoring tools into a single tool and reduce licensing and maintenance cost. Below are the alternatives that were considered. 1). Renew current licenses for both SolarWinds and AppDynamics without achieving any savings or operational efficiencies. 2). Considered other vendors like Dynatrace to replace AppDynamics at a reduced cost for services, but initial deployment and annual cost would significantly increase regardless of service selected. In addition, the other vendors considered didn't have the capabilities to monitor both application and infrastructure ecosystem which didn't allow for a consolidated approach to be adopted and/or reduction in licensing and ongoing maintenance cost. As a result, the other vendors considered were not an option. 3). In conclusion, SolarWinds was determined to be the most cost-effective response because of the expanded capabilities offered over the following modules, Hybrid Cloud Observability (HCO)/Database Performance Analytics (DPA)/AppOptics/Pingdom that meets the needs of IT to proactively monitor IT systems and retire tools with similar capabilities to reduce ongoing maintenance cost. Therefore, our decision is to move forward with deploying the expanded services offered by SolarWinds.	2023-03-27	2024-08-25	-1.00	1,766,608	336,026		585,466	481,809	-	32,919	40,668	3,425	6,648	116,264	107,781	-	3,444	4,510	530	-
112	2023	SQL Server Database Upgrade 2020-2022	Software(Intangible)	IT Digital Foundation	Prior period adjustment.							(1,591)				(57)	(1,269)	(113)	(152)	2,910			2,142	690	78	-
113	SUBTOTAL	2023 IT Digital Revolution										11,847,204	3,784,641	6,290,871	926,208	1,422,320	74,186	348,625	1,723,520	406,367	94,552	484,065	690,250	63,355	11,420
114	2023	AFP-Cyber Security	Network	Security	This project will replace cyber security infrastructure to support increasing system and application demands and to prevent system failures and service interruptions. When enterprise software or cyber security infrastructure aid to support and enhance customer interactions is obsolete, these assets are more expensive to support and can be more difficult to keep current with security updates. This project will create value by maintaining the currency of cyber security infrastructure for core enterprise software. These are used to ensure the stability of technology for business operations. The scope of this project consists of: (1) annually replacing a subset of cyber security firewalls and servers in keeping with a 3-5 year hardware lifecycle; and (2) performing application upgrades. As part of the review process, the alternatives considered were to: 1) upgrade or replace each of the assets identified in the plan. Option 1 was not chosen because it would not address the risk of obsolescence and the inability to patch or cyber security assets to avoid security risks, system vulnerabilities, and out-of-warranty repair costs. Option 2 was not chosen due to the security risk inherent with not replacing assets as per standard refreshcycles increased system vulnerabilities, and stated warranty repair costs.	2023-01-01	2023-12-31	-1.00	-	-		-	(27,291)	27,291	-	-	-	-	-	-	-	-	-	-	-
115	2023	Pipeline SCADA Security	Network	Security	This project will implement major modifications to the Gas Supervisory Control and Data Acquisition (SCADA) environment to ensure compliance to American Petroleum Institute (API) 1164 standard. API 1164 is an NPMC regulatory requirement with recent updates, to the Gas Technical Standards. The project will implement IT, cyber security, and physical security equipment and site modifications necessary for regulatory compliance to API 1164. The NPMC requires the implementation of pipeline cyber security regulations pursuant to API 1164 on the Company natural gas pipeline system. The Company's Gas SCADA system is outdated and non-standardized, requiring significant modifications to be compliant with API 1164. Without the technology updates, the gas SCADA system is vulnerable to cyber attacks that potentially risk disrupting delivery to customers. Interruptions in gas delivery and compliance could be subject to fines and penalties from the NPMC and other regulatory entities (i.e., the Transportation Security Administration's). This project will add value to the Company by: (1) modernizing and standardizing the Gas SCADA network at the Company's gas compressor stations and control rooms; (2) mitigating cyber security vulnerabilities in the Gas SCADA network; (3) allowing the Company to fully comply with API 1164 requirements; and (4) fulfilling the commitment to the NPMC to provide a secure gas system that meets customer needs. The project scope includes updates for multiple gas SCADA-related locations, including eight gas compressor stations, two gas control rooms, two data centers, and multiple intelligent pipeline field devices. To establish compliance with API 1164, the project will: (1) design a holistic network architecture to implement both physical and technical barriers; (2) implement physical enhancements to impacted facilities, such as additional doors or data rooms, and modified HVAC systems to provide necessary climate control for the SCADA equipment; (3) install additional security cameras and/or card readers necessary to control access to new and existing equipment; (4) complete technology upgrades requiring design, development, testing and implementation for the Gas SCADA network at each of the planned locations. Upgrades will consist of endpoint protection, identity and access management, vulnerability management, business continuity capabilities, cyber incident response, asset management, and commensurate test environments; and (5) implement additional security measures to accomplish the new camera system(s). Site construction work of trenching, pole, etc.; (10) Facility lighting; (11) badge card investigation for personnel working at the site; (12) security equipment maintenance and testing; (13) security vulnerability assessments; (14) security communication plans; (15) personnel training; (16) security drill and exercises for the following locations. These activities will be performed at the following company locations: Owners of Freedom, Northville, Muskegon Fuel Center. Alternatives are not available because this is a compliance mandate from the TSA.	2020-06-01	2024-10-28	-1.00	12,592,731	542,854		3,409,966	33,530	190,353	1,004,358	1,757,458	69,554	354,710	184,227	55,291	5,435	12,217	61,284	-	-

117	2023	TSA Critical Facility Structure	Network	Security	This project will implement enhanced security measures outlined by the Transportation Security Administration (TSA) for critical facility assets in order to bring the locations up to enhanced status and avoid non-compliances. This project will increase the security and reliability of gas delivery to our customers while also meeting federal requirements Pipeline facilities that are deemed critical are required to apply enhanced security measures. Today, Consumers Energy currently has designated 4 locations as critical. However, based on the April 2021 update to the TSA Pipeline Security Guidelines, Section 5 (Critical Facility Criteria), a significant number of our gas infrastructure that were not previously subject to evaluation will now fall into scope. As we continue to analyze the remainder of our gas assets, we believe an additional 1000 pipeline facilities (pipeline interconnection, metering and/or regulating stations, pump stations, compressor stations, operational control facilities, main line valve, tank farms and terminals, etc.) may be deemed critical. Consumers Energy will be taking a phased implementation approach and will begin the process by implementing the enhanced security measures at the reminder of our compressor stations. Failure to update our sites will put us out of compliance with the updated guidelines. The objective of the project is to implement enhanced security measures outlined by the TSA for the following four critical assets: (1) Freedom Compressor, (2) Mackinaw River Compressor, (3) Overall Compressor, and (4) Northville Compressor. In order to bring these locations up to Enhanced status and avoid non-compliance. This project will increase the security and reliability of gas delivery to our customers while also meeting federal requirements Enhanced measures that will need to be implemented include, but are not limited to: (1) access controls; (2) access readers; (3) cameras; (4) video and audio programming; (5) fencing and barriers; (6) gates; (7) locks and key control; (8) fence intrusion (which may be accomplished with a new camera system); (9) subcontractor work of trenching, pole, etc.; (10) Facility lighting; (11) badge card investigation for personnel working at the site; (12) security equipment maintenance and testing; (13) security vulnerability assessments; (14) security communication plans; (15) personnel training; (16) security drill and exercises for the following locations. These activities will be performed at the following company locations: Owners of Freedom, Northville, Muskegon Fuel Center. Alternatives are not available because this is a compliance mandate from the TSA.	2023-11-27	2025-12-28	-1.00	9,088,335	584,724		1,648,968	-	482,496	40,576	1,156,229	-	12,752	33,409	-	-	32,279	487	3	641
118	2023	ARP-Physical Security	New Computers / Hardware	Security	This project will enhance or replace physical security assets to provide improved visibility and incident resolution related to security concerns. The Company has several thousand physical security asset devices currently in use including security camera, motion detectors, intrusion detection systems, and card access systems. Current limitations include the lack of integrated solutions for centralized management, situational awareness, real time monitoring, compliance with regulations and guidelines, and faster response to emergencies and incidents. This could result in the increase of potential security vulnerabilities, associated penalties, and reputational damage. The value provided by completing the project is to: (1) maintain compliance with State and Federal Regulations; (2) reduce redundancies with less of a need for multiple cameras and reducing gaps in functionality; and (3) optimize overall system performance. Included in the project is the enhancement or replacement of assets including: (1) advanced door systems at Company buildings; (2) security cameras for monitoring capabilities; and (3) gate and lock systems, which include security cameras, motion detectors, intrusion detection systems, and card access systems. Alternatives considered include: (1) not refreshing physical security assets, and (2) defer a portion of the refresh of physical security assets per asset refresh cycle industry standard. Alternatives 1 and 2 were not selected due to the risk of security concerns, incident resolution, and the inability to meet FERC requirements. The alternative selected maintains compliance, reduces redundancies and gaps in functionality, and optimizes overall performance of physical security systems.	2023-01-01	2023-12-31	-1.00	1,437,957	13,517		468,297	-	256,170	78	199,948	-	5,105	4,731	-	-	4,731	-	-	-
119	2023	CRSP	New Computers / Hardware	Security	Prior period adjustment.							-	-	-	-	13,450	-	(13,450)	-	-	-	-	-	-	-
120	2023	Radar Intrusion Detection	New Computers / Hardware	Security	This project will deploy new radar detection technology to enable the detection and tracking of individuals at Company sites. The radar will alert in real time and automatically dispatch Company security or law enforcement to investigate. The Company currently lacks the ability to detect potential intruders at Company sites across the state, including critical infrastructure sites such as city gates, compressor stations, substations, generation plants, and hydro stations. Currently, three sites have flawed fence intrusion detection technology that result in the occurrence of multiple false alarms that require an employee to investigate. Additionally, the current detection technology is unable to identify the difference between animals and humans, cannot set different boundaries, and prohibits the expansion of intrusion detection in an area other critical sites. Any investigation that has to be done is hampered by the limitations of the current system, requiring manual frame by frame review of video playback is manually intensive and time consuming. Completion of this project will provide value to the Company through evaluating and selecting a more reliable intrusion detection solution that reduces the number of false alarms and prevents resources from indexing sent to a site for unnecessary investigations. Additionally, the project will improve the efficiency of investigations by reducing the amount of time it takes to review playback to develop a suspect or investigative lead. In most cases this will be eliminated completely. This added layer of security benefits both the Company through waste elimination, as well as the Company's customers through the safety and security of assets necessary to continue to serve. The scope of this project encompasses: (1) implementing radar intrusion detection options; (2) establishing a priority list of sites where the solution will be rolled out; and (3) installing updated radar intrusion detection systems with a focus on initial deployment at infrastructure sites, including compressor stations, electric substations, and hydro-electric sites. Alternatives considered included: (1) keeping the current fence intrusion detection solution; or (2) implementing a new intrusion detection solution. The preferred option is to implement a new solution, given the above limitations with the current solution.	2019-12-30	2024-08-29	-1.00	2,960,419	10,245		130,089	-	200,138	7,233	(90,057)	498	2,277	-	-	-	-	-	-	-
121	2023	Application Currency-Security Capital	Software(Intangible)	Security	This project will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyber threats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Security portfolio adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; (4) address ing version interdependencies and compatibility between systems; and (5) allowing the Company to leverage additional functionality available in the upgrades; (6) provides customer value through closing the gaps on vulnerabilities that can impact reliability; (7) provides a mechanism for proactive actions to stay ahead of evolving cyber threats. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Security portfolio are routinely evaluated to determine if upgrade efforts are necessary to maintain an appropriate level of currency and then prioritized accordingly. During that evaluation process, the alternative of delaying the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application's current and risking failure; (2) an increase in the number of incidents; (3) paying increased support costs; and (4) prevention of employees from performing their daily tasks. This project is ongoing upgrades and supports these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	20,319	2,240		319	-	-	-	-	-	359	784	470	-	314	-	-	-
122	2023	Application Currency-Security O&M	Software(Intangible)	Security	This project will utilize both O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrade. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyber threats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Security portfolio adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality; (4) addressing version interdependencies and compatibility between systems; and (5) allowing the Company to leverage additional functionality available in the upgrades. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Security portfolio are routinely evaluated to determine if upgrade efforts are necessary to maintain an appropriate level of currency and then prioritized accordingly. During that evaluation process, the alternative of delaying the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application's current and risking failure; (2) an increase in the number of incidents; (3) paying increased support costs; and (4) prevention of employees from performing their daily tasks. This project is ongoing upgrades and supports these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2023-01-01	2023-12-31	-1.00	29,258			-	-	-	-	-	-	-	14,364	-	-	14,287	-	78	-
123	2023	Enhancements-Security Capital	Software(Intangible)	Security	This initiative will use Capital funding to make enhancements to existing technology to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements in accordance with accounting rules. As business conditions improve and change, compliance requirements evolve, and new capabilities are needed, new requirements surface that call for smaller effort software application changes (enhancements). Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, limit the Company's ability to consistently meet objectives, and increase security risk. The value of technology enhancements in the Security Portfolio lies in: (1) enhancing security protections by funding emerging or unplanned cyber security activities resulting from audits, incidents, or a changing threat landscape; (2) addressing the number of incidents associated with outdated software; (3) increasing application stability, leading to fewer incidents due to outdated software; and (4) allowing the Company to leverage additional functionality available in the technology. The scope of technology applications encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board that routinely evaluates and prioritizes the work. Security enhancements fortify the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes in a fast and nimble manner. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	1,269,946	267,035		727,662	196,286	28,162	144,075	295,738	3,549	59,863	67,100	-	-	59,622	6,523	954	-
124	2023	Enhancements-Security O&M	Software(Intangible)	Security	This initiative will use O&M funding to make enhancements to existing technology and to address requests generated by changing business requirements. As business conditions improve and change, compliance requirements evolve, and new capabilities are needed, new requirements surface that call for smaller effort software application changes (enhancements). Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, limit the Company's ability to consistently meet objectives, and increase security risk. The value of technology enhancements in the Security Portfolio lies in: (1) enhancing security protections by funding emerging or unplanned cyber security activities resulting from audits, incidents, or a changing threat landscape; (2) addressing the number of incidents associated with outdated software; (3) increasing application stability, leading to fewer incidents due to outdated software; and (4) allowing the Company to leverage additional functionality available in the technology. While these work efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing technology investments for Security. The scope of technology applications encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and assesses requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2023-01-01	2023-12-31	-1.00	-	631,654		-	-	-	-	-	-	-	283,491	14,177	-	190,927	23,644	4,705	39

127	2023	Saviynt Enterprise Identity Governance and Access (EIGA) Implementation	Software(intangible)	Security	The project will implement Saviynt EIGA module, consolidate Identity Access Management (IAM) functionality into Saviynt, and retire the Identity Manager application. By implementing the new solution, the Company will optimize IAM functionality, eliminate complexity, and reduce support costs. In addition, the project will integrate the OT network with an IAM solution that will allow for automated management of users and entitlements in the OT Active Directory domains and applications. The current version of Access Now reached end-of-life in December 2022, with support discontinued in January 2023. The application has numerous custom workflows and integrations, requiring professional services for ongoing use and changes. It lacks proper data analytics and reporting, posing risks such as inability to fix critical defects, software incompatibility, compliance issues, increased costs, and degraded performance. The Company uses multiple IAM tools, each performing critical functions, leading to numerous required interfaces and customizations. While a benefit for end users, these integrations increase the risk of system failures, higher support costs, multiple subscriptions, infrastructure and maintenance costs, and more expensive upgrades. The current solution utilizes SAP HR batch file processes that introduce full-set points, delays, and data integrity issues. Failures in these processes can prevent new or transferred employees from accessing necessary systems, leading to operational disruptions and potential compliance risk due to inappropriate access retention. This project provides value by: (1) Consolidating multiple IAM platforms through the implementation of the Saviynt Enterprise IGA Module, reducing complexity and support costs; (2) Decreasing complexity and enhancing efficiency by reducing interfaces between multiple identity tools; (3) Improving the end-user experience and reducing human struggle with access requests through a new, intuitive portal design; (4) minimizing custom code and focusing on out-of-the-box functionality; and (5) Streamlining employee data processing with the implementation of an HR interface. This project scope includes: (1) Implementing the Saviynt EIGA module to consolidate IAM platforms; (2) Standardizing processes by removing customized code and using out-of-the-box functionality; (3) Replacing and improving access systems (ASA addressing issues with aging application vs. multiple IAM platforms, integration challenges, and antiquated HR processing. Alternatives considered include: (1) Implementing hot fixes to Access Now version 8.1.5 to ensure support through mid-2023; (2) Upgrading only the application to current supported version, excluding the new web portal but will including new application functionality; (3) Remaining on current version that will be unsupported as of January 2023, requiring vendor professional services for any break/fix. Patches and enhancements may potentially introduce additional risk of version instability; (4) Implementing IAM functionality in Saviynt platform to manage access requests, including Active Directory, SAP, SAP HR, disconnected systems, and existing API integrations. The alternative selected was implementing the new Saviynt system, eliminating Accesshow software.	2023-11-27	2024-12-30	-1.00	5,913,132	710,912		-	-	-	-	-	-	-	1,141	-	-	-	1,052	88	0	-

131	2024	Application Currency-Corporate Services-O&M	Software(intangible)	Corporate	The Corporate Services initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application currency security and operational risks, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application to Fusion, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increase number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrade and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	-	493,488		-	-	-	-	-	-	-	180,978	-	-	-	172,505	14,304	168	-
132	2024	Asset Accounting Upgrade	Software(intangible)	Corporate	The project will upgrade our current accounting asset management software to the latest version as required by the vendor and implement additional new feature, ensuring continued support of a critical financial application and providing new functionality. In 2022, standard vendor support ends for the current on-premise software. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the new version vendor support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub ledger, it is necessary to perform an upgrade and maintain vendor support. In addition, the upgrade provides additional functionality to increase the frequency of financial reporting and improve visibility. The current monthly allocation process has limited visibility to Company financial performance, and the upgrade provides functionality that allows more frequent allocation processes. Additionally, implementing the vendor's regulatory module eliminates the time-consuming and labor-intensive process of manual data extracts for regulatory analysis used for Cost of Service modeling. This project creates value for the Company by ensuring compliance with regulated financial accounting within the fixed asset sub ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) eliminating the labor intensive and time-consuming process of pulling data for regulatory analysis used for Cost of Service; (3) automating financial tasks and; (4) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support. The project scope includes: (1) upgrading the vendor software from the current version to the newer version; (2) implementing new functionality that includes features for the regulatory Cost of Service analysis, additional reporting, job scheduling, and central load error processing; and (3) populating the data lake with data from the asset accounting system. Alternatives considered include: (1) Upgrade to the newest cloud version of PowerPlan. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrade, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service reporting, and centralized error processing. (2) Evaluate SAP options for leasing, asset, and tax management capabilities. While this option would initiate the need for an interface between SAP and PowerPlan, it would likely be more complex, cost more, and may not provide all the required features. (3) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements.	2021-09-27	2023-12-25	-0.99	4,630,550	260,286		-	-	-	-	-	-	-	10,089	-	-	-	-	10,089	-	-
133	2024	HR Support Pack and Business Software Inc Upgrade 2023	Software(intangible)	Corporate	The HR Support Pack and BSI upgrade will update the SAP system with HR Support Packs that are released annually by SAP to comply with HR and tax changes. SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax changes, resulting in the inability to calculate and distribute payroll. This project creates value for the Company by: (1) ensuring that its system is in compliance with new financial rules and regulations; and (2) ensuring that it can calculate and distribute payroll. The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information by the Company. As this is an upgrade of an existing system, the alternative considered was to delay the upgrade. This alternative was not chosen due to the risk of not complying with financial rules and regulations.	2022-12-26	2024-01-22	0.00	-	664,262		-	-	-	-	-	-	-	6,530	-	-	-	825	5,282	423	-
134	2024	HR Support Pack and Business Software Inc Upgrade 2024	Software(intangible)	Corporate	The HR Support Pack and BSI upgrade will update the SAP system with HR Support Packs that are released annually by SAP to comply with HR and tax changes. SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax changes, resulting in the inability to calculate and distribute payroll. This project creates value for the Company by: (1) ensuring that its systems are in compliance with new financial rules and regulations; and (2) ensuring that it can calculate and distribute payroll. The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information by the Company. As this is an upgrade of an existing system, the alternative considered was to delay the upgrade. This alternative was not chosen due to the risk of not complying with financial rules and regulations.	2024-03-25	2024-12-08	0.00	-	569,446		-	-	-	-	-	-	-	315,758	-	-	-	44,884	164,612	6,262	-
135	2024	Product Family Enhancements Corporate Capital	Software(intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. A business process improvement and change, new requirements surface that call for small-or-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Corporate Services Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing Tier 3 software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and Public Affairs. Prior to implementation enhancement, a review is completed to identify the best solution. During that review, requests for this fund are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	1,813,930	119,298		510,538	110,838	-	318,419	102,706	3,278	15,197	44,140	27,676	-	-	2,556	13,864	45	-
136	2024	Product Family Enhancements Corporate O&M	Software(intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business process improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Corporate Services Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and Public Affairs. Prior to implementation enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	185,469		-	-	-	-	-	-	-	70,273	-	-	-	18,627	50,451	1,195	-
137	2024	Talent Management Enablement	Software(intangible)	Corporate	The project will deliver technology solutions to enable best-in-class Talent Management programs and processes that are critical to achieve the Company's overarching Talent Strategy Plan. The Talent Strategy Plan is a key enabler of the Company's Integrated Resource Plan (IRP), Electric Distribution Infrastructure Investment Plan (EDIIP), and Natural Gas Delivery Plan (NGDP). Effective Talent Management programs and processes are critical to develop the skills, capabilities, productivity, and experience necessary to successfully execute these plans that deliver clean, reliable, affordable energy through an exceptional customer experience. Significant technology improvements are required to transform human resources (HR) to develop the skills and capabilities necessary to achieve the Company's strategic destination. Currently, many Talent Management processes are manually managed with little or no technology enablement. Specifically, the talent compensation process are mostly manually done outside the system which introduces waste, and a potential for errors. In addition there is a limited visibility of competency gaps within the workforce. The Company cannot effectively place talent in accelerated development programs aligned to competency gaps, nor can it recognize and motivate employees for quickly increasing competency and performance. Furthermore, the Company operates in an increasingly competitive job market where candidates and employees expect best-in-class processes, technologies and experiences relative to their employment and career development. The lack of full technical enablement across Talent Management programs can pose a risk to employee attraction, retention and limits the ability to develop the right skills at the right time to deliver on Company strategies. This project will add value to the Company through technology that will enable: (1) fully funded and integrated compensation modules; (2) accelerated and targeted talent development of critical skill areas sets to deliver on the Company's commitment to clean energy and exceptional customer experience; (3) transparency into talent and skill gaps to inform succession planning and business continuity and career development; (4) Career Development and Employee Retention. The scope will include: (1) implementation of each system/application; (2) integration with current systems, applications and processes as applicable; (3) retrofit current systems and applications to ensure a seamless end-to-end experience of HR processes; (4) delivery of mobile capabilities for in-scope processes; (5) reporting and analytics dashboards and insights for in-scope processes. Three alternatives were considered for these Talent Management programs and processes: (1) develop custom, internally built solutions that do not meet most requirements. This alternative was not selected because a custom solution would result in higher overall costs, higher maintenance costs, fewer upgrades, and would not leverage industry best practices to ensure best-in-class delivery. (2) Select an incumbent software tool. This alternative was not selected because it requires internal maintenance, increases infrastructure costs, and would have less frequent upgrades which would hinder the Company's ability to ensure processes are evolving alongside industry trends and best practices. (3) Evaluate and select dual/SaaS solutions) which would lower infrastructure costs, less internal maintenance than an on-premise solutions and would be built and evolved with upgrades based on industry best practices. Based on research, internal experience with successful best practice implementations, and vendor demonstrations, option three was selected.	2023-02-27	2025-12-19	-1.00	1,221,532	464,821		138,825	-	-	117,915	14,687	1,073	150	61,152	-	-	-	704	59,338	1,110	-
138	SUBTOTAL	2024 Corporate										684,353	110,838	-	436,334	117,482	4,351	15,347	594,920	27,676	-	280,101	317,939	9,203	-
139	2024	Application Currency-CoBo Capital	Software(intangible)	Customer	The CoBo initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct, negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the CoBO adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risks; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application on software; (2) assessing any new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the CoBO are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	-	90,993		-	-	-	-	-	-	-	18,278	-	-	-	5,466	12,559	254	-
140	2024	Click to Chat	Software(intangible)	Customer	Prior period adjustment.							2,958	77,921	-	166	(76,993)	-	1,821	132	-	-	-	124	9	-
141	2024	Energy Assistance Enhancements and Maintenance Annual Updates	Software(intangible)	Customer	The Energy Assistance Enhancements and Maintenance Annual Updates project, formerly known as Consumers Affordable Resource for Energy (CARE) project, will implement software changes to offer energy assistance to low-income customers and streamline the process for the assistance agencies who use the assistance portal. This is accomplished through improved user interfaces and updates to SAP to process various requests. Upcoming modifications to the CARE credit forfeiture, ongoing and annual review of requests, that includes criteria from the Department of Health and Human Services (DHHS) and Michigan Public Service Commission ("MPSC") to prioritize the list of changes. Each grant year, DHHS and MPSC stipulate the criteria required for customers to enroll in the CARE program, how the Company and agencies will manage the enrollment process and track and report customers, and how they will administer the Energy Assistance Program ("EAP") Benefit through bill credits and arrears forgiveness. The criteria changes significantly each year; therefore, the Energy Assistance Enhancement and Maintenance Annual Updates application requires modifications to meet the new requirements. If the regulatory requirements are not fulfilled, the Company is at risk of losing state Low-Income Home Energy Assistance Program ("LIHEAP") funds to assist low-income customers with paying their energy bills, thereby increasing the customers risk of shutoff for non-payment. In addition, our energy assistance programs function within all software platforms in the company which consistently need enhancements and updates. The project will provide the following value: (1) complete modifications to internal SAP applications and the Company Portal to receive LIHEAP funding, which can be used to provide customers the bill credits and arrears forgiveness; (2) improve the data within the assistance agencies portal, thereby making it easier to assist customers in need of LIHEAP funding; and (3) complete modifications to customer facing platforms. The project scope includes: (1) updating the enrollment and status process; (2) allowing for two mid-year bills; (3) improving reporting; (4) updating the arrears forgiveness plan; (5) satisfying additional regulatory requirements for the annual grant rule changes required by the Department of Health and Human Services and Michigan Public Service Commission; (6) updating CARE during a process; and (7) updating CARE PASS functionality to enhance Agency Self-Service. Alternatives considered included: (1) continue with current process, which would lead to loss of grant funding, thus decreasing or eliminating energy assistance dollars for customers; (2) transfer administration of Energy Assistance Programs to a third party organization, which would remove ownership and visibility into the health of the program while increasing administrative costs; and (3) make annual updates to the application, which will allow agencies to easily enroll customers on assistance programs and allow placement of holds to stop or prolong credit activity until assistance decisions are granted. Option 3 was selected since it provides long-term proactive energy assistance to customers and prevents loss of grant funds. Changes are required to internal systems (SAP, Agency Portal, etc.), therefore a status or third party alternative is not viable. Additionally, retiring the existing Agency Portal for a new application would increase costs beyond that of the routine upgrades.	2024-01-01	2024-12-31	0.00	-	348,712		-	-	-	-	-	-	-	132,124	-	-	-	88,140	40,865	3,118	-
142	2024	Enhancements - Customer Experience and Operations - Cap	Software(intangible)	Customer	The CoBO initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business process improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the CoBO Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for CoBO. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience Operations, Applications Support and Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. 143	2024	Enhancements -CX&D-O&M	Software(Intangible)	Customer	The CX&D initiative will utilize O&M funding to make enhancements to existing technology and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort technology changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing technology requires a short timeframe between inception and implementation. Failure to make these changes or to update aging technology can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of technology enhancements in the CX&D Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT technology investments for CX&D. The scope of technology enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	184,758		-	-	-	-	-	-	-	70,003	-	-	-	36,978	31,507	1,518	-
144	2024	Genesys Cloud Migration	Software(Intangible)	Customer	The project will migrate the Company's existing on-premise customer contact solution and deploy it to the Genesys Platform As A Service (PAAS) cloud-based solution. It will provide the Company with the ability to reduce operational costs for performing upgrades and maintenance, take advantage of new enhancements offered by the vendor, and ensure continued support of a critical customer communication channel. In 2018, standard vendor support ended for the current on-premise contact center software and extended support is not available from the vendor. Without vendor support, the application no longer receives security patches, bug fixes, or functionality support from the vendor, which creates security, stability, and reliability risk. With the upcoming end of standard support, the vendor is no longer offering feature enhancements to the current on-premise solution limiting the Company's ability to invest in new ways to better serve its customers. This project will provide value to both the Company and its customers through: (1) reducing costs with cloud allocated hardware scalable to current usage needs; (2) reducing operating costs with vendor managed feature updates and maintenance provided without service disruption; (3) providing access to new and innovative capabilities to enhance customer service; and (4) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support. The project scope includes: (1) deploying the new PAAS cloud-based solution in the vendor cloud environment; (2) installing a new internet circuit to directly connect the Company's systems to the vendors cloud environment; (3) updating existing customer interactive voice response (IVR) logic to accommodate the new cloud implementation; and (4) implement new features supporting analytics, quality, and reporting. Alternatives considered include: (1) Defer to later years. The alternative was not selected due to rapid upgrades of existing on-premise hardware, increasing our ability to take advantage of new features offered by the cloud solution and reducing cost savings opportunities presented by moving to the cloud. (2) Deploy Genesys on-premise solution to new on-premise hardware. This alternative was not selected due cost associated with purchasing new hardware and does not address the security, stability, and reliability risk resulting from the vendor end of support for the on-premise software. (3) Select and migrate to a new vendor software. This alternative was not selected due to the complexity of our existing internal integrations base and the Genesys platform and the Company's other internal systems. As a result, selecting a new system that a new vendor would make the switch over prohibitive. (4) Migrate to the Genesys Cloud platform. This alternative was selected due to it building on the Company strategy of moving to cloud, reducing operating and maintenance costs, and reduce risk by ensuring consistent, seamless vendor support.	2024-07-02	2025-08-28	-0.80	-	8,808,452		-	-	-	-	-	-	-	47,623	-	-	-	1,589	45,987	47	-
145	2024	Product Family Enhancements -Customer-Capital	Software(Intangible)	Customer	The Customer initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Customer Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. 146	2024	Product Family Enhancements -Customer-O&M	Software(Intangible)	Customer	The Customer initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Customer Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	33,847		-	-	-	-	-	-	-	12,824	-	-	-	892	11,709	224	-
147	2024	Rate Change Maintenance	Software(Intangible)	Customer	The Rates Case Implementation project will modify SAP billing in accordance with pricing and rate change requirements. For the Company to continue to meet and comply with the Michigan Public Service Commission (MPSC) rate change requirements, there is a need to make periodic updates/modifications to the existing prices and rate structures. These updates help ensure accuracy of billing and provide optimal rates for customers. The project will add value for both the Company and its customers through: (1) improved customer satisfaction by providing accurate billing; (2) optimized rate configuration enabling rate changes to be made more efficiently; and (3) timely updates to Company applications that incorporate mandatory changes to the rate structure that include new surcharges, price changes, and energy efficiency programs. The scope of this project encompasses: (1) implementation of annual or monthly (or both) rate changes, rate structure changes as approved by the MSPC; and (2) optimizing the rate configuration in the Company's back-end systems for more efficient rate changes. An alternative considered for this effort was a fully dedicated offshore development model. The option ensured resources were readily available with a more cost effective hourly expense. This alternative was not chosen due to the risk of billing inaccuracies and customer complaints. These risks were deemed too high due to the complexities of the rate structure, new development, and the timing it would take for testing of this model. Cloud is not an applicable option in this case as we are not replacing any software. The option to use onshore resources to plan, coordinate, and execute the rate changes was selected as it supports the Company's operation model for rate changes.	2024-01-01	2024-12-31	0.00	-	278,944		-	-	-	-	-	-	-	105,689	-	-	-	689	102,718	2,282	-

150	2024	Application Currency-Electric & Gas Shared-Capital	Software(Intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities as associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber-security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Electric and Gas Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	714,106	342,288		236,738	160,216	-	31,339	13,952	886	10,937	326,647	40,538	-	86,108	-	-	-	-
151	2024	Application Currency-Electric & Gas Shared-O&M	Software(Intangible)	Electric & Gas Shared	The Electric and Gas Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber-security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. 156	2024	Enhancements -Operations-Capital	Software(Intangible)	Electric & Gas Shared	The Operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the Operations Portfolio is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	200,998	3,188		61,008	(8,324)	-	60,271	478	-	4,582	1,179	-	-	-	-	1,179	-	-

Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	248,133		-	-	-	-	-	-	-	94,015	-	285	-	52,344	39,625	1,761	-
158	2024	Enhancements -TEOS-Capital	Software(intangible)	Electric & Gas Shared	The TEOS initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in the TEOS Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for TEOS. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	67,468	100,000		20,476	-	-	17,490	-	126	2,861	37,000	-	-	12,184	24,296	520	-
159	2024	Field Contractor Work Management Technology Enablement	Software(intangible)	Electric & Gas Shared	The project provides the ability to electronically manage contractor work and increases accuracy and timeliness of information processing for field work deliverables. This project additionally will create new opportunities to measure and optimize field work process supporting customer on-time delivery goals. Contractor field employees use manual, paper-based processes and generic communication technologies (phone, radio, email, collaboration sites) to perform work for the Company. Due to the manual nature, inaccuracy, and delay of information processing there are negative impacts to the availability and accuracy of work status. This limits the opportunity to measure and optimize field work processes that support customer on-time delivery and other goals. The project will add value by: (1) improving on-time delivery of customer work by providing electronic work order information to contractors; (2) improving customer satisfaction through efficiency in scheduling work and reporting on the progress electronically; (3) increasing safety by tracking work and contractor data provided by information from the last known location of the contractor; (4) improving material management; (5) making it easier to renew emergent work for contracts to balance workloads and meet customer commitments; and (6) enabling real-time updates to work order information, increasing data accuracy and reducing invoice reconciliation time. The project scope includes: (1) identifying requirements for a Bring Your Own Device (BYOD) field contractor work management technology solution and process; (2) developing, configuring, and testing interfaces, software, and solutions for the solution; (3) implementing the solution and process for the following work groups: Electric High Voltage Distribution (HVD), Electric Low-Voltage Distribution (LVD), Mutual Assistance, Forestry, Gas Distribution, Gas Code Compliance, and Substation Operations Construction Metrics; (4) updating the following dependent contract types to support BYOD field contractor work management: zone, specific skill, ancillary, electric storm, and mutual assistance; and (5) training field contractors on the new technology and processes. The alternatives considered included: (1) Continue with the current paper-based process. This alternative was not selected because this approach does not allow for the timely, data-driven work management metrics required to improve service to customers. (2) Use the current Company mobile application. This alternative was not selected because the solution is not expected to receive long-term investments by the vendor and the mobile application would require more upfront investment than the proposed option. (3) Use a 3rd party platform specifically designed for contractor work management. This alternative would not be able to leverage the benefits and integrations with the existing platform and would require additional new integrations. (4) Provide Company-funded field devices to contractors. This alternative was not selected because the investment in hardware, management of on-board repairs of boarding of devices to contractors, and training and device management is cost-prohibitive and introduces a risk of the loss of or misuse of information security and corporate assets. Leveraging the existing field work management solution was chosen because it uses existing well-developed functionality while leveraging cloud-based, BYOD-capable tiles to move short-term and long-term contractors from paper process to the established, standard work management system.	2021-05-24	2024-12-31	-0.90	2,168,316	624,732		545,508	-	110,206	164,392	239,188	5,040	26,678	63,996	11,921	1,076	41,552	8,712	527	207
160	2024	Field Mapping and Graphics	Software(intangible)	Electric & Gas Shared	This project will implement a solution for the mobile field mapping and data collection that can search and view facility map data, view work order designs, and create work order as-built construction drawings in the field. This software technology increases process efficiency, personal tasking/field graphics functionality, reducing IT complexity and reducing unit increasing adoption in the field through ease of use. In addition, it allows the Company to move to a supported application platform and retire the unsupported ArcPad solution. The current mapping and graphics application was implemented in 2002 and is no longer sold or supported in any capacity, and the custom solutions developed for the application cannot be changed. Due to the impact and accuracy of the GIS landbase (streets, political boundaries, etc.), the outdated electric maps that are referencing that data causes the maps to be unreadable which cause a safety issue. Additionally, field employees have considerable challenges when attempting to use the software due to its dowess, an aged interface, and dated processes. The project will add value by: (1) providing more accurate geospatial data, including facility map data, pre-construction designs, and as-built construction drawings; (2) consolidating daily tasks into a more simplified experience; (3) eliminating the process waste from duplicating asset data in two systems; (4) establishing the adoption of the Geographic Information System (GIS) standard; and (5) making mapping and graphics data available on field devices. The project scope includes: (1) installing a new mobile field mapping and graphics application; (2) creating the ability to search and view the facility map data in GIS format along with the ability to search by address; (3) viewing pre-constructed work order designs in a new GIS format; and (4) creating as-built construction drawings in GIS format for completed work orders. Four alternatives were evaluated and three were determined not viable for the project: (1) Continue maintaining the current ArcPad application. This option was not selected because the Company is no longer able to maintain the ArcPad application to mitigate issues if the application crashes/critical defects. Total failure of the application could invert field crews back to paper-based facility maps, risking safety using static, outdated data, or requiring the creation of as-built construction drawings on paper documents. (2) Use the Adobe or Snagit application for creating as-built construction drawings. This option was not selected because field users would have to use one solution for facility maps and use rudimentary drawing tool like Adobe or Snagit for creating as-built construction drawings. This option was also not selected because it introduces additional steps due to the complexity and customization needed to integrate the applications. (3) Build a custom Mapping and Graphics solution. This option was not selected as existing industry solutions are available at a much lower cost with much less risk. (4) Implementing the new field mapping and graphics software was selected as this option will consolidate field graphics functionality into one efficient process and provide a current, supported solution	2020-11-30	2025-08-25	-0.72	4,400,537	70,897		238,081	-	-	140,637	77,999	2,397	12,048	5,806	-	-	-	5,806	-	-	-

The value of software enhancements in Electric and Gas operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	37,775		-	-	-	-	-	-	-	14,313	-	-	7,330	6,579	404	-
165	2024	Spatial Asset Management	Software(intangible)	Electric & Gas Shared	This initiative will implement SAP's Spatial Asset Management module. It will allow users to view assets, outfit actions, and orders geospatially using map. The module will allow us to create and maintain asset maintenance tasks for each segment of our gas and electric distribution network (linear assets) We will create linear assets as technical objects (such as functional locations and equipment) and create linear data. We will enable creation of maintenance plans for these technical objects which result in notifications, maintenance orders, and measurement documents. We will enable monitoring the condition of our linear assets, identify where there is damage or a defect, and manage all types of maintenance tasks (planned, unplanned, and preventative). Current Consumer Energy lacks spatial visualization and spatial awareness of work and assets impacting requirements for first time quality and inspecting the ability to plan, bundle and execute nearby work. The lack of a linear asset management capability affects the full work management value stream resulting in overproduction of asset maintenance activity such as assessments, surveys, and inspections. This project creates value for the company by: 1) providing capability in SAP to view assets, notifications, and work orders on a map, 2) providing location awareness in SAP for assets and work, 3) establishing linear asset management capability in SAP for gas and electric delivery networks, 4) enabling end-to-end map-based workflows. The scope of this project encompasses implementation in SAP of the Spatial Asset Management module. Alternatives considered include: 1) A Cloud-based individual asset integration between GIS and SAP. This alternative was not selected as it proves ineffective in addressing needs of the end-to-end work management value stream while increasing the technical footprint of customization. There are also performance concerns with cloud to on-prem integrations. 2) We'd group certain approaches to viewing work on a map. This alternative was not selected as it does not support extended operations the enterprise requirements call for. 3) Do nothing. This alternative was not selected as this would delay realizing costs and inefficiencies in gas and electric work management. 4) The alternative to implement the Spatial Asset Management module in SAP was chosen as it expands use of a core technology investment, supports current investment in our work management value stream, and is compatible with our GIS technology.	2023-12-04	2025-11-30	-1.00	3,158,109	206,194	ROM	276,878	70,737	-	187,684	-	-	18,458	36,702	-	-	25,950	10,752	-	-
166	2024	Work Management Scheduling Analytics and Reporting	Software(intangible)	Electric & Gas Shared	The project will implement a solution to optimize the key components of the Distribution Planning and Scheduling functions including forecasting, work order intake, resource identification, work schedule creation, work resolution preparation and associated work order analytics. The Distribution Planning, Scheduling and Administrative Support & Financial Services (Work Plan Strategy) teams are utilizing manually intensive work methods, systems and forecasting models. These inefficiencies impact the creation of work plans, task prediction capacity planning, and reduce productivity of operational partners. The project will add value by providing: (1) streamlined process to test for workload review and preparatory analysis, leading to increased focus on work-level priority, execution of work and a reduction of human touch; (2) increased accuracy in crew work schedules, leading to improved customer satisfaction and on-time delivery of customer-requested work, system integrity work, and gas compliance requirements; (3) reduced manual scheduling steps, reporting and analysis of data associated with work management processes and systems; thereby minimizing the risk of human error hours spent developing and updating crew work sheets; and (4) improved forecasting accuracy that results in greater transparency into the weekly schedule and associated work plan. The project scope includes: (1) implement a solution to facilitate the review of work orders from various engineering organizations, allowing for streamlined check-in of work orders; (2) implement a scheduling tool that utilizes predictive modelling and advanced analytics and streamlines daily schedule modifications; (3) enhance integration with the Area applications to bring in employee capacity and availability information; (4) integrate with SAP to retrieve work order data and manage record keeping requirements; (5) enhance integration with Field Service Suite (FSS) for quicker access to MISO 045 information and work order assignments; and (6) implement associated analytics and reporting. Three primary alternatives were considered for the project: (1) Automating manual data movement across excel and current systems through Robotic Process Automation. This option was not chosen because it will not create new efficiencies and will not provide data and insights into whether the schedule supports operating priorities and metrics, financial scenarios, first time completion of work, and daily goals; (2) Integrating an off-the-shelf planning and scheduling system. This option is not preferred due to associated up-front and long-term costs; and (3) Implementing a hybrid of an off-the-shelf planning component with custom built scheduling functions. This is the preferred option to provide a more cost-effective and targeted fit for the organization.	2022-01-26	2024-11-20	-0.69	2,283,004	176,667		159,638	-	-	135,974	13,714	970	2,970	22,005	22,005	-	-	-	-	-	-
167	**SUBTOTAL**	**2024 Electric & Gas Shared**										**1,943,245**	**213,875**	**98,818**	**994,862**	**530,064**	**12,185**	**91,712**	**705,271**	**74,150**	**1,076**	**184,716**	**189,682**	**4,189**	**207**
168	2024	Application Currency Gas-O&M	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Gas Engineering and Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational impacts of performing the upgrade, and ability to defer until next cycle. The scope of upgrading these applications encompasses: (1) upgrading the application software; (2) assessing any new functionality for value to the Company; (3) making necessary configuration changes; (5) testing the upgraded software; and (5) updating documentation related to the integration changes. Application within the Gas Engineering and Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) having increased support costs, and (4) possibly requiring additional support from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2025-12-31	-1.00	-	225,321		-	-	-	-	-	-	-	205,321	-	-	-	222,778	1,902	642	-
169	2024	Corrosion Control Modernization	Software(intangible)	Gas	Prior period adjustment.							2,959	196,708	(87,301)	-	(148,400)	-	1,993	-	-	-	-	-	-	-
170	2024	Gas Leak Asset and Work Management	Software(intangible)	Gas	The project will implement functionality to automate gas leak compliance tasks and track all gas leak activity in the Gas Geographic Information System (GIS), creating a single system of record for gas leaks data, and providing a spatial display of leak data to improve leak management visibility. The gas leak process utilizes two systems to complete work and monitor gas leak compliance: SAP and Inspection Manager. Gas leak information is manually transferred between SAP and Inspection Manager and vice versa by compliance technicians. An internal audit identified 38 (18 leak orders, resulting in a 63% defect rate, with inconsistent information recorded between SAP and Inspection Manager. Lack of quality control to help ensure accurate leak information across systems may inhibit management's ability to effectively monitor gas leaks and could result in leaks not being re-classified or repaired in a timely manner. This has regulatory compliance and safety impacts such as missed compliance dates which may result in fines and increased public safety risk resulting from untimely or missed leak repairs. The project provides value to both the Company and customers, including: (1) improving productivity and field waste in accuracy; (2) enabling near-real-time reporting and automated metric reporting on open leak backlog; (3) creating one system of record for all leak assets in GIS; (4) implementing quality improvements for scheduling and routing of leak crews; (5) reducing risk of future audit findings or non-compliance resulting from duplicate open leak orders; (6) optimizing resource allocation for gas service post-system by eliminating manual posting of leak repairs into GIS; (7) optimizing resource allocation for the gas compliance team by eliminating the posting of leak repairs in Inspect on Manager; and (8) streamlining the leak survey workflow to improve the human struggle caused by use of paper maps and manual processes for leak order tracking. The scope of this project includes: (1) design and implementation of an API integration between the asset systems and the work management system to create, update, and manage leak maintenance, repair, and emergent orders and inspection schedules through the Enterprise Service Bus (ESB) or similar; (2) configuration of new SAP and Service Suite work order completion forms required to support new work processes; (3) updating the business intelligence dataset to support reporting; (4) reconfiguring workflows in Inspection Manager to capture all leak data from GIS; (5) design and implement a solution to replace the use of paper maps in the leak survey process; (6) implementing a workflow to communicate first time and repeated customer contacts for a given leak; (7) implementing an open leak order geospatial map of all open leak orders, utilized across office and field technology; (8) creating a system indicator that flags duplicate leak orders at the same location; and (9) implementing functionality to provide visibility through a list/map of all open leaks orders within a specified radius. Five alternatives were considered for the project: (1) Implement a Quality Assurance/Quality Control (QA/QC) process to ensure data is consistent between both SAP and Inspection Manager. This alternative was not selected because it requires an increase in labor costs for manual reporting and data checks. In addition, as demonstrated by the audit, manual processes, even manual QA/QC processes, are subject to human error, and each error creates safety and noncompliance risk. (2) Implement a Robotic Process Automation (RPA) to sync data. This solution was explored but is not viable because the base leak processes are too complex. (3) Implement a new GIS-based compliance solution that can be integrated with SAP. This alternative is too costly, given recent investment in the current Inspection Manager solution. (4) Defer project implementation. The alternative selected is to implement this project now, rather than later, as a result of recent gas leak related audit findings. (5) Implement functionality to automate gas leak compliance tasks and track all gas leak activity in the GIS. This alternative was selected because it leverages existing solutions in a new way, optimizing resources and technology investment. The use of Circuit technology was not considered due to the enhanced functionality being added to systems and applications that are already on premises.	2023-08-24	2024-12-27	-1.00	50,000	6,225	ROM	-	-	-	-	-	-	-	769	-	-	760	-	9	-

171	2024	Gas SCADA Software Solution	Software(intangible)	Gas	The Gas Supervisory Control And Data Acquisition (SCADA) software solution project will replace the current Gas SCADA Software with a more standardized software package enabling the Company to more efficiently meet Federal and MPSC requirements. The current Gas SCADA software solution was originally implemented in 2000 and was based on the gas system requirements at that time. While the solution has been maintained since its implementation, the Company's gas system has outgrown the current capabilities. As the solution ages, there is increased effort required to address obsolete application and database software architecture, and enhancements to the system are limited. To address the capability gaps, custom middleware and integrations have been developed where tech exists mean maintenance and support. This environment adds complexity and cost to solution upgrades and troubleshooting issues. The current Gas SCADA solution will limit the ability to invest in digital solutions for increased system health monitoring and preventative maintenance capabilities due to the complexity to integrate these future capabilities within. The project will add value by: (1) reducing risk of non-compliance by improving the ability to document and follow State and Federal requirements, improving customer safety; (2) improving efficiency and reliability when performing routine software upgrades, because a standard out-of-the-box software has less risk of breaking during upgrades, as gaps exist from custom code added software; (3) reducing maintenance costs due to fewer individual software programs and less custom code; (4) improving Gas Control management capabilities that support the Federal and MPSC requirements for gas pipeline and Gas Distribution operations; (5) improving reliability by using proven gas industry standard and software with configuration features, rather than a fully custom end system that has the possibility of being impacted by the next version update; (6) purchasing standard, out-of-the-box software that meets a high percentage of requirements and avoids multiple custom applications and specially coded programs to achieve results; and (7) providing a basis for capturing data required for use in computer-based preventative maintenance programs and more predictive technologies. In addition, implementing industry-specific software helps the collective gas industry as it moves to leverage the vendor development of future version enhancements, which adds more value to gas industry users. The comprehensive Gas SCADA system is used to monitor and control the operating conditions of the transmission and distribution gas systems. The Gas SCADA System includes remote terminal units (RTUs), field devices (i.e. valves, meters, cathodic), and computers running SCADA software. This scope covers the Gas SCADA software solution only. The project scope includes the following: (1) significant planning, including consulting assistance, to define the implementation strategy for the effort, given the magnitude of the technology effort; (2) selection and implementation of a new Gas SCADA software solution; (3) planning of a phased rollout of new hardware and software; and (4) retirement and decommission of the legacy gas SCADA solution and equipment once the new system is fully tested and operational. Alternatives considered include: (1) continue to maintain the current solution, at the risk of increasing reliability issue that result in controlling and monitoring the Company's gas system; (2) invest in enhancing the existing SCADA software solution which would introduce additional custom development and more specialized functions that may not be supported in future vendor releases; and (3) replace the solution with a gas SCADA software solution that meets requirements to support the Natural Gas Delivery Plan. Alternative three has been selected to ensure sustainability for this critical solution. The current legacy system is operating at well beyond its original design specifications, so the potential points of failure are not fully known or understood. If the SCADA project is not completed, the legacy system could become unstable and Impact Gas Control's ability to operate and monitor real-time system conditions, maintain safe operations, and compliance with regulatory requirements. It could also impact the ability to commission new facilities which require remote monitoring or control or cause the need for 24/7 manual field monitoring of certain facilities.	2022-04-18	2025-12-31	-0.97	18,018,040	2,205,237		6,022,548	555,511	855,365	1,194,638	4,957,908	23,030	441,113	460,517	113,779	170,909	191,534		184	4,111
172	2024	Gas Storage Probabilistic Risk Model	Software(intangible)	Gas	The Gas Storage Probabilistic Risk Model project will implement a risk analysis model for comprehensive predictive risk analysis and modeling on gas storage wells. The current Gas Storage model is a relative risk model that requires risk to differ from not impact information using qualitative data and ordinal scales to produce a risk ranking. In simple terms, the relative risk model is not capable of creating a statistically significant result. The risk assessment used in the current model provides a ranking for likelihood, consequence, and risk that is relevant only in comparison to other rankings. While the outputs provide a sense of relative risk when comparing one well to another, the current risk model does not provide anything qualitative that relates to the failure of wells. Also, the current transmission model does not meet the requirements of the MPSC, as indicated in a letter of noncompliance (dated January 15, 2019), and risk ranking for storage systems has historically followed transmission rule-making. Lastly, the current model introduces risk in PHMSA findings as a non-probabilistic model. Completion of this project will provide value to both the Company and its customers. Each party will benefit from safety improvements and risk mitigation through statistically based risk modeling that leads to more informed will improvement projects and improved targeted plug and abandonment projects. Implementing probabilistic risk modelling supports the changes planned for in the Company's Natural Gas Delivery Plan (NGDP), including the Company Gas Management Safety Systems (GMS). It GMS incorporates the Company's plan to implement the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems). Additionally, the implementation of a probabilistic risk model will: (1) calculate quantitative risk scores that include measures of probability, frequency, or expected loss of events, and (2) configure multiple data sources, to make advanced statistical calculations for interacting threats, both of which allow the Company to make more informed financial and strategic decisions based on improved quality inputs and mitigate the risk of PHMSA findings. The probabilistic model will rank the wells in risk-associated dollars making it easier to interpret risk results for the purpose of making business decisions. Furthermore, the Pipeline and Hazardous Material Safety Administration (PHMSA) has identified the probabilistic risk model as a potential best practice for storage operators over other risk models (PHMSA Pipeline Risk Modeling white paper, dated May 5, 2016), so the project adds value by aligning with industry best practices. The project scope encompasses the implementation of a probabilistic risk model for gas storage wells. The project will: (1) install and configure risk model; (2) configure multiple data sources; and (3) diesel operators and dashboards. Alternatives considered include: (1) continue the use of the relative risk model, but invest in substantial effort to continually manually managing data inputs and quality checks; (2) implement a custom, Excel-based probabilistic risk model through a consulting effort; (3) implement an on-premise probabilistic risk model, and (4) implement a cloud-based model. The first alternative was not selected because although the manual effort is possible, it is becoming increasingly difficult to complete as the model utilizes more data sources that need to be annually updated and validated. The second alternative was not selected because although the effort minimizes the IT cost of the project, the model may limit the creation of secondary data sources, leading to multiple sources of truth. The on-premise solutions analyzed are not mature and have not been widely tested with transmission operators, so alternative three was not selected. The fourth alternative of implementing the cloud-based probabilistic risk model was chosen because it is the most cost-efficient long-term implementation approach, providing commercials, off-the-shelf capabilities, industry-proven technology, and an ongoing vendor support and improvement roadmap.	2023-04-14	2024-12-24	-1.00	1,577,860	145,522		619,958	-	-	30,711	555,985	319	32,942	10,158	-	-	-	10,000	-	158
173	2024	Gas T&D Historian	Software(intangible)	Gas	The Gas Transmission and Distribution (T&D) Historian project will replace the current historian for Gas T&D, eDNA (a traditional Supervisory Control and Data Acquisition (SCADA) historian product), and migrate to the standard OSIsoft PI enterprise historian system. The PI system is a suite of software products that are used to collect, store, view, analyze, and share operational data with systems and an adjunct matter experts. The historian for Gas Transmission and Distribution resides on a decades old platform and is not the Company's historian standard. Data access is cumbersome, requires multiple tools to access it, and does not provide for the storing, analysis or visualization of operational data in a timely manner with appropriate change management control. With the implementation of smart meters, the Company standardized on the more robust OSIsoft PI historian which is used for: (1) Renewable Generation; (2) Electric Transmission & Distribution; and, (3) Smart Energy. The Gas T&D historian has yet to be migrated to OSIsoft PI, and the eDNA gas data has limited accessibility and usability in its current state and is no longer supported by the vendor. In addition, maintaining the two platforms along with the new system requires duplicate resources and skills. This project will create a more accessible and centralized data source with better controls that can be leveraged as the system of record. The project will add value for both Gas Engineering and Gas Operations organizations within the Company by: (1) informing decision-making based on real-time data; (2) improving real-time situational awareness of Operators personnel for information that does not need to be monitored by Gas Control; (3) improving the ability to respond to abnormal situations that do not required immediate intervention through that direct communication to Operations personnel; (4) providing information for the development of proactive analytics to reduce potential catastrophic events; (5) streamlining data access through visualization and analytics; and (6) reducing the waste of using multiple interfaces to interpret data. From an IT perspective, consolidating to one standard historian platform will result in savings in hardware, software, maintenance, resources and training. This scope of this project includes: (1) migrate the eDNA Gas T&D historian, a traditional SCADA historian, and migrate to the enterprise Historian, OSIsoft PI; (2) develop analytics, visualization and reporting capabilities to support tracking of metrics and making operational decisions; (3) migrate the decades-old MKS mooth Access-based functionality Gas Reports solution and (4) retiring the legacy Gas T&D eDNA system hardware and software). An alternative considered for the project was to upgrade eDNA Gas Historian to the latest version. This option was not selected because it requires a significant investment, and does not meet analytics, reporting, usability and access ability needs as well as the software owner has announced the 1 unsafe, for this software. Furthermore, the Company standard for historians is OSIsoft PI and maintaining two platforms results in redundant efforts in training, support personnel and technology. The option to replace eDNA with the Company standard OSIsoft PI historian was well as extend to eliminate duplicate training, support personnel, and technology, and to leverage the more robust data analytics capabilities in the OSIsoft PI tool set. Currently the plan is to implement the Gas T&D Historian with the Gas SCADA Software Solution to eliminate the need to have duplicate historians within the Gas SCADA Software Solution is being implemented. If this project is not completed, an interruption of our operational data reporting capabilities could occur and could result in a no-compliance and could potentially interrupt certain wholesale accounting and billing functions.	2024-02-19	2025-12-15	-0.87	1,496,412	241,715		732,796	446,250	160,500	102,849	-	-	43,197	17,015	-	-	16,570	-	445	-
174	2024	Product Family Enhancements-Gas-Capital	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements in Gas Engineering and Operations is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experiences; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software applications/investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Finance Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	427,727	88,193		427,727	-	-	170,848	217,029	16,525	23,325	88,193	-	-	20,440	65,470	2,283	-
175	2024	Product Family Enhancements-Gas-O&M	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. 178	2024	ARP-Local Area Network	Network	IT Digital Foundation	This project will upgrade the Company's entire LAN and a significant portion of the Wireless Local Area Network (WLAN). At some Company locations, LAN equipment has been in service since 2011. If the LAN/WLAN hardware and software is not routinely refreshed, the Company will lose the manufacturer support needed for equipment bug fixes, security vulnerability patches, and enhancements. In addition, aging equipment cannot accommodate the increasing demand for wireless devices necessary to perform day-to-day operations that rely on wireless-enabled devices, such as rugged field devices, cell phones, barcode scanners, tablets, and other mobile devices. As equipment ages, it is at risk of higher failure rates, which increase the risk of unplanned outages. In the event of unplanned outage, business areas would not be able to access services on the corporate network including email, SAP, internet, and phones. The project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; (4) ensuring equipment is vendor supported, thereby ensuring support for bug fixes, security vulnerability patching, and enhanced features; (5) providing consistent wireless coverage across Company locations; (6) increasing user productivity through a higher performing wireless network, which increases the productivity and efficiency of office and field employees serving customers; and (7) improving support for wireless Internet Protocol (IP) phones, Internet of Things (IoT) and field devices. The project's scope includes: (1) refreshing the LAN equipment and software across all Company sites; (2) identifying the required features for the new equipment; (3) implementing the new equipment according to industry best practices; (4) replacing wireless network with upgraded infrastructure and verifying wireless coverage is as expected; and (5) collecting wireless survey data for all Company locations in order to design improved wireless network coverage. The alternative considered was to continue operating on the existing platform past the vendor's end-of-support date. The vendor support period ended in May of 2021, and paying for extended support is not an option offered by the vendor. The risk inherent in not refreshing the platform is a lack of support, including access to the latest features and security updates, and bug fixes. The Company chose the option to refresh the latest hardware and software available, following a five-year refresh cycle.	2024-01-01	2024-12-31	-1.00	4,189,732	85,523		1,139,131	160,822	874,609	208,725	190,301	7,536	77,157	31,643	-	-	2,216	12,698	16,484	246	-
179	2024	ARP-Radio	Network	IT Digital Foundation	This project will refresh hardware to include; 800MHz Radios and infrastructure, cellular modems, plant radios and systems, cellular amplification devices and vehicle repeaters in service trucks. This equipment supports mission critical voice and data communications for plant and field service personnel and dispatch personnel. 800MHz radios are upgraded on a 10-year lifecycle basis. Plant radio systems are upgraded on a scheduled 7-year lifecycle basis. Cellular modems are refreshed on a 5-year lifecycle basis. Amplification systems are refreshed on a 10-year lifecycle. Vehicle consoles are typically retired with the vehicle but are salvaged for reuse in new vehicles when possible. 800MHz, mobile, and portable radios, Plant radio systems, and Cellular modems support core business functions, life safety as mandated, and rapid response for restoration of customer service and critical infrastructure. Company radio systems must be refreshed on a scheduled basis or risk exceeding life expectancy and failing. The refresh of these subscriber units in a proactive manner is critical to providing service to customers. If these units are not refreshed, the increased risk of unit failure would result in interruptions to timely and concise communications to field personnel to resolve gas leaks, and downed electric lines, or service turn-on requests, which directly affects life safety. This project creates value for customers and the Company by: (1) upholding public safety; (2) ensuring timely responses and repairs to emergent gas leaks, wire downs, and electric outages; (3) ensuring real-time communications between Company dispatch locations and crews in the field; (4) ensuring the safety of personnel working in higher risk workspaces by replacing equipment with units that contain internally safe batteries; (5) supporting continuous improvement as it is highly replacing equipment that is capable of capturing audio recordings; and (6) remaining in compliance with MPSC regulatory requirements by maintaining critical radio infrastructure. The project scope consists of: (1) scheduled replacement of radios and modems and consoles; and (2) installing additional radios modems and console assets to satisfy growth requirements; and (3) scheduled replacement of out of date cellular and radio boosters. The alternatives considered included: (1) Replace the existing units with new units from other radio and modem vendors and (2) purchase new radio subscriber units from existing manufacturers. Option 2 was not selected because the Company now uses a standards-based radio system allowing for multiple radio manufacturer options. Option 1 was selected to allow for a competitive bidding process that will provide the most cost-effective radio that will meet the needs of users.	2024-01-01	2024-12-31	-1.00	1,335,332	154,940		619,480	-	677,124	(109,961)	48,118	1,760	2,347	57,328	-	-	53,924	1,560	1,744	99	-
180	2024	Application Currency-IT/Digital Foundation-Application Platforms-Capital	New Computers / Hardware	IT/Digital Foundation	The Application Platforms initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor-supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber-security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility issues. This project is delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk, potential impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Application Platforms are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the additional upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increase in number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	92,400	141,101		38,048	-	-	28,043	-	-	-	52,207	-	-	52,127	-	80	-
181	2024	ARP-Collaboration	New Computers / Hardware	IT Digital Foundation	This project will replace the Company's obsolete or out of date audio, visual, telephony and other communication collaborative tools and equipment. When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value by: (1) ensuring that the Company's audio, visual, telephony, and other communications systems are stable and reliable; and (2) enabling the Company to leverage a new telephone systems that have reached end of mainstream manufacturer support. The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for evolving business requirements. The following alternatives were considered: (1) refresh visual assets and a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only. These alternatives were not chosen due to the risk inherent with a partial replacement of assets, which include: (1) a reduced supply of equivalent replacement Avaya parts that are no longer be produced; and (2) an erosion of the knowledge held by employees on skill sets and assets.	2024-01-01	2024-12-31	-1.00	1,231,853	208,340		336,938	-	254,377	11,223	67,648	1,178	22,592	77,086	-	-	8,879	4,796	22,796	32	40,583
182	2024	ARP-Field Device Asset Management (FDAM)	New Computers / Hardware	IT Digital Foundation	This project will replace field devices according to a four-year refresh cycle that is based on industry standards, hardware failure, security patches, and software compatibility. When Field Device Assets are to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with Security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular four-year refresh cycle. This project creates value for the Company by: (1) improving stability and availability of business critical applications by proactively replacing field devices prior to increasing hardware failures; and (2) allowing field workers to complete their job tasks. The project scope consists of: replacing field device assets according to the four-year refresh cycle. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for field devices; and (2) use outdated equipment. The Company did not choose these options because: (1) there would be an increase risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the assets that need refreshing in future years based on the number of devices that were not replaced during the four-year refresh cycle; and (4) it could cause an inability to apply security patches. Based on India Hydata, waiting longer than the five-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle to alleviate these concerns.	2024-01-01	2024-12-31	-1.00	3,043,872	5,350		1,139,985	-	1,307,786	10,146	14,489	1,441	2,973	1,980	-	-	1,980	-	-	-	-
183	2024	ARP-Operational Technology Support Gas	New Computers / Hardware	IT Digital Foundation	The ARP- OT Support Gas project will replace dated end to date servers on a rotating 5 year refresh schedule. When OT Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value by maintaining the currency of the Company's IT Infrastructure and the core enterprise software that are utilized to support the operation of the Company's critical gas infrastructure. The program scope consists of: 1) replacement of computer hardware under the program; and (2) installing additional new compute capacity to account for expanding business requirements. The alternatives considered include: (1) continue to operate hardware beyond a five to seven-year refresh cycle or (2) refresh hardware based on a five to seven-year refresh cycle along with evaluating the health of the asset and evaluating business needs. The alternative to operate hardware beyond a five to seven-year refresh cycle was not selected due to the risk that these hardware components failures would cause system reliability and safety for customers, as vendors do not provide extended support after seven years. The Company chose the alternative to refresh this hardware based on a five to seven-year refresh cycle along with evaluating the health of the asset and evaluating business needs to reduce the risk of impacting critical infrastructure that supports systems such as Gas SCADA and Gas Compression control systems.	2024-01-01	2024-12-31	-1.00	1,033,227	19,800		1,033,227	47,957	980,660	39,640	9,218	1,518	4,180	19,800	19,800	-	-	-	-	-	-

184	2024	ARP-Printer Asset Management (PAM)	New Computers / Hardware	IT Digital Foundation	This project will replace and install select printers, plotters, and multi-function printing devices based on printer replacement assessments and a five-year refresh cycle. Printer service and usage history is evaluated and a determination is made if a printer can be repurposed instead of ordering a new one. When Printer Assets used to support custo mer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with firmware and security updates. The Company is at risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improving the dependability of these printer devices for employees; (2) averting increased costs due to hardware repairs; and (3) ensuring compatibility with enterprise print applications. The project scope consists of the annual replacement of printer assets according to a five-year refresh cycle. The alternatives considered for the project included prolonging refresh cycles from three to seven years as well as running the assets to failure. The selection of a five-year cycle was deemed to be the best solution since anything less than five years would increase the likelihood of unneeded expense for replacement of devices that were still in good operating condition. Anything greater than five years was assessed monthly to ensure it is not run-to-failure, including running the asset to failure, resulting in additional expenses for maintenance of the equipment and down time, negatively affecting employee productivity. The Company was also the printer fleet based on years of active service, service history, printer usage data, and the number of users within a facility. Based on these factors, the Company ther determines, repurposes, leaves in place, or refreshes the printers.	2024-01-01	2024-12-31	-1.00	1,037,279	5,000		316,816	-	101,353	8,989	2,138	599	1,474	1,850	-	-	1,850	-	-	-
185	2024	ARP-Server and Storage	New Computers / Hardware	IT Digital Foundation	This project will replace or augment server and storage infrastructure for the Company. When Server and Storage Hardware Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with security updates as equipment becomes obsolete. The Company is at risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improved stability and availability of business-critical applications by proactively replacing server and storage hardware assets prior to the likelihood of increasing hardware failures; and (2) ensuring that adequate resources are available to support application demands after five to seven years of actual use. The scope of the program encompasses: (1) replacement of server and storage hardware assets; and (2) installation of additional new computers and storage capacity to account for evolving business requirements. The alternatives considered were to purchase extended maintenance, new some of these assets to the cloud with the Digital-Hybrid Cloud and Data Center Migration project, or to replace the assets on the current cycle. The option to purchase extended maintenance was not selected because full support could not be offered after seven years, and maintenance costs would increase. The preferred option is to move some of these assets to the cloud in the Digital Hybrid Cloud and Data Center Migration project while refreshing the remainder using the five- to seven-year cycle as it is the most cost-effective option. If the Digital-Hybrid Cloud and Data Center Migration project is not approved as part of this rate case, the Company plans to continue to refresh these critical technologies at the current level based on a five- to seven-year refresh cycle to mitigate the risks of failure.	2024-01-01	2024-12-31	-1.00	774,113	112,720		236,948	1,248	200,494	14,999	12,285	447	5,380	41,706	-	8,737	20,345	11,438	1,057	130
186	2024	ARP-Workstation Asset Management (WAM)	New Computers / Hardware	IT Digital Foundation	This project will replace and install new desktops, laptops, and tablets on a five-year refresh cycle based on industry standards, hardware failures, security patches, and software compatibility. Monitors will be replaced every eight years based on Company data related to its total failure rates. When Workstation Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with security updates as equipment becomes obsolete. The Company is at risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improving stability and availability of business-critical applications by proactively replacing workstations prior to increasing hardware failures; and (2) allowing business partners to complete their job tasks. The project scope consists of: (1) replacing workstation assets; and (2) installing new units for new resources. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for all desktops and laptops; (2) extend the replacement cycle only on desktops from four years to five years; and (3) use outdated equipment. The Company did not select these options because (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) I would increase the ARP in future years based on the number of devices that were not replaced during the four-year refresh cycle; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the four-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle for desktops, laptops, and tablets; and an eight-year cycle for monitors to alleviate these concerns.	2024-01-01	2024-12-31	-1.00	5,916,948	28,244		1,778,794	-	1,712,808	79,353	3,238	1,656	(1,281)	10,450	-	3,921	-	2,857	159	3,514
187	2024	Data Center 2.0	New Computers / Hardware	IT Digital Foundation	Prior period adjustment.				2	-	-	-	-	-	2	-	-	-	-	-	-	-	-	-	-
188	2024	Digital-Hybrid Cloud and Data Center Migration	New Computers / Hardware	IT Digital Foundation	This project will optimize data center assets and asset replacement project purchases by migrating or retiring applications out of existing Company and co-location data centers into cloud services, reducing operational costs for running IT services and leveraging increased capabilities to improve the efficiency, quality, and speed-to-market of customer-facing and internal IT services. The technology currently deployed in the Company's data centers meets many customers' needs today. However, the pace of digital transformation is increasing rapidly, and requirements for applications are evolving faster than the technology in the Company's data centers can respond in a cost-effective manner. The data center constraints lead to longer implementation times, missing capabilities, or reduced functionality in the applications that the Company can deploy. This project will create value by ensuring the Company's technology requirements are met through a comprehensive and cost-effective combination of data centers and public cloud services. Specifically, by migrating applications to cloud services, the project will: (1) reduce capacity, hardware maintenance, and security device costs at the co-location data center; (2) reduce hardware maintenance and security device costs at the production data center; (3) enable the ability to scale infrastructure quickly up or down without costly up-front hardware purchases; (4) reduce application risk through cost-effective, scalable infrastructure redundancy and availability; (5) reduce ongoing server and storage asset replacement costs; (6) reduce ongoing networking equipment replacement costs; (7) reduce operational support costs; and (8) enable the use of a vast array of cloud services to support Company applications. The project scope includes: (1) prompt right-sized migration of co-location data center to become the primary data center for on-premise IT services; (2) demoting the Company's production data center to the disaster recovery data center for on-premise IT services; (3) analyzing applications for migration to cloud or retirement; (4) migrating applications from on-premise to cloud; (5) transforming applications to use cost-effective cloud services; (6) altering network architecture and deploying less infrastructure to allow each location (on-premise or in cloud) to function independently; (7) deploying cloud and on-premise cost management tools (spend processes; (8) simplifying and optimizing backup and disaster recovery resources and processes using cloud services; (9) implementing additional automation for application deployment and management; (10) changing the operations model for support of cloud-based applications; (11) educating and increasing the skills of IT and other employees in leveraging public cloud services; and (12) transforming IT to become the broker of cloud services for the Company. Alternatives considered included (1) migrating to public cloud services faster. This alternative was not chosen because the Company's ability to absorb new technology investments the Company has already made in data center equipment would prevent a faster move from being efficient and effective, introducing additional financial risk; (2) migrating to public cloud services slower or not at all. This alternative was not selected because delaying public cloud services and capabilities coupled with requiring an extension of the life of existing data center equipment creates increased financial and operational risk; and (3) contracting with an outside vendor to provide cloud services to run applications for the Company. This alternative was not selected because industry information shows the option as not yet cost effective or not providing a maturity level that the Company would be able to easily consume with limited in-house experience and expertise in public cloud. The alternative to migrate to a hybrid cloud and data center model was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.	2023-02-01	2025-12-30	0.15	6,876,180	5,887,409		706,430	32,937	(61,302)	236,542	410,599	23,014	42,621	369,497	72,120	-	62,898	125,385	9,093	-
189	2024	SAP HANA Database Migration	New Computers / Hardware	IT Digital Foundation	In preparation for SAP's planned end of support for its Business Suite product in 2027, the Company will migrate its existing SAP databases from Oracle to SAP HANA in advance of the required move to SAP HANA. The Company's SAP applications currently run on either Oracle's relational database management system as their underlying database technology. SAP has informed its customers that its legacy Business Suite (aka ECC) product will end in 2027, along with support for all non-SAP database platforms. SAP has also informed customers that the future direction for their enterprise solution is S/4HANA, a solution built explicitly for their HANA database platform. To prepare for these upcoming events, the company will migrate all of its SAP databases off of Oracle and onto SAP HANA. This project has the purpose/benefit for the company's eventual shift to SAP's HANA-based solutions by: (1) proactively migrating SAP databases to a database technology that is fully supported by SAP beyond 2027; and (2) mitigating the risk of a complete loss of support for the current Oracle database technology in 2027. Project scope includes: (1) procurement of HANA software licensing to cover all migrated SAP applications; (2) data migration for all SAP applications from the Oracle database to SAP HANA; and (3) implementation of new application support policies, procedures and tools required to manage the newly migrated SAP HANA applications. Given SAP's announcement regarding the end of support for its ECC product in 2027, all customers running SAP on database software other than HANA will also lose support for their associated database software in 2027. SAP is offering no other options for databases other than HANA beyond 2027. While there is no alternative to the HANA database for SAP going forward, the Company has considered multiple options: (1) Perform a direct migration from SAP Business Suite on Oracle to S4/HANA. A direct migration to S4/HANA brings greater operational risk to the Company as both the underlying database technology and the SAP application's functionality would change simultaneously, so this alternative was not selected. (2) Remain on the current SAP Business Suite product but competitively bid support services to a third-party provider instead of SAP. This alternative was not selected because moving to a third-party support model forces the Company to remain on outdated SAP software and eliminates any possibility of benefitting from new business functionality provided by S4/HANA. It will also require the Company to accept significant risk due to the fact that SAP security patches and upgrades will not be available upon termination of the SAP maintenance agreement. (3) Migrate to SAP's Software as a Service (SaaS) implementation of S4/HANA. This alternative was not selected because an S4/HANA SaaS migration is a much more disruptive option as the Company's business processes must be adjusted to accommodate functionality differences between ECC and S4/HANA. The risk of negative business impact is significantly greater than simply changing the underlying database technology. The selected alternative to migrate the SAP databases to HANA prior to implementing S4/HANA gives the Company several years to solidify its HANA database infrastructure before introducing the substantial business process change required with S4/HANA.	2023-04-24	2025-12-31	-0.72	6,491,044	1,352,658		732,349	115,904	-	77,497	462,216	19,207	57,485	381,640	-	-	46,938	226,170	8,532	-
190	2024	2010 SharePoint Platform Replacement	Software(intangible)	IT Digital Foundation	Prior period adjustment.														34						34
191	2024	Application Currency-EPS-O&M	Software(intangible)	IT Digital Foundation	The EPS (formerly IA3) initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the EPS adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrades these applications encompasses: (1) upgrading the application software; (2) assessing new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the EPS are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) ongoing increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	-	216,793		-	-	-	-	-	-	-	82,141	-	-	53,465	26,493	2,183	-
192	2024	Application Currency-IT/Digital Foundation-Application Platforms-O&M	Software(intangible)	IT/Digital Foundation	The Application Platforms initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Application Platforms area are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) ongoing increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	-	51,521		-	-	-	-	-	-	-	19,521	-	-	19,208	-	313	-
193	2024	AnyWay Secure Transport 2024 Upgrade	Software(intangible)	IT Digital Foundation	Anway Secure Transport is the Company multi-protocol Managed File Transfer (MFT) gateway for securing, managing, and tracking data file flow for our business partners and external vendors. File impacting billing, HR, Supply Chain, Finance, Alternate Energy Programs, Front Office, Back Office, Device Management, Outage Management and Business Reporting functions utilize these services. This project will update the platform to the current software version, enabling cost savings potential enhancements while retaining data security and platform supportability. As Anway Secure Transport is the public-facing managed file transfer gateway, maintaining platform version integrity is critical to ensuring it remains secure and supportable in the event of a cyber attack, outage or other critical incident. A prolonged outage or incident, for any reason, compromises the ability of the Company to perform mission-critical business transactions in finance, operations and direct customer support. Upgrading this application also gives the Company the opportunity to properly scale Secure Transport and take advantage of the growing demand for additional, cost-saving features of the tool, such as managing internal Electronic Data Interchange transactions. The value this project brings Consumers Energy and its customers includes: (1) Addressing known problems and limitations of the current software and hardware platforms. (2) Ensuring continued secure, scalable, and critical data transmission services as running through Anway as mission critical functioning. (3) Creating the capacity to methodically merge/streamline internal and external data file transfer services to eliminate waste. (4) Merging/streamlining the company data file transfer services reducing cyber-attack vectors and creates a more easily maintained and monitored security model. The scope of this project include: (1) Upgrading the application and database to the current release and supported version. (2) Refreshing the underlying application infrastructure by upgrading to the latest operating system and hardware platforms. (3) Enable and test expanded Electronic Data Interchange (EDI) functionality. Alternatives considered include: (1) deferring the upgrade. This alternative was not selected because the Anway Secure Transport platform handles critical Company financial, HR and operational transactions--the risk associated with problems stemming from an outdated and unsupported version is too high. Nor would the waste elimination benefits of using the upgraded Anway platforms start considerably ($?) for 36+ months. (2) Replacing the platform. The estimated project costs and timetable for replacing the business functions currently performed by the existing Anway Secure Transport platform would be extensive, and operationally, it is not well suited for a cloud or hybrid cloud solution. In addition to significant platform, application, implementation and functional testing costs, replacing it would require extensive coordination and testing with all of the internal and external account holders, taking upwards of one calendar year. (3) Upgrading the platform. This provides the Company the most cost-effective alternative, balancing costs, known risks, and even growing business capacity and productivity.	2024-02-27	2024-12-20	-1.00	-	476,892	ROM	-	-	-	-	-	-	-	95,802	25	-	7,699	87,140	938	-
194	2024	Cloud Virtual Desktop	Software(intangible)	IT Digital Foundation	Prior period adjustment.				-	-	-	-	-	-	-	-	-	-	485	-	-	456	-	30	-
195	2024	Digital-Cloud Data and Analytics Platform	Software(intangible)	IT/Digital Foundation	This project will provide Artificial Intelligence (AI) and analytics in the cloud across the business to uncover new paths to value, faster, allowing the organization to make better decisions and enable delivery across the NiSOF, Electric Grid integration, customer programs, and other business needs. The project will additionally establish data governance roles and responsibilities, process es, and implement to ols to support best practices across the enterprise. Consumers Energy faces several challenges in its ongoing data modernization journey, which include: (1) legacy data platforms operations; (2) long lead times for data exploration and identification of data assets; (3) lack of data ownership and quality; (4) limited data governance best practices across data ownership, access control & security; and (5) heavy dependence on IT for business intelligence reporting and analytics. The project will add value by providing data to support business needs by: (1) optimizing data platform operations costs with workflow based platform infrastructure deployment using repre-built modules and templates; (2) reducing data operations build complexity and data engineering costs through automation; (3) improving data quality and governance that leads to reduced costs of data provisioning, data duplication, and improved data accuracy; (4) streamlining data access requests, management, and governance to reduce risk and support efficiency; and (5) increasing the speed to deliver new data and data capabilities, improving productivity, and improving access to data. This projects is an enabler for business areas to use these capabilities to build analytic models for asset and labor optimization that is anticipated to more than offset the project costs. The project scope includes: (1) developing and modernizing the analytics platform in the cloud to allow Consumers Energy to implement new use cases leveraging simplified infrastructure deployments and operations, (2) building data management capabilities, centric catalog, access, and data flow; (3) developing data ordering workflows and data access management controls; (4) prioritization and new datasets; (5) simplifying infrastructure configuration; (6) automating deployment process es; (7) enabling data governance tools and processes. Alternatives considered include: (1) Address current pain points in existing on-premise and cloud analytical platforms. This alternative was not selected because the existing platforms requires new investments in licensing and infrastructure, delivery for new capabilities cannot keep pace with demand, still requires investment to address legacy system technical obsolescence, and business areas would not realize asset and labor optimizations. (2) Continue to build new data pipelines in the existing on-premise and cloud analytics platforms. This alternative was not selected because it would not address the current pain points in the existing on-premise and cloud analytics platforms, limiting the Company's ability to have required data and analytics capabilities to improve processes and realize asset and labor optimizations. (3) Implement a new data and analytics platform in the cloud. This alternative was selected because it provides improved analytics capabilities, faster access to data that is critical to improve business process, and reduces technical obsolescence.	2023-04-17	2024-12-27	-1.00	12,263,186	1,683,500		2,707,575	133,290	-	439,752	2,030,640	21,283	82,607	456,341	204,100	-	81,016	163,494	5,900	1,741
196	2024	Enhancements-IT-Capital	Software(intangible)	IT Digital Foundation	The IT Initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete routine activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are not the projects normally reviewed annually, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	39,925	-		12,137	65	-	4,231	-	68	7,753	-	-	-	-	-	-	-
197	2024	Enhancements-IT-O&M	Software(intangible)	IT Digital Foundation	The IT Initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are not the projects normally reviewed annually, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. 198	2024	Enterprise Print - Scan Suite	Software(intangible)	IT Digital Foundation	The project is intent is to upgrade the current Enterprise Print and Capture suite for improved data security and integration for the workforce home business partner. The company currently maintains a print and capture suite that will have support ending in 2025. Only high-level security patches will be available after this date. The company maintains a fleet of servers that are scheduled to be upgraded. The current print and capture suite is not compatible with the targeted server operating systems. The lack of internal resources require the company to continue to absorb increased costs to contract administrative personal. This project maintains cost savings achieved by eliminating waste full print jobs and further enables a productive, and flexible workforce for business partners working remotely. This project also ensures that the latest data transmission security requirements of are met by the solution. The project scope includes: (1) upgrading the current suite to the latest version, (2) consolidating the amount of print servers in the environment; (3) training for company personal to administer the suite; (4) converting all workflows from the current system; (5) implementing remediation for security vulnerability risk; (6) integrating device management with Enterprise Configuration Management Database (CMDB) for asset tracking and monitoring. Alternatives considered: (1) migrating to cloud services. This alternative was not chosen at this time due to maturity levels found with subscription services. This alternative was not selected as it would required new print and scanning specific to another print-scan product. (2) Print-scan products that were less costs. This alternative was not selected, due to fewer capabilities offered from the current product, which would introduced an inefficiencies in the current processes. (4) upgrade current product. This alternative was chosen due to low overall cost of not requiring new hardware, maturity of current product, and providing same level of capabilities required to support current processes.	2024-04-05	2024-12-31	-1.00	660,096	216,630		210,409	-	-	-	8,500	197,416	107	311	80,153	-	-	-	79,999	-	154	-
199	2024	Enterprise Service Bus Application 2020-2021 Upgrade	Software(intangible)	IT Digital Foundation	Prior period adjustment.							101	-	-	83	-	-	18	-	-	-	-	-	-	-
200	2024	Enterprise Service Bus Application 2024-2025 Upgrade	Software(intangible)	IT Digital Foundation	This project will upgrade and migrate the Business Works developer application to the next version. Newer ESB software versions offer improved integration with Rest/API services and applications. It is critical that this vital data tool or pathway be more scalable, secure, and capable of integrating to service-based environment. In addition, the messaging and event modules within the ESB are currently outside of their standard support windows. While it is possible to continue to get extended support by paying an estimated premium of approximately $80,000 annually, this is just temporary coverage and serves only to delay the need for an upgrade. The value this project provides the Company includes: (1) cost avoidance to avoid extensive payments for extend support purposes; (2)avoid technical debt exposure; (3) operational resiliency; and (4) improved administrative and operational efficiencies. The project scope includes implementing current version of all applications that are part of the ESB application, database versions and required database drivers. Alternatives considered included: (1) Accept the annual $80,000 extended maintenance as-is. Given the critical nature of this application, it is not recommended to lose mainstream support for any of the applications involved. Any sustained ESB product deficiency would impact many areas of the Company, such as billing, revenue collection, and remote meter management. The current implementation of the ESB platform was built with 5 years of growth in mind. This alternative was not chosen due to risk to Company operations, and the additional expense. (2) Replace the on-premise upgrade plan to implement a cloud-based solution. A cloud migration would also take longer to complete, which would put the Company at risk of falling outside of the current vendor support window for the products current version. (3) Upgrade the restricapplication. This option was selected because it best meets the Company needs for the near future by restoring vendor support for fixes and patches, and enables product scalability to the measure required of business capabilities.	2024-09-04	2025-11-21	-0.93	-	784,244	ROM	-	-	-	-	-	-	-	2,661	-	-	-	2,661	-	-	-
201	2024	IT Operations Management - Service Operations	Software(intangible)	IT Digital Foundation	This project will implement an application service mapping tool to effectively manage business-critical services through identification of infrastructure components and application interactions. This tool automates the mapping process to create a complete, up-to-date, and accurate record of the mapped application service in the Database. Application service mapping not only hand-in-hand with asset discovery, building on discovered infrastructure data to identify all the assets that support a service, and along with their service-specific relationships. As the IT systems steadily increase in complexity and evolve faster than the IT organization can respond to system issues in an optimized and cost-effective manner, the current configuration of the system does not provide the clarity needed in order to understand how the infrastructure interacts with the applications within the IT System. It supports and in order to respond to emergent IT incidents in the most rapid and cost-effective manner. This constraints can lead to lengthy response and implementation times; negligible or ineffective resolutions; reduced functionality; and elevated outage times in the infrastructure and applications in the system. This project will create value for the Company by mapping critical application services through discovery of the underlying infrastructure associated with application services and its relationship to parent business applications. Specifically, by creating application service maps, this project will: (1) increase visibility and understanding between Information Technology (IT) infrastructure and Configuration Items; (2) improve accuracy through real-time, automatically updated infrastructure and component changes; (3) reduce IT Subject Matter Experts time on emergent IT issues; (4) Utilize of IT Service Management processes; and (5) Reduce downtime by identifying dependencies and impact analysis. The project scope includes: (1) implementation of On-Premise application service maps which have significant business impact; (2) establishment of process roles needed to support service maps built. Alternatives considered included: (1) Choose an alternate IT Operations Management System with Cloud capabilities. This alternative was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain a similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. This alternative was not chosen as there would be a correlation gap between application services and the underlying infrastructure and would not address the ever-increasing resolution costs. (4) Develop and implement an on-premises service mapping and process solution. This alternative was chosen due to the value in the Information Technology (IT) Operations Management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can utilize the Configuration Management Database (CMDB) and work hand-in-hand with asset discovery	2023-10-01	2024-08-30	-1.00	3,012,243	699,524		60,745	-	-	1,134	41,980	710	16,941	24,369	-	-	171	23,711	486	-
202	2024	Nimbus Phase 5	Software(intangible)	IT Digital Foundation	Prior period adjustment.							(1,016)	(1,016)	-	-	-	-	-	-	-	-	-	-	-	-
203	2024	Operational Technology - Service Management Upgrade	Software(intangible)	IT Digital Foundation	This project will implement Operational Technology service management capabilities. Service management provides automated asset tracking, maintenance, and incident management for the assets. The Company' internal Audit team conducted an audit of the Operational Technology (OT) asset environment and identified significant gaps in the patch management program. The patch management operating model is decentralized, has limited and inconsistent standards, does not have a company-wide governance structure to monitor all business areas of the Company and lacks a complete and accurate asset inventory. Due to the lack of a complete asset inventory, as well as a significant number of gaps identified in the patch management governance, operating model, processes, and controls to manage all assets within the Company's environment, an unknown magnitude of risk exists that critical patches were not installed timely, which could create the potential for increased security vulnerabilities. The project provides value to the Company in three ways: 1.)Establishes a complete and accurate asset inventory; 2.) Creates a Company-wide governance structure with documented standards and processes to manage the assets and 3.) Defines a comprehensive patch management operating model with clearly defined roles and responsibilities. The project scope include: (1) the implementation of an asset management tool (2)the implementation of an incident management tool, (3) and the establishment of process roles needed to support the assets. Alternatives considered included: (1) Choose a Cloud based alternate asset management system. This option was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain a similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. Continue to manually track or not track Operational Technology (OT) Digital assets at the Company, which will not address the need to effectively track OT Digital assets and plan for their support. (4) Develop and implement an asset management and incident management tool and process. This alternative ultimately chosen has strengths in Information Technology's (IT) service management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can help bridge the gap between IT and OT, enable the Company to manage both types of assets through a single interface.	2023-10-01	2024-08-29	-1.00	892,455	192,305		49,747	-	-	11,271	22,908	1,035	14,532	16,246	-	-	(720)	16,919	47	-
204	2024	Product Family Enhancements-Application Platforms Services-Capital	Software(intangible)	IT/Digital Foundation	The IT Initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and funds to ability improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fees and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	708,412	230,308		215,008	-	2,312	197,971	7,889	1,668	5,164	85,214	-	-	85,109	-	105	-
205	2024	Product Family Enhancements-Application Platforms Services-O&M	Software(intangible)	IT Digital Foundation	The IT Initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and funds to ability improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fees and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	390,340		-	-	-	-	-	-	-	154,880	-	-	145,641	6,984	2,255	-
206	2024	Product Family Enhancements-IT/Digital Foundation-Capital	Software(intangible)	IT/Digital Foundation	The IT Initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and funds to ability improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fees and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	1,034,209	273,686		310,888	119	817	263,889	32,131	4,789	12,138	101,264	3,337	-	87,914	8,920	1,093	-
207	2024	Product Family Enhancements-IT/Digital Foundation-O&M	Software(intangible)	IT/Digital Foundation	The IT Initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives. The value of software enhancements that benefit the IT organization is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and funds to ability improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fees and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	356,630		-	-	-	-	-	-	-	155,124	-	-	113,260	20,582	1,283	-
208	2024	Public Key Infrastructure (PKI) Upgrade	Software(intangible)	IT Digital Foundation	Replace on-premise PKI to stay supported by the manufacturer. The existing PKI that is used to issue certificates to IT systems for secure communications needs to be upgraded to stay supported by the manufacturer. If the PKI is not maintained, in the event of a system failure the Company would not have support in recovering. All IT systems requiring secure communications via certificates would go offline within these days. Replace existing PKI with new PKI that is supported by the manufacturer. The project will build and configure the servers necessary to provide Public Key Infrastructure services, put in place physical token management for maintaining security, migrate certificates using said management to the new system and decommission the old systems. The Company has a limited scope security PKI on the Internet only. (1) The Company looked into expanding the service to include usage in the Company network but found the solution to not be economically viable. (2) The Company also looked at full cloud solutions, but it did not meet the security standards currently being used and implemented. (3) The Company looked at continuing extended support, however the continuing extended support is not available by the vendor. (4) The Company selected a hybrid solution of part cloud and part on-premise to meet all operational and security compliance requirements. The cgoal is unity to retain ownership of the keys on-premise prior to evaluating ownership through the cloud.	2023-10-02	2024-12-31	-1.00	1,818,198	423,977		419,226	43,022	141,083	98,695	161,578	466	14,432	96,921	(12,352)	68,374	34,447	5,990	462	-
209	2024	SAP Support Pack Upgrade 2023-2024	Software(intangible)	IT Digital Foundation	The SAP Support Pack Upgrade project is to maintain the currency levels of all SAP applications. This will ensure the applications are at version levels that are supported by SAP, have the latest patches and bug fixes, and provide cross-application compatibility for our business partners. To continue to maintain SAP application version currency, across all applications, the support packs released by SAP must be routinely applied. Within a maintaining application currency, the core business application is running on the SAP platform are at risk of losing vendor support, resulting in the inability to apply bug fixes and patches, including security patches, and maintain application interoperability and stability. The project will add value by: (1) maintaining supportability of SAP applications; (2) mitigating system security, stability and reliability risks by ensuring the applications are up-to-date with the most current patches and bug fixes released by SAP; and (3) ensuring ongoing cross-application cost capability. The scope of this project includes routine support pack upgrades to all SAP applications, which include: Enterprise Core Component (ECC), Customer Relationship Manager (CRM), Enterprise Portal, Process Orchestration (PO), Business Warehouse (BW), Business Objects (BOBJ), Data Services (DS), Governance, Risk and Compliance (GRC), Solution Manager, Data Quality Manager (DQM), Graphical User Interface (GUI), Single Sign On (SSO), System Landscape Directory (SLD) and other related SAP applications. Alternatives considered include: (1) Divide the scope into individual projects by SAP application. This alternative was not selected because the efforts are interrelated and to replexing them separately could lead to duplication of work, especially testing efforts, and therefore potentially higher costs. (2) Migrate to SAP S/4HANA. This option was not selected at this time because it is part of the long-term digital plan and requires substantial planning and investment, (3) Retire the project scope through regular support pack upgrades. This alternative was selected because it provides the best balance of minimal cost and maintaining support by combining multiple application upgrades through a single support pack upgrade effort.	2023-10-30	2024-10-31	-1.00	-	169,421		-	-	-	-	-	-	-	60,292	-	-	2,756	55,028	2,508	-
210	2024	Software Asset - Service Management Upgrade	Software(intangible)	IT Digital Foundation	This project will optimize the software asset management process by systematically monitor, assess and oversee software licenses and compliance using Software Asset Management Professional. The on-premises software asset management technology currently used in the Company lacks compatibility to automate license reclamation, cost optimization, and license forecasting. These software asset management constraints lead to the inability to optimize software license purchasing and effective license demand management. This project will create value by ensuring the Company's technology requirements are met through a comprehensive and cost-effective software asset management process and workflow. Specifically, by replacing the on-premise application, the project will: (1) streamline the software request workflow including license reclamation and software deployment; (2) help ensure compliance with software license agreements; (3) identify opportunities for license optimization leading to cost optimization; (4) mitigate risk related to software asset management; (5) optimize license forecasting and (6) increase asset visibility. The project scope includes: (1) the implementation of software asset management tools; (2) the establishment of process and process roles needed to support the assets; and (3) retirement of the on-premise software asset management tool. Alternatives considered included: (1) Choose an alternate Cloud based asset management system. This alternative was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain a similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. This alternative was not selected as the current Software Asset Management tool that lacks integration and automation and will not address optimizing and effective management of licenses and purchases. (4) Develop and implement an on-premises Software Asset Management solution. This alternative ultimately chosen has strengths in software as set management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can helps license compliance, optimization and automation.	2023-06-01	2024-08-15	-0.80	1,130,474	260,229		31,358	-	-	5,844	12,710	1,281	1,518	29,647	-	-	12,610	15,541	1,495	-
211	2024	Software Platform Refresh	Software(intangible)	IT Digital Foundation	The Software Platform Refresh project will upgrade server operating systems, hypervisors (virtual machine monitors), and databases to retain in low-cost vendor support. For systems that go beyond their normal manufacturer support ending, there will be increased support and maintenance fees of 20% to 100% above current support and maintenance depending on vendor. Completing this project will owes the organization to (1) avoid high support costs; (2) provide for system security and (3) stay current to promote seamless interoperability among servers, applications, and databases. Aging servers are more susceptible to security vulnerabilities and performance issues that ultimately could affect the business and customers. The project will add value for the Company by (1) and dispositions for special maintenance agreements required at the end of normal manufacturer support; (2) ensuring reliability and compliance with Information Security requirements; (3) improving data center environment stability; and (4) avoiding the need for high risk upgrades that cross multiple versions. The project scope includes: (1) upgrading operating systems and databases on servers that are near end of support with a given vendor; and (2) maintaining hypervisors at the current version for stability and performance. A funding options matrix was completed to review the potential alternatives. The alternatives identified were: (1) Complete the full scope of the solution for $1 million in order to eliminate the need for ongoing extended support; (2) Reduce the scale of the solution, which requires $1.6 million in ongoing extended support; (3) Reduce the scale of the solution even further, which requires $2.4 million in ongoing extended support; (4) Do not complete a software platform refresh, which requires $3.3 million in ongoing extended support. Alternative 1 was selected as the most cost effective solution to ensure ongoing system stability; seamless integration; and mitigation of cyber-security risks without the significant cost of extended support necessary for End of Life software systems.	2024-01-01	2024-12-31	-1.00	-	82,550		-	-	-	-	-	-	-	31,278	21,649	-	7,377	1,886	365	-

MICHIGAN PUBLIC SERVICE COMMISSION
Consumers Energy Company
Synopsis Containing Descriptions, Scope, Benefits, Implementation Dates and Detailed Costs of Actual and Projected Gas & Common Capital Expenditures and O&M Expenses
For the years 2023, 2024, 2025 and 2026
Information Technology Department

REDACTED

Case No.: U-21806
Exhibit No.: A-20 (SHB-5)

212	2024	SolarWinds Performance Monitoring Expansion Upgrade	Software(intangible)	IT Digital Foundation	This project will develop an IT observability and monitoring solution that provides an aggregate view of IT system availability and performance. The current IT enterprise monitoring approach doesn't provide a comprehensive view of application and infrastructure health resulting in unplanned service interruptions, extended service interruptions, and system performance degradation. In addition, unplanned service interruptions have a negative impact on business partners ability to provide reliable services to utility customers. The SolarWinds Expansion project will allow IT to reduce the number of monitoring tools and consolidate end-to-end view of IT performance alerts to a single pane of glass. These actions will prevent major service interruptions, reduce Major Incident Mean Time to Restore (MTTR), improve IT system stability, and ultimately reduce O&M labor cost. This project scope includes : 1) Perform proof of value (POV) assessment for the following SolarWinds modules, Hybrid Cloud Observability (HCO), Database Performance Analytics (DPA)/ AppOptics/ Pingdom; 2) Transition applications monitored by AppDynamics to SolarWinds. 3.) Deploy and configure agent base infrastructure monitors for applications and infrastructure 4.) Retire AppDynamics. 5.) Transition critical applications not monitored by AppDynamics to SolarWinds. 6.) Create performance monitoring tools/dashboards for critical systems. 7.) Define monitoring templates for rapid deployment of new monitoring services. 8.) Training the Product/Platform Teams on use and management of SolarWinds. Several monitoring tools were considered to manage alerts and escalation on Consumers Energy IT application and infrastructure ecosystem. Other considerations included our ability to consolidate other monitoring tools into a single tool and reduce licensing and maintenance cost. Below are the alternatives that were considered: 1). Renew current licenses for both SolarWinds and AppDynamics with out achieving any savings or operational efficiencies. 2). Considered other vendors like Dynatrace to replace AppDynamics at a reduced cost for service, but initial deployment and annual cost would significantly increase regardless of service selected. In addition, the other vendors considered didn't have the capabilities to monitor both application and infrastructure which didn't allow for a consolidated approach to be adopted and/or reduction in licensing and ongoing maintenance cost. As a result, the other vendors considered were not an option. 3). In conclusion, SolarWinds was determined to be the most cost-effective approach because of the expanded capabilities offered through the following modules, Hybrid Cloud Observability (HCO)/ Database Performance Analytics (DPA)/ AppOptics/ Pingdom that meets the needs of IT to proactively monitor IT systems and retire tools with similar capabilities to reduce ongoing maintenance cost. Therefore, our decision is to move forward with deploying the expanded services offered by SolarWinds.	2023-03-27	2024-08-29	-0.49	1,766,608	336,026		1,135	-	-	979	-	-	217	1,422	300	-	685	363	73	-
213	2024	Tibco API Exchange Gateway Replacement	Software(intangible)	IT Digital Foundation	This project is looking to retire the API Exchange Gateway which the Tibco ESB and replace it with a new solution called Microsoft Self-Hosted Gateway. The API Exchange Gateway is used by the TIBCO ESB to integrate to external vendors, all new development will need to be done to integrate this solution. The Tibco API Exchange Gateway is anticipated to be sunset by the vendor, as they have already dropped all development of enhancements for the platform. This project creates value for the Company by: (1) Avoiding the risks of running an project no longer supported by the vendor (i.e. the Tibco Enterprise Service Bus API Exchange module), and (2) Enabling the Company the opportunity to move to a product that is more stable, secure, and usable. The project scope includes: (1) Conducting a RFP to procure a replacement product and review the architecture team to migrate the product. (2) Migrate all current work items to the new platform. (3) Conduct appropriate testing to ensure all Service Level Agreements are met. Alternatives considered include: (1) Evaluating the replacement of the current product with a new product that is not already in the Company environment. This alternative was not selected because it was did not be cost effective. (2) Keeping the current application as is. This alternative was not selected as the vendor for the current platform has stopped all development for his product. (3) Leveraging an existing solution already in the Company environment. This alternative was selected as it avoids multiple solutions with redundant capabilities and avoids costs for supporting and maintaining a second solution.	2023-01-03	2024-12-27	-1.00	899,876	122,603		278,133	-	-	189,672	15,298	1,159	66,997	45,363	-	-	23,565	20,506	1,293	-

Renew current licenses for both SolarWinds and AppDynamics without achieving any savings or operational efficiencies. 2). Considered other vendors like Dynatrace to replace AppDynamics at a reduced cost for service, but initial deployment and annual cost would significantly increase regardless of service selected. In addition, the other vendors considered didn't have the capabilities to monitor both application and infrastructure which didn't allow for a consolidated approach to be adopted and/or reduction in licensing and ongoing maintenance cost. As a result, the other vendors considered were not an option. 3). In conclusion, SolarWinds was determined to be the most cost-effective approach because of the expanded capabilities offered through the following modules, Hybrid Cloud Observability (HCO)/ Database Performance Analytics (DPA)/ AppOptics/ Pingdom that meets the needs of IT to proactively monitor IT systems and retire tools with similar capabilities to reduce ongoing maintenance cost. Therefore, our decision is to move forward with deploying the expanded services offered by SolarWinds.	2024-01-01	2024-12-31	-1.00	420,000	25,000		217,139	93	898,182	15,437	842	115	1,799	9,250	-	-	4,118	5,132	-	-	-
216	2024	Pipeline SCADA Security	Network	Security	This project will implement major modifications to the Gas Supervisory Control and Data Acquisition (SCADA) environment to ensure compliance to American Petroleum Institute (API) 1164 standard. API 1164 is an MPSC regulatory requirement with most updates to the Gas Technical Standards. The project will implement IT, cyber security, and physical security equipment and the modifications necessary for regulatory compliance to API 1164. The MPSC requires the implementation of pipeline cyber security regulations pursuant to API 1164 on the Company natural gas pipeline system. The Company's Gas SCADA system is outdated and non-standardized, requiring significant modifications to be compliant with API 1164. Without the technology updates, the gas SCADA system is vulnerable to cyber attacks that potentially risk disrupting deliveries to customers. Interruptions in gas delivery and non-compliance to API 1164 mandated requirements could be subject to fines and penalties from the MPSC and other regulatory entities (i.e., the Transportation Security Administration). This project will add value to the Company by: (1) modernizing and standardizing the Gas SCADA network at the Company's gas compressor stations and storage fields; (2) mitigating cyber security vulnerabilities in the Gas SCADA network; (3) allowing the Company to fully comply with API 1164 requirements; and (4) fulfilling the commitment to the MPSC to provide a secure gas system that meets customer needs. The project scope includes updates for multiple gas SCADA-related locations, including eight gas compressor stations, two gas control rooms, two data centers, and multiple intelligent pipeline field devices. To establish compliance with API 1164, the project will: (1) design a holistic network architecture to implement both physical and technical changes; (2) implement physical enhancements to impacted facilities, such as additional doors on data rooms, and modified HVAC systems to provide necessary climate control for the SCADA equipment; (3) install additional security cameras and/or card readers necessary to control access to new and existing equipment; (4) complete technology upgrades requiring design, development, testing and implementation for the Gas SCADA network at each of the planned locations. Upgrades will consist of endpoint protection, identity and access management, vulnerability management, business continuity capabilities, cyber incident response, asset management, and so on mature test environments; and (5) implement additional security measures on field devices, including default credentials, secure communications, change management, and patching activities. As this is a regulatory compliance requirement, there are no alternatives to completing this project. Without the completion of this project, the Company could be subject to noncompliance fines and penalties from the MPSC.	2020-06-01	2024-10-28	-1.00	12,592,731	542,854		639,681	68,641	(76,988)	305,722	204,365	6,298	131,593	117,802	67,663	220	18,818	31,101	-	-
217	2024	TSA Critical Facility Structure	Network	Security	This project will implement enhanced security measures outlined by the Transportation Security Administration (TSA) for critical facilities sets in order to bring the locations up to enhanced status and avoid non-compliances. This project will increase the security and reliability of gas delivery to our customers while also meeting federal requirements. Pipeline facilities that are deemed critical set are required to apply enhanced security measures. Today, Consumers Energy currently has designated 4 locations as critical. However, based on the April 2021 update to the TSA Pipeline Security Guidelines, best on 5 Critical Facility Criteria), a significant number of our gas infrastructure that were not previously subject to evaluation will now fall into scope. As we continue to analyze the remainder of our gas assets, we believe an additional 1000 pipeline facilities (pipeline interconnections, metering and/or regulating stations, compressor stations, operational control facilities, main line valves, tank farms and terminals, etc.) may be deemed critical. Consumers Energy will be taking a phased implementation approach and will begin the process by implementing the enhanced security measures at the remainder of our compressor stations. Failure to update our sites will put us out of compliance with the updated guidelines. The objective of the project is to implement enhanced security measures outlined by the TSA for the following four critical assets: (1) Freedom Compressor, (2) Muskegon River Compressor, (3) Overisel Compressor, and (4) Northville Compressor. In order to bring these locations up to Enhanced status and avoid non-compliances. This project will increase the security and reliability of gas delivery to our customers while also meeting federal requirements. Enhanced Security measures that will need to be implemented include, but are not limited to: (1) access controls; (2) access invaders; (3) cameras; (4) video and audio programming; (5) fencing and barriers; (6) gates; (7) locks and key control; (8) fence intrusion (which may be accomplished with a new camera system); (9) subcontractor work for trenching, patches, etc.; (10) field lighting; (11) background investigations for personnel working at the site; (12) security equipment maintenance and testing; (13) security vulnerability assessments; (14) security communication plans; (15) personnel training; (16) security drills and exercises for the following locations. These activities will be performed at the following company locations: Overisel Freedom, Northville, Muskegon River. Alternatives are not available because this is a compliance mandate from the TSA.	2023-11-27	2025-12-28	-1.00	9,088,335	584,724		3,798,608	-	888,051	84,144	2,846,217	-	28,196	30,000	-	30,000	-	-	-	-
218	2024	ARP-Physical Security	New Computers / Hardware	Security	This project will enhance or replace physical security assets to provide improved visibility and incident resolution related to security concerns. The Company has several thousand physical security asset devices currently in use including security cameras, motion detectors, intrusion detection systems, and card access systems. Current limitations include the lack of integrated solutions for centralized management, situational awareness, real time monitoring, compliance with regulations and guidelines, and effective responses to emergencies and incidents. This could result in the increase of potential security vulnerabilities, associated penalties, and reputational damage. The value provided by completing the project is to: (1) maintain compliance with State and Federal Regulations; (2) reduce redundancies with less of a need for multiple cameras and reduced support in functionality; and (3) optimize overall system performance included in the project is the enhancement or replacement of assets including: (1) advanced door systems at Company buildings; (2) security cameras for monitoring capabilities; and (3) gate and lock systems, which include security cameras, motion detectors, intrusion detectors systems, and card access systems. Alternatives considered include: (1) not refreshing physical security assets, and (2) before-and-after enhancements to improve and standardize the business partner experience As part of the review process the alternative considered was using manual processes. This option was not chosen because it was deemed too costly and inefficient.	2024-01-01	2024-12-31	-1.00	1,551,703	29,934		470,942	-	899,408	1,767	269,146	16	605	11,076	-	-	11,022	-	53	-
219	2024	Radar Intrusion Detection	New Computers / Hardware	Security	Prior period adjustment.							(6,791)	-	(7,205)	-	419	-	-	-	-	-	-	-	-	-
220	2024	AccessNOW	Software(intangible)	Security	The Access show project will implement on-figurable identity, Access Management functionality and best practices, and will enforce compliance. Access NOW replaced the CAAR system enterprise wide in 2018Q4 with over 50,000 requests being made since product launch. However, Access NOW's manual process and lack of integration are leading to increased risk for human error and time spent on process set that can be automated. This project will add value by: (1) reduce human error and failure points through automation; (2) improving and standardizing the business partner experience; (3) centralize access management; (4) ensuring regulatory compliance; and (5) ensuring system stability and continuous improvement. The project scope includes implementing additional integrations to Active Directory domains that are not currently connected to the Access NOW application (ConsCorp.com, DNSC.com, emu.com, mpa.com energy.com, cpbpa. com energy.com) and integration to the Company's SAP systems) to allow for automation of SAP role access provisioning. In addition, the project scope includes: (1) design, configuration and testing of technical connectors; (2) completion of application support pack upgrades to the next version(s) to maintain system stability and to stay current with vendor releases; and (3) review and implement enhancements to improve and standardize the business partner experience As part of the review process the alternative considered was using manual processes. This option was not chosen because it was deemed too costly and inefficient.	2017-05-29	2022-10-31	-0.95	4,392,463	1,603,587		130,819	-	2,573	157,006	(31,998)	101	2,171	10,154	-	-	9,461	606	86	-
221	2024	Application Currency-Security Capital	Software(intangible)	Security	This project will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyber threats, per tect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Security portfolio adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; (4) allowing the Company to leverage new functionality available in the upgrades; (5) provides customer value through closing the gaps on vulnerabilities that can impact reliability; (7) provides a mechanism for proactive actions to stay ahead of evolving cyber threats. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on consideration that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) assessing any new functionality for value to the Company, (2) making necessary configuration changes, (3) testing the upgraded software, and (4) updating documentation related to the integration changes. Applications within the Security portfolio are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number or incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for the listed applications possible and fortifies the Company's ability to keep the large number of security applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	30,000	10,002		9,105	-	-	9,105	-	-	-	3,701	196	-	3,505	-	-	-
222	2024	Application Currency-Security O&M	Software(intangible)	Security	This project will utilize both O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrade The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyber threats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Security portfolio adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality; (4) addressing version interdependencies and compatibility between systems; and (5) allowing the Company to leverage new functionality available in the upgrades; (6) provides customer value through closing the gaps on vulnerabilities that can impact reliability; (7) provides a mechanism for proactive actions to stay ahead of evolving cyber threats. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on consideration that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Security portfolio are routinely evaluated to determine if upgrade efforts are necessary to maintain an appropriate level of currency and then prioritized accordingly. During that evaluation process, the alternative of delaying the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increase in the number of incidents; (3) paying increased support costs; and (4) prevention of employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of security applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2024-01-01	2024-12-31	-1.00	-	15,904		-	-	-	-	-	-	-	6,026	-	-	6,024	-	2	-
223	2024	Enhancements-Security Capital	Software(intangible)	Security	This initiative will use Capital funding to make enhancements to existing technology and to address requirements generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements in accordance with accounting rules. As business conditions improve and change, compliance requirements evolve, and new capabilities are needed, new requirements surface that call for smaller effort software application changes (enhancements). Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval and individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, limit the Company's ability to consistently meet objectives, and increase security risk. The value of technology enhancements in the Security Portfolio lies in: (1) enhancing security protections by funding engineering or unplanned cyber security activities resulting from audits, incidents, or a changing threat landscape; (2) lessening the number of incidents associated with outdated software; (3) increasing application stability, leading to fewer incidents due to outdated software; and (4) allowing the Company to leverage additional functionality available in the technology. The scope of technology application enhancements: (1) making necessary systems changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy, and compliance. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each business that routinely evaluates and prioritizes the work and assesses requests for value using categorical benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	11,814		-	-	-	-	-	-	-	4,371	-	-	-	4,371	-	-
224	2024	Enhancements-Security O&M	Software(intangible)	Security	This initiative will use O&M funding to make enhancements to existing technology and to address requests generated by changing business requirements. As business conditions improve and change, compliance requirements evolve, and new capabilities are needed, new requirements surface that call for smaller effort software application changes (enhancements). Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval and individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, limit the Company's ability to consistently meet objectives, and increase security risk. The value of technology enhancements in the Security Portfolio lies in: (1) enhancing security protections by funding engineering or unplanned cyber security activities resulting from audits, incidents, or a changing threat landscape; (2) lessening the number of incidents associated with outdated software; (3) increasing application stability, leading to fewer incidents due to outdated software; and (4) allowing the Company to leverage additional functionality available in the technology. While these small-work technology efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvement to existing technology investments for Security. The scope of technology applications encompasses: (1) making necessary systems changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each business that routinely evaluates and prioritizes the work and assesses requests for value using categorical benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2024-01-01	2024-12-31	-1.00	-	664,869		-	-	-	-	-	-	-	251,913	8,988	-	211,266	29,825	1,808	25
225	2024	Saviynt Enterprise Identity Governance and Access (EIGA) Implementation	Software(intangible)	Security	The project will implement Saviynt EIGA module, consolidate Identity Access Management (IAM) functionality into Saviynt, and retire the identity Manager application. By implementing the new solution, the Company will optimize IAM functionality, eliminate complexity, and reduce support costs. In addition, the project will integrate the OT network with an IAM solution that will allow for automated management of users and entitlements in the OT Active Directory domains and applications. The current version of Access show reached end of life in December 2022, with support also continued in January 2023. The application has numerous custom workflows and integrations, requiring professional services for ongoing use and changes. It lacks proper data analytics and reporting, posing risk such as inability to fix critical defects, software incompatibility, compliance issues, increased costs, and degraded performance. The Company uses multiple IAM tools, each performing specific functions, leading to numerous required interfaces and customizations. While beneficial for end users, these integrations increase the risk of system failure, higher support costs, multiple subscriptions, infrastructure and maintenance costs, and more expensive upgrade. The current solution utilizes SAP Hirtsteh file processes that introduce failure points, delays, and data integrity issues. Failures in these processes can prevent new or transferred employees from accessing necessary systems, leading to operational disruptions and potential compliance risks due to inappropriate access retention. This project provides value by: (1) Consolidating multiple IAM platforms through the implementation of the Saviynt Enterprise IGA Module, reducing complexity and support costs; (2) Decreasing complexity and enhancing efficiency by reducing interfaces between multiple identity tools; (3) Improving the end-user experience and reducing human struggle with access requests through a new, intuitive portal design; (4) minimizing custom code and focusing on configurations only by utilizing out-of-the-box functionality; and (5) Streamlining employee data processing with the implementation of an HR interface. The project scope includes: (1) Implementing the Saviynt EIGA module to consolidate IAM platforms; (2) Standardizing processes by removing customized code and using out-of-the-box functionality; (3) Replacing and improving access system (4)Addressing issues with aging applications, multiple IAM platforms, integration challenges, and antiquated HR processing. Alternatives considered include: (1) Implementing Net Iq as Access Now version 8.1.5 to ensure support through mid-2023; (2) Upgrading only the application to current supported versions, including the new web portal but will including new application function ality; (3) Remaining on current version that will be unsupported as of January 2023, requiring vendor professional services for any break / fix. Patches and enhancements may potentially introduce additional risk of version instability; (4) Implementing IAM functions in Saviynt platform to manage access requests, including Active Directory, SAP, SAP HR, disconnected systems, and existing API integrations. The alternative selected was implementing the new Saviynt system, eliminating Access Now software.	2023-11-27	2024-06-30	-1.00	5,913,132	710,912		930,609	433,752	-	135,349	299,998	123	61,393	74,085	63,370	-	10,620	91	4	-

229	2025	2025 Union Contract Changes	Software(Intangible)	Corporate	The 2025 Union Contract Changes project will implement SAP and other system changes required as a result of three collective bargaining agreements which will be renegotiated and ratified. Collective bargaining agreements expire every five years for Operating (Maintenance and Construction), Collective bargaining agreements expire every five years for ONEAC (Operating (Maintenance and Construction), CCC (Customer Contact Center) and Zeeland employees groups. For ONEAC, the current agreement ends June 1, 2025. CCC agreement ends on August 1, 2025. Zeeland agreement ends October 1, 2025. Technology changes are required to reflect these new agreements. Otherwise, employees in this union groups may not be paid appropriately or get correct benefits. Completion of this project will provide value to the Company and its customers through: (1) ease to elimination by making changes in the software for any pay and benefit changes as required by the new agreements; (2) defect reduction by adding process automation to otherwise manual processes including and recording work, premium, and absence time; and (3) improved employee engagement among the ONEAC, CCC, and Zeeland union employees. The scope of this project encompasses making any system changes required to support the new working agreement for the ONEAC, CCC, and Zeeland employees. Exact details will be finalized after the negotiation process is completed and contracts are approved. Three alternatives were considered for this project: (1) Make no system changes other the contracts are ratified. This option was not chosen because it exposes the Company to possible fines, disengaged employees, union grievances, significant manual processes leading to greater possibility of error, hiring additional staff to perform activities outlined in the agreements, and increased legal costs due to employee grievances. (2) Find other third-party software to support the changes required by the union agreements. This option was not chosen because it would require SAP integration along with additional software licensing and maintenance costs. (3) Make system changes to eliminate manual updating, comply with the working agreement language, support union employee engagement, and reduce grievance. Option (3) was chosen because it leverages current SAP technology, automates what would otherwise require manual processing, and is the least costly option	2025-04-01	2026-12-01	0.00	-	618,667		-	-	-	-	-	-	-	-	122,436	-	-	-	51,295	63,132	-	8,010	-
230	2025	Application Currency-Corporate-Capital	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technological landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber-security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) address ing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	57,350	5,350	ROM	18,033	-	15,715	1,571	-	97	629	1,991	-	-	1,860	-	130	-
231	2025	Application Currency-Corporate-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technological landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber-security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) address ing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	-	372,068	ROM	-	-	-	-	-	-	-	105,208	-	-	126,362	-	8,845	-
232	2025	Asset Accounting Tax Upgrade	Software(Intangible)	Corporate	The project will upgrade our current accounting asset management tax software to the SaaS version as required by the vendor or a replacement solution and implement additional new features, ensuring continued support of a critical Financial application, and providing new functionality. In 2026, standard vendor support ends for the current on-premise PowerTax software. Using vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. There are also larger costs to upgrade if the upgrades are further apart due to complexities to functions and too many versions exist at any one time. This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub-ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) automating manual tasks; (3) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support; and (4) lowering costs with more frequent upgrades to reduce too many updates to and reduce the number of versions to be adopted. The project scope includes: (1) evaluating current vendor/product solution with market leaders; (2) upgrading the vendor's software from the current version to the newer version. Alternatives considered include: (1) Evaluate SAP options for fixed asset, and tax management capabilities. While this option would eliminate the need for an interface between SAP and PowerTax, it would be more complex, costs more, and not provide all the required features. (2) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements. (3) Analyze and go to do all possibilities (4) wait until a future upgrade cycle. (5) Upgrade to the newest version of current solution. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrade, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing.	2026-02-01	2026-11-01	-1.00	-	1,572,781	ROM	-	-	-	-	-	-	-	146,387	19,729	-	39,457	78,915	8,286	-
233	2025	Asset Accounting Upgrade 2025-2026	Software(Intangible)	Corporate	The project will upgrade our current accounting asset management software to the latest version as required by the vendor, ensuring continued support of a critical financial application. Standard vendor support will end for the current on-premise software on an undisclosed timeline. Using vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. There are also larger costs to upgrade if the upgrades are further apart due to complexities to functions and too many versions exist at any one time. This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub-ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) automating manual tasks; (3) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support; and (4) lowering costs with more frequent upgrades to reduce too many updates to and reduce the number of versions to be adopted. The project scope includes: (1) evaluating current vendor/product solution with market leaders; (2) upgrading the vendor's software from the current version to the newer version. Alternatives considered include: (1) Evaluate SAP options for fixed asset, and tax management capabilities. While this option would eliminate the need for an interface between SAP and PowerTax, it would be more complex, costs more, and not provide all the required features. (2) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements. (3) Analyze and go to do all possibilities (4) wait until a future upgrade cycle. (5) Upgrade to the newest version of current solution. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrade, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing.	2025-02-01	2026-11-01	-1.00	-	682,561	ROM	-	-	-	-	-	-	-	371,652	-	-	59,186	-	162,466	-
234	2025	HR Support Pack and Business Software Inc Upgrade 2025	Software(Intangible)	Corporate	The HR Support Pack and BSI upgrade will update the SAP system with HR Support Packs that are released annually by SAP to comply with HR and tax changes. SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax changes, resulting in the inability to calculate and distribute payroll. This project creates value for the Company by: (1) ensuring that its systems are in compliance with new financial rules and regulations; and (2) ensuring that it can calculate and distribute payroll. The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information by the Company. Alternatives considered include: (1) Not upgrading to the current support packs which results in noncompliance with financial rules and regulations and inaccurate payroll. (2) there is no economical do-ud solution, so this option was not entertained. (3) apply the appropriate support pack upgrades. Option (3) is the preferred option because it enables the company to comply with HR and tax changes, resulting in the ability to correctly calculate and distribute payroll.	2025-02-05	2025-12-31	0.00	-	983,661		-	-	-	-	-	-	-	367,457	28,764	-	38,668	201,075	16,782	72,168
235	2025	Product Family Enhancements-Corporate-Capital	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. A business process improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual level or here. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work activities and efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and, Public Affairs. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for the funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	3,848,634	552,239		1,209,636	-	-	780,283	12,578	68,072	348,699	205,471	-	-	183,553	8,475	13,442	-
236	2025	Product Family Enhancements-Corporate-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual level or here. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	-	555,559		-	-	-	-	-	-	-	206,723	-	-	193,199	-	13,524	-
237	2025	Talent Management Enablement	Software(Intangible)	Corporate	The project will deliver technology solutions to enable best-in-class Talent Management programs and processes that are critical to achieve the Company Significant technology improvements are required to transform Human Resources (HR) to develop the skills and capabilities necessary to achieve the Company This project will add value to the Company through technology that will enable: (1) fully functional integrated compensation modules; (2) a calculated and targeted talent development of critical skills necessary to deliver on the Company The scope will include: (1) implementation of each system/application; (2) integration with current systems, applications and processes as applicable; (3) retrofit current systems and applications to ensure a seamless end-to-end experience of HR processes; (4) delivery of mobile capabilities for in scope processes; (5) reporting and analytics dashboards and report insights for in scope processes. Three alternatives were considered for these Talent Management programs and processes: (1) Develop custom, internally built solutions that could meet most requirements. This alternative was not selected because a custom solution would result in higher overall costs, higher maintenance costs, fewer upgrades, and would not leverage industry best practices to ensure in-house delivery. (2) Select an on-premise software tool. This alternative was not selected because it requires internal maintenance, increased infrastructure costs, and would have less frequent upgrades which would hinder the Company's ability to ensure processes are evolving alongside industry trends and best practices. (3) Evaluate and select do-ud SaaS solution(s) which would have lower infrastructure costs, less internal maintenance than an on-premise solution, and would be built and evolved with upgrades based on industry best practices. Based on research, internal experience with success of best practice implementations, and vendor demonstrations, option three was selected.	2023-02-27	2025-12-19	-1.00	1,221,532	464,821	ROM	175,211	-	-	55,003	78,575	9,350	30,283	35,700	-	-	18,603	13,022	4,074	-

240	2025	Application Currency-Customer-O&M	Software(Intangible)	Customer	The Customer initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Customer digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to few er incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, and (2) updating documentation related to the integration changes. Applications within the Customer are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	-	10,456	ROM	-	-	-	-	-	-	-	3,800	-	-	3,551	-	249	-
241	2025	Customer Order Service Tracker	Software(Intangible)	Customer	Short cycle orders including gas emergencies and meter services account for many of the incoming customer inquiries to the contact centers. This project will implement a service order status tracker to provide transparency to customers and oversight to internal teams supporting utility service orders across Company service areas. The tracker will provide timely and accurate service order updates, creating a more robust customer experience for tracking service order status and location-based updates. Customers have limited visibility to when Company assigned crews will be on premise and what work will be completed. This is due to features missing within the Company's digital channel for accurate updates from dispatch, scheduling, and field crews. The lack of awareness drives calls into the call center, resulting in approximately 360,000 annual contact center call related to short cycle requests. Additionally, this lack of visibility increases truck rolls due to dispatchers being unaware of an open location and routes which can cause crews to be assigned when a location could have completed the work. This leads to overall customer dissatisfaction because of a lack of visibility to scheduled and ongoing short cycle work. Enabling a digital channel for communication regarding utility service orders will improve customer experience and reduce the waste of repetitive crew dispatching. This project will add value to the Company and its customers by: (1) providing transparency for customers on the timing and location of the associated crew completing utility short cycle service orders, (2) reducing calls to contact centers by customers seeking clarification regarding arrival times through visibility to scheduling time considerations, notifications, and updates to customers when crews are enroute, (3) improving crew success assignment by current location, which decreases wasted truck rolls time and enabling location services for active crews, (4) increasing visibility into the service person(s) completing the order by enabling crews to connect with customers through digital channels, and (5) improving customer experience for short cycle service orders by implementing a channel of choice for Company interactions. The scope for the project includes: (1) modifying the customer self-service portal to include features that support utility service order tracking, including the location of crews en-route, (2) providing location and mobile capabilities, (3) enhancing the existing crew arrival platform to allow real-time status updates that can be communicated to customers, (4) building custom-released services to updates internal portals in real-time, and (5) enabling text and email notifications to alert customers of service crews arrival times. Alternatives considered for this project include: (1) Deploy a mobile application to address utility service order tracking, (2) utilize a do-ud hosted solution from a third-party, (3) modify the existing customer portal to enable customers and the Company to track utility service orders and crews. Options one and two were not selected as the cost associated with deployment would greatly outweigh the benefits with all-inclusive internal improved customer experience. The third option was selected because it utilizes existing technologies, which reduces the implementation complexity and project cost and has faster value realization for the customer and the Company.	2025-01-10	2026-08-28	-1.00	4,021,500	1,186,250	ROM	798,198	-	-	212,153	282,800	34,652	228,700	309,009	-	-	83,715	111,620	13,673	-
242	2025	Energy Assistance Enhancements and Maintenance Annual Updates	Software(Intangible)	Customer	The Energy Assistance Enhancements and Maintenance Annual Updates project, formerly known as Consumers Affordable Resource for Energy (CARE) project, will implement software changes to offer energy assistance to low-income customers and streamline the process for the assistance agencies who use the assistance portal. This is accomplished through improved user interface and updates to SAP processes various requests. Upcoming modifications will be identified following an ongoing and annual review of requests, that includes criteria from the Department of Health and Human Services (DHHS) and Michigan Public Service Commission (MPSC) to prioritize the list of changes. Each grant year, DHHS and MPSC stipulate the criteria required for customers to enroll in the CARE program, how the Company and agencies will manage the enrollment process and track active CARE customers, and how they will administer the Michigan Energy Assistance Program (MEAP) benefits through bill credits and arrears forgiveness. The criteria changes significantly each year; therefore, the Energy Assistance Enhancement and Maintenance Annual Updates application requires modifications to meet the new requirements. If the regulatory requirements are not fulfilled, the Company is at risk of losing state Low Income Energy Assistance Fund (LEAF) funds to assist low-income customers with paying their energy bills, thereby increasing the customers risk of shutoff for non-payment. In addition, our energy assistance programs funds on with in all software platforms in the company which co nsistently need enhancements and updates. The project will provide the following value: (1) complete modifications to internal SAP application and Energy Portal to receive LEAF funding, which can be used to provide customers the bill credits and arrears forgiveness; (2) improve data within the assistance agencies portal, thereby making it easier to assist customers in need of LEAF funding; and (3) complete modifications to customer facing platforms. The project scope includes: (1) updating the enrollment and status process; (2) allowing for flat monthly bills; (3) improving reporting; (4) updating the arrears forgiveness plan; (5) satisfying additional regulatory requirements for the annual grant rule changes required by the Department of Health and Human Services and Michigan Public Service Commission; (6) updating CARE during process; and (7) updating the assistance portal (CEPAS) functionality to enhance Agency Self-Service. Alternatives considered include: (1) continue with current process. This alternative was not chosen because it was believed to loss of grant funding, thus decreasing or eliminating energy assistance dollars for customers; (2) transfer administration of Energy Assistance Programs to a third party organization. This alternative was not selected because it would remove ownership and visibility into the health of the program while increasing administrative costs; and (3) make annual updates to the application, which will allow agencies to easily enroll customers in assistance programs and allow placement of holds to stop or prolong credit active/pundi assistance decisions are granted. This option was selected since it provides long-term proactive energy assistance to customers and prevents loss of grant funds. Changes are required to internal systems such as SAP, a large internal system that supports broad areas of the business, and the Agency Portal, an internally developed web application, therefore a single cloud or third party alternative is not viable. Additionally, retiring the existing Agency Portal for a new application would increase costs beyond that of the routine upgrades.	2025-01-01	2025-12-31	0.00	-	332,623		-	-	-	-	-	-	-	123,769	-	-	105,821	9,851	8,097	-

MICHIGAN PUBLIC SERVICE COMMISSION
Consumers Energy Company
Synopsis Containing Descriptions, Scope, Benefits, Implementation Dates and Detailed Costs of Actual and Projected Gas & Common Capital Expenditures and O&M Expenses
For the years 2023, 2024, 2025, and 2026
Information Technology Department

REDACTED

Case No.: U-21806
Exhibit No.: A-20 (SHS-5)
Page: 17 of 27
Witness: SHBaker
Date: December 2024

243	2025	Genesys Cloud Migration	Software(intangible)	Customer	The project will migrate the Company 's 2020 standard vendor support ends for the current on-premise software and extended support is not available from the vendor. Without vendor support, the application no longer receives security patches, bug fixes, or functionality support from the vendor, which creates security, stability, and reliability risk. With the upcoming end of standard support, the vendor is no longer offering feature enhancements to the current on-premise solution limiting the Company. This project will provide value to both the Company and its customers through: (1) reducing risk with its outdated stated hardware scalable to current usage needs; (2) reducing operating costs with vendor managed feature updates and maintenance provided without service disruption; (3) providing access to new and innovative capabilities to enhance customer service; and (4) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support. The project scope includes: (1) deploying the new PWS cloud-based solution in the vendor cloud environment; (2) installing a new internet circuit to directly connect the Company. Alternatives considered include: (1) Defer to later years. This alternative was not selected due to requiring upgrades of existing on-premise hardware, impeding our ability to take advantage of new features offered by the cloud solution, and reducing cost savings opportunities presented by moving to the cloud. (2) Deploy Genesys on-premise solution to new on-premise hardware. This alternative was not selected due cost associated with purchasing new hardware and does not address the security, stability, and reliability risk resulting from the vendor end of support for the on-premise software. (3) Select and migrate to a new vendor software. This alternative was not selected due to the complexity of our existing internal integrations between the Genesys platform and the Company's other internal systems. As a result, selecting a new system with a new vendor would make the switch cost prohibitive. (4) Migrate to the Genesys Cloud platform. This alternative was selected due to it building on the Company strategy of moving to cloud, reducing operating and maintenance costs, and reduces risk by ensuring consistent, seamless vendor support.	2024-07-02	2025-12-28	-0.80	-	8,008,452			-	-	-	-	-	-	-	32,354	-	-	-	17,756	8,384	6,215	-
244	2025	Product Family Enhancements-Customer-Capital	Software(intangible)	Customer	The Customer Initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software applications changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Customer Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Application Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project forth is the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	7,710,995	900,958		2,428,586	-	-	1,157,996	657,113	77,042	531,414	318,847	-	-	-	272,675	18,392	27,780	-
245	2025	Product Family Enhancements-Customer-O&M	Software(intangible)	Customer	The Customer Initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Customer Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Application Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project forth is the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	-	434,156		-	-	-	-	-	-	-	161,549	-	-	-	100,024	32,584	9,211	19,729
246	2025	Rate Change Maintenance	Software(intangible)	Customer	The Rates Change Maintenance project will modify SAP billing in accordance with pricing and rate change requirements. For the Company to continue to meet and comply with the Michigan Public Service Commission (MPSC) rate change requirements, there is a need to make gentle updates/modifications to the existing price and rate structures. These updates help ensure accuracy of billing and provide optimal rates for customers. The project will add value for both the Company and its customers through: (1) improved customer satisfaction by providing accurate billing; (2) optimized rate configuration enabling rate changes to be made more efficiently; and (3) timely updates to Company applications that incorporate mandatory changes to the rate structure that include new surcharges, price changes, and energy efficiency programs. The scope of this project encompasses (1) implementation of annual or monthly (or both) electric and gas customer price changes, and rate structure changes as approved by the MSPC; and (2) optimizing the rate configuration in the billing system to implement the most efficient rate changes. An alternative considered for this effort was a fully dedicated offshore development model. The option ensured resources were readily available with a more cost-effective labor expense. This alternative was not chosen due to the risk of billing inaccuracies and customer complaints. These risks were deemed too high because of the complexity of the structure, new development, and the timing it was all take for testing of this model. Cloud is not an applicable option in this case as we are not replacing any software. The option to use onsite resources to plan, coordinate, and execute the rate changes was selected as it supports the Company's operation model for rate changes.	2025-01-01	2025-12-31	0.00	-	318,120		-	-	-	-	-	-	-	318,372	-	-	-	110,628	-	7,744	-
247	2025	SiteCore Primary Upgrade 2025	Software(intangible)	Customer	The project will refresh all components of the website hosting delivery, search, and analytics applications to add new features and improve search capabilities. Sitecore is the content management application for the consumers energy.com website, a channel many customers use for access rapid content information and bill payment. Sitecore is currently operating on version 10.3, which is due to end mainstream support at the end of 2025. If this occurs, there will be an increase in support and maintenance fees of 10% above the annual subscription spend in order to purchase extended support, security updates and fixes will only be made available if the extended support is purchased, and product support for errors or required hotfixes that may impact platform stability will not be available even if extended support is purchased. The project will add value to the Company by: (1) avoiding costs for extended maintenance agreements required at the end of mainstream support; (2) ensuring that the website retains the most up-to-date security patches; and (3) supporting the Company's OE go-live by improving reliability and performance. The project scope includes: (1) upgrading the Sitecore content management software to include content hosting and delivery allowing the use of new features and functionality; (2) migrating the Sitecore platform to the most up-to-date hardware and software by refreshing the application and database servers to a newer version of Windows Server and SQL Server. Alternatives considered include: (1) Delay the upgrade. This alternative was not chosen due to the current version falling outside of the mainstream support window, requiring additional 10% in maintenance fees. Along with rapidly changing feature sets that are continually being developed by the vendor, the Company would be in a worse position to handle constantly changing cyber threats; (2) Migrate to a cloud solution. This alternative was not chosen due to the cost/benefit analysis of re-architecting our current Sitecore implementation to facilitate dual migration is not viable at this time; and (3) Upgrade Sitecore on a two-year cycle. This alternative was chosen as it provides upto-date functionality, stability, and mitigates cyber security risks while minimizing cost and impact.	2025-01-16	2025-10-16	-1.00	116,432	245,030	ROM	36,595	-	-	23,887	-	1,672	11,036	91,168	-	-	-	85,204	-	5,964	-

250	2025	Application Currency-Electric & Gas Shared-Capital	Software(intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in the project to complete expense activities as associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Electric and Gas Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Electric and Gas Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increased number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	124,000	184,000	ROM	38,600	-	15,715	15,715	-	7,200	-	68,575	-	-	-	64,089	-	4,486	-
251	2025	Application Currency-Electric & Gas Shared-O&M	Software(intangible)	Electric & Gas Shared	The Electric and Gas Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Electric and Gas Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Electric and Gas Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increased number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	-	493,166		-	-	-	-	-	-	-	183,506	-	-	-	166,707	5,129	11,670	-
252	2025	Application Currency-Operational Technology-O&M	Software(intangible)	Electric & Gas Shared	The Operational Technology initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor support versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Operational Technology adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective databases, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Operational Technology are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increased number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	-	102,802		-	-	-	-	-	-	-	38,253	-	-	-	32,458	-	5,794	-
253	2025	Product Family Enhancements-Electric & Gas Shared-Capital	Software(intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities as associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Electric and Gas Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project forth is the Company ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	848,304	65,300		286,628	-	11,315	31,526	110,948	8,486	104,348	24,296	-	-	930	8,558	13,767	1,042	-
254	2025	Product Family Enhancements-Electric & Gas Shared-O&M	Software(intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Electric and Gas Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. 255	2025	Spatial Asset Management	Software(intangible)	Electric & Gas Shared	This initiative will implement SAP's Spatial Asset Management module. It will allow users to view assets, notifications, and orders geospatially using a map. The module will allow the Company to create and maintain asset maintenance plans for each segment of our gas and electric distribution networks (linear assets). The Company will create linear assets as technical objects (such as functional locations and equipment) and store linear data. The Company will enable creation of maintenance plans for these technical objects which result in notifications, maintenance orders, and measurement documents. We will enable monitoring the condition of our linear assets, identify where there is damage or a defect (as right start point and end point and offset), and manage all types of maintenance tasks (planned, unplanned, and preventative). Currently, the Company lacks spatial visualization and spatial awareness of work and assets impacting requirements for first time quality and impacting the ability to plan, bundle and execute nearby work. The lack of a linear asset management capability affects the full work management value stream resulting in overproduction of asset maintenance activity such as assessments, surveys, and inspections. This project creates value for the Company by (1) providing capability in SAP to view assets, notifications, and work orders on a map; (2) providing location awareness in SAP for assets and work; (3) establishing linear asset management capability in SAP for gas and electric delivery networks; and (4) enabling end-to-end map-based workflows. The scope of this project encompasses implementation in SAP of the Spatial Asset Management module. Alternatives considered include: (1) implement a cloud-based individual asset integration between GIS and SAP. This alternative was not selected as it proves ineffective in addressing needs of the end-to-end work management value stream while increasing the technical footprint of customization. There are also performance concerns with cloud to on-premis integrations; (2) implement work group centric approaches to viewing work on a map. This alternative was not selected as it does not support standard operation through the entire work management value stream; (3) Do nothing. This alternative was not selected as this would result in increasing costs and inefficiencies in gas and electric work management; and (4) The alternative to implement the Spatial Asset Management module in SAP was chosen as it expands use of a core technology investment, supports current investment in our work management value stream, and is compatible with our GIS technology.	2023-12-04	2025-11-30	-1.00	3,158,109	206,194	ROM	228,385	-	-	62,860	113,148	12,321	36,056	39,811	-	-	-	14,883	22,324	2,604	-

256	2025	Standard Work Plan	Software(intangible)	Electric & Gas Shared	The Gas and Electric Resource Planning process is solely reliant on spreadsheets and manual data collection from numerous, disparate sources. It is not only time-consuming but also prone to errors, leading to potential inefficiencies in resource allocation and a lack of detailed, insightful planning. The sole use of spreadsheets makes analyses and what-if scenario development cumbersome. The lack of workplan controls contributes to the completion of just-ahead-work resulting in unnecessary OT and contractor expense. Implementing a controlled replanning platform that will interface with existing systems like SAP, DAMP, and EAM Dashboard would transform our planning organization, offering a clear view of planned work and ensuring that executed work is aligned with strategic objectives. In addition, a more integrated system that leverages automation and real-time data analytics would allow for the immediate, what if scenario planning the business needs to support sound, data-driven decision-making. The tool, alongside necessary process and system enhancements will enable the workflow and ultimately lead to schedule quality and ensure prudent overtime and contractor usage through reducing the amount of unattended work breaking into the work management process. A shift to a digital solution that fully aligns resources, work units and feeds the schedule will represent a significant step forward in resource management, aligning with modern best practices. The Gas and Electric Resource Planning process is solely reliant on spreadsheets and manual data collection from numerous, disparate sources. It is not only time-consuming but also prone to errors, leading to potential inefficiencies in resource allocation and a lack of detailed, insightful planning. The sole use of spreadsheets makes analyses and what-if scenario development cumbersome. The lack of workplan controls contributes to the completion of just-ahead-work resulting in unnecessary OT and contractor expense. The project will add value by: (1) improving Work Planning Annual Forecast Process. This involves the enhancement of automated inputs, processing, and reporting with a shift towards a more asset-driven prioritization method and; (2) converting Monthly Work Plans into Weekly Schedules. Establish a process that seamlessly transforms monthly plans into executable weekly schedules for easy handoff from planning to scheduling; (3) providing the ability to Run Forecasting and Planning Scenarios. Execute forecasting and planning scenarios and provide comparative analysis; (4) improve system reliability of Work Planned jobs increasing forecast accuracy of downstream processes; and (5) creating multiple dashboards based on the audience of the data providing visibility across all levels of Operations Leadership as well as Supply Chain proactively informing of upcoming work need, potential gaps, opportunities for contingencies if levers are pulled and clean executable work keeping our workforce fully engaged and productive. This results in improved Field Operations and Customer Satisfaction with delivery commitments and meeting reliability and compliance dates. The project scope includes the following: (1) developing a system for Work Planning Annual and Monthly forecast with automation; (2) creating the ability to translate the Monthly forecast into an executable Weekly Schedule; (3) creating technology for running Planning Scenarios with ability to compare scenarios for optimized field execution; (4) improving system visibility of Work Planned jobs increasing forecast accuracy of downstream processes (ie. material); and (5) building Dashboards and reports to provide visibility and help management maintain process control. Alternatives considered: (1) Purchase commercially available system. The option was not selected as a single all-encompassing system does not link the Annual forecasting to execution. Products reviewed included Prometheus. (2) Microsoft Excel based solution, extending the Microsoft excel based solution was not selected as it does not provide the level of data integration for controlling large number of forecasted work items. (3) Development of a system that integrates with our SAP investment. This option was not selected as it does not align to expected value delivery timeline. (4) Purchase a SaaS solution to enable planning & forecasting with integration to our SAP work management system. The fourth alternative was elected because it aligns to the expected value delivery timeline and meets the functional requirements.	2024-06-04	2025-12-28	-0.98	922,640	5,584,900	ROM	218,918	-	-	128,863	81,738	14,741	64,601	166,411	-	-	-	114,969	40,555	10,887	-

259	2025	Application Currency-Gas O&M	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Gas Engineering and Operations digital systems addresses what is required by the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Application within the Gas Engineering and Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During this review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) prevent ing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	-	105,192		-	-	-	-	-	-	-	105,189	-	-	1,917	98,307	-	6,882	-
260	2025	Gas Distribution Probabilistic Risk Model	Software(intangible)	Gas	The project will implement a risk analysis model for comprehensive predictive risk analysis and modeling on gas distribution pipeline assets. Relative risk models are unit-less measures of risk derived from input information using qualitative data and ordinal scales to produce "risk index" scoring, in simple terms, the relative risk model does not provide true statistical measures. The risk assessment used in the current model provides a score for likelihood, consequence, and risk that is relevant only in comparisons to other scores. While the outputs provide a sense of relative risk when comparing no pipeline with another, the scores do not provide quantitative scales for probability, frequency, or expected loss of events. Although pipeline operators commonly use relative risk models, the quality of the relative risk ranking relies on subject matter expert inputs, human preferences, and assumptions. Completion of this project will provide value to both the Company and its customers. The project scope encompasses the implementation of a probabilistic risk model for gas distribution. Alternatives considered for the project include: (1) implement a custom, Excel-based probabilistic risk model through a consulting effort. This alternative was not selected because although the effort minimizes the IT cost of the project, the model creation from all secondary data sources, leading to multiple "sources of truth". (2) Implement a custom built probabilistic risk model. This alternative was not selected because the custom built solution is analyzed are not mature and have not been widely tested with transmission operators.	2025-10-01	2027-10-31	-1.00	4,510,700	41,870	ROM	2,431,430	1,800,000	-	210,000	175,000	26,950	219,470	26,394	-	-	7,440	17,227	1,727	-
261	2025	Gas SCADA Software Solution	Software(intangible)	Gas	The Gas Supervisory Control And Data Acquisition (SCADA) software solution project will replace the current Gas SCADA Software with a more standardized software package enabling the Company to more efficiently meet Federal and MPSC requirements. The current Gas SCADA software solution was originally implemented in 2000 and was based on the gas system requirements at that time. While the solution has been maintained since its implementation, the Company's gas system has outgrown the current capabilities. As the solution ages, there is increased effort required to address obsolete application and database software architecture, and enhancements to the system are limited. To address the capability gaps, custom interfaces and integrations have been developed where each requires maintenance and support. This environment adds complexity and cost to solution upgrades and troubleshooting issues. The current Gas SCADA solution will limit the ability to invest in digital solutions for increased system health monitoring and preventative maintenance capabilities due to the complexity to integrate these future capabilities with it. The project will add value by: (1) reducing risk of non-compliance by improving the ability to document and follow State and Federal requirements, improving customer safety; (2) improving efficiency and reliability when performing routine software upgrades, because standardization of the Gas software fleet has less risk of breaking during upgrades, as opposed to more custom-coded software; (3) reducing maintenance costs due to fewer individual software programs and less custom code; (4) improving Gas Control management capabilities that support the Federal and MPSC requirements for gas pipeline and Gas Distribution operations; (5) improving reliability by using proven gas industry standard software with configurable functionality, rather than a fully custom and system that has the possibility of being impacted by the next version update; (6) purchasing standard, out-of-the-box software that meets a high percentage of requirements and avoids multiple custom applications and specialty coded programs to achieve results; and (7) providing a data link for capturing data required for use in computer-based preventative maintenance programs and more predictive technical spikes. In addition, implementing industry-specific software helps the collective gas industry users to encourage the vendor development of future versions with enhancements, which adds more value to gas industry users. The comprehensive Gas SCADA system is used to monitor and control the operating conditions of the transmission and distribution gas systems. The Gas SCADA system includes remote terminal units (RTUs), field devices (i.e. valves, meters, odorizers), and computers running SCADA software. This scope covers the Gas SCADA software solution only. The project scope includes the following: (1) significant planning, including consulting assistance, to define the implementation strategy for the effort, given the magnitude of the technology effort; (2) selection and implementation of a new Gas SCADA software solution; (3) planning of a phased rollout of new hardware and software; and (4) retirement and decommission rings of the legacy gas SCADA solution and equipment once the new system is fully tested and operational. Alternatives considered include: (1) continue to maintain the current solution, at the risk of increasing reliability issues that result in controlling and monitoring the Company's gas system; (2) invest in enhancing the existing Gas SCADA software solution which would introduce additional custom development and more parallel functions that may not be supported in future vendor releases; and (3) replace the solution with a gas SCADA software solution that meets requirements to support the Natural Gas Delivery Plan. Alternative three has been selected to ensure sustainability for this critical solution. The current legacy system is operating at well beyond its original design specification, so the potential points of failure are not fully known or understood. If the SCADA project is not completed, the legacy system could become unstable and impact Gas Control's ability to operate and monitor real-time system conditions, maintain safe operations, and compliance with regulatory requirements. It could also impact the ability to dismiss on new facilities which require remote monitoring or control or cause the need for 24/7 manual field monitoring of certain facilities.	2022-04-18	2025-12-31	-1.00	18,016,040	2,305,237		8,038,938	2,083,987	7,364	956,112	3,856,566	324,519	810,488	1,081,755	382,856	167,070	157,028	195,500	24,677	104,624
262	2025	Gas T&D Historian	Software(intangible)	Gas	The Gas Transmission and Distribution (T&D) Historian project will replace the current historian for Gas T&D, eDNA (a traditional Supervisory Control and Data Acquisition (SCADA) historian product), and migrate to the standard OSIsoft PI enterprise historian system. The PI system is a suite of software products that are used to collect, store, view, analyze, and share operational data with systems users and subject matter experts. The historian for Gas Transmission and Distribution resides on a decades old platform and is not the Company's historian standard. Data access is cumbersome, requires multiple tools to access it, and does not provide for the storing, analysis or visualization of operational data in a timely manner with appropriate change management control. With the implementation of smart meters, the Company standardized on the more robust OSIsoft PI historian which is used for: (1) Renewable Generation; (2) Electric T&D, and, (3) Smart Energy. The Gas T&D historian has yet to be migrated to OSIsoft PI, and the eDNA gas data has limited access ability and usability in its current state and is no longer supported by the vendor. In addition, maintaining the older platform requires the new system requires duplicate resources and skills. The project will create a more accessible and centralized data source with better controls that can be leveraged as the system of record. The project will add value for both Gas Engineering and Gas Operations organizations within the Company by: (1) informing decision making based on real-time situational awareness of Operations personnel for information that does not need to be monitored by Gas Control; (2) improving the ability to respond to abnormal situations that do not require immediate intervention through that direct communication to Operations personnel; (4) providing information for the development of proactive and reactive plans to potential catastrophic events; (5) streamlining data access through visualization and analytics; and (6) reducing the waste of using multiple interfaces to interpret data. From an IT perspective, consolidating to one standard historian platform will result in savings in hardware, software, maintenance, resources and training. This scope of this project includes: (1) replacing the eDNA Gas T&D historian, a traditional SCADA historian, and migrating to the enterprise historian, OSIsoft PI; (2) developing analytics, visualization and reporting capabilities to support tracking of metrics and making operational decisions; (3) replacing the decades-old Microsoft Access-based custom Daily Gas Reports solution; and (4) retiring the legacy Gas T&D eDNA system (hardware and software). An alternative considered for the project was to upgrade eDNA Gas Historian to the latest version. This option was not selected because it requires a significant investment, and does not meet analytics, reporting, usability and access fully needs as well as the software owner has announced the "sunset" of the eDNA software. Furthermore, the Company standard for historians is OSIsoft PI and maintaining two platforms results in redundant efforts in training, support personnel and technology. The option to replace eDNA with the Company standard OSIsoft PI historian was selected to eliminate duplicate training, support personnel, and technology and to leverage the more robust data analytic capabilities in the OSIsoft PI tool set. Currently there is an effort with the Gas SCADA Software Solution to eliminate the need for a two-duplicative historians while the Gas SCADA Software Solution is being implemented. If this project is not completed, an interruption of our operational data reporting capabilities could occur and could result in a non-compliance and could potentially interrupt certain accounting and billing functions.	2024-02-19	2025-12-15	-0.93	1,496,412	241,715		768,636	-	160,500	410,223	-	212,893	-	224,700	-	-	10,000	200,000	14,700	-
263	2025	Product Family Enhancements-Gas Capital	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Gas Engineering and Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and ensures requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	679,909	85,438		679,909	-	14,393	262,355	196,160	31,000	176,000	85,438	-	-	31,098	15,000	39,340	-
264	2025	Product Family Enhancements-Gas O&M	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software applications changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Gas Engineering and Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and ensures requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	-	239,401		-	-	-	-	-	-	-	359,401	-	4,242	202,019	13,256	19,884	-
265	2025	Tracking & Traceability	Software(intangible)	Gas	Tracking and Traceability is a project driven from proposed regulatory rules that will require utilities to map new and replacement installations with tracking and traceability data for plastic pipe, fittings, and fusions for the lifetime of the asset. The Company does not currently have a Tracking and Traceability program that will meet PHMSA proposed requirements (PHMSA-2014-0086) also known as the Plastic Pipe Rule. Tracking and traceability systems tie the collection of information that provides manufacturing, material type, and location information for pipe and components. PHMSA defines the terms. This project will develop a sustainable Tracking and Traceability program that will meet PHMSA requirements (PHMSA-2014-0086) which address the proposed tracking and traceability requirements. The project adds value by capturing traceability data via barcode readers and location tracking information via Global Positioning System (GPS) equipment to improve the quality of data and assist the Company in determining future scopes of work in the event of any component manufacture recalls. The scope of work will include: (1) changes in SAP Supply Chain processes to capture the required barcode information for all plastic components used in gas distribution and service lines; (2) changes in SAP Work Management processes to account for capturing barcode information as part of material components added to work orders, capturing fusion information from work order completion and capturing GPS coordinates from work order completion; (3) changes in GIS to capture GPS coordinates of plastic components and GPS coordinates of component fusions; (4) building of a repository for tracking and traceability data and analytics; (5) purchase reading equipment for transmission and gas distribution tracks; and (6) purchasing of GPS locating equipment to capture coordinates. Alternatives considered: (1) The do nothing alternative, which was not selected because it would expose the company to significant legal and financial risk resulting from non-compliance. (2) Internally develope digital technology supporting the tracking & traceability standards included in the PHMSA-2014-0086 plastic pipe rule. The second alternative is being pursued by the Company	2025-01-01	2027-06-30	0.00	14,864,950	2,488,640	ROM	3,138,430	-	291,250	1,730,000	324,000	143,780	837,400	510,390	-	-	395,000	82,000	33,390	-

267	SUBTOTAL	2025 Gas										14,980,738	3,123,067	395,157	3,180,600	4,651,004	704,985	1,816,368	2,223,267	382,856	171,312	800,892	532,983	140,400	104,624
268	2025	AFIP-Infoblox Refresh	Network	IT Digital Foundation	This project will replace the three legacy core components, Domain Name System (DNS) Infoblox Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out of date, they are more expensive to support and can be more difficult to keep current with security updates. Concurrent Energy also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. The value of this program includes: (1) enabling Company to efficiently manage and control their network; and (2) providing Domain Name System. The scope of this project includes the replacement of DNS, DHCP and IPAM assets on a 5-7 years refresh cycle. The alternative considered was to continue operating on existing Infoblox equipment past the vendor's end-of-support date. This alternative was not selected because it exposes the Company to risk from unsupported software bugfixes, security updates, and other software fixes. The alternative to replace the existing Infoblox equipment with the latest hardware and software provided by the vendor was selected to avoid these risks and continue a regular refresh cycle.	2025-01-01	2025-12-31	-1.00	978,213	53,500		478,718	-	451,486	16,880	14,469	2,194	6,752	19,906	-	-	11,162	7,441	1,302	-
269	2025	AFIP-Local Area Network	Network	IT/Digital Foundation	This project will upgrade the Company's entire LAN and a significant portion of the Wireless Local Area Network (WLAN). At some Company locations, LAN equipment has been in service since 2011. The project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; (4) ensuring equipment is vendor supported, thereby ensuring support for bug fixes, security vulnerability patching, and enhanced features; (5) providing consistent wireless coverage across Company locations; (6) increasing user productivity through a higher performing wireless network, which increases the productivity and satisfaction of Company's office and field employees. The project scope includes: (1) refreshing the LAN equipment and software as well as all Company switches; (2) identifying the required features for the new equipment; (3) implementing the new equipment according to industry best practices; (4) replacing wireless network with upgraded infrastructure and verifying wireless coverage is as expected; and (5) collecting wireless survey data for all Company locations in order to design improved wireless network coverage. The alternative considered was to continue operating on the existing platform past the vendor's end-of-support date. The vendor support period ended in May of 2018, and paying for extended support is not an option offered by the vendor. The risk inherent in not refreshing the platform is a lack of vendor support resulting in an absence of software bug fixes, security updates, and break fixes. The Company chose to replace the existing equipment with the latest hardware and software available, following a five year refresh cycle.	2025-01-01	2025-12-31	-1.00	320,435	57,930		156,546	-	108,518	24,115	9,887	2,380	9,646	21,554	-	2,046	15,255	2,977	1,276	-
270	2025	AFIP-Radio	Network	IT Digital Foundation	This project will refresh hardware to include; 800Mhz Radios and infrastructure, cellular modems, plant radios and systems, cellular amplifiers devices, vehicle consoles in service trucks, other communications equipment, and associated test equipment. 800Mhz mobile, and portable radios, Plant radio systems, and Cellular modems support core business functions, life safety communications, and rapid response for restoration of customers service and critical infrastructure. Company radio and cellular systems must be refreshed on a scheduled basis or risk exceeding life expectancy and failing or becoming obsolete. The refresh of this equipment in a proactive manner is critical to providing service to customers. If these units are not refreshed, the increased risk of unit failure would result in interruptions to timely and concise communications to field personnel to resolve gas leaks, and downed electric lines, or service turn-on requests, which risks life safety. The project creates value for customers and the Company by: (1) upholding public safety; (2) ensuring timely responses and repairs to emergent gas leaks, wire downs, and electric outages; (3) ensuring real-time communications between Company dispatch locations and crews in the field; (4) ensuring the safety of personnel working in higher risk work spaces by replacing equipment with units that contain intrinsically safe batteries; (5) supporting continuous improvement and training by replacing equipment that is capable of capturing audio recordings; and (6) remaining in compliance with MPSC regulatory requirements by maintaining critical radio infrastructure. The project scope consists of: (1) scheduled replacement of radios, modems, and consoles; and (2) installing additional radios modems and consoles as to satisfy growth requirements; and (3) scheduled replacement of out of date cellular and radio boosters. The alternatives considered included: (1) Replace the existing units with new units from other radio and modem manufacturers; (2) purchase new radio subscriber units from existing manufacturers.	2025-01-01	2025-12-31	-1.00	2,388,927	114,491		1,152,179	-	851,981	39,289	226,649	18,616	15,715	42,598	-	24,370	12,175	4,861	1,192	-

271	2025	Application Currency-IT/Digital Foundation-Application Platforms-Capital	New Computers / Hardware	IT/Digital Foundation	The Application Platforms initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expensive activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective databases; (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Application Platforms are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employee's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future. This project will replace the Company's obsolete or out-of-date audio, visual, telephony and other communication collaboration tools and equipment. When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates. The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for evolving business requirements. The following alternatives were considered: (1) refresh visual assets and a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only	2025-01-01	2025-12-31	-1.00	61,446	20,335	ROM	15,116	-	-	10,372	-	726	4,066	7,566	-	-	6,420	-	1,146	-
272	2025	ARP-Collaboration	New Computers / Hardware	IT/Digital Foundation	This project will replace the Company's obsolete or out-of-date audio, visual, telephony and other communication collaboration tools and equipment. When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for expanding business requirements. The following alternatives were considered: (1) continue to operate hardware beyond a five-year refresh cycle as long as it remains functional; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only	2025-01-01	2025-12-31	-1.00	1,189,835	226,189		372,708	-	273,999	60,233	33,208	5,363	-	84,158	-	25,673	25,221	29,438	3,826	-
273	2025	ARP-Field Device Asset Management (FDAM)	New Computers / Hardware	IT/Digital Foundation	This project will replace field devices according to a four-year refresh cycle that is based on industry standards, hardware failure, security patches, and software compatibility. When Field Device Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with Security updates as equipment becomes obsolete. This project creates value for the Company by: (1) improving stability and availability of business-critical applications by proactively replacing field devices prior to increasing hardware failures; and (2) allowing field workers to complete their job tasks. The project scope consists of replacing field device assets according to the four-year refresh cycle. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for field devices; and (2) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the assets that need refreshing in future years based on the number of devices that were not replaced during the current refresh cycle; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the five-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company elected a four-year refresh cycle to alleviate these concerns.	2025-01-01	2025-12-31	-1.00	1,081,280	17,224	-	1,081,540	-	1,061,280	17,224	-	1,206	6,889	1,860	-	1,860	-	-	-	-
274	2025	ARP-Operational Technology Support Gas	New Computers / Hardware	IT/Digital Foundation	The ARP- OT Support Gas project will replace dated and obsolete servers on a rotating 5-year refresh schedule. When OT Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value by maintaining the currency of the Company. The program scope consists of: (1) a replacement of computer hardware under the program; and (2) installing additional new compute capacity to account for expanding business requirements. The alternatives considered include: (1) continue to operate hardware beyond a five-year refresh cycle as long as it remains functional; (2) refresh hardware based on a five-year refresh cycle along with evaluating the health of the asset and evolving business needs. The alternative to operate hardware beyond a five-year refresh cycle was not selected due to the risk that these hardware component failures would address system reliability and safety for customers. The Company chose the alternative to refresh this hardware based on a five-year refresh cycle along with evaluating the health of the asset and evolving business needs to reduce the risk of impacting critical infrastructure that supports systems such as Gas SCADA and Gas Compression control systems.	2025-01-01	2025-12-31	-1.00	979,178	120,440		979,178	-	802,500	41,255	-	2,888	72,535	120,440	57,000	39,000	-	22,000	1,540	-
275	2025	ARP-Printer Asset Management (PAM)	New Computers / Hardware	IT/Digital Foundation	This project will replace and install select printers, plotters, and multi-function printing devices based on printer replacement assessments and a five-year refresh cycle. Printer service and usage history is evaluated and a determination is made if a printer can be repurposed instead of ordering a new one. When Printer Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with Security updates as equipment becomes obsolete. The project creates value for the Company by: (1) improving the dependability of these printer devices for employees. The project scope consists of the annual replacement of printer assets according to a five-year refresh cycle. The alternatives considered for the project included: (1) a longer refresh cycles from three to seven years as well as running the assets to failure. The selection of a five-year cycle was deemed to be the best solution as it maximizes the life/cost of unneeded expense for replacement of assets that were still in good operating condition. Another alternative than five years is assessed monthly to ensure it is not run to failure, including running the asset to failure, resulting in additional expenses for maintenance of the equipment and downtime, negatively affecting employee productivity. The Company assesses the printer fleet based on years of active service, service history, printer usage data, and the number of users within a facility. Based on these factors, the Company either decommissions, repurposes, leaves in place, or refreshes the printers.	2025-01-01	2025-12-31	-1.00	1,611,861	5,000		505,608	-	402,978	9,272	-	649	3,709	1,860	-	1,860	-	-	-	-
276	2025	ARP-Server and Storage	New Computers / Hardware	IT/Digital Foundation	This project will replace or augment server and storage infrastructure for the Company. When Server and Storage Hardware Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and can be more challenging to keep current with Security updates. This project creates value for the Company through: (1) improved stability and availability of business-critical applications by proactively replacing server and storage hardware assets prior to the likelihood of increasing hardware failures; and (2) ensuring that adequate resources are available to support application demands after five to seven years of utilization. The scope of this program encompasses: (1) replacement of server and storage hardware assets; and (2) installation of additional new computers and storage capacity to account for evolving business requirements. The alternatives considered were to: purchase extended maintenance, move some of these assets to the Cloud with the Digital -Hybrid Cloud and Data Center Migration project, or to replace these assets on the current cycle. The option to purchase extended maintenance was not selected because a full support would not be offered after seven years, and maintenance costs would increase. The preferred option is to move some of these assets to the cloud in the Digital Hybrid Cloud and Data Center Migration project while refreshing the remainder using the five- to seven-year cycle as it is the most cost-effective option in IT the Digital Hybrid Cloud and Data Center Migration project is not approved as part of this rate case, the Company plans to continue to refresh these critical technologies at the current level based on a five- to seven-year refresh cycle to mitigate the risk of failure.	2025-01-01	2025-12-31	-1.00	1,739,577	139,100		546,749	-	378,222	110,005	-	7,700	50,822	51,755	-	-	48,369	-	3,386	-
277	2025	ARP-Workstation Asset Management (WAM)	New Computers / Hardware	IT/Digital Foundation	This project will replace and install new desktops, laptops, and tablets on a five-year refresh cycle based on industry standards, hardware failures, security patches, and software compatibility. Monitors will be replaced every eight years based on Company data related to its tonal failure rates. When Workstation Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improving stability and availability of business critical applications by proactively replacing workstations prior to increasing hardware failures; and (2) allowing business partners to complete their job tasks. The project scope consists of: (1) replacing workstation assets; and (2) installing new units for new resources. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for all desktops and laptops; (2) extend the replacement cycle only on desktops from four years to five years; and (3) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the ARP in future years based on the number of devices that were not replaced during the four-year refresh cycle; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the four-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle for desktops, laptops, and tablets; and an eight-year cycle for monitors to alleviate these concerns.	2025-01-01	2025-12-31	-1.00	8,982,469	89,935		2,815,190	-	2,083,128	66,317	39,700	7,428	26,527	33,462	-	31,763	1,588	-	111	-
278	2025	Digital-Hybrid Cloud and Data Center Migration	New Computers / Hardware	IT/Digital Foundation	This project will optimize data center assets and asset replacement project purchases by migrating or retiring applications out of existing Company and co-location data centers into cloud services, reducing operational costs for running IT services and leveraging increased cloud capabilities to improve the efficiency, quality, and speed-to-market of customer-facing and internal IT services. The technology currently deployed in the Company's data centers needs many customers' needs today. However, the pace of digital transformation is increasing rapidly, and requirements for applications are evolving faster than the technology in the Company's data centers can respond in a cost-effective manner. These data center constraints lead to longer implementation times, missing capabilities, or reduced functionality in the applications that the Company can deploy. This project will create value by ensuring the Company's technology requirements are met through a comprehensive and cost-effective combination of data centers and public cloud services. Specifically, by migrating applications to cloud services, the project will: (1) reduce capacity, hardware maintenance, and security device assets at the co-location data center; (2) reduce hardware maintenance and security device costs at the production data center; (3) enable the ability to scale infrastructure quickly up or down without costly up-front hardware purchases; (4) reduce application risk through cost-effective, scalable infrastructure redundancy and availability; (5) reduce ongoing server and storage asset replacement costs; (6) reduce ongoing networking equipment replacement costs; (7) reduce operational support costs; and (8) enable the use of a variety of cloud services to support Company applications. The project scope includes: (1) preparing the co-location data center to become the primary data center for on-premise IT services; (2) demoting the Company's production data center to the disaster recovery data center for on-premise IT services; (3) analyzing applications for migration to cloud or retirement; (4) migrating applications from on-premise to cloud; (5) transforming applications to use cost-effective cloud services; (6) starting network architecture and deploying base infrastructure to allow each location (on-premise or cloud) to function independently; (7) deploying cloud and on-premise cost management tool/agreed processes; (8) simplifying and optimizing backup and disaster recovery resources and processes using cloud services; (9) implementing additional automation for application deployment and management; (10) changing the operations model for support of cloud-based applications; (11) educating and increasing the skills of IT and other employees in leveraging public cloud services; and (12) transforming IT to become the broker of cloud services for the Company. Alternatives considered included: (1) migrating to public cloud services faster. This alternative was not chosen because the Company's ability to absorb new technologies coupled with their investments the Company has already made in data center equipment would prevent a faster move from being efficient and effective, intoducing additional financial risk; (2) migrating to public cloud services slower or not at all. This alternative was not selected because delaying public cloud services and capabilities coupled with requiring an extension of the life of existing data center equipment creates increased financial and operational risk; and (3) contracting with an outside vendor to provided cloud services to run applications for the Company. This alternative was not selected because industry information shows the option as not yet cost effective or not providing a maturity level that the Company would be able to easily consume with limited in-house experience and expertise in public cloud. The alternative to migrate to a hybrid cloud and data center model was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.	2023-02-01	2025-12-30	0.17	6,876,180	5,887,409		598,268	56,574	-	325,187	-	46,426	130,075	215,877	-	-	176,717	-	12,370	26,789
279	2025	SAP HANA Database Migration	New Computers / Hardware	IT/Digital Foundation	In preparation for SAP's planned end of support for its Business Suite product in 2027, the Company will migrate its existing SAP databases from Oracle to SAP HANA in advance of the required move to S/4HANA. The Company's SAP application currently utilizes Oracle's relational database management system as their underlying database storage technology. SAP has informed its customers that standard support for its legacy Business Suite (aka ECC) product will end in 2027, along with support for all non-SAP database platforms. SAP has also informed customers that the future direction for their enterprise solution is S/4HANA, a solution built explicitly for their HANA database platform. To prepare for these upcoming events, the Company will migrate all of its SAP databases off of Oracle and onto SAP HANA. This project leverages the groundwork for the company's eventual shift to SAP's HANA-based solutions by: (1) proactively migrating SAP databases to a database technology that is fully supported by SAP beyond 2027; and (2) mitigating the risk of a complete loss of support for the current Oracle database technology in 2027. Project scope includes: (1) procurement of HANA software licensing to cover all migrated SAP applications; (2) data migration for all SAP applications from the Oracle database to SAP HANA; and (3) implementation of new application support policies, procedures and tools required to manage the newly migrated SAP HANA applications. Given SAP's announcement regarding the end of support for its ECC product in 2027, all customers running SAP on database software other than HANA will also lose support for their associated database software in 2027. SAP is offering no other options for databases other than HANA beyond 2027. While there is no alternative to the HANA database for SAP going forward, the Company has considered multiple options: (1) Perform this project but not migrate from SAP Business Suite on Oracle to S/4HANA. A direct migration to S/4HANA brings greater operational risk to the Company as both the underlying database technology and the SAP application's functionality would change simultaneously, so this alternative was not selected. (2) Remain on the current SAP Business Suite product but competitively bid support services to a third-party provider instead of SAP. This alternative was not selected because moving to a third-party support model forces the Company to remain on outdated SAP software and eliminates any possibility of benefitting from new business functionality provided by S/4HANA. It will also require the Company to accept significant risk due to the fact that SAP security patches, application patches and upgrades will not be available upon termination of the SAP maintenance agreement. (3) Migrate to SAP's Software as a Service (SaaS) implementation of S/4HANA. This alternative was not selected because an S/4HANA SaaS migration is a much more disruptive option as the Company's business processes are structured differently between ECC and S/4HANA. The risk of negative business impact is significantly greater than simply changing the underlying database technology. (4) Migrate the SAP databases to HANA prior to implementing S/4HANA. This alternative was selected as it gives the Company several years to solidify its HANA database infrastructure before introducing the substantial business process changes required with S/4HANA.	2023-04-24	2025-12-31	-0.78	6,491,044	1,352,658		530,038	-	-	57,920	396,598	27,762	47,757	152,783	-	-	58,415	84,373	9,995	-
280	2025	20% ROW Adjustment - IT/Digital Foundation	New Computers / Hardware	IT/Digital Foundation	This is for the 20% ROW Adjustment for IT projects.							(1,036)	-	-	(2,074)	-	(149)	(813)	-	-	-	-	-	-	-
281	2025	Application Currency-IT/Digital Foundation-Application Platforms-O&M	Software(intangible)	IT/Digital Foundation	The Application Platforms initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective databases; (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Application Platforms are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employee's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future. This project will replace the Company's obsolete or out-of-date audio, visual, telephony and other communication collaboration tools and equipment. When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates. The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for expanding business requirements. The following alternatives were considered: (1) refresh visual assets and a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only	2025-01-01	2025-12-31	-1.00	-	97,027		-	-	-	-	-	-	-	36,104	-	-	30,635	-	5,469	-
282	2025	Application Currency-IT/Digital Foundation-Infrastructure Platforms-O&M	Software(intangible)	IT/Digital Foundation	The Infrastructure Platforms initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Infrastructure Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective databases; (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Infrastructure Platforms are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employee's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future. This project will replace the Company's obsolete or out-of-date audio, visual, telephony and other communication collaboration tools and equipment. The following alternatives were considered: (1) refresh visual assets and a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only	2025-01-01	2025-12-31	-1.00	-	20,699		-	-	-	-	-	-	-	7,522	-	-	6,382	-	1,139	-
283	2025	Data & Analytics Platform Rationalization	Software(intangible)	IT/Digital Foundation	This project will optimize the Data & Analytics system landscape by creating connections, migrating data into Data Lake 2.0 (DL 2.0), and building visualizations from the data in DL 2.0. Following the enablement of DL 2.0, retirement of the IT Data & Analytics legacy systems including SnipSite Data Lake (SDL), SAP Business Warehouse (BW), SAP Business Objects (BOBJ), Natrieve HANA, the BW Portal, and SnipSite Data Objects Data Services (BODS) systems will reduce the total cost of ownership associated with maintaining and supporting legacy systems. The IT Data & Analytics legacy systems (SDL, SAP BW, SAP BOBJ, Natrieve HANA, the BW Portal, and BODS) are outdated, inefficient, and become significantly more complex in nature with the introduction of DL 2.0. If these legacy systems are not retired, they will continue to cost the Company money as major investments are needed to maintain and support them. This platform rationalization project creates value for the Company and its customers by reducing the total cost of ownership associated with maintaining and supporting legacy systems including licensing fees, maintenance costs, infrastructure, and support resources. The project scope includes: (1) the assessment of the existing Data & Analytics platforms including SDL, SAP BW, SAP BOBJ, Natrieve HANA, the BW Portal, and BODS; (2) inventory of data and reports still being used by stakeholders; (3) determination of migration strategy; (4) data migration to the Azure Data Lake; (5) report migration to Power BI; (6) organizational change management; and (7) the retirement/decommissioning of the legacy platforms and applications. Alternatives considered: (1) upgrade legacy systems in place (on-premise). This alternative was not selected because this is costly and misaligned with the Company's cloud strategy. (2) Lift and shift the current on-premise systems to the cloud through the Hybrid Cloud Transformation Program. This alternative was not selected because it would duplicate the work being done as part of the DL 2.0 project and would not provide the same efficiencies that DL 2.0 introduces. The alternative to migrate all data sources to DL 2.0 and retire legacy systems was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.	2025-03-03	2026-08-14	0.15	10,002,200	1,660,500	ROM	3,086,340	31,430	-	178,192	1,781,938	12,478	82,325	412,084	-	-	37,225	372,254	2,604	-
284	2025	Enterprise Service Bus Application 2024-2025 Upgrade	Software(intangible)	IT/Digital Foundation	This project will upgrade and migrate the Business Works developer application to the next version. Newer ESB software versions offer improved integration with Rest/API services and applications. It is critical that this vital data tool or pathway be more scalable, secure, and capable of integrating to a service-based environment. In addition, the messaging and event modules within the ESB are currently outside of their standard support windows. While it is possible to continue to get extended support by paying an estimated premium of approximately $80,000 annually, this is just temporary to wrangle and serves only to delay the need for an upgrade. The value this project provides the Company includes: (1) to circumvent extensive payments for extend support purposes; (2) avoid technical obsolescence; (3) operational resiliency; and (4) improved administrative and operational efficiencies. The project scope includes implementing current version of all applications that are part of the ESB application, database version, and required database drivers. Alternatives considered included: (1) Accept the annual $80,000 extended maintenance cost. Given the critical nature of this application, it is not recommended to lose mainstream support for any of the applications involved. Any sustained ESB product deficiency would impact many areas of the Company, such as billing, revenue collection, and remote meter management. The current implementation of the ESB platform was built with 5 years of growth in mind. This alternative was not chosen due to risk to Company operations, and the additional expense. (2) Replace the on-premise upgrade plan to implement a cloud-based solution. A cloud migration would also take longer to complete, which would put the Company at risk of falling outside of the current vendor support window for the products current version. (3) Upgrade the existing application. This option was selected because it best meets the Company needs for the near future by restoring vendor support for fixes and patches, and enables product scalability to the measure required of business capabilities.	2024-09-04	2025-11-21	-1.00	-	784,244	ROM	-	-	-	-	-	-	-	389,103	-	-	270,283	-	18,920	-

MICHIGAN PUBLIC SERVICE COMMISSION
Consumers Energy Company
Synopsis Containing Descriptions, Scope, Benefits, Implementation Dates and Detailed Costs of Actual and Projected Gas & Common Capital Expenditures and O&M Expenses
For the years 2023, 2024, 2025 and 2026
Information Technology Department

REDACTED

Case No.: U-21806
Exhibit No.: A-20 (SHB-5)
Page: 20 of 27
Witness: SHBaker
Date: December 2024

285	2025	Iron Enterprise Edition 2026 Upgrade	Software(intangible)	IT Digital Foundation	The project will upgrade Iron Enterprise Edition (EE), which collects the reads from meters to ensure non-estimated tel accuracy. Iron Enterprise Edition (EE) is the Company's keystone application of the Advanced Metering Infrastructure (AMI), that provides 8 figures that includes time of use data. If this application does not stay current, the Company increases the risk bus ness operations co uld be interrupted or compromised. Iron Enterprise Edition (EE) is a key co mponent in keeping the Company current, with billing capacity, stability, and accuracy obligations. This project creates value for the Company by: (1) ensuring the features and functio nality needed to meet and exceed cus tomer satisfaction and billing accuracy are available to business partners and IT; (2) meeting information Security. The scope of this project includes: (1) upgrading the Iron Enterprise Edition (EE) application s to the next appropriate version; (2) migrating the database to the next version required by the application. Alternatives considered included: (1) Defer the upgrade. This alternative was not selected because it would decouple Iron EE (EE's Meter Data Management) from the Iron security infrastructure introducing application instability, security and dependency risks to the utility, possibly negatively impacting critical customer electric and gas billing operations. It would also likely affect other business critical Iron applications use, creating more expense to support and no ability to leverage updated tool capability (2) Replace the platform. Replacing EE/MDM would require the application business owners to undertake a new initiative mirroring the expense and efforts that went into the multi-million dollar project responsible for setting up and leveraging this utility. (3) Perform the upgrade. This option is superior for both our customers and our Company because it maintains vendor support for hot fixes and patches, and aligns with all upgrade projects related to other Iron products.	2025-07-29	2026-12-09	-1.00		695,277	ROM								48,856					3,196	
286	2025	Product Family Enhancements-Application Platforms Services-Capital	Software(intangible)	IT/ Digital Foundation	The IT initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements that benefit the IT organization is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT finance and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	955,650	132,106		300,161	-	-	172,834	31,400	14,298	81,798	49,153	-	-	20,519	21,189	7,445	-
287	2025	Product Family Enhancements-Application Platforms Services-O&M	Software(intangible)	IT Digital Foundation	The IT initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. 290	2025	SAP S/4HANA Implementation	Software(intangible)	IT Digital Foundation	[redacted]																				
291	2025	Software Platform Refresh	Software(intangible)	IT Digital Foundation	The Software Platform Refresh project will upgrade server operating systems, hypervisors, databases and infrastructure platforms to retain low-cost vendor support. For systems that go beyond their normal manufacturer support ending, there will be increased support and maintenance fees of 20% to 100% above current support and maintenance depending on vendor. Completing the project allows the organization to (1) avoid high support costs; (2) provide for system security and (3) stay current to promote seamless interoperability among servers, applications, and databases. Aging platforms are more susceptible to security vulnerabilities and performance issues that ultimately could affect the business and customers. The project will add value for the Company by (1) avoid ing costs for special maintenance agreements required at the end of normal manufacturer support; (2) ensuring reliability and compliance with Information Security requirements; (3) improving data center environment stability and (4) avoiding the need for high-risk upgrades that cross multiple versions. The project scope includes: (1) upgrading operating systems and databases on servers that are near end of support with a given vendor; and (2) maintaining hypervisors and infrastructure platforms at the current version for stability and performance. A funding options matrix was completed to review the potential alternatives. The alternatives identified were: (1) Complete the full scope of the solution for $1 million in order to eliminate the need for ongoing extended support; (2) Reduce the scale of the solution, which requires $1.6 million in ongoing extended support; (3) Reduce the scale of the solution even further, which requires $2.4 million in ongoing extended support; (4) Do not complete a software platform refresh, which requires $1.3 million in ongoing extended support. Alternative 1 was selected as the most cost effective solution to ensure ongoing system stability; seamless integration and mitigation of cyber-security risks without the significant cost of extended support necessary for end of life software systems.	2025-01-01	2025-12-31	-1.00	-	113,463		-	-	-	-	-	-	-	42,219	-	-	39,457	-	2,762	-
292	2025	20% ROM Adjustment - IT/Digital Foundation	Software(intangible)	IT Digital Foundation	This is for the 20% ROM Adjustment for IT projects.																				
293	SUBTOTAL	2025 IT/Digital Foundation																							
294	2025	ARP-Cyber Security	Network	Security	This project will replace cyber security infrastructure to support increasing systems and application demands and to prevent system failures and service interruptions. When enterprise software or cyber security infrastructure used to support and enhance customer interactions is obsolete, these assets are more expensive to support and can be more difficult to keep current with security updates. This project will create value by maintaining the currency of the cyber security infrastructure for core enterprise software. These are used to ensure the stability of technology for business operations. The scope of this project consists of: (1) annually replacing a subset of cyber security firewalls and servers in keeping with a 3-5 year hardware lifecycle and (2) performing application upgrades. As part of the review process, the alternatives considered were to: (1) upgrade or replace only those assets identified in the plan; (2) upgrade or replace a portion of the assets identified in the plan. Option 1 was not chosen because it would result in continued refresh cycle for cyber security assets to avoid security risks, system instabilities, and out-of-warranty repair costs. Option 2 was not chosen due to the security risk inherent with not replacing assets per standard refresh cycle timelines.	2025-01-01	2025-12-31	-1.00	450,000	25,000		237,176	-	178,482	24,115	-	-	14,469	9,932	-	-	9,932	-	-	-
295	2025	TSA Critical Facility Structure	Network	Security	This project will implement enhanced security measures outlined by the Transportation Security Administration (TSA) for critical facilities sets in order to bring the locations up to enhanced status and avoid non-compliances. This project will increase the security and reliability of gas delivery to our customers while also meeting federal requirements. Pipeline facilities that are deemed critical are required to apply enhanced security measures. Today, the Company current has designated 4 locations as critical. However, based on the April 2021 update to the TSA Pipeline Security Guidelines, Section 5 (Critical Facility Criteria), a significant number of our gas infrastructure that were not previously subject to evaluation will now fall into scope. As the Company continues to analyze the remainder of our gas assets, there is the potential for an additional 1,000 pipeline facilities (pipeline interconnections, metering and regulation stations, compressor stations, operational control facilities, main line valve, tank farms and terminals, etc.) may be deemed critical. The Company will be taking a phased implementation approach and will begin the process by implementing the enhanced security measures at the remainder of our compressor stations. Failure to update our sites will put the Company out of compliance with the updated guidelines. This project provides value to the Company by: (1) implementing enhanced security measures outlined by the TSA for four critical assets; and (2) increasing the security and reliability of gas delivery to our customers while meeting federal requirements. This project will implement the following enhanced security measures: (1) access control; (2) access readers; (3) cameras; (4) video and audio programming; (5) fencing and barriers; (6) gates; (7) locks and key control; (8) fence intrusion; (9) subcontractor work of trending poles, etc.; (10) forklift lighting; (11) background investigations for personnel working at the sites; (12) security equipment maintenance and testing; (13) security vulnerability assessments; (14) security communication plans; (15) personnel training; and (16) security drills and exercises for the following locations. Alternatives considered were: (1) To not implement the enhanced security measures outlined by the Transportation Security Administration (TSA) for critical facility assets. This option was not chosen due to the risk of not complying with the TSA enhanced security measures. (2) To implement the enhanced security measures outlined by the Transportation Security Administration (TSA) for critical facility assets. This alternative was chosen to avoid the risk of not complying with the TSA enhance security measures, such as increased vulnerability of attacks, financial penalties, and operational disruptions.	2023-11-27	2025-12-28	0.00	9,088,335	584,724		2,192,000	-	1,000,000	400,000	800,000	-	152,000	85,600	-	-	80,000	-	5,600	-
296	2025	ARP-Physical Security	New Computers / Hardware	Security	The ARP Physical Security, formerly known as Physical Security Asset Refresh will enhance or replace physical security assets to provide improved visibility and incident resolution related to security concerns. The Company has several thousands of physical security assets currently in use including security cameras, motion detectors, intrusion detection systems, and card access systems. Current limitations include the lack of integrated solutions for centralized management, situational awareness, real-time monitoring, compliance with regulations and guidelines, and faster response rates to emergencies and incidents. This could result in the increase of potential security vulnerabilities, associated penalties, and reputational damage. The value provided by completing the project is to: (1) maintain compliance with State and Federal regulations; (2) reduce redundancies with less of a need for multiple cameras and reducing gaps in functionality; and (3) optimize overall system performance. Included in the project is the enhancement or replacement of assets including: (1) advanced door systems at Company buildings; (2) security cameras for monitoring capabilities; and (3) gate and lock systems, which include security cameras, motion detectors, intrusion detection systems, and card access systems. Alternatives considered include: (1) not refreshing physical security assets, and (2) defer a portion of the refresh of physical security assets per an asset refresh cycle industry standard. Alternatives 1 and 2 were not selected due to the risk of security concerns, incident resolution, and the inability to meet NERC requirements. The alternative selected maintains compliance, reduces redundancies and gaps in functionality, and improves performance of physical security systems.	2025-01-01	2025-12-31	-1.00	1,903,740	12,626		598,031	-	313,986	37,716	141,435	104,894	-	4,698	-	-	2,902	1,488	307	-
297	2025	Security/OT Field Modernization	New Computers / Hardware	Security	This project will implement new infrastructure for accomplishing improved security in the field for OT assets. Gas and Electric technicians are using corporate laptops to manage critical OT infrastructure which does not follow cyber security best practices for managing critical infrastructure. The value of this project is deploying dedicated company OT laptops and associated OT infrastructure that can move between OT locations only and providing a secure environment. This project will procure and configure approximately 130 devices that will be used to manage critical OT infrastructure. The Company reviewed several options to mitigate cyber security risks inherent with the use of standard corporate laptops managing critical infrastructure. The alternatives considered are: (1) Continue utilizing existing profile way of using Corporate domain laptops with software installed; (2) Engage in a custom design and implement a proposed infrastructure; (3) Considered to replace all allow use of all local access to critical systems; (4) Consider extending the OT network to remote Company locations; (5) Deploy a dedicated company OT laptop and OT communications circuits, which includes cellular connectivity. The dedicated OT laptop and communications circuits presented the best way to secure the critical infrastructure by limiting internet and e-mail access. Vendors and subcontractors could also utilize these approved dedicated systems for managing infrastructures they help support at Company locations. Based on the analysis performed, the Company chose to deploy a dedicated OT laptop and communications circuits.	2025-01-13	2026-06-01	-1.00	1,161,568	305,600	ROM	262,478	-	89,313	107,239	-	7,507	58,219	72,777	13,022	-	-	-	-	59,754
298	2025	20% ROM Adjustment - Security	New Computers / Hardware	Security	This is for the 20% ROM Adjustment for Security projects.							(32,496)	-	(17,910)	(21,448)	-	(1,501)	(11,644)	-	-	-	-	-	-	-
299	2025	Application Currency-Security-Capital	Software(intangible)	Security	This project will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Security global assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protection; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The applications upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risks; penalties/ impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Application within Security are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risk of failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	146,200	4,622	ROM	45,951	-	-	31,450	-	-	14,521	-	1,720	-	-	1,459	-	260	-

300	2025	Application Currency-Security-O&M	Software(Intangible)	Security	This project will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrade. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Security/Global assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (3) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within Security are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2025-01-01	2025-12-31	-1.00	-	155,827	ROM	-	-	-	-	-	-	-	57,909	-	-	-	49,137	-	8,772	-
301	2025	Enhancements-Security-Capital	Software(Intangible)	Security	This initiative will use Capital funding to make enhancements to existing technology and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements in accordance with accounting rules. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from review or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Security lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Security in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing a Security enhancement, a review is completed to identify the best solution. During that review, requests for the funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	1,598,988	99,967		508,562	88,189	7,985	160,393	70,062	176,273	-	37,195	-	-	2,703	19,151	15,340	-
302	2025	Enhancements-Security-O&M	Software(Intangible)	Security	This initiative will use O&M funding to make enhancements to existing technology and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Security lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Security in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing a Security enhancement, a review is completed to identify the best solution. During that review, requests for the funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2025-01-01	2025-12-31	-1.00	-	399,129		-	-	-	-	-	-	-	148,515	4,580	-	132,378	2,655	8,902	-
303	2025	Saviynt Enterprise Identity Governance and Access (EIGA) Implementation	Software(Intangible)	Security	This project will implement Saviynt EIGA modules, consolidate Identity Access Management (IAM) functionality into Saviynt, and retire the Identity Manager application. By implementing the new solution, the Company will optimize IAM functionality, eliminate redundancy, and reduce support costs. In addition, the project will integrate the OT network with the IAM solution that will allow for automated management of users and entitlements in the OT Active Directory domains and applications. The current version of Access Show reached end-of-life in December 2022, with support discontinued in January 2023. The application has numerous custom workflows and integrations, requiring professional services for ongoing use and changes. It lacks proper data analytics and reporting, posing risk such as inability to fix critical defects, software incompatibility, compliance issues, increased costs, and degraded performance. The Company uses multiple IAM tools, each performing critical functions, leading to numerous required interfaces and customizations. While beneficial for end users, these integrations increase the risk of system failure, higher support costs, multiple subscriptions, infrastructure and maintenance costs, and more expensive upgrades. The current solution built on SAP HR batch file processes that introduced failure points, delays, and data integrity issues. Failure in these processes can prevent new or transferred employees from accessing necessary systems, leading to operational disruptions and potential compliance risks due to inappropriate access retention. This project provides value by: (1) Consolidating multiple IAM platforms through the implementation of the Saviynt Enterprise IGA Module, reducing complexity and support costs; (2) Decreasing complexity and enhancing efficiency by reducing interfaces between multiple identity tools; (3) Improving the end-user experience and reducing human struggle with access requests through a new, intuitive portal design; (4) Minimizing custom code and focusing on configurations only by utilizing out-of-the-box functionality; and (5) Streamlining employee data processing with the implementation of a consolidated Identity Governance Administration (IGA) platform. (2) Standardizing processes by removing custom code and using out-of-the-box functionality; (3) Right sizing and improving access security; (4) Addressing issues with aging applications vs. multiple IAM platforms, integration challenges, and anticipated HR process drag. Alternatives considered include: (1) implementing hot fixes to Access Now version 11.5 to ensure support through mid-2023; (2) Upgrading only the application to current supported version, including the new web portal but will including new application on function rolling; (3) Remaining on current version that will be unsupported as of January 2023, requiring vendor professional services for any break / fix. Patches and enhancements may potentially introduce additional risk of version instability; (4) Implementing IAM functions in Saviynt platform into manage access requests, including Active Directory, SAP, SAP HR, disconnected systems, and existing API integrations. The alternative selected was implementing the new Saviynt system, eliminating AccessNow software.	2023-11-27	2024-06-30	-1.00	5,913,132	710,912		597,282	-	31,480	96,804	345,730	43,518	79,800	167,555	74,414	-	52,276	-	3,659	37,207

306	TOTAL	2025																							
307	2026	2025 Union Contract Changes	Software(Intangible)	Corporate	The 2025 Union Contract Changes project will implement SAP and other system changes required as a result of three collective bargaining agreements which will be renegotiated and ratified. Collective bargaining agreements expire every five years for Operating Maintenance and Construction (OMC) Electrical Operating Maintenance and Construction (OMC) CCC (Customer Contact Center) and Zeeland employee groups. For OMC, the current agreement ends June 1, 2025. CCC agreement ends in August 1, 2025. Zeeland agreement ends October 1, 2025. Technology changes are required to reflect these new agreements. Otherwise, employees in these union groups may not be paid appropriately or get correct benefits. Completion of this project will provide value to the Company and its customers through: (1) ease to eliminate by making changes in the software for any pay and benefit changes as required by the new agreements; (2) defect reduction by adding process automation to otherwise manual processes for tracking and recording work, premium, and absence time; and (3) improved employee engagement among the OMC, CCC, and Zeeland union employees. The scope of this project encompasses making any system changes required to support the new working agreement for the OMC, CCC, and Zeeland employees. Exact details will be finalized after the negotiation process is completed and contracts are approved. Three alternatives were considered for this project: (1) Make no system changes after the contracts are ratified. This option was not chosen because it exposes the Company to possible fines, disengaged employees, unimplemented agreements, significant manual processes leading to greater possibility of errors, hiring additional staff to perform activities outlined in the agreements, and increased legal costs due to employee grievances. (2) Find other third-party software to support the changes required by the union agreements. This option was not chosen because it would require SAP integration along with additional software licensing and maintenance costs. (3) Make system changes to eliminate manual updating, comply with the working agreement language, support union employee engagement, and reduce grievances. Option (3) was chosen because it leverages current SAP technology, automates what would otherwise require manual processing, and is the least costly option	2025-04-01	2026-01-01	0.00	-	618,667		-	-	-	-	-	-	-	102,384	-	-	-	41,430	54,254	6,700	-
308	2026	Application Currency-Corporate-Capital	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective databases; (2) assessing any new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	197,340	18,540		61,248	-	53,481	5,343	-	220	2,249	6,768	-	-	6,325	-	443	-
309	2026	Application Currency-Corporate-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective databases; (2) assessing any new functionality for value to the Company; (3) making necessary configurations changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	-	332,567		-	-	-	-	-	-	-	120,853	-	-	112,947	-	7,906	-
310	2026	Asset Accounting Tax Upgrade	Software(Intangible)	Corporate	The project will upgrade our current accounting asset management tax software to the SaaS version as required by the vendor or a replacement solution and implement additional new features, ensuring continued support of a critical financial application, and providing new functionality. In 2026, standard vendor support ends for the current on-premise PowerTaxs software. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. In addition, the upgrade provides additional functionality to increase the frequency of financial reporting and improve visibility. This project creates value for the Company by ensuring compliance with regulated and financial accounting with the fixed asset sub-ledger. In addition, the project adds value by: (1) moving to a SaaS solution in order stay supported; and (2) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support. The project scope includes: (1) evaluating current vendor/product solution with market leaders; (2) upgrading the vendor software from the current version to the newer SaaS version or replacing it. Alternatives considered include: (1) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements. (2) Do nothing and remain on unsupported, on-prem tax solution. This option introduces technical and financial risk which would be costly; (3) Upgrade to the newest SaaS version of current on-prem solution. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing.	2026-02-01	2026-01-31	-1.00	-	1,572,781	ROM	-	-	-	-	-	-	-	122,121	101,011	-	9,864	9,864	1,381	-
311	2026	Asset Accounting Upgrade 2025-2026	Software(Intangible)	Corporate	The project will upgrade our current accounting asset management software to the latest version as required by the vendor, ensuring continued support of a critical financial application. Standard vendor support will be ending for the current on-premise software on an undisclosed timeline. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. There are also larger costs to upgrade if the upgrades are further apart due to complex trigger activities and too many versions increases at any one time. This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub-ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) automating manual tasks; (3) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support; and (4) lowering costs with more frequent upgrades to reduce testing complexities and reduce the number of versions to be adopted. The project scope includes: (1) evaluating current vendor/product solution with market leaders; (2) upgrading the vendor software from the current version to the newer version. Alternatives considered include: (1) Evaluate SAP options for leasing, asset, and tax management capabilities. While this option would eliminate the need for an interface between SAP and PowerPlan, it would be more complex, at a more, and not provide all the required features. (2) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements. (3) Analyze and go to do all possibilities (4) wait until a future upgrade; (5) Upgrade to the newest version of current solution. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrade, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing	2025-02-01	2026-01-31	-1.00	-	682,561	ROM	-	-	-	-	-	-	-	26,387	-	-	4,932	-	21,455	-
312	2026	Enterprise Risk Management	Software(Intangible)	Corporate	The project will implement software to simplify processes pertaining to Enterprise Risk Management, improve efficiency, provide risk identification and repository tools, and provide real-time risk information. The Enterprise Risk Team (ERT) works with Risk Owners (ROs) on an annual basis to identify new risks, update existing risks, quantify impacts and likelihoods of these risks, document mitigation plans, identify trends, and formulate risk tolerance metrics. This work is accomplished through an Excel workbook and Word process between ERT and ROs to gain alignment on content. This effort culminates in multiple Risk Map PowerPoint, Microsoft Word and email documents presented to senior management and to the Board of Directors (BoD) on an annual basis. The Interview, time-consuming manual Enterprise Risk Management (ERM) process creates risks of human error that can go undetected or create version tracking issues. The existing process results in substantial inefficient use of time by risk analysts and risk owners throughout the Company, limits the breadth of analysis that can be provided, and limits the overall ability of the Company to timely identify, analyze, and communicate risk to our senior leaders, thereby causing potential delay in responding to emerging risks. Because of the lengthy manual process, it is only performed once a year, but must be performed more frequently to proactively manage enterprise risk. Utility industry peers leverage software to more effectively manage enterprise risk management programs. This project creates value for the Company by: (1) providing real-time risk information to interested parties including risk champions, risk owners, senior management, and the Board of Directors (BoD) supporting proactive risk management; (2) creating a centralized and repository for risk identification, management, and mitigation plans; (3) eliminating waste by simplifying processes; and (4) improving efficiency of the risk owners and analysts. The scope of the project includes: (1) create risk analysis templates and models for automated reporting; (2) configure automated workflows for periodic risk updates; (3) configure dynamic templates that prompt the risk owners based on prior selections; (4) organize risk assessments through an online and searchable data capture (repository); (5) create new reports and executive dashboards; (6) data conversion; and (7) set record retention rules. Alternatives considered include: (1) Continue use of the current manual process which result in waste, lack of quality results, and annual review of risks; (2) Build a custom internal enterprise risk solution. This option was not selected as it will not result in an enterprise risk program that leverages best practices that exist in software provided by the leaders in risk management software; and (3) Implement a software solution from a leading enterprise risk solution vendor. While this would introduce new license and ongoing support costs, it is the preferred option because it leverages industry best practice with a proven solution; provides application reliability, security, and stability through ongoing vendor support; and brings innovation and insights via the reporting of risk information through management dashboards. In addition, it aligns the Company with utility industry peer practices for more effective enterprise risk management.	2026-01-01	2027-01-01	-1.00	-	609,253	ROM	-	-	-	-	-	-	-	31,708	-	-	9,773	21,246	688	-
313	2026	Expense Reporting Improvements	Software(Intangible)	Corporate	The Expense Reporting Improvements project will increase productivity when creating expense reports; leverage workflows for expense processing and exceptions; improve adherence to company policies, provide insights through improved reporting and minimize human intervention and struggle throughout the expense process. Multiple problems exist with our current expense reporting system in the areas of usability, employee engagement, inefficiencies, compliance, and audit exceptions. Submitting expense reports is not intuitive, leading to errors and the need for manual intervention. In addition, employees have to manually create risk analysis templates and models for automated reporting; (2) configure automated workflows for periodic risk updates; (3) configure dynamic templates that prompt the risk owners based on prior selections; (4) organize risk assessments through an online and searchable data capture (repository); (5) create new reports and executive dashboards; (6) data conversion; and (7) set record retention rules. Alternatives considered include: (1) Continue use of the current manual process which result in waste, lack of quality results, and annual review of risks; (2) Build a custom internal enterprise risk solution. This option was not selected as it will not result in an enterprise risk program that leverages best practices that exist in software provided by the leaders in risk management software; and (3) Implement a software solution from a leading enterprise risk solution vendor. While this would introduce new license and ongoing support costs, it is the preferred option because it leverages industry best practice with a proven solution; provides application reliability, security, and stability through ongoing vendor support; and brings innovation and insights via the reporting of risk information through management dashboards. In addition, it aligns the Company with utility industry peer practices for more effective enterprise risk management.	2026-06-01	2027-06-30	-1.00	1,212,000	216,600	ROM	185,248	-	-	62,860	78,575	9,900	33,913	52,238	-	-	-	29,765	14,883	3,125	4,465

MICHIGAN PUBLIC SERVICE COMMISSION
Consumers Energy Company
Synopsis Containing Descriptions, Scope, Benefits, Implementation Dates and Detailed Costs of Actual and Projected Gas & Common Capital Expenditures and O&M Expenses
For the years 2023, 2024, 2025 and 2026
Information Technology Department

REDACTED

Case No.: U-21806
Exhibit No.: A-20 (SHS-5)
Page: 22 of 27
Witness: Sheldon
Date: December 2024

314	2026	HR Support Pack and Business Software Inc Upgrade 2026	Software(Intangible)	Corporate	The Human Resources (HR) Support Pack and Business Software Inc (BSI) upgrade will update the SAP system with HR Support Packs that are released annually by SAP to comply with HR and tax changes. SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax change, resulting in the inability to calculate and distribute payroll. This project creates value for the Company by: (1) ensuring that its systems are in compliance with new financial rules and regulations; and (2) ensuring that it can calculate and distribute payroll. The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information to the Company. Alternatives considered include: (1) Not upgrading to the current support packs which results in noncompliance with financial rules and regulations and inaccurate payroll; (2) there is no economical cloud solution, so this option was not entertained; (3) apply the appropriate support pack upgrade. Option (3) is the preferred option because it enables the company to comply with HR and tax changes, resulting in the ability to correctly calculate and distribute payroll.	2026-02-05	2026-12-31	0.00	-	785,068		-	-	-	-	-	-	-	-	-	-	-	285,289	-	-	28,764	-	38,668	201,075	16,782	-
315	2026	Product Family Enhancements-Corporate Capital	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities as sociated with Capital enhancements. The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for small-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and, Public Affairs. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	2,929,434	418,489		930,721	-	-	591,703	12,572	42,299	274,147	155,706	-	-	197,045	8,475	10,186	-
316	2026	Product Family Enhancements-Corporate-O&M	Software(Intangible)	Corporate	The Corporate Services initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities as sociated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and, Public Affairs. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	-	458,548		-	-	-	-	-	-	-	170,625	-	-	159,463	-	11,162	-
317	2026	Self Service Vendor Portal	Software(Intangible)	Corporate	The work will create an external portal for vendors to exercise self-service features to streamline and automate purchase order and invoice management and improve visibility to invoice and payment status. For Accounts Payable, vendors must repeatedly interact with the Company through multiple channels to ask questions, submit invoices, or check invoice or payment status, including email, physical mail, or the phone. Once a request is submitted, additional calls, emails, or Company portal requests are required for status updates, to make payments, or to respond to missed contacts. The existing service portal has functionality limited to incoming vendor inquiries only and lacks self-service options for vendor invoice and payment management and lacks the ability for vendors to utilize business invoice creation from POs. The limitations of the existing portal result in waste and inefficiencies for vendors and Company employees/contractors, which currently includes 6 contracted resources, and creates the potential for late payments or missing early payment discounts. For Supply Chain, vendors must repeatedly interact with the Company through multiple channels to ask questions, update PO's (quantities, costs, shipping dates) including email, physical mail, or the phone. Once a request is submitted, additional calls, emails, or Company portal requests are required for status updates or to respond to missed contacts. The existing service portal has functionality limited to incoming vendor inquiries only and lacks self-service options for updates to the POs. The limitations of the existing portal result in waste and inefficiencies for vendors and Company employees/contractors, which currently includes 6 contracted resources. This also creates the potential for late payments, missing early payment discounts, delays in receiving due to lack of shipping notifications from vendors, delays to scheduled work due to lack of acknowledgement and lead time adherence, and the inability to enforce contractual obligations. This project creates value for the Company by: (1) creating self-service functionality/increasing touchless invoice creation/processing that also ses the vendor to select items from a purchase order to create an invoice on demand; (2) providing vendors with real-time invoice and payment status, increasing end-payer productivity by eliminating waste; (3) allow self-service updates of vendor master data (banking info, remittance info, etc.); (4) fewer late payments by vendors thus reducing Company follow up and tracking; (5) creating better visibility for vendors to take advantage of early payment discounts thus reducing related vendor inquiries; (6) reducing vendor questions related to invoice and purchase orders through self-service functions and portal information; (7) reducing the cost per invoice; (8) creating self-service functionality/increasing touchless PO creation/processing that also ses the vendor to select items from a purchase order to update quantities, costs, and shipping dates; (9) providing vendors with real-time PO information, increasing end-payer productivity by eliminating waste; and (10) fewer late deliveries by vendors thus reducing Company follow up and tracking. The project scope includes: (1) submit an RFP for a vendor portal solution and implementation; (2) configure ability for vendors to more efficiently and more accurately self-submit invoices and POs; (3) configure ability for vendors to self-convert items on a purchase order to an invoice; (4) configure ability for vendors to view invoice and payment status; (5) configure ability for vendors to make changes to SAP master data, including PO line item details; (6) configure ability to offer/process dynamic discounting; (7) create new reports and dashboards; (8) enable/embed tool to validate vendors should have access to the portal and removing access when appropriate; (9) configure ability for vendors to make self-serve changes to shipping status and delivery dates; and (10) integration to vendor invoice management system and SAP. Alternatives considered include: (1) Continue use of the current manual processes which results in waste and inefficiency for employees and vendors. This could also result in late payments and lost discounts for vendors; (2) Build a custom solution. This option was not selected as the Company has a vendor portal, that is only leveraged for vendor ask questions. As well, it doesn't leverage best practices; (3) Building a combination of custom and standard integration to existing solutions. This option was not selected because it doesn't follow industry best practices; (4) expand our current vendor portal. This option is not chosen due to limited functionality and roadmap, and (5) implement a new SaaS solution specific to a vendor portal experience. Option (5) is the preferred option because it leverages industry best practices with a proven solution; provides application reliability, security, and stability through ongoing vendor support; and brings innovation to vendors via real-time process sing.	2025-09-01	2026-08-15	1.13	134,816	1,839,600	ROM	41,378	-	-	27,658	-	1,936	12,778	47,774	-	-	14,883	29,765	3,125	-
318	2026	30% ROM Adjustment - Corporate	Software(Intangible)	Corporate	This is for the 20% ROM Adjustment for IT projects.							(57,776)	-	(10,686)	(19,172)	(15,715)	(2,411)	(9,811)	-	-	-	-	-	-	-
319	SUBTOTAL	2026 Corporate										1,151,789	-	40,745	668,393	75,652	51,964	315,276	1,121,853	139,775	-	801,096	339,563	82,155	4,465
320	2026	Application Currency Customer-O&M	Software(Intangible)	Customer	The Customer initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Customer digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impact stability and functionality, leading to fewer incidents due to outdated software; and (4) address repression interdependencies and repairability between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software; (2) assessing new functionality for value to the Company, (3) making necessary configuration changes, (4) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications with Customer are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the funding of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future	2026-01-01	2026-12-31	-1.00	-	183,110		-	-	-	-	-	-	-	65,609	-	-	61,317	-	4,292	-
321	2026	Customer Order Service Tracker	Software(Intangible)	Customer	Short cycle orders including gas emergencies and meter services account for many of the incoming customer inquiries to the contact centers. This project will implement a service order status tracker to provide transparency to customers and overnight to internal teams supporting utility service orders across Company service areas. The tracker will provide timely and accurate service order updates, creating a more robust customer experience for tracking service order status and location-based updates. Customers have limited visibility to when Company assigned crews will be on premise and what work will be completed. This is due to features missing within the Company's digital channels for accurate updates from dispatch, scheduling, and field crews. The lack of awareness drives calls into the call center, resulting in approximately 365,000 annual contact center calls related to short cycle requests. Additionally, this lack of visibility increases truck rolls due to dispatchers being unaware of crew locations and routes which can cause crews to be assigned when a local crew could have completed the work. This leads to overall customer dissatisfaction because of a lack of visibility to scheduled and ongoing short cycle work. Enabling a digital channel for communication regarding utility service orders will improve customer experience and reduce the waste of repetitive crew dispatching. This project will add value to the Company and its customers by: (1) providing transparency for customers on the timing and location of the associated crew completing utility short cycle service orders, (2) reducing calls to contact centers by customers seeking clarification regarding arrival times through visibility to scheduling, real-time crew locations and updated estimations to customers when crews are enroute, (3) improving service assignment by current location, which decreases wasted truck rolls through enabling location services for active crews, (4) increasing visibility into the service person(s) completing the order by enabling crews to connect with customers through digital channels, and (5) improving customer experience for short cycle service orders by implementing a channel of choice for Company interactions. The scope for the project includes: (1) modifying the customer self-service portal to include features that support utility service order tracking, including the location of crews en-route, (2) providing tasking and mobile capabilities, (3) enhancing the existing Geo wallenci platform to allow real-time status updates that can be communicated to customers, (4) utilizing location-based services to update internal portal in real-time, and (5) enabling text and email notifications to alert customers of service crews arrival times. Alternatives considered for this project include: (1) Daptay a mobile application to address utility service order tracking, (2) utilize a cloud hosted solution from a third-party, (3) modify the existing customer portal to enable customers and the Company to track utility service orders, and crews. Options one and two were not selected as the cost associated with deployment would greatly outweigh the benefits with poll reductions and improved customer experience. The third option was selected because it utilizes existing technologies, which reduces the implementation complexity and project cost and has faster value realization for the customer and the Company.	2025-01-10	2026-08-28	-1.00	4,021,500	1,186,250	ROM	505,588	-	-	141,435	188,580	23,101	152,467	189,039	-	-	55,810	74,414	9,116	-
322	2026	Energy Assistance Enhancements and Maintenance Annual Updates	Software(Intangible)	Customer	The Energy Assistance Enhancements and Maintenance Annual Updates project, formerly known as Consumers Affordable Resource for Energy (CARE) project, will implement software changes to offer energy assistance to low income customers and streamline the process for the assistance agencies who use the assistance portal. This is accomplished through improved user interface and updates to SAP processes various requests. Upcoming modifications will be identified following an ongoing and annual review of requests, that includes criteria from the Department of Health and Human Services (DHHS) and Michigan Public Service Commission (MPSC) to prioritize the list of changes. Each grant year, DHHS and MPSC stipulate the criteria required for customers to enroll in the CARE program, how the Company and agencies will manage the enrollment process and track active CARE customers, and how they will administer the Michigan Energy Assistance Program (MEAP) benefits through bill credits and arrears forgiveness. The criteria changes significantly each year, therefore, the Energy Assistance Enhancement and Maintenance Annual Updates application requires modifications to meet the new requirements. If the regulatory requirements are not fulfilled, the Company is at risk of losing state Low Income Energy Assistance Fund (LIEAF) funds to assist low-income customers with paying their energy bills, thereby increasing the customers risk of shutoff for non-payment. In addition, our energy assistance programs function within all software platforms in the company which consistently need enhancements and updates. The project will provide the following value: (1) complete modifications to internal SAP applications and Agency Portal to receive LIEAF funding, which can be used to provide customers their bill credits and arrears forgiveness; (2) improve the data within the assistance agencies portal, thereby making it easier to assist customers in need of LIEAF funding; and (3) complete modifications to customer facing platforms. The project scope includes: (1) updating the enrollment and status process; (2) allowing for multiple bill credits; (3) improving reporting; (4) updating the arrears forgiveness plan; (5) satisfying additional regulatory requirements for the annual grant rule changes required by the Department of Health and Human Services and Michigan Public Service Commission; (6) updating CARE during process; and (7) updating the assistance portal (CEPAS) functionality to enhance Agency Self-Service. Alternatives considered include: (1) continue with current process. This alternative was not chosen because it was utilized to loss of grant funding, thus decreasing or eliminating energy assistance dollars for customers; (2) transfer administration of Energy Assistance Programs to a third party organization. This alternative was not selected because it would remove ownership and visibility into the health of the program while increasing administrative costs; and (3) make small updates to the applications, which will allow agencies to easily enroll customers in assistance programs and allow placement of holds to stop or prolong credit activity until assistance decisions are granted. This option was selected since it provides long-term proactive energy assistance to customers and prevents loss of grant funds. Changes are required to internal systems such as SAP, a large internal system that supports broad areas of the business, and the Agency Portal, an internally developed web application, therefore a single cloud or third-party alternative is not viable. Additionally, retiring the existing Agency Portal for a new application would increase costs beyond that of the routine upgrades.	2026-01-01	2026-12-31	0.00	-	332,623		-	-	-	-	-	-	-	123,769	-	-	105,821	9,851	8,097	-
323	2026	Product Family Enhancements-Customer-Capital	Software(Intangible)	Customer	The Customer initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Customer Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	5,820,555	757,158		1,828,401	-	-	727,570	718,671	55,035	328,125	381,714	-	-	239,189	18,392	24,134	-
324	2026	Product Family Enhancements-Customer-O&M	Software(Intangible)	Customer	The Customer initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in the Customer Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Customer. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Customer Experience and Operations, Applications Support and, Device Management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	-	434,156		-	-	-	-	-	-	-	161,549	-	-	100,024	32,584	9,211	19,729
325	2026	Rate Change Maintenance	Software(Intangible)	Customer	The Rates Change Maintenance project will modify SAP billing in accordance with pricing and rate change requirements. For the Company to continue to meet and comply with the Michigan Public Service Commission (MPSC) rate change requirements, there is a need to make periodic updates/modifications to the existing price and rate structures. These updates help ensure accuracy of billing and provide optimal rates for customers. The project will add value for both the Company and its customers through: (1) improved customer satisfaction by providing accurate billing, (2) optimized rate configuration enabling rate changes to be made more efficiently; and (3) timely updates to Company applications that incorporate mandatory changes to the rate structure that include new surcharges, price changes, and energy efficiency programs. The scope of the project encompasses: (1) implementation of annual or monthly (or both) electric and gas customer price changes, and rate structure changes as approved by the MSPC; and (2) optimizing the rate configuration in the Company's back-end systems for more efficient rate changes. An alternative considered for this effort was a fully dedicated offsite development model. The option ensured resources were readily available with a more cost-effective labor expense. This alternative was not chosen due to the risk of billing inaccuracies and customer complaints. These risks were deemed too high because of the complexity of the rate structure, new development, and the timing it would take for testing of this model. Cloud is not an applicable option in this case as we are not replatforming software. The option to use onsite resources to plan, coordinate, and execute the rate changes was selected as it supports the Company's operation model for rate changes.	2026-01-01	2026-12-31	0.00	-	318,120		-	-	-	-	-	-	-	118,372	-	-	110,628	-	7,744	-

328	2026	Application Currency-Electric & Gas Shared-Capital	Software(Intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risks; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database; (2) assessing new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the Electric and Gas Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increase of number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	304,000	34,000		119,158	-	22,001	69,460	-	32,091	-	7,962	-	-	7,441	-	521	-
329	2026	Application Currency-Electric & Gas Shared-O&M	Software(Intangible)	Electric & Gas Shared	The Electric and Gas Operations initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risks; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software; (2) assessing new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the Electric and Gas Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increase of number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	-	635,392	ROM	-	-	-	-	-	-	-	286,429	-	-	220,961	-	15,467	-
330	2026	Application Currency-Operational Technology-Capital	Software(Intangible)	Electric & Gas Shared	The Operational Technology initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Operational Technology logs adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risks; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database; (2) assessing new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the Operational Technology logs are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increase of number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology logs landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	225,228	55,469	ROM	91,582	-	-	38,018	-	2,661	14,903	20,638	-	-	19,288	-	1,350	-
331	2026	Application Currency-Operational Technology-O&M	Software(Intangible)	Electric & Gas Shared	The Operational Technology initiative will utilize O&M funding to keep applications current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Operational Technology adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risks; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database; (2) assessing new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Applications within the Operational Technology are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure; (2) an increase of number of incidents; (3) paying increased support costs; and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology logs landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	-	325,990	ROM	-	-	-	-	-	-	-	121,301	-	-	113,365	-	7,935	-
332	2026	Next Generation electronic Shift Operations Management System(eSOMS)Replace(Software(Intangible)		Electric & Gas Shared	The project replaces the eSOMS with updated cadence lock out tags out ("LOTO") management software for Electric Generation facilities, and narrative log and mobile rounds functionality for Electric Generation and Gas Compression facilities. The vendor is replacing the current system used at the Company and other utilities with a new software package called Lumada. The software migration is necessary for the Company to retain vendor support, so that the databases on the now to receive security patches, bug fixes, and functionality support from the vendor, and avoid security, stability, and reliability risk. The project will add value by: (1) maintaining functionality of a critical life safety application; (2) reducing the human struggle that comes from manual workarounds and an older application; (3) empowering employees with proper electronic tools to meet customer expectations; (4) enabling process improvements to deliver outages more effectively; (5) reducing plant down time; (6) increasing reliability; and (7) increasing standardization across the Company. The scope of this project includes: (1) configuring software for clearance management, logbook, rounds, automated emails, and reporting; (2) migrating and archiving data; (3) enabling additional offsite capabilities; (4) integrating the Shift APP for equipment and current status of work orders; (5) add regime integration to SAP for notifications from rounds and clearance functions; (6) testing the software, data migrations and integrations; and (7) updating configuration management databases, runbook, system recovery plan, LOTO work procedures, qualifications training and other standard documentation. Alternatives considered include: (1) continuing to use the eSOMS application, though without vendor support. This alternative was not selected because losing vendor support for this critical application increases risks for application security, reliability, and supportability that can result in an employee safety incident in the complex tagging process, an extended plant production outage, a prolonged plant reliability issue, or regulatory or compliance violations. (2) instituting the manual business continuity process until the application replacement is possible. This alternative was not selected because it would also increase the previously mentioned potential risks. (3) Replacing the eSOMS application by customizing SAP. This alternative was not selected as it would be more expensive and introduce additional risk to employees due to poor application fit. (4) Migrating the existing eSOMS data to an out the box application such as the Lumada application. The option to migrate the existing eSOMS application to an on or off the box solution was chosen to minimize cost and risk to the Company and its employees. Cloud hosting of the application infrastructure at the vendor's location was also evaluated though due to the greater cost of this vendor hosting, the application infrastructure will be hosted on premise at the Company.	2026-01-19	2027-08-26	-1.00	912,523	45,658	ROM	188,639	-	6,086	88,255	47,146	6,313	40,859	9,892	-	983	4,742	3,721	446	-
333	2026	Product Family Enhancements-Electric & Gas Shared-Capital	Software(Intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between investigation and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Electric and Gas operations is in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing Software applications investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	848,304	65,300		266,628	-	11,315	31,526	110,948	8,486	104,348	24,296	-	930	8,558	13,767	1,042	-
334	2026	Product Family Enhancements-Electric & Gas Shared-O&M	Software(Intangible)	Electric & Gas Shared	The Electric and Gas operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between investigation and implementation and cannot and should not wait for rate case approval at an individual line item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Electric and Gas Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing Software applications investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	-	183,449		-	-	-	-	-	-	-	68,261	-	-	57,608	5,129	4,538	-
335	2026	Standard Work Plan	Software(Intangible)	Electric & Gas Shared	The Gas and Electric Resource Planning process is solely reliant on spreadsheets and manual data collection from numerous, disparate sources. It is not only time consuming but also prone to errors, leading to potential inefficiencies in resource allocation and a lack of detailed, insightful planning. The sole use of spreadsheets makes analyses and what-if scenario development cumbersome. The lack of workplan controls contributes to the completion of jail-shaved work resulting in unnecessary OT and contractor expense. Implementing a centralized planning platform that will interface with existing systems like SAP, SWPP, and EAM Dashboard would transform our planning organization, offering a clear view of planned work and ensuring that executed work is aligned with strategic objectives. In addition, a more integrated system that leverages automation and real-time data analytics would allow for the immediate, what if scenario planning the business needs to support sound, data-driven decision-making. The tool, alongside new synapses and system enhancements will streamline the workflow and ultimately lead to schedule quality and ensure prudent overtime and contractor usage through reducing the amount of unplanned work breaking into the work management process. As a first-to-a digital solution that fully aligns resources, work units and feeds the schedule will represent a significant step forward in resource management, aligning with modern best practices. The Gas and Electric Resource Planning process is solely reliant on spreadsheets and manual data collection from numerous, disparate sources. It is not only time consuming but also prone to errors, leading to potential inefficiencies in resource allocation and a lack of detailed, insightful planning. The sole use of spreadsheets makes analyses and what if scenario development cumbersome. The lack of workplan controls contributes to the completion of jail-shaved work resulting in unnecessary OT and contractor expense. The project will add value by: (1) Improving Work Planning Annual Forecast Process: This involves the enhancement of automated inputs, processing and reporting with a shift towards a more asset-driven prioritization method and; (2) converting Monthly Work Plans into Weekly Schedules: Establish a process that seamlessly transforms monthly work plans into executable weekly schedules for each yard off from planning to scheduling; (3) providing the ability to Run Forecasting and Planning Scenarios: Execute forecasting and planning scenarios and provide comparative analysis; (4) Improve system reliability of Work Planned jobs: Increasing forecast accuracy of slow rate work processes; and (5) creating multiple dashboards based on the audience of the data providing visibility across all levels of Operations Leadership as well as Supply Chain proactively informing of upcoming workload, potential gaps, opportunities for contingencies if teams are pulled and clean executable work keeping our workforce fully engaged and productive. This results in improved Field Operations & Customer Satisfaction with delivery commitments and meeting reliability and compliance dates. The project scope includes the following: (1) Developing a system for Work Planning Annual and Monthly Forecast with automation; (2) creating the ability to translate the Monthly Forecast into executable Weekly Schedule; (3) creating technology for running Planning Scenarios with ability to compare scenarios for optimized field execution; (4) improving system reliability of Work Planned jobs: increasing forecast accuracy of downstream processes (ie. material); and (5) building Dashboards and reports to provide visibility and help management maintain process control. Alternatives considered: (1) Purchase commercially available system. This option was not selected as a single all-encompassing system does not link the Annual Forecasting to execution. Products reviewed included Prometheus. (2) Microsoft Excel based solution, extending the Microsoft excel based solution was not selected as it does not provide the level of data integration for controlling large number of forecasted work items. (3) Development of a system that integrates with our SAP investment. This option was not selected as it does not align to expected value delivery timeline. (4) Purchase a SaaS solution to enable planning & forecasting with integration to our SAP work management system. The fourth alternative was selected because it aligns to the expected value delivery timeline and meets the functional requirements.	2024-06-04	2025-12-28	-0.98	922,440	3,584,900	ROM	-	-	-	-	-	-	-	84,798	-	-	77,762	1,488	5,548	-

340	2026	Compression Air Permit And Compliance Digitalization	Software(intangible)	Gas	The project modernizes and expands the use of software and digital forms in support of station air permits and code compliance at Gas Compression facilities. The current process around air permits and compliance for Gas Compression is cumbersome, largely paper based, and is made up of multiple disconnected systems. This leads to poor visibility, process inefficiency and waste, re-work, equipment risk, and human error. No project provides value to the Company through (1) increased productivity by direct data entry in the field, (2) improved quality through increased accuracy of updates completed at the time and place of the work, (3) elimination of the need to enter data into multiple disconnected systems, and (4) improved safety through access to real-time information used at work sites rather than printed procedures and forms. The scope of the project includes: (1) Merging the existing air permit and compliance tools into a single solution, (2) purchasing licenses to add Gas Compression users to the company's existing mobile work management software, and (3) configuring changes in SAP and the mobile work management software to replace the paper-dependent process with the ability to access and update maintenance, operations, and safety information for Gas Compression. Alternatives considered include: (1) Utilize an SAP work management mobile solution. An SAP work management solution was not selected since it is an unproven solution at the Company and would require additional project and support costs. (2) Continue with the manual paper-based process and forms. Continuing with the manual paper-based process and forms was not selected because it would not eliminate the identified process waste, re-work, and human error. (3) Costs rise the existing Electronic Shift Operations Management System (eSOMS) mobile application to add work management functions. A customized mobile application was not chosen because it would require additional project cost and an ongoing support budget for a custom solution that the product was not intended to support. (4) Adopt a cloud based SAAS solution. This option was not selected as it was a high cost option. (5) Utilize the existing Service Suite solution currently deployed for Gas and Electric Distribution. The Service Suite solution was selected because it is both an internally developed solution at the Company and provides the required mobility and digital benefits at a lower cost than other options.	2026-01-06	2027-12-31	-1.00	766,138	109,926	ROM	462,216	-	1,300	300,000	-	21,000	139,755	45,726	-	-	42,735	-	-	2,991	-
341	2026	Gas Distribution Probabilistic Risk Model	Software(intangible)	Gas	The project will implement a risk analysis model for comprehensive predictive risk analysis and model regression distribution pipeline assets. Relative risk models are unit-less measures of risk derived from input information using qualitative data and ordinal scales to produce "risk index" scoring. In simple terms, the relative risk model does not provide true statistical measures. The risk assessment used in the current model provides a score for likelihood, consequence, and risk of one asset only in comparison to other scores. While the outputs provide a sense of relative risk when comparing one pipeline with another, the scores do not provide quantitative scores for probability, frequency, or expected loss of events. Although pipeline operators commonly use relative risk models, the quality of the relative risk ranking relies on subject matter expert inputs, human inferences, and opinions. Completion of this project will provide value to both the Company and its customers. The project scope encompasses the implementation of a probabilistic risk model for gas distribution. Alternatives considered for the project include: (1) Implement a custom, Excel-based probabilistic risk model through a consulting effort. This alternative was not selected because although the effort minimizes the IT cost of the project, the model requires the creation of secondary data sources, leading to multiple "sources of truth". (2) Implement a custom built probabilistic risk model. This alternative was not selected because the custom built solution is analyzed are not mature and have not been widely tested with transmission operators.	2025-10-01	2027-10-31	-1.00	4,510,700	41,870	ROM	1,038,640	-	-	420,000	350,000	53,900	215,740	7,961	-	-	7,440	-	521	-
342	2026	Product Family Enhancements-Gas-Capital	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Gas Engineering and Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor opex and work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating business orientation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund ingare governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a range of benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	1,523,409	181,738		1,523,409	-	14,393	812,355	196,140	70,000	430,500	181,738	-	-	121,098	15,000	45,640	-
343	2026	Product Family Enhancements-Gas-O&M	Software(intangible)	Gas	The Gas Engineering and Operations initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for a make-effort software application change that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Gas Engineering and Operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Gas Engineering and Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Gas Engineering and Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this fund ingare governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using a range of benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	-	239,401		-	-	-	-	-	-	-	239,401	-	-	4,242	202,019	13,256	19,884	-
344	2026	Replacement for Gas Automated Meter Reading (AMR) Technology	Software(intangible)	Gas	This project will replace Iron Field Collection Systems (ICS) and Iron Mobile with the newest Iron Software as a Service (SaaS) Temetra along with replacing Iron Mobile with Temetra Mobile for Gas AMR meters. This will allow the Company to leverage new cloud capabilities and align with the Company's Cloud strategy. The Company is using ICS and ICS mobile to gather gas meter reads. The vendor is replacing these systems with new Cloud software called Temetra and Temetra Mobile due to ICS and Iron Mobile being end of life December 2026. The software migration is necessary to maintain vendor support. Latest security patches, bug fixes, latest functionality while avoiding security, stability, and reliability risks for the Company. Moving to Iron Temetra will ensure no gas meter reading disruption and continued integration with existing gas communication modules and Iron Security Manager. The project adds value by: (1) continuing to collect accurate and timely gas meter reads; (2) removing the risk of being on unsupported versions; (3) utilizing the latest functionality such as retrieving historical data, and pulling reads on demand; (4) seamlessly getting up to date security patches; (5) and reducing ongoing networking equipment replacement and upgrade costs. Included in the implementation is: (1) configuring and deploying Temetra and Temetra Mobile; (2) migrating data; (3) integrating to Iron Enterprise Edition (EE); from Security Manager (SM); gas AMR PI Historian and Data Lake; (5) integrating to Iron Data Collector (MC Itg); (5) testing the software, data migrations and integrations; (6) educating and increasing the skills of the employees to leverage the new cloud services; (7); and decommissioning ICS and Iron Mobile and the on-premise databases and servers. Alternatives considered included: (1) continuing to use the ICS application and Iron Mobile without vendor support. This alternative was not selected because it would add gas meter reading data collection which would negatively impact critical customer billing operations. It would also decouple from the Iron security infrastructure that the other business critical Iron applications use, creating more expense and complexity in the technology environment. (2) Replace the platform with a different mobile gas reading application, which would also require the Company to replace the 1.2 million gas communication modules on the meters. Replacing ICS would require the application business owners to undertake a large initiative requiring multiple years to implement and a multi-team effort from start to finish. It would also increase the amount of technology needed to be supported and add cost to support as it would be a standalone product. (3) Move to Iron's Cloud technology (Temetra and Temetra Mobile). This option best suits customers and the Company's needs for the future as it offers new functionality while maintaining the system integrated into the Iron Security infrastructure and with the other Iron software products in use at the Company.	2026-01-12	2026-10-15	-1.00	1,027,600	112,086	ROM	1,027,600	803,282	-	108,680	57,830	7,608	50,210	112,086	-	-	100,320	4,744	7,022	-
345	2026	Tracking & Traceability	Software(intangible)	Gas	Tracking and Traceability is a project driven from proposed regulatory rules that will require utilities to map new and replacement installations with tracking and traceability data for plastic pipe, fittings, and fusions for the lifetime of the asset. The Company does not currently have a Tracking and Traceability program that will meet PHMSA proposed requirements (PHMSA-2014-0086); also known as the Plastic Pipe Rule. Tracking and traceability refers to the collection of information that provides manufacturing, material type, and location information for pipe and components. PHMSA defines the terms. The project will develop a sustainable Tracking and Traceability program that will meet PHMSA requirements (PHMSA-2014-0086) which address the proposed tracking and traceability requirements. The project adds value by capturing traceability data via barcode readers and location tracking information via Global Positioning System (GPS) equipment to improve the quality of data and assist the Company in determining future scopes of work in the event of any component manufacture recalls. The scope of work will include: (1) changes in SAP Supply Chain processes to capture the required barcode information for all plastic components used in gas distribution and service lines; (2) changes in SAP Work Management processes to account for capturing barcode information as part of material components added to work orders, capturing fusion information from work order completion and capturing GPS coordinates from work order completion; (3) changes in GIS to capture GPS coordinates of plastic components and GPS coordinates of component fusions; (4) building of a repository for tracking and traceability reporting and analysis; (5) purchasing barcode reading equipment for crewrooms and gas distribution trucks; and (6) purchasing of GPS locating equipment to capture coordinates. Alternatives considered: (1) The do nothing alternative, which was not selected because it would expose the company to significant legal and financial risk resulting from non-compliance. (2) Internally develop digital technology supporting the tracking & traceability standards included in the PHMSA-2014-0086 plastic pipe rule. The second alternative is being pursued by the Company.	2025-01-01	2027-06-30	0.00	14,864,950	2,488,640	ROM	7,177,830	-	4,081,350	1,750,000	324,000	143,780	1,068,100	908,350	-	-	395,000	80,000	33,250	-
346	2026	30% ROW Adjustment - Gas	Software(intangible)	Gas	This is for the 20% ROW Adjustment for IT projects.							(1,598,775)	(160,656)	(802,680)	(516,736)	(146,166)	(45,518)	(196,811)	-	-	-	-	-	-	-
347	SUBTOTAL	2026 Gas										9,998,609	642,626	3,225,153	2,879,299	781,616	252,070	1,617,744	1,352,105	31,185	4,248	1,079,013	110,000	124,086	-
348	2026	ARP-Infoblox Refresh	Network	IT-Digital Foundation	This project will replace the three legacy core components, Domain Name System (When Infoblox Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. Consumers Energy also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. The value of this program includes: (1) enabling the Company to efficiently manage and control their network; and (2) providing Domain Name System. The scope of this project includes the replacement of NIOS, DDI and IPAM assets on a six-7-year refresh cycle. The alternative considered was to continue operating existing Infoblox equipment past the vendor's end of support date. This alternative was not selected because it carries risks with not having vendor support, software bug fixes, security updates, and other software fixes. The alternative to replace the existing Infoblox equipment with the latest hardware and software provided by the vendor was selected to avoid these risks and continue a regular refresh cycle.	2026-01-01	2026-12-31	-1.00	197,440	32,100		99,235	-	66,315	14,469	7,235	1,519	5,788	11,943	-	-	5,581	5,581	781	-
349	2026	ARP-Local Area Network	Network	IT-Digital Foundation	This project will upgrade the Company's entire LAN and a significant portion of the Wireless Local Area Network (WLAN). At some Company locations, LAN equipment has been in service since 2011. The project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; (4) ensuring equipment is vendor supported, thereby ensuring support for bug fixes, security updates, and enhanced features; (5) providing consistent wireless coverage across all Company locations; (6) increasing user productivity through higher performing wireless network, which increases the productivity and efficiency of office and field employees. The project scope includes: (1) refreshing the LAN equipment and software across all Company sites; (2) identifying the required features for the new equipment; (3) implementing the new equipment according to industry best practices; (4) replacing wireless network with upgraded infrastructure and verifying wireless coverage is as expected; and (5) collecting wireless survey data for all Company locations in order to design improved wireless network coverage. The alternative considered was to continue operating on the existing platform past the vendors end-of-support date. The vendor support period ended in May of 2016, and paying for extended support is not an option offered by the vendor. The risk inherent in not refreshing the platform is a lack of vendor support resulting in an absence of software bug fixes, security updates, and break fixes. The Company chose to replace the existing equipment with the latest hardware and software available, following a five-year refresh cycle.	2026-01-01	2026-12-31	-1.00	511,110	47,370		246,508	-	180,863	48,230	12,058	1,500	3,858	17,625	-	1,302	12,278	2,977	1,068	-
350	2026	ARP-Radio	Network	IT-Digital Foundation	This project will refresh hardware to include; 800Mhz Radios and infrastructure, cellular modems, plant radios and systems, cellular amplification devices, vehicle consoles in service trucks, other communications equipment, and associated test equipment. 800Mhz, mobile, and portable radios, Plant radio systems, and Cellular modems support core business functions. It's safety communications, and rapid response for restoration of customers service and critical infrastructure. Company radios must be refreshed on a scheduled basis or risk exceeding life expectancy and failing or becoming obsolete. The refresh of this equipment in a proactive manner is critical to providing service to customers. If these units are not refreshed, the increased risk of unit failure would result in interruptions to timely and consistent communications to field personnel to resolve gas leaks, and downed electric lines, or service turn-on requests, with the risk to life safety. This project creates value for customers and the Company by: (1) upholding public safety; (2) ensuring timely responses and repairs to emergent gas leaks, wire downs, and electric outages; (3) ensuring real-time communications between Company dispatch locations and crews in the field; (4) ensuring the safety of personnel working in higher risk workspaces by replacing equipment with units that contain intrinsically safe batteries; (5) supporting continuous improvement and training by replacing equipment that is capable of recording recordings; and (6) meeting rule compliance with NERC regulatory requirements by maintaining critical radio infrastructure. The project scope consists of: (1) scheduled replacement of radios, modems, and consoles; and (2) installing additional radios modems and consoles as is to satisfy growth requirements; and (3) scheduled replacement of out of date cellular and radio boosters. The alternatives considered was included: (1) Replace the existing units with units from other manufacturers and modern manufacturers; (2) purchase new radio subscriber units from existing manufacturers.	2026-01-01	2026-12-31	-1.00	2,508,316	221,783		1,209,761	-	903,172	43,588	226,640	18,917	17,435	82,519	-	-	70,090	6,754	4,861	813	-
351	2026	Application Currency-IT/Digital Foundation-Application Platforms-Capital	New Computers / Hardware	IT/Digital Foundation	The Application Platforms initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive security updates and upgrades to address defects, patch against system threats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades in the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impact stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regular sprontized based on considerations to their include application security, security number of versions behind the current available versions security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database; (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes. Applications within the Application Platforms are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of these efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining a balanced balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) pay ing increased support costs, and (4) preventing enhancements from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and functioning properly. Without these upgrades, the Company will further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	237,591	209,506	ROM	98,638	-	-	40,105	-	2,807	15,721	77,950	-	-	72,851	-	5,100	-
352	2026	ARP-Collaboration	New Computers / Hardware	IT-Digital Foundation	This project will refresh the Company's obsolete or out-of-date audio, visual, telephony and other communication collaborative tools and equipment. When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates. The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for evolving business requirements. The following alternatives were considered: (1) refresh visual assets and a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only.	2026-01-01	2026-12-31	-1.00	1,754,542	222,451		551,458	-	468,384	51,199	26,658	5,017	-	82,767	-	-	9,636	67,716	5,415	-
353	2026	ARP-Core Network	New Computers / Hardware	IT-Digital Foundation	This project will refresh the Data Center network equipment. When network assets that are used to support customer interactions and ensure the stability of mission critical business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; and (4) standardizing network infrastructure across Data Centers. The project scope includes the replacement of all core network devices with next generation devices. The alternative considered was to continue running in the current state or defray the replacement of network devices and accept the risk of further business and customer impact when more equipment failures occur.	2026-01-01	2021-12-31	-1.00	539,800	34,000		169,619	-	157,150	6,286	3,148	1,823	1,257	12,650	-	3,892	3,721	4,465	573	-
354	2026	ARP-Field Device Asset Management (FDAM)	New Computers / Hardware	IT-Digital Foundation	This project will replace field devices according to a four-year refresh cycle that is based on industry standards, hardware failures, security patches, and software compatibility. When Field Device Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with Security updates as equipment becomes obsolete. This project creates value for the Company by: (1) improving stability and availability of business-critical applications by proactively replacing field devices prior to increased hardware failures; and (2) allowing field workers to complete their job tasks. The project scope consists of replacing field devices according to the four-year refresh cycle. The alternatives considered were to: (1) extend the replacement cycle from four years to five years for field devices; and (2) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the assets that need refreshing in future years based on the number of devices that were not replaced during the four-year refresh cycle; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the five-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company elected a five-year refresh cycle to alleviate these concerns.	2026-01-01	2026-12-31	-1.00	7,678,471	5,000		2,413,148	-	2,351,388	42,242	-	2,957	16,897	1,860	-	1,860	-	-	-	-
355	2026	ARP-Operational Technology Support Gas	New Computers / Hardware	IT-Digital Foundation	The ARP- OT Support Gas project will replace dated and obsolete servers on a rotating 5-year refresh schedule. When OT Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value by maintaining the currency of the Company. The program scope consists of: (1) replacement of computer hardware under the program; and (2) installing additional new compute capacity for expanding business requirements. The alternatives considered include: (1) continue to operate hardware beyond a five-year refresh cycle and defer/ramp hardware based on a five-year refresh cycle along with evaluating the health of the asset and evolving business needs. The alternative to operate hardware beyond a five-year refresh cycle was not selected due to the risk that these hardware component failures would cause system reliability and safety for customers. The Company chose the alternative to refresh the hardware based on a five-year refresh cycle along with evaluating the health of the asset and evolving business needs to reduce the risk of impacting critical infrastructure that supports systems such as Gas SCADA and Gas Compression control systems.	2026-01-01	2026-12-31	-1.00	2,765,844	454,194		2,765,844	-	2,214,189	269,960	-	18,897	262,848	454,194	104,814	349,380	-	-	-	-
356	2026	ARP-Printer Asset Management (PAM)	New Computers / Hardware	IT-Digital Foundation	This project will replace and install select printers, plotters, and multi-function printing devices based on printer replacement assessments and a five-year refresh cycle. Printer service and usage history is evaluated and a determination is made if a printer can be repurposed instead of ordering a new one. When Printer Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with firmware and security updates. This project creates value for the Company by: (1) improving the dependability of these printer devices for employees. The project scope consists of the annual replacement of printer assets according to a five-year refresh cycle. The alternatives considered for the project included looking at refresh cycles from three to seven years as well as running the assets to failure. The selection of a five-year cycle was determined to be the best solution since anything less than five years would increase the likelihood of unneeded expense for replacement of assets that were still in good operating condition. Anything greater than five years is assessed monthly to ensure it is not run-to-failure, including running the asset to failure, resulting in additional expenses for maintenance of the equipment and downtime, negatively affecting employee productivity. The Company assesses the printer fleet based on years of active service, service history, printer usage data, and the number of users within a facility. Based on these factors, the Company either decommissions, repurposes, leases in place, or refreshes the printers.	2026-01-01	2026-12-31	-1.00	130,839	5,000		46,128	-	40,480	471	-	33	189	1,860	-	1,860	-	-	-	-

357	2026	AFP-Server and Storage	New Computers / Hardware	IT Digital Foundation	This project will replace or augment server and storage infrastructure for the Company. When Server and Storage Hardware Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support, and can be more challenging to keep current with Security updates. This project creates value for the Company through: (1) improved stability and availability of business-critical applications by proactively replacing server and storage hardware assets prior to the likelihood of increasing hardware failures; and (2) ensuring that adequate resources are available to support application demands after five to seven years of actual use. The scope of this programencompasses es: (1) replacement of server and storage hardware assets; and (2) installation of additional new computers and storage capacity to account for evolving business requirements. The alternatives considered were to purchase extended maintenance, move some of these assets to the cloud with the Digital -Hybrid Cloud and Data Center Migration project, or to replace the assets in the current cycle. The option to purchase extended maintenance was not selected because a full support would not be offered after seven years, and maintenance costs would increase. The preferred option is to move so me of these assets to the cloud in the Digital Hybrid Cloud and Data Center Migration project while refreshing the remainder using the five- to seven-year cycle as it is the most cost-effective option. If the Digital-Hybrid Cloud and Data Center Migration project is not expressed as part of this rate case, the Company plans to continue to refresh these critical technologies at the current level based on a five- to seven-year refresh cycle to mitigate the risk of failure.	2026-01-01	2026-12-31	-1.00	2,302,530	683,050		715,681	-	603,300	78,575	-	5,500	36,302	179,727	150,224	-	-	42,788	3,721	2,995	-
358	2026	ARP-Workstation Asset Management (WAM)	New Computers / Hardware	IT Digital Foundation	This project will replace and install new desktops, laptops, and tablets on a five-year refresh cycle based on industry standards, hardware failures, security patches, and software compatibility. Monitors will be replaced every eight years based on Company data related to historical failure rates. When Workstation Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle. This project creates value for the Company by: (1) improving stability and availability of business-critical applications by proactively replacing workstations prior to increasing hardware failures; and (2) allowing business partners to complete their job tasks. The project scope consists of: (1) replacing workstation assets; and (2) installing new units for new resources. The alternatives considered were to: (1) extend the replacement cycle from five years to six years; (2) extend the replacement cycle only on desktops from four years to five years; and (3) use outdated equipment. The Company did not select these options because it: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the ARP infrastructure costs that were not replaced during the four year refresh cycle; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the four-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle for desktops, laptops, and tablets, and an eight-year cycle for monitors to alleviate these concerns.	2026-01-01	2026-12-31	-1.00	6,070,278	60,792		1,907,888	-	1,813,670	44,610	26,797	4,996	17,844	22,619	-	-	21,470	1,073	-	75	-
359	2026	Operational Technology (OT) Datacenter Migration	New Computers / Hardware	IT Digital Foundation	The OT environment consists of systems supporting the control and monitoring of electric grid, electric generation, gas compression and natural gas pipeline. These systems are critical for safe and reliable natural gas and electric delivery. The OT Datacenter Migration project enhances the Company's capabilities by re-hosting to an enhanced datacenter at a vendor facility. The Company's current datacenter for the OT environment needs modernization and relocation from the Parnall Data Center. The current location is not the preferred location to house servers and systems critical to the control of the Electric Grid or Gas Pipeline due to the close proximity to a railway system. The climate conditions in the current OT datacenter are aging and have had faults resulting in unplanned shutdowns. The location of the datacenter in the basement of the Parnall building is nearby to the main water piping for the building. There have been instances of water infiltration in the past. This project creates value for the Company by significantly strengthening capabilities through: (1) mitigating legacy physical and location risks at the current Parnall OT infrastructure is a modern, highly secured environment with redundancy in climate conditions; and (2) better datacenter facilities support with a guarantee of redundant power. The scope of the project includes: (1) migration of the OT environment from the Parnall Data Center to a co-located vendor data center; (2) re-validation of the OT Production and Disaster Recovery procedures once migration is completed; (3) migration of IT systems required for supporting the OT environment; and (4) decommission the existing OT environment from the Parnall location. The Company performed an analysis of alternatives to expand capabilities as well as address constraints and risks: (1) Remain at the current Parnall Data Center; (2) migrate OT environments to the Cloud; and (3) relocate to a third-party co-location facility. Current state/best practice does not recommend migration of OT environments to the cloud. The co-location vendor provides the building, cooling, power, and physical security the Company asks for its servers, storage, and other computing and networking equipment at the current Parnall location. Based on the analysis, the Company decided to implement the third alternative.	2026-06-30	2027-12-01	-1.00	7,749,620	4,479,267	ROM	2,118,530	157,150	1,574,663	94,290	157,130	17,601	160,676	859,768	-	-	-	111,620	202,777	22,008	523,363
360	2026	20% ROM Adjustment - IT/Digital Foundation	New Computers / Hardware	IT Digital Foundation	This is for the 20% ROM Adjustment for IT projects.							(446,028)	(31,430)	(314,959)	(26,879)	(31,430)	(4,082)	(35,279)	-	-	-	-	-	-	-
361	2026	Application Currency-IT/Digital Foundation-Application Platforms-O&M	Software(Intangible)	IT/ Digital Foundation	The Application Platforms initiative will utilize O&M funding to keep application s current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor support nat versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can lea ve a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through upgrades to the Application Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The application upgrades in scope are regularly prioritized based on considerations that include application criticality, number of versions behind the current available version s, security and operational risk, operational impacts of performing the upgrade, ability to defer, and cost. The scope of upgrading these applications encompasses: (1) upgrading the application s oftware and respective databases; (2) assessing any new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software, and (5) updating documentation related to the integrations changes. Applications within the Application Platforms area are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for this application possible and forthcoming. The Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions n, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	-	289,604	ROM	-	-	-	-	-	-	-	107,687	-	-	-	100,642	-	7,045	-
362	2026	Application Currency-IT/Digital Foundation-Infrastructure Platforms-O&M	Software(Intangible)	IT/ Digital Foundation	The Infrastructure Platforms initiative will utilize O&M funding to keep application s current for security and reliability. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor support nat versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of application s through application currency upgrades in the Infrastructure Platforms adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. 363	2026	Data & Analytics Platform Rationalization	Software(Intangible)	IT Digital Foundation	This project will optimize the Data & Analytics system landscape by creating connections, migrating data into Data Lake 2.0 (DL 2.0), and building visualizations from the data in DL 2.0. Following the enablement of DL 2.0, retirement of the IT Data & Analytics legacy systems including Teradata Data Lake (EDL), SAP Business Warehouse (BW), SAP Business Objects (BOBJ), Native HANA, the BW Portal, and SAP Business Objects Data Services (BODS) creates value by reducing the total cost of ownership associated with maintaining and supporting legacy systems. The IT Data & Analytics legacy systems (EDL, SAP BW, SAP BOBJ, Native HANA, the BW Portal, and BODS) are outdated, inefficient, and become significantly more expensive to maintain over time. Additionally, these systems are no longer meeting the business needs and require significant investments are needed to maintain and support them. This platform rationalization project creates value for the Company and its customers by reducing the total cost of ownership associated with maintaining and supporting legacy systems including licensing fees, maintenance costs, infrastructure, and support resources. The project scope includes: (1) the assessment of the existing Data & Analytics platforms including EDL, SAP BW, SAP BOBJ, Native HANA, the BW Portal, and BODS; (2) inventory of data and reports still being used by stakeholders; (3) determination of migration strategy; (4) data migration to the Azure Data Lake; (5) report migration to Power BI; (6) organization change management; and (7) the retirement/decommissioning of the legacy platforms and applications. Alternatives considered: (1) upgrade legacy systems in place (on-premise). This alternative was not selected because this is costly and misaligned with the Company's cloud strategy. (2) Lift and shift these on-premise systems to the cloud through the Hybrid Cloud Transformation Program. This alternative was not selected because it would duplicate the work being done as part of the DL 2.0 project and would not provide the same efficiencies that DL 2.0 introduces. The alternative to migrate all data sources to DL 2.0 and retire legacy systems was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.	2025-03-03	2026-08-14	0.15	10,002,200	1,660,500	ROM	1,057,148	31,430	-	88,963	889,638	6,223	41,101	305,735	-	-	-	18,585	185,848	1,302	-
364	2026	ISS Papyrus 2026 Upgrade	Software(Intangible)	IT Digital Foundation	This project will upgrade the Papyrus Objects suite of applications to the most recent version available per vendor recommendation. The ISS Papyrus applications critical to creating electronic and paper correspondence for customers, including bills and dunnings. The application will be at least 1 major upgrade revision behind by 2026. It's imperative our customers retain uninterrupted access to their paper bills, dunning notices and other communications delivered by ISS. If it also makes customer bills available for online viewing through the website and mobile apps. Without the upgrade, our vendors make no guarantee that any substantial patches or hot fixes impacting application reliability, capacity and security will be forthcoming. The upgrade will address these problems and challenges, as well bring ensure all other platform components comply with our company operational and security standards. The value of this project includes: (1) providing a more stable operation ne ed t by upgrading to the nex et recent version available; (2) maintaining the necessary vendor support; and (3) resolving tuning and stability issues with the vendors. The scope of the project is to upgrade the various license products that comprise the Papyrus Objects suite of applications. As this is an upgrade of an existing system, the alternative considered was to delay the upgrade and continue operating with the current version. This alternative was not chosen due to the risk of application stability and the inability to maintain cyber security patching.	2026-02-01	2026-10-01	-1.00	719,700	276,000	ROM	226,202	92,719	25,164	70,718	-	4,950	32,671	102,691	-	-	-	93,017	-	6,511	3,163
365	2026	Itron Enterprise Edition 2026 Upgrade	Software(Intangible)	IT Digital Foundation	This project will upgrade Itron Enterprise Edition (EE), which collects the reads from meters to ensure non-estimated bill accuracy. Itron Enterprise Edition (EE) is the Company's keystone application of the Advanced Metering Infrastructure (AMI), that provides the gas data. Included in this scope of work is the IT infrastructure introducing application instability, security and dependency risks to the utility, possibly negatively impacting critical customer electric and gas billing operations. It would also likely affect other business critical Itron applications such as creating more expense to support and no ability to leverage updated software capability. (2) Replacing EE/MDM would require the application business owners to undertake a new initiative mirroring the expense and effort that went into the multi-million dollar project responsible for setting up and leveraging this utility. (3) Perform nothing. This option is superior for both our customers and our Company because it maintains vendor support for hot fixes and patches, and aligns with all upgrade projects related to other Itron products.	2025-07-29	2026-06-09	-1.00	-	495,277	ROM	-	-	-	-	-	-	-	48,856	-	-	-	45,660	-	3,196	-
366	2026	Product Family Enhancements-Application Platforms Services-Capital	Software(Intangible)	IT/ Digital Foundation	The IT initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements that benefit the IT organization s in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experiences; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary systems changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management. Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	955,650	305,850		303,361	-	-	172,834	31,430	14,298	81,798	113,797	-	-	-	85,164	21,189	7,645	-
367	2026	Product Family Enhancements-Application Platforms Services-O&M	Software(Intangible)	IT Digital Foundation	The IT initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. 370	2026	SAP S/4HANA Implementation	Software(Intangible)	IT Digital Foundation	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]	[redacted]
371	2026	SAP Support Pack Upgrade 2026	Software(Intangible)	IT Digital Foundation	The SAP Support Pack Upgrade project is to maintain the currency levels of all SAP applications. This will ensure the applications are at versions levels that are supported by SAP, have the latest patches and bug fixes, and provide cross-application compatibility for our business partners. To continue to maintain SAP application version currency, across all applications, the support packs released by SAP must be routinely applied. Without maintaining application currency, the core business applications running on the SAP platform are at risk of losing vendor support, resulting in the inability to apply bug fixes and patches, including security patches, and maintain application interoperability and stability. The project will add value by: (1) maintaining supportability of SAP applications; (2) mitigating system security, stability and reliability risk by ensuring the applications are up-to-date with the most current patches and bug fixes released by SAP; and (3) ensuring ongoing cross-application compatibility. The scope of this project includes routine support pack upgrades to all SAP applications, which include: Enterprise Core Component (ECC), Customer Relationship Manager (CRM), Enterprise Portal, Process Orchestration (PO), Business Warehouse (BW), Business Objects (BOBJ), Data Services (DS), Solution Manager, Data Quality Manager (DQM), Graphical User Interface (GUI), Single Sign On (SSO), Systems Landscape Directory (SLD) and other related SAP applications. Alternatives considered include: (1) Divide the scope into individual projects by SAP application. This alternative was not selected because the efforts are interrelated and completing them separately could lead to duplication of work, especially testing efforts, and therefore potentially higher costs. (2) Migrate to SAP S/4HANA. This option was not selected, because a SAP S/4HANA is a multi-year project that is not expected to be completed by the year-end 2026. So an alternative approach is needed to perform the application upgrades and maintain currency in the meantime. (3) Balance the project scope through regular support pack upgrades. This alternative was selected because it provides the best balance of minimizing cost and maintaining support by combining multiple application upgrades through a single support pack upgrade effort.	2026-02-01	2026-10-31	-1.00	-	1,086,557		-	-	-	-	-	-	-	364,849	-	-	369,018	-	25,831	-
372	2026	Software Platform Refresh	Software(Intangible)	IT Digital Foundation	The Software Platform Refresh project will upgrade server operating systems, hypervisors, databases and infrastructure platforms to retain low-cost vendor support. For systems that go beyond their normal manufacturer support ending, there will be increased support and maintenance fees of 20% to 100% above current support and maintenance depending on vendor. Completing this project allows the organization to (1) avoid high support costs; (2) provide for system security; and (3) be current to promote seamless interoperability among servers, application, and databases. Aging platforms are more susceptible to security vulnerabilities and pose a reasonable threat that could affect the business and customers. The project will add value for the Company by (1) avoiding costs for special maintenance agreements required at the end of normal manufacturer support; (2) ensuring stability and compliance with Information Security requirements; (3) improving data center environment stability; and (4) avoiding the need for high risk upgrades that cross multiple versions. The project scope includes: (1) upgrading operating systems and databases on servers that are near end of support with a given vendor; and (2) maintaining hypervisors and infrastructure platforms at the current version for stability and performance. A funding options matrix was developed to review the potential alternatives. The alternatives identified were: (1) Complete the full scope of the solution for $1 million in order to eliminate the need for ongoing extended support; (2) Reduce the scale of the solution, which requires $1.6 million in ongoing extended support; (3) Reduce the scale of the solution even further, which requires $2.4 million in ongoing extended support; (4) Do not complete a software platform refresh, which requires $1.3 million in ongoing extended support. Alternative 1 was selected as the most cost effective solution to ensure ongoing system stability, seamless integration, and mitigation of cyber-security risks without the significant cost of extended support necessary for end of life software systems.	2026-01-01	2026-12-31	-1.00	-	113,463		-	-	-	-	-	-	-	42,219	-	-	39,457	-	2,762	-
373	2026	20% ROM Adjustment - IT/Digital Foundation	Software(Intangible)	IT Digital Foundation	This is for the 20% ROM Adjustment for IT projects.																				
374	**SUBTOTAL**	**2026 IT/Digital Foundation**																							
375	2026	ARP-Cyber Security	Network	Security	This project will replace cyber security infrastructure to support increasing system and application demands and to prevent system failures and service interruptions. When enterprise software or cyber security infrastructure used to support and enhance customer interactions is obsolete, these assets are more expensive to support and can be more difficult to keep current with security updates. This project will create value by maintaining the currency of the cyber security infrastructure for core enterprise software. These are used to ensure the stability of technology for business operations. The scope of this project consists of: (1) annually replacing a subset of cyber security firewalls and servers in keeping with a 3-5 year hardware lifecycle; and (2) performing application upgrades. As part of the review process, the alternatives considered were to: (1) upgrade or replace only those assets identified in the plan; (2) upgrade or replace a portion of the assets identified in the plan. Option 1 was not chosen because it ensures that only the security assets to avoid security risks, system vulnerabilities, and out-of-warranty repair costs. Option 2 was not chosen due to the security risk inherent with not replacing assets as per standard refreshcycles increased system vulnerabilities, and out-of-warranty repair costs.	2026-01-01	2026-12-31	-1.00	450,000	25,000		238,725	-	180,189	24,115	-	-	14,469	9,302	-	-	9,302	-	-	-
376	2026	ARP-Physical Security	New Computers / Hardware	Security	The ARP Physical Security, formerly known as Physical Security Asset Refresh, will enhance or replace physical security assets to provide improved visibility and incident resolution related to security concerns. The Company has several thousand physical security asset devices currently in use including security cameras, motion detectors, intrusion detection systems, and card access systems. Current limitations include the lack of integrated solutions for centralized management, situational awareness, real-time monitoring, compliance with regulations and guidelines, and faster response rates to emergencies and incidents. This could result in the increase of potential security vulnerabilities, associated penalties, and reputational damage. The value provided by completing the project is to: (1) maintain compliance with State and Federal Regulations; (2) reduce redundancies with lots of a need for multiple cameras and reducing gaps in functionality; and (3) optimize overall system performance. Included in the project is the enhancement or replacement of assets including: (1) advanced door systems at Company buildings; (2) security cameras for monitoring capabilities; and (3) gate and lock systems, which include security cameras, motion detectors, intrusion detection systems, and card access systems. Alternatives considered include: (1) not refreshing physical security assets, and (2) defer a portion of the refresh of physical security assets per an asset refresh cycle industry standard. Alternatives 1 and 2 were not selected due to the risk of security concerns, incident resolution, and the inability to meet FERC requirements. The alternative selected maintains compliance, reduces redundancies and gaps in functionality, and optimizes overall performance of physical security systems.	2026-01-01	2026-12-31	-1.00	2,474,862	12,626		777,378	-	408,119	49,031	181,866	136,363	-	4,698	-	-	2,902	1,488	307	-
377	2026	Security/OT Field Modernization	New Computers / Hardware	Security	This project will implement new infrastructure for accomplishing improved security in the field for OT assets. Gas and Electric technicians are using corporate laptops to manage critical OT infrastructure which does not follow cyber security best practices for managing critical infrastructure. The value of this project is deploying dedicated company OT laptops and associated OT infrastructure that can move between OT locations only and providing a secure environment. This project will procure and configure approximately 130 devices that will be used to manage critical OT infrastructure. The Company reviewed several options to mitigate cyber security risks inherent with the use of standard corporate laptops managing critical infrastructure. The alternatives considered are: (1) Continue utilizing existing profiles which using Corporate domain laptops with software installed; (2) Begin an outside vendor to design and implement a proposed infrastructure; (3) Considered completely disallowing use of all local access to critical systems; (4) Consider extending the OT network to remote Company locations; (5) Deploy a dedicated company OT laptop and OT communications circuits, which includes cellular connectivity. The dedicated OT laptop and communications circuits presented the best way to secure the critical infrastructure by limiting internet and e-mail access. Vendors and contractors could also utilize these approved dedicated systems for managing infrastructure they help support at Company locations. Based on the analysis performed, the Company chose to deploy a dedicated OT laptop and communications circuits.	2025-01-13	2026-06-01	-1.00	1,161,568	305,600	ROM	102,608	-	38,722	39,382	-	2,757	21,743	40,927	7,441	-	-	-	-	33,486
378	2026	30% ROM Adjustment - Security	New Computers / Hardware	Security	This is for the 20% ROM Adjustment for Security projects.							(30,581)	-	(7,364)	(7,876)	-	(551)	(4,549)	-	-	-	-	-	-	-
379	2026	Application Currency-Security Capital	Software(Intangible)	Security	This project will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades. The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Security digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protection; (3) address sing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; potential impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software; (2) assessing any new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Application swithin Security are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing endusers from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	146,200	10,700		45,951	-	-	31,450	-	14,521	-	3,981	-	-	3,721	-	260	-
380	2026	Application Currency-Security O&M	Software(Intangible)	Security	This project will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrade The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities. Maintaining the appropriate versions of applications through application currency upgrades to the Security digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protection; (3) address sing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers. The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; potential impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software; (2) assessing any new functionality for value to the Company; (3) making necessary configuration changes; (4) testing the upgraded software; and (5) updating documentation related to the integration changes. Application swithin Security are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing endusers from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.	2026-01-01	2026-12-31	-1.00	-	160,339		-	-	-	-	-	-	-	134,082	-	-	125,310	-	8,772	-
381	2026	Business Continuity - Program Management Tool	Software(Intangible)	Security	The Business Continuity Program Management Tool is critical for successful and effective Business Continuity, Disaster Recovery, and Emergency Management Programs. The software tool will provide automation, enhance the company's incident management processes, establish critical linkages between departments and essential functions they support, and it will perform necessary analysis before, during, and after a disruption that allow for the efficient response to minimize downtime. The current business continuity and disaster recovery program management tool does not offer the capabilities to advance programmaturity and to foster a world class response to a business interruption. The current tool limits automation opportunities and has gaps in how it handles template enhancements, which results in the need for manual workarounds in order to prevent losing critical data. The lack of capability affects reporting, upstream/ downstream impact mapping, incident Command System (ICS) documentation automation, and user administration. This project will create value for the Company by: (1) maintaining the documentation that supports the recovery efforts of critical processes and associated essential functions that, if disrupted, would present significant impact to the Company and our customers; (2) limiting business and community impact while providing a critical energy service; (3) prioritization of the recovery of critical processes and resource allocation during a business continuity incident(s); (4) providing a consistent, organized and expedient response process; (5) an Incident Command System that is flexible to meet the needs of any incident, regardless of severity or scope; (6) providing a mechanism for identifying restorations gaps between critical business processes and IT recovery capabilities; (6) reducing or eliminating human error and waste; and (7) improved and more efficient user experience. The project scope includes: (1) Framework for the development and maintenance of Business Continuity, System Application and Recovery Plans, Incident Command System, and Disaster Recovery Plans that are effective and easily accessible during an event; (2) automation for reporting to track status and to measure effectiveness and maturity of the program (Business Continuity, Emergency Management, Disaster Recovery Programs); (3) component that facilitates effective incident response and response efforts through incident management tools that utilize concepts from the Federal Emergency Management Agency (FEMA) National Incident Management System (NIMS); (4) program management tools to monitor required program deliverables; (5) template for developing and maintaining site hazard assessments; (6) dependency mapping of critical business processes and IT applications; and (7) integrated business impact analysis process. Alternatives considered include: (1) continue to use its fragmented current Disaster Recovery to ols. This alternative was not selected because it currently do es not offer the capabilities to advance program maturity and to foster a world class response to a business interruption. (2) Revert back to manual processes. This alternative was also not selected because the manual process is time consuming, leads to human struggle and duplicative work. A previous KPMG Audit of the Business Continuity Program indicated the need for interdependency mapping and a software tool is the best way to accomplish this. (3) Implement a best-in-class Cloud Software as a Service (SaaS) solution. This alternative was selected because there are better SaaS solutions that fit the needs outlined above. The final application will be determined after a Request For Proposal is issued and a vendor is selected in the project plan phase.	2026-05-02	2027-03-02	-1.00	-	103,797	ROM	-	-	-	-	-	-	-	39,710	-	-	27,248	9,864	2,598	-
382	2026	Enhancements-Security Capital	Software(Intangible)	Security	This initiative will use Capital funding to make enhancements to existing technology and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements in accordance with accounting rules. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Security lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Security in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing a Security enhancement, a review is completed to identify the best solution. During that review, requests for this fund ingare governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software technology changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.	2026-01-01	2026-12-31	-1.00	776,088	153,816		248,938	88,189	7,695	58,245	70,092	19,783	-	57,230	-	-	37,668	19,151	411	-
383	2026	Enhancements-Security O&M	Software(Intangible)	Security	This initiative will use O&M funding to make enhancements to existing technology and to address requests generated by changing business requirements. As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas. Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company. The value of software enhancements in Security lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Security in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance. Prior to implementing a Security enhancement, a review is completed to identify the best solution. During that review, requests for this fund ingare governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. 384	2026	Forward Web Proxy Services	Software(intangible)	Security	The project will replace the current web proxy service platform with a new platform. A web proxy service is a type of proxy server that sits between a client and the internet. It acts as an intermediary that evaluates, modifies, and forwards the client. The Company currently leverages an existing vendor platform for web proxy services that has been in existence since 2021. Since the implementation of the platform, is has caused ongoing operational issues and elevated web filtering and connectivity. When there is a degradation of service, company employees and contractors are unable to access internet or cloud-based resources. As the company continues its cloud and SAAS journey, it is imperative to provide consistent access and communication, while still protecting the company from cyber threats. This project creates value for the Company by (1) increasing service reliability for employees and contractors to internet and cloud-based resources; (2) utilize technology to enable the Company to handle all types of different workloads from varying geographic locations and is highly available; (3) using a mature and scalable web proxy service provider; and (4) providing Zero Trust by continuously verifying every connection request. The project scope includes: (1) replacing the current web proxy services solution and implementing a new system; (2) replacing physical web proxy hardware; and (3) potentially changing SAAS cloud vendors. The Security team did extensive research on alternative web proxy services solutions. Alternatives considered include: (1) continue to use and maintain the current web proxy services platform. This alternative was not chosen due to the consistent operational issues with the platform that make it unreliable. The result of an unreliable system means that employees and contractors are unable to access business critical services such as email, Teams, ServiceNow, SharePoint Online; (2) Route all internet traffic through the Company's corporate data center. This alternative wasn't chosen because the capabilities of firewall cannot as effective in stopping sophisticated cyber-attacks as using a web proxy service; (3) replace current system with modern vendor platform for web proxy services. The option that was chosen is to replace the current solution with a new system. This option was chosen because it offers additional features such as browser isolation (the ability to contain web pages so that the web page can't affect the client we illustration) and sandboxing (a way to safely execute malicious applications without impacting the Company's network). As part of the evaluation the Company reassessed based on outside advisors and industry trend analysis, focusing on the ability to execute and the vendor's company strategy.	2026-01-15	2027-12-30	-1.00	4,481,532	882,770	ROM	1,418,146	1,253,356	-	15,715	50,218	1,100	88,086	179,960	163,836	-	3,163	11,906	1,055	-
385	2026	Physical Access Management and Alarm Response	Software(intangible)	Security	The project will replace the Company's Physical Access Management System to establish a centralized platform that manages user identities, authenticates users, authorizes access, and audits user activities. The intent of this project is to consolidate and modernize the Company's physical security systems that will enable enhanced security monitoring to prevent unauthorized entry into sensitive corporate areas while providing increased flexibility to the Company's valued employees and contractors. The Company's Security Fusion Center (the Fusion Center) is the Company's combined physical and cyber security operations center(s) experiencing operational issues with the current physical access management system. The installation is out of date and causes inconsistent behavior when given tasks by automations within the Company's Identity Management solution. Frequent issues have been reported related to frozen jobs in the Company's existing access management solution due to the current system's database. This results in significant waste in the form of (1) waiting, the business partner is waiting much longer than they should have to for the system to process their request as un-freezing job is a manual process; (2) lost productivity, that waiting can cause for the business partner as it can either prevent them from accessing sites they need, or slow them down unnecessarily while they work with others to be escorted; (3) rework, because frozen jobs don't always run correctly when unfrozen, meaning the business partner has to resubmit their request and/or Identity Operations has to do additional work to satisfy the original request; and (4) alarms can cause a frozen state that impact system stability and reduces security while bys a result. Not moving to new technology also carries a growing risk of outright system failure which could result in unauthorized physical access and/or impact the Company's ability to effectively function. The current installation of the physical access management system and the Company's current card readers do not support next generation physical access control methods, such as digital ID. This prevents the Company from adopting new methods and practices that can lower costs and improve control and responsiveness. All employees, contractors, staff, and visitors are impacted by the problem. This project creates value for the Company by: (1) developing an alarm and event monitoring system, which will enable seamless orchestration of system alarms and scenarios; (2) adding automation that will streamline remediation processes and technicians operate as for efficiency; (3) refining access revocation and badge access management to ensure only authorized personnel have entry privileges; (4) introducing new access control readers that will modernize the system, allowing for the use of mobile device badges for employees, contractors, and visitors, offering a more flexible and user-friendly experience for those entering the Company. Alternatives considered were: (1) Keeping the current physical access control system and processes as is. This alternative was not selected as the current platform is outdated, increasingly expensive to support, and does not include modern capabilities, such as digital IDs. It also does not reduce waste, cost, and it does not improve speed to delivery; (2) Developing a custom, in-house physical access control solution that includes modern capabilities, such as digital IDs. This option was not selected as the Company lacks the expertise to build such a solution. Custom-developed solutions have higher long-term, and generally result in significant waste, as well as lower speed to delivery; and (3) Implementing a new physical access control system that includes modern capabilities, such as digital IDs, that reduces waste and cost and improves speed to delivery. There are vendors in the market that specialize in physical access control systems that offer proven capabilities the Company is looking to implement. This option was selected as it will allow the Company to meet its objectives of fewer waste, lower cost, improved speed to delivery, by implementing digital IDs and enabling tighter integration between the physical access control system and the Company's other security platforms.	2026-01-15	2027-12-01	-1.00	6,335,145	1,205,203	ROM	1,036,138	473,807	355, 159	35,359	70,718	7,425	73,870	122,022	-	-	114,039	-	7,983	-
386	2026	Saviynt Enterprise Identity Governance and Access (EIGA) implementation	Software(intangible)	Security	The project will implement Saviynt EIGA module, consolidate Identity Access Management (IAM) functionality into Saviynt, and retire the Identity Manager application. By implementing the new solution, the Company will optimize IAM functionality, eliminate complexity, and reduce support costs. In addition, the project will integrate the OT network with an IAM solution that will allow for automated management of users and entitlements in the OT Active Directory domains and applications. The current version of Access Now reached end-of-life in December 2022, with support discontinued in January 2023. The application has numerous custom workflows and integrations, requiring professional services for ongoing use and changes. It lacks proper data analytics and reporting, posing risks such as inability to fix critical defects, software incompatibility, compliance issues, increased costs, and degraded performance. The Company uses multiple IAM tools, each performing critical functions, leading to numerous required interfaces and customizations. While beneficial for end users, these integrations increase the risk of system failure, higher support costs, multiple subscriptions, infrastructure and maintenance costs, and more expensive upgrades. The current solution utilizes SAP HR batch file processes that introduce failure points, delays, and data integrity issues. Failures in these processes can prevent new or transferred employees from accessing necessary systems, leading to operational disruptions and potential compliance risks due to inappropriate access retention. This project provides value by: (1) Consolidating multiple IAM platforms through the implementation of the Saviynt Enterprise IGA Module, reducing complexity and support costs; (2) Decreasing complexity and enhancing efficiency by reducing interfaces between multiple identity tools; (3) Improving the end-user experience and reducing human struggle with access requests through a new, intuitive portal design; (4) minimizing custom code and focusing on configurations only by utilizing out-of-the-box functionality; and (5) Streamlining employee data processing with the implementation of an HR interface. This project scope includes: (1) Implementing the Saviynt EIGA module to consolidate IAM platforms; (2) Standardizing processes by removing customized code and using out-of-the-box functionality; (3) Replacing and improving access system; (4) Addressing issues with aging applications, multiple IAM platforms, integration challenges, and antiquated HR processing. Alternatives considered include: (1) Implementing hot fixes to Access Now version 8.1.5 to ensure support through mid-2023; (2) Upgrading the application to current supported version, excluding the new web portal but will including new application functionality; (3) Remaining on current version that will be unsupported as of January 2023, requiring vendor professional services for any break / fix. Patches and enhancements may potentially introduce additional risk of version instability; (4) Implementing IAM functions in Saviynt platform to manage access requests, including Active Directory, SAP, SAP HR, disconnected systems, and existing API integrations. The alternative selected was implementing the new Saviynt system, eliminating AccessNow software.	2023-11-27	2024-06-30	-1.00	5,913,132	710,912		297,498	-	15, 715	44,379	188,580	15,647	33,169	22,454	-	-	20,985	-	1,469	-
387	2026	Security Threat Intelligence Tool	Software(intangible)	Security	This project will implement a threat intelligence application that will actively assess physical and cyber threats in the environment, visually display historical and active threat data for situational awareness and provide alerts to employees based on location of the threat. This information will allow the Company's combined physical and cyber security operations center (Fusion Center) to alert employees who are in the proximity of a physical threat on the risks they may face, help inform decisions on hardening facility locations and alert employees of active cyber threats that are currently impacting other co mpanies. The ability to proactively alert employees of the threats will have a positive impact on Safety and Cyber Security for the Company by reducing response time to incidents and reduce the likelihood an employee will be physically injured. The Co mpany. This project creates value for the Company by: (1) implementing a threat intelligence tool that actively assess es threats in the environment; (2) Visually displaying historical and active threat data for situational awareness; and (3) Providing alerts to co workers based their location. Accurate and timely informatio n about threat actors and their tactics enables the team to proactively perform targeted investigation, containment, and remediation. The project scope includes: (1) Implementing a single threat intelligence application that will provide intel on both physical and cyber threats; (2) Integrating with the current security orchestration platform; and (3) Building automation to notify co workers of physical threats that are identified through intel provided in the application. Alternatives considered include: (1) Maintaining the Company's current security posture of manually gathering information on threats through social media, law enforcement and news reports. Continue to alert employees of active threats once they are noticed by Fusion Center employees. This alternative was not selected because the process to gather the data is completely manual and the data gathered can be outdated by up to a week. Role data can put co mpany assets and employees in dangerous situations. Using outdated information delays response time for co mpany crews and law enforcement to address the situation. (2) Expanding the Company's current manual notifications tool due to integrate security threat intelligence intel. This alternative was not selected due to the risk of delayed response time to receive threat notification fro mthe current vendor in comparison to other vendors in the market. (3) Building an in-house threat intelligence application to fulfill the security threat intel requirements. This alternative was not selected because developing security platforms of this type is not in the core competences of the Co mpany. The Company's resources don't have access to the wide range of threat data that other co mpanies leverage to develop a threat intelligence application. In addition, the cost to maintain an in-house application of this type would not be economically practical. (4) Implementing a threat intelligence application that meets the Company's security threat intelligence requirements. This alternative was selected.	2026-02-07	2027-08-02	-1.00	863,838	123,900	ROM	238,939	142,975	-	39,626	15 715	2,760	28,053	38,137	27,198	-	7,641	-	521	2,977

390	TOTAL	2026																						

The Company fully plans to perform the projects included in the Information Technology cost projections, but the projections do not incorporate a specific confidence level. These costs were not projected using confidence levels. Rough Order Magnitude (ROM) estimates have been reduced by 30% as discussed in my testimony.

2025 Union Contract Changes

Report Pulled: 11/1/2024 **Item ID: 13951**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Comply - One Time **Work Type** Project

Alias HR - 2020 Union Changes, Human Resources - 2020 Union Changes, Human Resources -2020 Union Changes, Human Resources -2025 Union Contract Changes, People & Culture - 2025 Union Contract Changes, 2025 Union Contract Changes

Description The 2025 Union Contract Changes project will implement SAP and other system changes required as a result of three collective bargaining agreements which will be renegotiated and ratified. Collective bargaining agreements expire every five years for Operating Maintenance and Construction ("OM&C"), Virtual Contact Center ("VCC"), and Zeeland employee groups. For OM&C, the current agreement ends June 1, 2025. The VCC agreement ends August 1, 2025. The Zeeland agreement ends October 1, 2025.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement Collective bargaining agreements expire every five years for OM&C (Operating Maintenance and Construction), CCC (Customer Contact Center) and Zeeland employee groups. For OM&C, the current agreement ends June 1, 2025 . CCC agreement ends in August 1, 2025. Zeeland agreement ends October 1, 2025. Technology changes are required to reflect these new agreements. Otherwise, employees in these union groups may not be paid appropriately or get correct benefits.

Objectives Completion of this project will provide value to the Company and its customers through: (1) waste elimination by making changes in the software for any pay and benefit changes as required by the new agreements; (2) defect reduction by adding process automation to otherwise manual processes for tracking and recording work, premium, and absence time; and (3) improved employee engagement among the OM&C, CCC, and Zeeland union employees.

Scope The scope of this project encompasses making any system changes required to support the new working agreement for the OM&C, CCC, and Zeeland employees. Exact details will be finalized after the negotiation process is completed and contracts are approved.

Alternatives Three alternatives were considered for this project: (1) Make no system changes after the contracts are ratified. This option was not chosen because it exposes the Company to possible fines, disengaged employees, union grievances, significant manual processes leading to greater possibility of error, hiring additional staff to perform activities outlined in the agreements, and increased legal costs due to employee grievances. (2) Find other third-party software to support the changes required by the union agreements. This option was not chosen because it would require SAP integration along with additional software licensing and maintenance costs. (3) Make system changes to eliminate manual updating, comply with the working agreement language, support union employee engagement, and reduce grievances. Option (3) was chosen because it leverages current SAP technology, automates what would otherwise require manual processing, and is the least costly option.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Intangibles	Employee Engagement for the three union groups increases as measured annually in the areas of work/life balance and employee satisfaction.
Avoided Costs	If system changes are not made to automate the changes in the union agreements, additional employees/contractors will need to be hired to manually make the changes. The actual number of employees/contractors is not known at this time since union negotiations have not been finalized.
Intangibles	Union employees are engaged because they are being paid correctly per the union contract.
Avoided Costs	When union employees are paid correctly, the chance of grievances and issues with the NLRB (National Labor Relations Board) decreases. Grievances cost the company time and money, including legal costs.

AccessNOW — **Report Pulled: 11/1/2024** — **Item ID: 6665**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval — **Work Type** Project

Alias Dell 1 Identity Manager (CAAR Replacement), Directory Services Enhancements, Dell Identity Manager

Description The AccessNow project will implement configurable identity, Access Management functionality and best practices, and will enforce compliance.

Portfolio Corporate Services > Security Services > Security > * > * > *

Org CX&T — **Bus Unit** SECURITY — **Dept** Unspecified

WORK OBJECTIVES

Problem Statement AccessNOW replaced the CAAR system enterprise wide in 2018Q4 with over 50,000 requests being made since product launch. However, AccessNOW's manual processes and lack of integration are leading to increased risk for human error and time spent on processes that can be automated.

Objectives This project will add value by: (1) reducing waste and failure points through automation; (2) improving and standardizing the business partner experience; (3) centralizing access management; (4) ensuring regulatory compliance; and (5) ensuring system stability and continuous improvement.

Scope The project scope includes implementing additional integrations to Active Directory domains that are not currently connected to the AccessNOW application (arreCorp.com, DMZ.cms, ems.com, rtqa.cmsenergy.com, ciphqa.cmsenergy.com) and integration to the Company's SAP system(s) to allow for automation of SAP role access provisioning. In addition, the project scope includes: (1) design, configuration and testing of technical connections; (2) completion of application support pack upgrades to the next version(s) to maintain system stability and to stay current with vendor releases; and (3) review and implement enhancements to improve and standardize the business partner experience.

Alternatives As part of the review process the alternative considered was using manual processes. This option was not chosen because it was deemed too costly and inefficient.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Procedure & Work Methods	Medium	Medium	Manual processes are prone to human error, which could result in audit findings. We are striving to automate manual processes to automate this.

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Avoided Costs	In 2019 & 2020, the Identity and Access Management Operations team will see positive impacts from an automated system. This will allow the team to avoid hiring additional contractors to keep up with the work.
Intangibles	Morale boost. Replacing the Computer Access and Authorization request system, which was deemed one of the worse processes in the queue company, is considered a boost in company morale.

Add Card Transaction Fees

Report Pulled: 11/1/2024 **Item ID: 13409**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Digital Payment Fee Implementation, Digital Payment Fee Implementation (BOO#316), Add Card Transaction Fees

Description This project will implement a customer paid transaction fee for all customer payments issued using a credit or debit card across all Paymentus payment channels reducing operational costs associated with payment processing.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement The Company's customers have embraced card payment methods and at present credit and debit card payments account for 35% of payment transactions with adoption continuing to increase. Consequently, the Company incurs an annual expenditure of over $15 million to cover card payments. As customer adoption of credit and debit card payments increases, annual operating expenses will also continue to increase.

Objectives This project creates value for the Company and customers by: (1) updating all payment channels to enable customers to pay a fee for debit and credit card transactions; (2) reducing operating costs for payment processing; and (3) removing card payment restrictions on small and medium business customers.

Scope The project scope includes: (1) creating new payment messaging on bills to indicate card payment fee changes; (2) updating autopay functionality in all payment channels; (3) updating all payment channels to include a customer paid transaction fee when using card payment methods segmented by residential and business customers; (4) modifying existing integrations to support card transaction fee changes; and (5) educating customers regarding card transaction fee changes.

Alternatives Alternatives Considered include: (1) Implement a new Business Card Payment Portal which would allow the Company to distinguish between card types and charge a fee to non-residential customers who are utilizing high rebate card types. This alternative was not selected because it would require significant investment to create and maintain a separate business payment portal and the complex card rules which would minimize operating savings. (2) Implement a fee across all payment types, except autopay utilizing automated clearing house payments ("ACH"), in all payment channels for all customers. This alternative was not selected because implementing costs for ACH did not provide the optimal value and experience to customers. (3) Implement a fee for card payment transactions in all payment channels for all customers. This alternative was selected because it provides the best balance between achieving the project objectives, controlling costs, and optimizing value to customers.

Application Currency-Corporate Services-O&M

Report Pulled: 11/1/2024 **Item ID: 10253**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , Application Currency and Enhancements – Corporate Services - O&M, Application Currency – Corporate Services - O&M, Application Currency-Corporate Services-O&M

Description The Corporate Services initiative will utilize O&M funding to keep applications current for security and reliability.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-PLANNING & GOV

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

Work Category Maintain - Interval **Work Type** Project

Alias , Application Currency-Corporate-Capital

Description The Corporate Services initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades in the Corporate Services adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software and respective database, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the Corporate Services are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades in the CX&O adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the CX&O are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , Application Currency-Electric & Gas Shared-Capital

Description The Electric and Gas operations initiative will utilize both Capital and O&M funding to keep applications current for security and reliability. O&M is included in this project to complete expense activities associated with Capital upgrades.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-WORK MANAGEMENT

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades to the Electric and Gas operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the Electric and Gas operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Companys ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades to the Gas Engineering and Operations digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the Gas Engineering and Operations are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades in the Operational Technology adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the Operational Technology are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

WORK OBJECTIVES

Problem Statement The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives Maintaining the appropriate versions of applications through application currency upgrades to the Security digital assets adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives Applications within Security are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

WORK OBJECTIVES

Problem Statement

The Company manages a large number of applications in the technology landscape that require regular version upgrades to maintain vendor-supported software versions. Without vendor supported versions, the Company loses the ability to receive version updates and upgrades to address defects, patch security vulnerabilities, protect against cyberthreats, protect data, and add new features. Failure to upgrade these applications can have a direct negative impact on key customer and business processes, increase support costs, increase unplanned outages, and increase cyber security vulnerabilities.

Objectives

Maintaining the appropriate versions of applications through application currency upgrades in the TEOS adds value by: (1) enabling the Company to maintain vendor support; (2) remediating vendor security vulnerabilities and enhancing security protections; (3) addressing vendor defects that impair stability and functionality, leading to fewer incidents due to outdated software; and (4) addressing version interdependencies and compatibility between systems. This is essential to delivering safe, reliable, and affordable service to the Company's customers.

Scope

The application upgrades in scope are regularly prioritized based on considerations that include application criticality; number of versions behind the current available version; security and operational risk; operational impacts of performing the upgrade; ability to defer; and cost. The scope of upgrading these applications encompasses: (1) upgrading the application software, (2) assessing any new functionality for value to the Company, (3) making necessary configuration changes, (5) testing the upgraded software, and (5) updating documentation related to the integration changes.

Alternatives

Applications within the TEOS are routinely evaluated to determine if and what upgrade efforts are necessary to maintain an appropriate level of currency, as well as the priority of those efforts. During that review, the alternative of delaying the timing of the individual upgrades is considered based on: (1) maintaining an optimal balance between keeping the application current and risking failure, (2) an increased number of incidents, (3) paying increased support costs, and (4) preventing employees from performing their daily tasks. This project makes ongoing upgrades and support for these applications possible and fortifies the Company's ability to keep the large number of applications in the technology landscape secure and operational through upgrades. Without these upgrades, the Company will fall further behind in maintaining vendor-supported software versions, increasing the cost and complexity of the upgrade in the future.

ARP-Collaboration

EXECUTIVE SUMMARY

Report Pulled: 11/1/2024 **Item ID: 8213**

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP - Collaboration Asset Refresh,ARP — Collaboration, ARP-Collaboration

Description This project will replace the Company's obsolete or out-of date audio, visual, telephony and other communication collaborative tools and equipment.

Portfolio IT Services > Infrastructure > Network Services > Communication Network > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement When Collaboration Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle.

Objectives This project creates value by: (1) ensuring that the Company's audio, visual, telephony, and other communications systems are stable and reliable; and (2) migrate to new collaboration assets.

Scope The project scope consists of: (1) annually replacing aging collaboration assets; and (2) installing new collaboration assets to account for evolving business requirements.

Alternatives The following alternatives were considered: (1) refresh visual assets and a portion of the audio assets; (2) refresh a portion of the audio assets only; and (3) refresh visual assets only. These alternatives were not chosen due to the risk inherent with a partial replacement of assets, which includes: (1) a reduced supply of equivalent replacement Avaya parts that are no longer being produced; and (2) an erosion of the knowledge technicians possess on discontinued systems.

Risk Mitigation	The Company' research demonstrates that industry standards on refreshing hardware are generally three to five years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures; 2) avert customer frustration and employee downtime, (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities, (4) continue operating system support as older versions are retired by the manufacturer, and (5) ensure employees have the required software to perform their work.

ARP-Core Network Upgrade

Report Pulled: 11/1/2024 **Item ID: 6686**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias Core Network Refresh, ARP - Core Network Upgrade, ARP-Core Network Upgrade, ARP-Core Network

Description This project will refresh the Data Center network equipment.

Portfolio IT Services > Infrastructure > Network Services > Data Network > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement When network assets that are used to support customer interactions and ensure the stability of mission critical business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle.

Objectives This project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; and (4) standardizing network infrastructure across Data Centers.

Scope The project scope includes the replacement of all core network devices with next generation devices.

Alternatives The alternative considered was to continue running in the current state or delay the replacement of network devices and accept the risk of further business and customer impact when more equipment failures occur.

ARP-Cyber Security

EXECUTIVE SUMMARY

Report Pulled: 11/1/2024 **Item ID: 8240**

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP-Cyber Security,Asset Refresh Program - Cyber Security, ARP-Cyber Security

Description This project will replace cyber security infrastructure to support increasing system and application demands and to prevent system failures and service interruptions.

Portfolio Corporate Services > Security Services > Cyber Security & Shared Services > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-SECURITY PROGRAM MC

WORK OBJECTIVES

Problem Statement When enterprise software or cyber security infrastructure used to support and enhance customer interactions is obsolete, these assets are more expensive to support and can be more difficult to keep current with security updates.

Objectives This project will create value by maintaining the currency of the cyber security infrastructure for core enterprise software. These are used to ensure the stability of technology for business operations.

Scope The scope of this project consists of: (1) annually replacing a subset of cyber security firewalls and servers in keeping with a 3-5 year hardware lifecycle; and (2) performing application upgrades.

Alternatives As part of the review process, the alternatives considered were to: (1) upgrade or replace only those assets identified in the plan; (2) upgrade or replace a portion of the assets identified in the plan. Option 1 was not chosen based on continued refresh cycle for cyber security assets to avoid security risks, system vulnerabilities, and out-of-warranty repair costs. Option 2 was not chosen due to the security risk inherent with not replacing assets as per standard refresh cycles increased system vulnerabilities, and out-of-warranty repair costs.

Corporate Risk	Impact	Likelihood	Description
System Failure (SAP & Other)	Medium	Medium	The risks associated with not completing the program are impacts on business operations that are in service of the Company's customers. The probability of these risk occurring increases as the age of the asset increases. Unless linked to a specific corporate or IT risk, you would skip this section, and go to Other Impacts if risk mitigation

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Technology Capability	Compliance & Risk Management
Risk Mitigation	The Company' research demonstrates that industry standards on refreshing hardware are generally three to five years. Using these recommendations allows the Company to: 1) Avoid increasing costs as the result of hardware failures; 2) avert customer frustration and employee downtime; 3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities; 4) continue operating system support as older versions are retired by the manufacturer; and 5) ensure employees have the required software to perform their work.

ARP-Field Device Asset Management (FDAM)

Report Pulled: 11/1/2024 **Item ID: 8241**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP – Field Device Asset Management (FDAM),ARP — Field Device Asset Management (FDAM), ARP-Field Device Asset Management (FDAM)

Description This project will replace field devices according to a four-year refresh cycle that is based on industry standards, hardware failures, security patches, and software compatibility.

Portfolio IT Services > Infrastructure > End User Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement When Field Device Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with Security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular four-year refresh cycle.

Objectives This project creates value for the Company by: (1) improving stability and availability of business-critical applications by proactively replacing field devices prior to increasing hardware failures; and (2) allowing field workers to complete their job tasks.

Scope The project scope consists of replacing field device assets according to the four-year refresh cycle.

Alternatives The alternatives considered were to: (1) extend the replacement cycle from four years to five years for field devices; and (2) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the assets that need refreshing in future years based on the number of devices that were not replaced during the four year refresh cycle; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the four-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle to alleviate these concerns.

Intangibles	Replacing field equipment on a four-year refresh cycle benefits external customers because employees will be able to complete work in a timely manner, which increases customer satisfaction.
Risk Mitigation	The Company' research demonstrates that industry standards on refreshing hardware are generally three to five years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures, (2) avert customer frustration and employee downtime, (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities, (4) continue operating system support as older versions are retired by the manufacturer, and (5) ensure employees have the required software to perform their work.

ARP-Infoblox Refresh

Report Pulled: 11/1/2024 **Item ID: 6529**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP - Infoblox Refresh,ARP — Infoblox Refresh, ARP-Infoblox Refresh

Description This project will replace the three legacy core components, Domain Name System ("DNS"), Dynamic Host Configuration Protocol ("DHCP"), and Internet Protocol Address Management ("IPAM") also referred to as DDI ("DNS, DHCP, IPAM") environment with a modern, vendor supported system. Infoblox is the DDI solution that the Company uses to enable seamless network communications across critical systems.

Portfolio IT Services > Infrastructure > End User Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement When Infoblox Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. Consumers Energy also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle.

Objectives The value of this program includes: (1) enabling the Company to efficiently manage and control their networks; and (2) providing Domain Name System ("DNS"), Dynamic Host Configuration Protocol ("DHCP"), and Internet Protocol Address Management ("IPAM").

Scope The scope of this project includes the replacement of DNS, DHCP and IPAM assets on a 5-7 years refresh cycle.

Alternatives The alternative considered was to continue operating on existing Infoblox equipment past the vendor's end-of-support date. This alternative was not selected because it carries risks with not having vendor support, software bug fixes, security updates, and other software fixes. The alternative to replace the existing Infoblox equipment with the latest hardware and software provided by the vendor was selected to avoid these risks and continue a regular refresh cycle.

Risk Mitigation	The company' research demonstrates that industry standards on refreshing hardware are generally three to five years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures, (2) avert customer frustration and employee downtime, (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities, (4) continue operating system support as older versions are retired by the manufacturer, and (5) ensure employees have the required software to perform their work.

ARP-Local Area Network

Report Pulled: 11/1/2024 **Item ID: 6789**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias LAN Refresh,Local Area Network Refresh, ARP - Local Area Network, ARP-Local Area Network

Description This project will upgrade the Company's entire LAN and a significant portion of the Wireless Local Area Network (WLAN).

Portfolio IT Services > Infrastructure > Network Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement

At some Company locations, LAN equipment has been in service since 2011. If the LAN/WLAN hardware and software is not routinely refreshed, the Company will lose the manufacturer support needed for equipment bug fixes, security vulnerability patches, and enhancements. In addition, aging equipment cannot accommodate the increasing demand for wireless devices necessary to perform day-to-day operations that rely on wireless-enabled devices, such as rugged field devices, cell phones, barcode scanners, tablets, and other mobile devices. As equipment ages, it is at risk of higher failure rates, which increases the risk of unplanned outages. In the event of unplanned outages, business areas would not be able to access services on the corporate network including email, SAP, internet, and phones.

Objectives

The project will create value for the Company and its customers by: (1) increasing network reliability; (2) adding new functionality; (3) improving network performance; (4) ensuring equipment is vendor supported, thereby ensuring support for bug fixes, security vulnerability patching, and enhanced features; (5) providing consistent wireless coverage across Company locations; (6) increasing user productivity through a higher performing wireless network, which increases the productivity and efficiency of office and field employees serving customers; and (7) improving support for wireless Internet Protocol (IP) phones, Internet of Things(IoT) and field devices.

Scope

The project scope includes: (1) refreshing the LAN equipment and software across all Company sites; (2) identifying the required features for the new equipment; (3) implementing the new equipment according to industry best practices; (4) replacing wireless network with upgraded infrastructure and verifying wireless coverage is as expected; and (5) collecting wireless survey data for all Company locations in order to design improved wireless network coverage.

Alternatives

The alternative considered was to continue operating on the existing platform past the vendors end-of-support date. The vendor support period ended in May of 2021, and paying for extended support is not an option offered by the vendor. The risk inherent in not refreshing the platform is a lack of vendor support resulting in an absence of software bug fixes, security updates, and break fixes. The Company chose to replace the existing equipment with the latest hardware and software available, following a five year refresh cycle.

ARP-Operational Technology Support Gas

Report Pulled: 11/1/2024 **Item ID: 6530**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP - Critical Infrastructure Support, 2014 CIS Asset Refresh,ARP — Operational Technology Support, ARP — Operational Technology Support Gas, ARP-Operational Technology Support Gas

Description The ARP- OT Support Gas project will replace dated and obsolete servers on a rotating 5 year refresh schedule.

Portfolio IT Services > Infrastructure > Data Center - Enterprise Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SERV

WORK OBJECTIVES

Problem Statement When OT Assets that are used to support customer interactions and ensure the stability of technology for business operations are obsolete or out-of-date, they are more expensive to support and can be more difficult to keep current with Security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle.

Objectives This project creates value by maintaining the currency of the Company's IT infrastructure and the core enterprise software that are utilized to support the operation of the Company's critical gas infrastructure.

Scope The program scope consists of: (1) replacement of computer hardware under the program; and (2) installing additional new compute capacity to account for expanding business requirements.

Alternatives The alternatives considered include: (1) continue to operate hardware beyond a five year refresh cycle or (2) refresh hardware based on a five year refresh cycle along with evaluating the health of the asset and evolving business needs. The alternative to operate hardware beyond a five year refresh cycle was not selected due to the risk that these hardware component failures would cause system reliability and safety for customers. The Company chose the alternative to refresh this hardware based on a five year refresh cycle along with evaluating the health of the asset and evolving business needs to reduce the risk of impacting critical infrastructure that supports systems such as Gas SCADA and Gas Compression control systems.

B/C Ratio (Overall) -1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	High	The risks associated with not completing the program are both disruptive and adverse performance impacts on business operations that Operational Technology supports, which includes Gas Control and Gas Compressor Stations. The probability of these risks occurring increases as the age of the asset increases. Specifically: (1) There will be no security updates without the replacement, which increases our vulnerability. (2) Monitors to maintain the equipment will not be available. (3) Cyber security vulnerabilities will increase with aged systems, which make the systems more prone to attack and compromise. (4) This ensures compliance with TSA Security Directives and API standard 1164 required by the MPSC.

OTHER VALUE

Type	Description
Technology Capability	Gas T&D, Gas Compression
Risk Mitigation	The Company's research demonstrates that industry standards on refreshing hardware are generally three to five years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures, (2) avert customer frustration and employee downtime, (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities, (4) continue operating system support as older versions are retired by the manufacturer, and (5) ensure employees have the required software to perform their work.
Intangibles	This reduces the risk of potential cyber security incidents because upgraded systems have been built and calibrated for newer types of cyber-attacks. If the Operational Technology systems are not upgraded, it will affect the ability for Consumers Energy to meet the regulatory and compliance requirements needed for successful customer-facing operations.

Alias Physical Security,Physical Security Asset Refresh, ARP-Physical Security

Description The ARP-Physical Security, formerly known as Physical Security Asset Refresh, will enhance or replace physical security assets to provide improved visibility and incident resolution related to security concerns.

Portfolio Corporate Services > Security Services > Security > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-SECURITY PROGRAM MC

WORK OBJECTIVES

Problem Statement The Company has several thousand physical security asset devices currently in use including security cameras, motion detectors, intrusion detection systems, and card access systems. Current limitations include the lack of integrated solutions for centralized management, situational awareness, real time monitoring, compliance with regulations and guidelines, and faster responses to emergencies and incidents. This could result in the increase of potential security vulnerabilities, associated penalties, and reputational damage.

Objectives The value provided by completing the project is to: (1) maintain compliance with State and Federal Regulations; (2) reduce redundancies with less of a need for multiple cameras and reducing gaps in functionality; and (3) optimize overall system performance.

Scope Included in the project is the enhancement or replacement of assets including: (1) advanced door systems at Company buildings; (2) security cameras for monitoring capabilities; and (3) gate and lock systems, which include security cameras, motion detectors, intrusion detection systems, and card access systems.

Alternatives Alternatives considered include: (1) not refreshing physical security assets, and (2) defer a portion of the refresh of physical security assets per an asset refresh cycle industry standard. Alternatives 1 and 2 were not selected due to the risk of security concerns, incident resolution, and the inability to meet FERC requirements. The alternative selected maintains compliance, reduces redundancies and gaps in functionality, and optimizes overall performance of physical security systems.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Theft/Accidental Disclosure	Low	Medium	Having cameras and other physical security assets can help uncover activities leading to potential thefts and or accidents.

OTHER VALUE

Type	Description
Technology Capability	Compliance & Risk Management
Risk Mitigation	Lack of life cycle replacement wouldn't allow for integrated solutions for centralized management, situational awareness, real time monitoring, compliance with regulations and guidelines, and faster, more effective/consistent response to emergencies and incidents which could result in the increase of potential security vulnerabilities, associated penalties and reputation damage.
Intangibles	Security Visibility - Having updated camera/Door systems helps the security command center have been visibility into often un-monitored areas.

ARP-Printer Asset Management (PAM)

Report Pulled: 11/1/2024 **Item ID: 6671**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias Printer Asset Management,ARP — Printer Asset Management (PAM), ARP-Printer Asset Management (PAM)

Description This project will replace and install select printers, plotters, and multi-function printing devices based on printer replacement assessments and a five-year refresh cycle. Printer service and usage history is evaluated and a determination is made if a printer can be repurposed instead of ordering a new one.

Portfolio IT Services > Infrastructure > End User Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement When Printer Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with firmware and security updates. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle.

Objectives This project creates value for the Company by: (1) improving the dependability of these printer devices for employees; (2) averting increased costs due to hardware repairs; and (3) ensuring compatibility with enterprise print applications.

Scope The project scope consists of the annual replacement of printer assets according to a five-year refresh cycle.

Alternatives The alternatives considered for the project included looking at refresh cycles from three to seven years as well as running the assets to failure. The selection of a five-year cycle was deemed to be the best solution since anything less than five years would increase the likelihood of unneeded expense for replacement of assets that were still in good operating condition. Anything greater than five years is assessed monthly to ensure it is not run-to-failure, including running the asset to failure, resulting in additional expenses for maintenance of the equipment and downtime, negatively affecting employee productivity. The Company assesses the printer fleet based on years of active service, service history, printer usage data, and the number of users within a facility. Based on these factors, the Company either decommissions, repurposes, leaves in place, or refreshes the printers.

B/C Ratio (Overall) -1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	High	If Consumers Energy does not stay current with printer hardware, then it would not be able to use the updated software and would lose print functionality.

OTHER VALUE

Type	Description
Technology Capability	Asset Management
Risk Mitigation	The company' research demonstrates that industry standards on refreshing hardware are generally three to five years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures, (2) avert customer frustration and employee downtime, (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities, (4) continue operating system support as older versions are retired by the manufacturer, and (5) ensure employees have the required software to perform their work.
Technology Capability	The PAM program supports Engineering Design Process (Redline/Green Line Drawings); Storm Restoration (Hard Print for Damage Assessment). The daily print operations for Business Partners to complete their work as it relates to storms restorations, projects, D & E renderings and application process work.

ARP-Radio

Report Pulled: 11/1/2024 **Item ID: 8234**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP - Wireless Network,ARP — Wireless Network, ARP — Radio, ARP-Radio

Description This project will refresh hardware to include; 800Mhz Radios and infrastructure, cellular modems, plant radios and systems, cellular amplification devices, vehicle consoles in service trucks, other communications equipment, and associated test equipment. This equipment supports mission critical voice and data communications for plant and field service personnel and dispatch personnel. 800MHz radios are upgraded on a 10-year lifecycle basis. Plant radio systems are upgraded on a scheduled 10-year lifecycle basis. Cellular modems are refreshed on a 5-year life cycle basis. Amplification systems are refreshed on a 10-year life cycle.

Portfolio IT Services > Infrastructure > Network Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement 800MHz, mobile, and portable radios, Plant radios systems, and Cellular modems support core business functions, life safety communications, and rapid response for restoration of customers service and critical infrastructure. Company radio and cellular systems must be refreshed on a scheduled basis or risk exceeding life expectancy and failing or becoming obsolete. The refresh of this equipment in a proactive manner is critical to providing service to customers. If these units are not refreshed, the increased risk of unit failure would result in interruptions to timely and concise communications to field personnel to resolve gas leaks, and downed electric lines, or service turn-on requests, which risks life safety.

Objectives This project creates value for customers and the Company by: (1) upholding public safety; (2) ensuring timely responses and repairs to emergent gas leaks, wire downs, and electric outages; (3) ensuring real-time communications between Company dispatch locations and crews in the field; (4) ensuring the safety of personnel working in higher risk workspaces by replacing equipment with units that contain intrinsically safe batteries; (5) supporting continuous improvement and training by replacing equipment that is capable of capturing audio recordings; and (6) remaining in compliance with MPSC regulatory requirements by maintaining critical radio infrastructure.

Scope The project scope consists of: (1) scheduled replacement of radios, modems, and consoles; and (2) installing additional radios modems and console assets to satisfy growth requirements; and (3) scheduled replacement of out of date cellular and radio boosters.

Alternatives The alternatives considered included: (1) Replace the existing units with new units from other radio and modem manufacturers; (2) purchase new radio subscriber units from existing manufacturers. Option 2 was not selected because the Company now uses a standards-based radio system allowing for multiple radio manufacturer options. Option 1 was selected to allow for a competitive bidding process that will provide the most cost-effective radio that will meet the needs of users.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Avoided Costs	Cost avoidance of future Modem purchases. Transitioning cellular services from modems to devices avoids future yearly modem refresh costs of approximately $420,000.
Risk Mitigation	The company' research demonstrates that industry standards on refreshing radio hardware is generally seven to ten years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures, (2) mitigate customer frustration and employee downtime, (3) maintain high standards for customer and employee safety (4) maintain technology currency for employees to perform their work.
Intangibles	The radio system funded through the ARP — Radio project supports core business functions such as storm restoration, emergency gas leak repair, and day-to-day customer support. By reinvesting in the system Consumers Energy extends the effectiveness of the system.
Risk Mitigation	The risk inherent in not replacing these items is the extended support cost, which amounts to $225,000 annually. Moreover, additional service hour, parts replacement, material, and setup costs would be incurred for outfitting of vehicles.

ARP-Server and Storage

EXECUTIVE SUMMARY

Report Pulled: 11/1/2024 **Item ID: 8755**

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP - Server and Storage,ARP — Server and Storage, ARP-Server and Storage

Description This project will replace or augment server and storage infrastructure for the Company.

Portfolio IT Services > Infrastructure > Data Center - Storage > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement
When Server and Storage Hardware Assets used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and can be more challenging to keep current with Security updates. The Company also runs the risk of failure of these assets impacting customer interactions and business operations if it does not adhere to a regular five to seven-year refresh cycle.

Objectives
This project creates value for the Company through: (1) improved stability and availability of business-critical applications by proactively replacing server and storage hardware assets prior to the likelihood of increasing hardware failures; and (2) ensuring that adequate resources are available to support application demands after five to seven years of actual use.

Scope
The scope of this program encompasses: (1) replacement of server and storage hardware assets; and (2) installation of additional new computers and storage capacity to account for evolving business requirements.

Alternatives
The alternatives considered were to purchase extended maintenance, move some of these assets to the cloud with the Digital -Hybrid Cloud and Data Center Migration project, or to replace the assets on the current cycle. The option to purchase extended maintenance was not selected because full support would not be offered after seven years, and maintenance costs would increase. The preferred option is to move some of these assets to the cloud in the Digital Hybrid Cloud and Data Center Migration project while refreshing the remainder using the five- to seven-year cycle as it is the most cost-effective option. If the Digital-Hybrid Cloud and Data Center Migration project is not approved as part of this rate case, the Company plans to continue to refresh these critical technologies at the current level based on a five- to seven-year refresh cycle to mitigate the risk of failure.

B/C Ratio (Overall) -1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	High	Consumers Energy's vendor, Nutanix only offers full support for seven years after purchase of a solution. After the end of support no more security patches are available and if an issue is encountered the manufacturer will not assist in resolving.

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Avoided Costs	If all the existing hardware environment went beyond seven years, O&M would increase would by $202,000. Each 1/7th of the environment not upgraded would equate to an increase in O&M by $30,000.
Avoided Costs	Maintenance costs would increase by about 15% after seven years over current amounts in the ITPM.
Intangibles	Research firm IDC Economics reports that without proactive replacement server performance drops by 39%, annual support costs increase 148%, application management costs increase 40%, and unplanned downtime hours increase by 62%.
Risk Mitigation	The Company's research demonstrates that industry standards on refreshing hardware are generally five to seven years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures; (2) avert customer frustration and employee downtime; (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities; (4) continue operating system support as older versions are retired by the manufacturer; and (5) ensure employees have the required software to perform their work.

ARP-Workstation Asset Management (WAM)

Report Pulled: 11/1/2024 **Item ID: 8242**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ARP - Workstation Asset Management (WAM),ARP — Workstation Asset Management (WAM), ARP-Workstation Asset Management (WAM)

Description This project will replace and install new desktops, laptops, and tablets on a four-year refresh cycle based on industry standards, hardware failures, security patches, and software compatibility. Monitors will be replaced every eight years based on Company data related to historical failure rates.

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement When Workstation Assets that are used to support customer interactions and business operations are obsolete or out-of-date, they are more expensive to support and keep current with security updates as equipment becomes obsolete. The Company also runs the risk of failure of these assets if it does not adhere to a regular refresh cycle.

Objectives This project creates value for the Company by: (1) improving stability and availability of business-critical applications by proactively replacing workstations prior to increasing hardware failures; and (2) allowing business partners to complete their job tasks.

Scope The project scope consists of: (1) replacing workstation assets; and (2) installing new units for new resources.

Alternatives The alternatives considered were to: (1) extend the replacement cycle from four years to five years for all desktops and laptops; (2) extend the replacement cycle only on desktops from four years to five years; and (3) use outdated equipment. The Company did not select these options because: (1) there would be an increased risk of hardware failure and equipment outages that could impact the capacity of business partners to complete job tasks; (2) it could cause applications to run poorly or stop functioning; (3) it would increase the ARP in future years based on the number of devices that were not replaced during the four year refresh cycle ; and (4) it could cause an inability to apply security patches. Based on industry data, waiting longer than the four-year cycle would increase hardware failures, security patch issues, and software compatibility concerns, resulting in additional downtime that could affect customer safety and storm restoration. The Company selected a four-year refresh cycle for desktops, laptops, and tablets; and an eight-year cycle for monitors to alleviate these concerns.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	High	There is a high risk of hardware failure, the inability to keep current with security updates, and software compatibility issues without the four-year refresh.

OTHER VALUE

Type	Description
Technology Capability	6 - Asset Management
Avoided Costs	Future year costs would increase if equipment is not refreshed in planned year.
Risk Mitigation	The company' research demonstrates that industry standards on refreshing hardware are generally eight years. Using these recommendations allows the Company to: (1) Avoid increasing costs as the result of hardware failures, (2) avert customer frustration and employee downtime, (3) reduce security risks by ensuring that devices are updated and patched to prevent vulnerabilities, (4) continue operating system support as older versions are retired by the manufacturer, and (5) ensure employees have the required software to perform their work.
Technology Capability	The WAM program enables and supports all administrative, engineering, operational, and corporate process and activities.

Asset Accounting Tax Upgrade

Report Pulled: 11/1/2024 **Item ID: 13966**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , Asset Accounting Upgrade, Asset Accounting Upgrade 2026, Asset Accounting Upgrade 2025-2026, Asset Accounting Upgrade 2026, Asset Accounting Upgrade 2025-2027, Asset Accounting Tax Upgrade

Description The project will upgrade our current accounting asset management tax software to the SaaS version as required by the vendor or a replacement solution and implement additional new features, ensuring continued support of a critical financial application, and providing new functionality.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement In 2025, standard vendor support ends for the current on-premise PowerTax software. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. In addition, the upgrade provides additional functionality to increase the frequency of financial reporting and improve visibility.

Objectives This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub-ledger. In addition, the project adds value by: (1) moving to a SaaS solution in order stay supported; and (2) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support.

Scope The project scope includes: (1) evaluating current vendor/product solution with market leaders; (2) upgrading the vendor software from the current version to the newer SaaS version or replacing it.

Alternatives Alternatives considered include: (1) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements. (2) Do nothing and remain on unsupported, on-prem tax solution. This option introduces technical and financial risk which would be costly; (3) Upgrade to the newest SaaS version of current on-prem solution. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrades, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing.

Description The project will upgrade our current accounting asset management software to the latest version as required by the vendor and implement additional new features, ensuring continued support of a critical financial application and providing new functionality.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-PLANNING & GOV

WORK OBJECTIVES

Problem Statement

In 2022, standard vendor support ends for the current on-premise software. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. In addition, the upgrade provides additional functionality to increase the frequency of financial reporting and improve visibility. The current monthly allocation process has limited visibility to Company financial performance, and the upgrade provides functionality that allows more frequent allocation processes. Additionally, implementing the vendor's regulatory module eliminates the time-consuming and labor-intensive process of manual data extracts for regulatory analysis used for Cost of Service modeling.

Objectives

This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub-ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) eliminating the labor intensive and time-consuming process of pulling data for regulatory analysis used for Cost of Service; (3) automating manual tasks; and (4) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support.

Scope

The project scope includes: (1) upgrading the vendor software from the current version to the newer version; (2) implementing new functionality that includes features for the regulatory Cost of Service analysis, additional reporting, job scheduling, and centralized error processing; and (3) populating the data lake with data from the asset accounting system for improved reporting.

Alternatives

Alternatives considered include: (1) Upgrade to the newest, cloud version of PowerPlan. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrades, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing. (2) Evaluate SAP options for leasing, asset, and tax management capabilities. While this option would eliminate the need for an interface between SAP and PowerPlan, it would likely be more complex, cost more, and may not provide all the required features. (3) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements.

Description The project will upgrade our current accounting asset management software to the latest version as required by the vendor, ensuring continued support of a critical financial application.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement

Standard vendor support will be ending for the current on-premise software on an undisclosed timeline. Losing vendor support creates security and stability risk that can result in performance issues. When the application is out of the normal support with the vendor, the Company no longer receives security patches, support for defect resolution or bug fixes, and cannot enhance the application. To ensure compliance with regulated and financial accounting in the fixed asset sub-ledger, it is necessary to perform an upgrade and maintain vendor support. There are also larger costs to upgrade if the upgrades are further apart due to complex testing activities and too many version increases at any one time.

Objectives

This project creates value for the Company by ensuring compliance with regulated and financial accounting within the fixed asset sub-ledger. In addition, the project adds value by: (1) performing the allocation process on a more frequent basis providing better financial visibility; (2) automating manual tasks; (3) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support; and (4) lowering costs with more frequent upgrades to reduce testing complexities and reduce the number of versions to be adopted.

Scope

The project scope includes: (1) evaluating current vendor/product solution with market leaders; (2) upgrading the vendor software from the current version to the newer version.

Alternatives

Alternatives considered include: (1) Evaluate SAP options for leasing, asset, and tax management capabilities. While this option would eliminate the need for an interface between SAP and PowerPlan, it would be more complex, cost more, and not provide all the required features. (2) Evaluate other software options. This option will introduce new ongoing support costs and integrations and may not provide regulatory reporting and other needed improvements. (3) Analyze and go to cloud possibilities (4) wait until a future upgrade cycle; (5) Upgrade to the newest version of current solution. This is the preferred option as it will reduce hardware and server support costs, provide more frequent software upgrades, avoid database and server upgrades, provide weekly allocation functionality, and provide new features in job scheduling, regulatory reporting for Cost of Service, reporting, and centralized error processing.

AxWay Secure Transport 2024 Upgrade

Report Pulled: 11/1/2024 **Item ID: 11748**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , AxWay Secure Transport Upgrade, AxWay Secure Transport 2024 Upgrade, AxWay Secure Transport 2025 Upgrade, AxWay Secure Transport 2024 Upgrade

Description Axway SecureTransport is the Company's multi-protocol Managed File Transfer ("MFT") gateway for securing, managing, and tracking data file flow for our business partners and external vendors. Files impacting billing, HR, Supply Chain, Finance, Alternate Energy Programs, Front Office, Back Office, Device Management, Outage Management and Business Reporting functions utilize these services. This project will update the platform to the current software version, enabling cost saving operational enhancements while retaining data security and platform supportability.

Portfolio IT Services > Applications > Foundational Enterprise Applications > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement As Axway Secure Transport is the public-facing managed file transfer gateway, maintaining platform version integrity is critical to ensuring it remains secure and supportable in the event of a cyber attack, outage or other critical incident. A prolonged outage or incident, for any reason, compromises the ability of the Company to perform mission-critical business transactions in finance, operations and direct customer support. Upgrading this application also gives the Company the opportunity to properly scale SecureTransport and take advantage of the growing demand for additional, cost-savings features of the tool, such as managing internal Electronic Data Interchange transactions.

Objectives The value this project brings Consumers Energy and customers includes: (1) Addressing known problems and limitations of the current software and hardware platforms. (2) Ensuring continued secure, scalable, and critical data transmission services running through Axway continue functioning. (3) Creating the capacity to methodically merge/streamline internal and external data file transfer services to eliminate waste. (4) Merging/streamlining the company data file transfer services reducing cyber-attack vectors and creates a more easily maintained and monitored security model.

Scope The scope of this project includes (1) Upgrading the application and database to the current released and supported versions. (2) Refreshing the underlying application infrastructure by upgrading to the latest operating system and hardware platforms. (3) Enable and test expanded Electronic Data Interchange (EDI) functionality.

Alternatives Alternatives considered include: (1) deferring the upgrade. This alternative was not selected because the Axway SecureTransport platform handles critical Company financial, HR and operational transactions--the risk associated with problems stemming from an outdated and unsupported version is too high. Nor would the waste elimination benefits of using the upgraded Axway platform to start consolidating EDI for CE be realized. (2) Replacing the platform. The estimated project costs and timetable for replacing the business functions currently performed by the existing Axway SecureTransport platform would be extensive, and operationally, it is not well suited for a cloud or hybrid cloud solution. In addition to significant platform, application, implementation and functional testing costs, replacing it would require extensive coordination and testing with all of the internal and external account holders, taking upwards of one calendar year. (3) Upgrading the platform. This provides the Company the most cost-effective alternative, balancing costs, known risks, and even growing business capacity and productivity.

DATES (phase end)

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	Medium	An out-of-support version of Secure Transport that Axway no longer provides hotfixes for will put the company network at risk as this is a external (internet) facing application.

OTHER VALUE

Type	Description
Technology Capability	Customer Management
Intangibles	Newer versions of Secure Transport will assist in improving performance of the platform through bug fixes and performance tuning.
Risk Mitigation	The upgrade work will allow CE to harden the application and eliminate a significant single point of failure.

Business Continuity - Program Management Tool

Report Pulled: 11/1/2024 **Item ID: 12679**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Business Continuity - Disaster Recovery Planning Tool, Business Continuity - Program Management Tool

Description The Business Continuity Program Management Tool is critical for successful and effective Business Continuity, Disaster Recovery, and Emergency Management Programs. The software tool will provide automation, enhance the company's incident management processes, establish critical linkages between departments and essential functions they support, and it will perform necessary analysis before, during, and after a disruption that allows for the efficient response to minimize downtime.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-CORPORATE SECURITY

WORK OBJECTIVES

Problem Statement The current business continuity and disaster recovery program management tool does not offer the capabilities to advance program maturity and to foster a world class response to a business interruption. The current tool limits automation opportunities and has gaps in how it handles template enhancements, which results in the need for manual workarounds in order to prevent losing critical data. The lack of capability affects reporting, upstream / downstream impact mapping, Incident Command System (ICS) documentation automation, and user administration.

Objectives This project will create value for the Company by: (1) maintaining the documentation that supports the recovery efforts of critical processes and associated essential functions that, if disrupted, would present significant impact to the Company and our customers; (2) limiting business and community impact while providing a critical energy service; (3) prioritization of the recovery of critical processes and resource allocation during a business continuity incident(s); (4) providing a consistent, organized and expedient response process (Incident Command System) that is flexible to meet the needs of any incident, regardless of severity or scope; (5) providing a mechanism for identifying restorations gaps between critical business processes and IT recovery capabilities; (6) reducing or eliminating human error and waste; and (7) improved and more efficient user experience.

Scope The project scope includes: (1) framework for the development and maintenance of Business Continuity, System (Application) Recovery Plans, Incident Command System, and Disaster Recovery Plans that are effective and easily accessible during an event; (2) automation for reporting to track status and to measure effectiveness and maturity of the program (Business Continuity, Emergency Management, Disaster Recovery Programs); (3) component for facilitating effective training exercises and response efforts through incident management tools that utilize concepts from the Federal Emergency Management Agency (FEMA) National Incident Management System (NIMS); (4) program management tools to monitor required program deliverables; (5) template for developing and maintaining site hazard assessments; (6) dependency mapping of critical business processes and IT applications; and (7) integrated business impact analysis process.

Alternatives Alternatives considered include: (1) continue to use Riskonnect (current Disaster Recovery tool). This alternative was not selected because it currently does not offer the capabilities to advance program maturity and to foster a world class response to a business interruption. (2) Revert back to manual process. This alternative was not selected because the manual process is time consuming, leads to human struggle and duplicative work. A previous KPMG Audit of the Business Continuity Program indicated the need for interdependency mapping and a software tool is the best way to accomplish this. (3) Implement a best-in-class Cloud Software as a Service (SaaS) solution. This alternative was selected because there are better SaaS solutions that fit the needs outlined above. The final application will be determined after a Request For Proposal is issued and a vendor is selected in the project plan phase.

B/C Ratio (Overall) -1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Avoided Costs	A new tool leveraging automation would enable Emergency Management Department to save 376 labor hours annually. Calculation: once per quarter, 12 hours is spent going through data for 99 departments to ensure program deliverables are on track. On average 6 hours a week is composing follow-up emails and updating the tracking spreadsheet. About 2-4 hours
Intangibles	Cloud allows for maintenance, upgrades, and patching with no employee/contractor down time.
Technology Capability	Compliance & Risk Management
Risk Mitigation	Having an incident management component enables direct connection to emergency response plans and business continuity plans to facilitate a more efficient response. Incident Command System forms and tools that are integrated will save time and provide clear and concise reporting and recordkeeping. Current planning documentation for incidents is challenging to use, format, produce actionable plans, and get approvals. Current recordkeeping is very manual. This tool will provide a one-stop repository for planning, delivering the plans, recording the progress through multiple operational periods of an incident, and housing records. It will enable improved after-action reporting, tracking, and follow-up such as after-action task assignment, completion date tracking and assignment, late task completion escalation, advanced management-level reporting, and integration to other work management systems such as ServiceNow and SAP to enable pre-populating forms for incidents that begin in other work management applications.
Risk Mitigation	Having cloud with break glass accounts enables the company to access Emergency Response Plans (ERPs), Incident Command System (ICS) forms, and Business Continuity/Disaster Recovery Plans from any device in an event. Break glass accounts are native to the solution that is not managed within CE authentication so if CE gets hit with a ransomware attack or some other event that disables the network, these accounts can be used to still access the tool to get to the plans to assist with recovery.
Intangibles	If no tool is selected to replace the existing SaaS solution and the Company resorted to manual paper processes, Consumers Energy (CE) would have a higher risk of not being able to access mission-critical documentation during events. For Business Continuity, CE would not be able to mature the program and existing programs and preparedness/recovery gaps would remain.

Click to Chat

Report Pulled: 11/1/2024 **Item ID: 12372**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Click to Chat

Description This project will implement a click to chat platform, whereby customers can engage in a chat conversation with customer service agents. This solution will engage agents and customers to measure customer engagement interest and agent performance in handling chat(s) via the Consumers Energy website.

Portfolio Customer Services > Customer Interaction Channels > Digital > Digital > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement The company currently does not offer live chat on our website. Today, more than 41% of customers expect live chat and more than 50% who use mobile phones expect it. That number is only rising each year. J.D. Power found that live chat has become the leading digital contact method for online customers; 42% of customers prefer live chat compared to just 23% for email. Currently, the only way customers can connect with the company are through postal mailing, phone, email, fax, or digital forms. These options are just not efficient enough any longer.

Objectives This project creates value for the Company and it's customers by: (1) determining customer take rate and interest in leveraging chat as an engagement channel for Business Units of VCC and BCC originating from the owner website; (2) determine owner's customer service staff capacity to handle more than one chat session (customer interaction over chat) at a time. Capacity may be up to 4 sessions at a time; and (3) survey customer experience.

Scope The project scope encompasses: (1) chat offer managed based on statistics and state on agent availability and wait time; (2) robust reporting; (3) customer data push based on interactions; (4) agent experience - all interactions (chat, voice, SMS) can be received via software and allow for escalation; (5) monitoring of agent availability across all channels (ex. voice, chat); and (6) full integration across software and backend systems.

Alternatives Alternatives considered include: (1) continue use of the current communication methods. This alternative was not considered because customers prefer to chat with someone in real-time and online, rather than current communication channels (Telephone and Email). (2) Develop a message repository. This alternative was not considered because it is not cost effective and does not address the problem of having the customers' requirements for instant/real-time communication. This alternative could take upwards of 12-24 hours for a response. The recommended alternative of a Click to Chat platform, described in this entry, will involve utilizing industry best-practice vendors for a purpose-built solution to meet the requirements of our customers.

Compression Air Permit And Compliance Digitalization

Report Pulled: 11/1/2024 **Item ID: 12841**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias ER Mobility, Generation Operations Work Management Mobility, Generation Operations Digital Work Management, Generation Operations And Compression Digital Work Management, Generation Compression Digital Work Management, Compression Digital Work Management, Generation Compression Digital Work Management, Gas Compression

Description This project modernizes and expands the use of software and digitized forms in support of station air permits and code compliance at Gas Compression facilities.

Portfolio Gas Delivery Systems > Gas Operations > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement The current process around air permits and compliance for Gas Compression is cumbersome, largely paper based, and is made up of multiple disconnected systems. This leads to poor visibility, process inefficiency and waste, re-work, regulatory risk, and human error.

Objectives his project provides value to the Company through: (1) increased productivity by direct data entry in the field; (2) improved quality through increased accuracy of updates completed at the time and place of the work; (3) elimination of the need to enter data into multiple disconnected systems, and (4) improved safety through access to real-time information used at work sites rather than printed procedures and forms.

Scope The scope of the project includes: (1) Merging the existing air permit and compliance tools into a single solution, (2) purchasing licenses to add Gas Compression users to the company's existing mobile work management software, and (3) configuring changes in SAP and the mobile work management software to replace the paper-dependent process with the ability to access and update maintenance, operations, and safety information for Gas Compression.

Alternatives Alternatives considered include: (1) Utilize an SAP work management mobile solution. An SAP work management solution was not selected since it is an unproven solution at the Company and would require additional project and support costs. (2) Continue with the manual paper-based processes and forms. Continuing with the manual paper-based processes and forms was not selected because it would not eliminate the identified process waste, re-work, and human error. (3) Customize the existing electronic Shift Operations Management System (eSOMS) mobile application to add work management functions. A customized mobile application was not chosen because it would require additional project cost and an ongoing support budget for a custom solution that the product was not intended to support. (4) Adopt a cloud based SAAS solution. This option was not selected as it was a high-cost option. (5) Utilize the existing Service Suite solution currently deployed for Gas and Electric Distribution. The Service Suite solution was selected because it is both an industry standard and a proven solution at the Company and provides the required mobility and digital benefits at a lower cost than other options.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Intangibles	Employee Engagement improves as the more tech savvy candidate pool for these positions are looking for mobile tools to help them do their jobs.
Intangibles	Productivity increases by using electronic work packages and reducing the need to return to desktop kiosks for updates. With the electronic work packages, (1) employees have remote access to manuals such as the Gas Operations Manual for Gas Compression and local maintenance procedures to reference standard work, (2) it eliminates multiple physical hand-offs of work documents related to the work management process and (3) it frees up planners' time to focus on long-range and outage planning to adhere to goals such as the Periodic Factor metric and Gas Flow Deliverability goal for Gas Compression. Productivity can also be tracked and measured for further improvements. This level of tracking is not possible with the current process and information.
Intangibles	Quality is improved and rework decreases when updates are performed right at the time and place of the work instead of afterwards. For Gas Compression, it (1) eliminates the manual process to update work scope and ensures access to the most up-to-date work order package, (2) allows crews to input SAP Notifications while at the jobsite for improved accuracy of data collected (3) provides the ability to collect asset condition data accurately at the jobsite to feed the data lake for asset health, and allows for the development of electronic code forms with built-in validation to improve quality of compliance data being collected.
Intangibles	Safety is increased as the most current information is at the work site in the mobile device versus a printed procedure.
Avoided Costs	The labor savings on time charging on a toughpad versus re-entering time later in office is 10 mins/day/employee savings from the 15 mins/employee per day it currently takes to enter time. Employees currently take 15mins per day to enter time. 59 Gas Compression employees would save 10mins/day = .17Hour x 230 work days a year x 59 employees = 2,306.9 hours avoided per year * $61 Standard Labor Rate = $140,720.90 Avoided O&M Costs
Risk Mitigation	The project will mitigate the risk of work errors from using outdated procedures especially for performing Gas Compression code work inspections using electronic forms. Electronic forms will improve validation of required inspection data, thereby reducing the risk of MPSC audit findings and possible regulatory fines. It also reduces safety risk by having the ability to have jobsite access to Emergency Plans to meet corporate safety requirements.
Avoided Costs	With this project there are avoided costs in Gas Compression from eliminating paper work package assembly. The time for 6 exempt planners is 2 days per month; 8 planners x 2 days x 8 hours = 128 hours per month. The avoided cost for exempt planners is calculated at 128 hours/month x $48/hour x 12 months = $73,728 per year. Their capital/O&M split is 25/75 which breaks down to avoiding $18,432 in capital and $55,296 in O&M. Six non-exempt admins spend 8 hours/month; 6 admins x 8 hours = 48 hours per month. The avoided cost for non-exempt admins is calculated at 48 hours/month x $25/hour x 12 months = $14,400 per year. Their capital/O&M split is 15/85 which breaks down to avoiding $2,160 in capital and $12,240 in O&M.
Technology Capability	Work Management

Corrosion Control Modernization

Report Pulled: 11/1/2024 **Item ID: 12474**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Corrosion Control Modernization

Description This project will modernize the Corrosion Control measurement, documentation, and analysis process for Gas Transmission and Gas Distribution Corrosion Control. It will also automate the Corrosion Control process and eliminate manual data entry and paper from the process.

Portfolio Gas Delivery Systems > Gas Operations > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement The current gas pipeline corrosion control field data collection and monitoring process is antiquated and manually intensive. The existing process requires that technicians take readings from the corrosion control devices using a handheld DVM (Digital Voltmeter) and then record those readings on paper, followed by manual data entry into Inspection Manager. The results can then be further stored, processed and analyzed. This process is labor intensive and error prone, which could result in compliance issues, causes rework, and drives up labor costs.

Objectives This project creates value for the Company and its customers by: (1) modernizing the entire gas pipeline corrosion control field data collection and monitoring process; (2) eliminating the manual paper process of taking and recording measurements on corrosion control devices attached to gas pipelines; (3) automating the entire process from measurement through documentation and analysis; (4) providing an integrated solution that takes the measurements and records the results in one step; (5) implementing geographical location (latitude, longitude) mapping for each test point read to provide more efficient routing.

Scope The project scope includes: (1) purchasing hardware, connectivity, and software with related licenses needed to establish a modern electronic corrosion measurement and documentation system; (2) a data transfer to the new system from the existing system of record, Inspection Manager; and (3) training users in the use of the new system and deploy to all corrosion control technicians.

Alternatives Alternatives considered include: (1) continue with the current manual process. This option was not selected as it does not solve the issues associated with the paper-based manual process; (2) develop a Consumers Energy custom solution that would interface with a standard DVM and automate the current paper process using custom in house solution. This option was not selected as it would be far too costly and time consuming to develop in-house and a standard solution is available in the marketplace; and (3) purchase and implement a hybrid cloud-based COTS (Common Off The Shelf) hardware and software solution to provide an electronic means of data measurement and collection and then transfer that data to the existing GIS (Geographic Information System.) This option was selected as it meets the goal of automating the data collection and documentation process and eliminates the existing paper process.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Intangibles	Ability to electronically access proof of repair documentation, as well as, track repair history.
Technology Capability	Gas T&D, Generation
Intangibles	Improved compliance through reduction in errors created by the manual process.
Intangibles	Improved employee engagement by providing a modern paperless experience.
Avoided Costs	Reducing costs by eliminating revisits and rework caused by errors in the manual data entry and recording process as well as removing manual process steps.
Intangibles	Reducing errors introduced by manual data entry when technicians collect voltage readings in the field
Intangibles	The new devices have the ability to provide a geographical location (latitude, longitude) for each test point read. Employees are currently relying on test point description (description inputted by field employees)to describe our asset location. With the geographical stamp, employees will increase the accuracy of our GIS Records and also allow for more effective routing for all work types.
Avoided Costs	The new system will use Power Apps to create reports, eliminating the need for manually created reports.

Customer Order Service Tracker

Report Pulled: 11/1/2024 **Item ID: 9062**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Service Tracker, Customer Order Service Tracker

Description Short cycle orders including gas emergencies and meter services account for many of the incoming customer inquiries to the contact centers. This project will implement a service order status tracker to provide transparency to customers and oversight to internal teams supporting utility service orders across Company service areas. The tracker will provide timely and accurate service order updates, creating a more robust customer experience for tracking service order status and location-based updates.

Portfolio Customer Services > Customer Interaction Channels > Digital > Digital > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement Customers have limited visibility to when Company assigned crews will be on premise and what work will be completed. This is due to features missing within the Company's digital channels for accurate updates from dispatch, scheduling, and field crews. The lack of awareness drives calls into the call center, resulting in approximately 346,000 annual contact center calls related to short cycle requests. Additionally, this lack of visibility increases truck rolls due to dispatchers being unaware of crew locations and routes which can cause crews to be assigned when a local crew could have completed the work. This leads to overall customer dissatisfaction because of a lack of visibility to scheduled and ongoing short cycle work. Enabling a digital channel for communication regarding utility service orders will improve customer experience and reduce the waste of repetitive crew dispatching.

Objectives This project will add value to the Company and its customers by: (1) providing transparency for customers on the timing and location of the associated crew completing utility short cycle service orders, (2) reducing calls to contact centers by customers seeking clarification regarding arrival times through visibility to scheduling time-frames and providing notifications to customers when crews are en-route, (3) improving resource assignment by current location, which decreases wasted truck rolls through enabling location services for active crews, (4) increasing visibility into the service person(s) completing the order by enabling crews to connect with customers through digital channels, and (5) improving customer experience for short cycle service orders by implementing a channel of choice for Company interactions.

Scope The scope for the project includes: (1) modifying the customer self-service portal to include features that support utility service order tracking, including the location of crews en-route, (2) providing desktop and mobile capabilities, (3) enhancing the existing ServiceBench platform to allow real-time status updates that can be communicated to customers, (4) utilizing location-based services to update internal portal in real time, and (5) enabling text and email notifications to alert customers of service crews arrival times.

Alternatives Alternatives considered for this project include: (1) Deploy a mobile application to address utility service order tracking, (2) utilize a cloud hosted solution from a third-party, (3) modify the existing customer portal to enable customers and the Company to track utility service orders and crews. Options one and two were not selected as the cost associated with deployment would greatly outweigh the benefits with call reduction and improved customer experience. The third option was selected because it utilizes existing technologies, which reduces the implementation complexity and project cost and has faster value realization for the customer and the Company.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Customer Mgmt
Intangibles	Improve safety for both the Company's employees and customers by providing accurate estimated times of arrival, reducing the likelihood of threats of violence.
Intangibles	Improved customer experience related to real time updates from service crews completing activities in their area. The crews will have the ability to provide accurate estimated times of arrival and detail what work is being completed via digital channels. Building trust between the Company and its customers regarding the work being completed correctly, the first time a crew arrives.
Avoided Costs	Reduce Truck Rolls for appointments that weren't rescheduled in a timely manner and limiting truck rolls in locations where a crew can complete multiple jobs in a geographic location. Each avoided truck roll saves the company approximately $450.
Avoided Costs	Reduction in calls to validate arrival times of field crews based on more clarity and transparency regarding the service being completed. Currently 346,000 calls take place yearly regarding status of service orders. The project anticipates a 60% reduction over three years resulting in potential avoided costs of $537,996 per year. (Avg cost per call $7.63 [$9.76/call internal & $5.50/call H&H] * 69,000 calls reduced each year.)
Intangibles	Reduction in Customer Complaints regarding service orders, delays in service, and maintenance visits. Last year, the company received 6 formal complaints and 11 informal complaints regarding non-emergency maintenance work.

Customer Self-Service Online Work Scheduling

Report Pulled: 11/1/2024 **Item ID: 9035**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Online Work Scheduling, Customer Self-Service Online Work Scheduling

Description The Online Work Scheduling project will implement online, self-service work order scheduling for new business requests enabling future work requests to be scheduled online by customers new business requests, rather than contacting the contact center.

Portfolio Customer Services > Customer Interaction Channels > Digital > Digital > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement

Currently customers must call the contact center to schedule work and obtain updates given a lack of online self-service capabilities. To stay informed, customers are required to contact the contact center, and often requires multiple calls per work request. In addition, once work is completed customers do not receive confirmation that the work has been completed or what work was completed, which may also result in additional inbound customer calls. These inefficiencies require multiple inbound calls, which often results in customer dissatisfaction.

Objectives

The Company and its customer will see value through this project by: (1) implementing self-service capabilities for customers to submit new business requests, (2) reducing calls into contact centers, (3) improving the digital experience within the Company's customer portal, (4) improving quality of utility service work through timely customer surveys based on work completed, (5) improving work efficiency by providing routine updates online resulting in manual activity (6) improving overall customer experience as customers can utilize channel of choice, and (7) enabling future initiatives supporting customer site work by developing the technical and business process foundation for other initiatives to expand upon.

Scope

The project scope includes: (1) creating the ability for customer self-service online for new business requests, (2) enabling channel of choice options for scheduled work order confirmation notifications, and (3) automating scheduling of work orders in SAP and other back-end systems.

Alternatives

Alternatives considered include: (1) developing a form on the Company's web portal for customers to complete and send to a monitored email box, (2) purchasing a third party cloud solution to host a portal for customers to schedule work orders, (3) displaying a map of service areas with a number for customers to call their local dispatch area, and (4) enhancing the current customer self-service portal to include new business requests. The first and third alternatives were not selected because they will degrade the customer experience and require additional manual process steps and work, introducing waste to manage additional processes to schedule the work order. The second alternative was not selected due to the high cost of integrating a new solution with the existing customer platform and back-end systems and increases ongoing maintenance and support costs. The fourth alternative was selected because it improves customer experience through self-service, utilizes the existing customer self-service portal, increases process efficiency for scheduling work orders, and minimizes increases for ongoing maintenance and support costs.

Data & Analytics Platform Rationalization

Report Pulled: 11/1/2024 **Item ID: 13961**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Data & Analytics Platform Rationalization

Description This project will optimize the Data & Analytics system landscape by creating connections, migrating data into Data Lake 2.0 (DL 2.0), and building visualizations from the data in DL 2.0. Following the enablement of DL 2.0, retirement of the IT Data & Analytics legacy systems including SingleStore Data Lake (SSDL), SAP Business Warehouse (BW), SAP Business Objects (BOBJ), Native HANA, the BW Portal, and SAP Business Objects Data Services (BODS) creates value by reducing the total cost of ownership associated with maintaining and supporting legacy systems.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement The IT Data & Analytics legacy systems (SSDL, SAP BW, SAP BOBJ, Native HANA, the BW Portal, and BODS) are outdated, inefficient, and becoming duplicative in nature with the introduction of DL 2.0. If these legacy systems are not retired, they will continue to cost the Company money as major investments are needed to maintain and support them.

Objectives This platform rationalization project creates value for the Company and its customers by reducing the total cost of ownership associated with maintaining and supporting legacy systems including licensing fees, maintenance costs, infrastructure, and support resources.

Scope The project scope includes: (1) the assessment of the existing Data & Analytics platforms including SSDL, SAP BW, SAP BOBJ, Native HANA, the BW Portal, and BODS; (2) inventory of data and reports still being used by stakeholders; (3) determination of migration strategy; (4) data migration to the Azure Data Lake; (5) report migration to Power BI; (6) organization change management; and (7) the retirement/decommissioning of the legacy platforms and applications.

Alternatives Alternatives considered: (1) upgrade legacy systems in place (on-premise). This alternative was not selected because this is costly and misaligned with the Company's cloud strategy. (2) Lift and shift these on-premise systems to the cloud through the Hybrid Cloud Transformation Program. This alternative was not selected because it would duplicate the work being done as part of the DL 2.0 project and would not provide the same efficiencies that DL 2.0 introduces. The alternative to migrate all data sources to DL 2.0 and retire legacy systems was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.

Digital-Cloud Data and Analytics Platform

Report Pulled: 11/1/2024 **Item ID: 13443**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Accelerate Data Strategy, Digital-Cloud Data and Analytics Platform

Description This project will provide Artificial Intelligence (AI) and analytics in the cloud across the business to uncover new paths to value, faster, allowing the organization to make better decisions and enable delivery outcomes for the NGDP, Electric Grid Integration, customer programs, and other business needs. The project will additionally establish data governance roles and responsibilities, processes, and implement tools to support best practices across the enterprise.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement Consumers Energy faces several challenges in the ongoing data modernization journey, which include: (1) legacy data platform operations; (2) long lead times for data exploration and identification of data assets; (3) lack of data ownership and quality, (4) limited data governance best practices across data ownership, access control & security; and (5) heavy dependence on IT for Business Intelligence reporting and analytics.

Objectives The project will add value by providing data to support business needs by: (1) optimizing data platform operations costs with workflow-based platform infrastructure deployment using pre-built modules and templates; (2) reducing data operations build complexity and data engineering costs through automation; (3) improving data quality and governance that leads to reduced costs of data provisioning, data duplication, and improved data accuracy; (4) streamlining data access requests, management, and governance to reduce risks and support efficiency; and (5) increasing the speed to deliver new data and data capabilities, improving productivity, and improving access to data. This project is an enabler for business areas to use these capabilities to build analytic models for asset and labor optimization that is anticipated to more than offset the project costs.

Scope The project scope includes: (1) developing and modernizing the analytics platform in the cloud to allow Consumers Energy to implement new use cases leveraging simplified infrastructure configurations and automated deployment processes; (2) build and deploy data management capabilities, controls, catalog, assets, and data flow; (3) developing data ordering workflows and data access management controls; (4) prioritization and new datasets; (5) simplifying infrastructure configuration; (6) automating deployment processes; (7) enabling data governance tools and processes.

Alternatives Alternatives considered include: (1) Address current pain points in existing on-premise and cloud analytics platforms. This alternative was not selected because the existing platforms requires new investment in licensing and infrastructure, delivery for new capabilities cannot keep pace with demand, still requires investment to address legacy system technical obsolescence, and business areas would not realize asset and labor optimizations. (2) Continue to utilize existing on-premise and cloud analytics platforms. This alternative was not selected because it would not address the current pain points in the existing on-premise and cloud analytics platforms, limiting the Company's ability to have required data and analytics capabilities to improve processes and realize asset and labor optimizations. (3) Implement a new data and analytics platform in the cloud. This alternative was selected because it provides improved analytics capabilities, faster access to data that is critical to improve business process, and reduces technical obsolescence.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Avoided Costs	Automated deployments for infrastructure decreases build time and increases time spent on higher value work for the IT platform team. This will also decrease future project implementation hours and associated labor costs. Avoided benefits will be finalized following phase 1.
Intangibles	Enhance Workplace Productivity and Collaboration: Improve Analytics Efficacy and time to insights with data catalog and data democratization.
Risk Mitigation	Reduce Data compliance Risk and Exposure: Reduced exposure to data loss, compliance risk, or potential for data platform interruption with integrated data catalog, controls and governance.

Digital-Data and Analytics in the Cloud

Report Pulled: 11/1/2024 **Item ID: 8804**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Data and Analytics in the Cloud, Digital - Data and Analytics in the Cloud, Digital-Data and Analytics in the Cloud

Description This project will extend the current data and analytics environment into a cloud environment, which will enable data and analytics at-scale and enable the delivery of outcomes for the Natural Gas Delivery Plan, Electric Grid Integration, customer programs, and other business needs.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-PROD TRANSF, ARCH & QUAL

WORK OBJECTIVES

Problem Statement The Company currently has an on-premise data and analytics platform, Data Lake, that houses multiple data attributes ranging from customer, grid, and operations. As the Company requires more predictive and prescriptive analytical use case outcomes, the current environment is insufficient to handle the data analytics at-scale for multiple use cases. Also, the current solution lacks the libraries of advanced Machine Learning (ML), AI tools, and Industry-Standard Big Data Ingestion tools, which are standard offerings as part of Cloud environments, such as Amazon Web Services (AWS), Azure or Google Cloud Platforms.

Objectives The project will add value by: (1) establishing the technical foundation necessary to scale the platform, which enables data analytics at-scale for the identified use cases; (2) establishing ML workspaces in the cloud that enable predictive and prescriptive analytics at-scale for the identified use cases; (3) gain performance efficiencies for analytics and data capability execution in cloud, reducing wait time and lag for analytics teams; (4) enabling pay-per-use, which enables future cost optimization for the data analytics platform; and (5) empowering faster prototyping, testing, and deployment of analytics solutions.

Scope The project scope Includes: (1) introducing new data sets, including historical data, to enable Data Analytics use cases in the cloud; (2) implementing cloud-based Machine Learning (ML) and Artificial Intelligence (AI) capabilities; (3) integrating the agile DevOps toolset with the cloud-based data and analytics platform to enable future automation; (4) implementing capabilities to enable capacity-based pay-per-use; and (5) defining and implementing cloud-based data and analytics platform infrastructure that will enable future cloud migration and maintenance.

Alternatives The alternative considered to a cloud solution is to expand the on-premise infrastructure and purchase multiple tools to solve individual capability gaps. The Company did not choose this alternative because it is more costly than cloud due to higher infrastructure costs and a larger workforce required for implementation.

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Risk Mitigation	Foundational analytics capabilities enable the outcome of the Natural Gas delivery plan, Electric Grid Integration plan, and the Retail plan. If the Company is unable to quickly deliver foundational analytics capabilities it risks the outcomes of the strategic plans.
Intangibles	Implementation of the Data and Analytics in the Cloud will allow for routine upgrades and seamless integration of new analytic tools and libraries available within the cloud. This allows for quicker delivery of analytics for projects.
Intangibles	Implementation of the Data and Analytics in the Cloud will allow for the ability to quickly scale up compute power needed to run advanced analytics. Today, average time to purchase and expand on-premise hardware is between 3-6 months. That is 3-6 months that we are missing out on business value.

Digital-Hybrid Cloud and Data Center Migration

Report Pulled: 11/1/2024 **Item ID: 10502**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Hybrid Cloud and Data Center Migration, Digital - Hybrid Cloud and Data Center Migration, Digital-Hybrid Cloud and Data Center Migration

Description This project will optimize data center assets and asset replacement project purchases by migrating or retiring applications out of existing Company and co-location data centers into cloud services, reducing operational costs for running IT services and leveraging increased cloud capabilities to improve the efficiency, quality, and speed-to-market of customer-facing and internal IT services.

Portfolio IT Services > Infrastructure > Data Center - Enterprise Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-INFRASTRUCTURE PLATFORMS &

WORK OBJECTIVES

Problem Statement The technology currently deployed in the Company's data centers meets many customers' needs today. However, the pace of digital transformation is increasing rapidly, and requirements for applications are evolving faster than the technology in the Company's data centers can respond in a cost-effective manner. These data center constraints lead to longer implementation times, missing capabilities, or reduced functionality in the applications that the Company can deploy.

Objectives This project will create value by ensuring the Company's technology requirements are met through a comprehensive and cost-effective combination of data centers and public cloud services. Specifically, by migrating applications to cloud services, the project will: (1) reduce capacity, hardware maintenance, and security device costs at the co-location data center; (2) reduce hardware maintenance and security device costs at the production data center; (3) enable the ability to scale infrastructure quickly up or down without costly up-front hardware purchases; (4) reduce application risk through cost-effective, scalable infrastructure redundancy and availability; (5) reduce ongoing server and storage asset replacement costs; (6) reduce ongoing networking equipment replacement costs; (7) reduce operational support costs; and (8) enable the use of a vast array of cloud services to support Company applications.

Scope The project scope includes: (1) promoting the robust main co-location data center to become the primary data center for on-premise IT services; (2) demoting the Company's production data center to the disaster recovery data center for on-premise IT services; (3) analyzing applications for migration to cloud or retirement; (4) migrating applications from on-premise to cloud; (5) transforming applications to use cost-effective cloud services; (6) altering network architecture and deploying base infrastructure to allow each location (on-premise or in cloud) to function independently; (7) deploying cloud and on-premise cost management tooling and processes; (8) simplifying and optimizing backup and disaster recovery resources and processes using cloud services; (9) implementing additional automation for application deployment and management; (10) changing the operations model for support of cloud-based applications; (11) educating and increasing the skills of IT and other employees in leveraging public cloud services; and (12) transforming IT to become the broker of cloud services for the Company.

Alternatives Alternatives considered included: (1) migrating to public cloud services faster. This alternative was not chosen because the Company's ability to absorb new technologies coupled with the investments the Company has already made in data center equipment would prevent a faster move from being efficient and effective, introducing additional financial risk; (2) migrating to public cloud services slower or not at all. This alternative was not selected because delaying public cloud services and capabilities coupled with requiring an extension of the life of existing data center equipment creates increased financial and operational risk; and (3) contracting with an outside vendor to provide cloud services to run applications for the Company. This alternative was not selected because industry information shows the option as not yet cost effective or not providing a maturity level that the Company would be able to easily consume with limited in-house experience and expertise in public cloud. The alternative to migrate to a hybrid cloud and data center model was selected because of the expected cost benefits and technology capabilities it provides to the Company over a timeline that allows the Company to realize the value of existing investments.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Administrative and General Support
Risk Mitigation	Consumption of public cloud services offers infrastructure redundancy and availability at scale that cannot be duplicated in the Company's data centers, reducing the risk of running applications.
Intangibles	This project makes consumption of all types of public cloud resources possible to provide IT services in support of all business processes, enabling technology capabilities for Administrative and General Support.
Avoided Costs	With applications running in public cloud, the Company can expand and contract the consumption of IT services at will as appropriate versus purchasing hardware to expand in quantity and having no simple ability to contract.

Energy Assistance Enhancements and Maintenance Annual U Report Pulled: 11/1/2024 Item ID: 6683

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Comply - Interval **Work Type** Project

Alias CARE 5.0, Consumers Affordable Resource for Energy (CARE) Annual Updates, Energy Assistance Enhancements and Maintenance Annual Updates

Description The Energy Assistance Enhancements and Maintenance Annual Updates project, formerly known as Consumers Affordable Resource for Energy (CARE) project, will implement software changes to offer energy assistance to low-income customers and streamline the process for the assistance agencies who use the assistance portal. This is accomplished through improved user interfaces and updates to SAP to process various requests. Upcoming modifications will be identified following an ongoing and annual review of requests, that includes criteria from the Department of Health and Human Services (DHHS) and Michigan Public Service Commission (MPSC) to prioritize the list of changes.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement Each grant year, DHHS and MPSC stipulate the criteria required for customers to enroll in the CARE program, how the Company and agencies will manage the enrollment process and track active CARE customers, and how they will administer the Michigan Energy Assistance Program (MEAP) benefits through bill credits and arrears forgiveness. The criteria changes significantly each year; therefore, the Energy Assistance Enhancement and Maintenance Annual Updates application requires modifications to meet the new requirements. If the regulatory requirements are not fulfilled, the Company is at risk of losing state Low Income Energy Assistance Fund (LIEAF) funds to assist low-income customers with paying their energy bills, thereby increasing the customers risk of shutoff for non-payment. In addition, our energy assistance programs function within all software platforms in the company which consistently need enhancements and updates.

Objectives The project will provide the following value: (1) complete modifications to internal SAP application and Agency Portal to receive LIEAF funding, which can be used to provide customers the bill credits and arrears forgiveness; (2) improve the data within the assistance agencies portal, thereby making it easier to assist customers in need of LIEAF funding; and (3) complete modifications to customer facing platforms.

Scope The project scope includes: (1) updating the enrollment and status process; (2) allowing for flat monthly bills; (3) improving reporting; (4) updating the arrears forgiveness plan; (5) satisfying additional regulatory requirements for the annual grant rule changes required by the Department of Health and Human Services and Michigan Public Service Commission; (6) updating CARE dunning process; and (7) updating the assistance portal (CE PASS) functionality to enhance Agency Self-Service.

Alternatives Alternatives considered include: (1) continue with current process. This alternative was not chosen because it would lead to loss of grant funding, thus decreasing or eliminating energy assistance dollars for customers; (2) transfer administration of Energy Assistance Programs to a third party organization. This alternative was not selected because it would remove ownership and visibility into the health of the program while increasing administrative costs; and (3) make annual updates to the application, which will allow agencies to easily enroll customers on assistance programs and allow placement of holds to stop or prolong credit activity until assistance decisions are granted. This option was selected since it provides long-term proactive energy assistance to customers and prevents loss of grant funds. Changes are required to internal systems such as SAP, a large internal system that supports broad areas of the business, and the Agency Portal, an internally developed web application, therefore a single cloud or third-party alternative is not viable. Additionally, retiring the existing Agency Portal for a new application would increase costs beyond that of the routine upgrades.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Avoided Costs	As a result of our compliance with CARE requirements, we have access to MEAP funds that help to pay down low-income customer's arrears, therefore preventing those from being written off. This year, we are expecting to enroll 9,350 customers with an average arrears of $285, thus potentially avoiding $2.6M in bad debt write-offs.
Risk Mitigation	As a result of our compliance with CE PASS requirements, Department of Health and Human Service and other agencies would not be able to assist our customers. This could result in $60-$70 million dollars not able to be funded to the company.
Technology Capability	Customer Management - As a result of this project, we will better be able to manage our customers who otherwise would fall behind on bills.

Enhancements - Customer Experience and Operations- Cap

Report Pulled: 11/1/2024 **Item ID: 8776**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , Enhancements - Customer Experience and Operations- O&M, Enhancements - Customer Experience and Operations- Cap

Description The Enhancements – Customer Experience – Operations project provides funding for small changes and improvements to existing software to address requests needed due to changing business requirements.

Portfolio IT Services > Applications > Customer Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement As business processes improve and change, new requirements surface requiring smaller effort software application changes. These software enhancements are neither projects nor operational work but require funding for resources. The annual budget cycle should ensure funding is provided for software enhancement small work efforts to ensure we are leveraging the value of existing IT investments to support business processes.

Objectives Requests for this funding are governed by a cross-functional board of representatives from each area which meets monthly to evaluate and prioritize the work. The board assesses requests for value using benefits that are categorized into hard cost savings, cost avoidance, safety, achieving corporate goals, and mitigating risk. Included in the implementation are small changes and functionality improvements to existing software application investments for Customer Experience and Operations.

Scope The enhancement requests are fulfilled to provide functionality for areas such as dunning, customer billing, programs for low income customers (i.e. Winter Protection Program, Special Protection Program), Company website, contact center, energy efficiency, and rates.

Alternatives Historically, specific budget was not allocated for enhancements work requiring efforts to identify funding for each request. As part of our review process the alternative considered was to not provide funding for enhancements. However, this limits our ability to make software changes to support process improvements, regulatory changes, and to meet legally required system changes.

Enhancements-Cloud Automation

Report Pulled: 11/1/2024 **Item ID: 8806**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Cloud Automation Phase 6m, Enhancements - Cloud Automation, Enhancements-Cloud Automation

Description The Enhancements - Cloud Automation project provides funding for small changes and improvements to existing software to address requests needed due to changing business requirements.

Portfolio IT Services > Infrastructure > Data Center - Enterprise Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-ENTERPRISE PRODUCTS AND SEI

WORK OBJECTIVES

Problem Statement The Company's existing cloud automation platform consists of a number of scripts that automate the build of infrastructure such as servers, operating systems, databases, and application installations in minutes or hours. These scripts include security hardening and application of the latest patches. This project will maintain and improve these scripts to ensure they meet the latest security policy and requirements, and any changes to the way the operating systems, databases, or applications are configured.

Objectives The value of this enhancement project is the implementation of small changes and functionality improvements to existing IT software application investments for Cloud Automation such as cost avoidance of 70 hours per year by removing failed build release tickets and 120 hours per year on Windows and Linux template patching improvements, safety, achieving corporate goals, and mitigating risk.

Scope The scope of the enhancement includes requests that will be fulfilled to provide functionality for areas such as automating IT servers, firewall set-ups, etc.

Alternatives The alternative would be to continue as is with existing scripts; however, this introduces security risks and additional manual steps to build infrastructure, which in turn, will lead to increased costs and risk of manual errors.

Report Pulled: 11/1/2024 **Item ID: 11155**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Application Currency and Enhancements – Corporate Services - Capital, Application Currency – Corporate Services - O&M, Enhancements – Corporate Services - Capital, Enhancements – Corporate Services - O&M, Enhancements-Corporate Services-O&M

Description The Corporate Services initiative will utilize O&M funding to make enhancements to existing software and to address requests generated by changing business requirements.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-PLANNING & GOV

WORK OBJECTIVES

Problem Statement

As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives

The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services.

Scope

The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and, Public Affairs.

Alternatives

Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

WORK OBJECTIVES

Problem Statement

As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives

The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment.

Scope

Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management.

Alternatives

Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

Problem Statement

As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives

The value of software enhancements in Security lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment.

Scope

Included in the implementation are small changes and functionality improvements to existing IT software application investments for Security in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as cyber security related platforms, cyber security incident response, physical security, security awareness, risk management, privacy and compliance.

Alternatives

Prior to implementing a Security enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for Security enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

Enterprise Print - Scan Suite

Report Pulled: 11/1/2024 **Item ID: 11651**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , Enterprise Print - Scan Suite

Description The projects intent is to upgrade the current Enterprise Print and Capture suite for improved data security and integration for the work from home business partner.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** Unspecified

WORK OBJECTIVES

Problem Statement The company currently maintains a print and capture suite that will have support ending in 2025. Only high-level security patches will be available after this date. The company maintains a fleet of servers that are scheduled to be upgraded. The current print and capture suite is not compatible with the targeted server operating systems. The lack of internal resources requires the company to continue to absorb increased costs to contract administrative personal.

Objectives This project maintains cost savings achieved by eliminating wasteful print jobs and further enables a productive, and flexible workforce for business partners working remotely. This project also ensures that the latest data transmission security requirements of are met by the solution.

Scope The project scope includes: (1) upgrading the current suite to the latest version; (2) consolidating the amount of print servers in the environment; (3) training for company personal to administer the suite; (4) converting all workflows from the current system; (5) implementing remediation for security vulnerability risk;. (6) integrating device management with Enterprise Configuration Management Database (CMDB) for asset tracking and monitoring.

Alternatives Alternatives considered: (1) migrating to cloud services. This alternative was not chosen at this time due to maturity levels found with subscription services. (2) other print-scan products. This alternative was not selected as it would required new print and scanning specific to another print-scan product.. (3) Print-scan products that were less costs. This alternative was not selected, due to fewer capabilities offered than the current product, which would introduction inefficiencies in the current processes. (4) upgrade current product. This alternative was chosen due to lower overall cost of not requiring new hardware, maturity of current product, and providing same level of capabilities required to support current processes.

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Enterprise Risk Management

Description The project will implement software to simplify processes pertaining to Enterprise Risk Management, improve efficiency, provide risk identification and repository tools, and provide real-time risk information.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement

The Enterprise Risk Team (ERT) works with Risk Owners (RO) on an annual basis to identify new risks, update existing risks, quantify impacts and likelihoods of these risks, document mitigation plans, identify trends, and formulate risk tolerance metrics. This work is accomplished through an iterative back-and-forth process between ERT and ROs to gain alignment on content. This effort culminates in multiple Risk Map PowerPoint, Microsoft Word and email documents organized by area of risk. These risk maps are then presented to senior management and to the Board of Directors (BoD) on an annual basis. The intensive, time-consuming manual Enterprise Risk Management (ERM) process creates risks of human error that can over or under quantify risks, introduce data anomalies, and create version tracking issues. The existing process results in substantial inefficient use of time by risk analysts and risk owners throughout the Company, limits the breadth of analysis that can be provided, and limits the overall ability of the Company to timely identify, analyze, and communicate risks to our senior leaders, thereby causing potential delays in responding to emerging risks. Because of the lengthy manual process, it is only performed once a year, but must be performed more frequently to proactively manage enterprise risk. Utility industry peers leverage software to more effectively manage enterprise risk management programs.

Objectives

This project creates value for the Company by: (1) providing real-time risk information to interested parties including the risk team, risk owners, senior management, and the Board of Directors (BoD) supporting proactive risk management; (2) creating a centralized repository for risk identification, management, and mitigation plans; (3) eliminating waste by simplifying processes; and (4) improving efficiency of the risk owners and analysts.

Scope

The scope of the project includes: (1) create risk analysis templates and tools for automated reporting; (2) configure automated workflow to perform risk updates; (3) configure dynamic templates that prompt the risk owners based on prior selections; (4) organize risk assessments through an online and searchable data capture (repository); (5) create new reports and executive dashboards; (6) data conversion; and (7) set record retention rules.

Alternatives

Alternatives considered include: (1) Continue use of the current manual processes which result in waste, lack of quality results, and annual review of risks; (2) Build a custom internal enterprise risk solution. This option was not selected as it will not result in an enterprise risk program that leverages best practices that exist in software provided by the leaders in risk management software; and (3) Implement a software solution from a leading enterprise risk solution vendor. While this would introduce new license and ongoing support costs, it is the preferred option because it leverages industry best practices with a proven solution; provides application reliability, security, and stability through ongoing vendor support; and brings innovation and insights via the reporting of risk information through management dashboards. In addition, it aligns the Company with utility industry peer practices for more effective enterprise risk management.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Compliance & Risk Management
Avoided Costs	ERM Group can save up to 252 hours annually through efficiencies in: (1) Risk form configuration (24 hours saved); (2) Workflow including email/phone conversations, report creation and Quality control (229 hours saved) These efficiencies would free up time for more value-added activities such as ad hoc analysis, more frequent risk updates to management, emerging risk
Risk Mitigation	Implementing a centralized solution will mitigate risk by better managing risks. One third of the 150 risk tolerance metrics are currently red.
Risk Mitigation	This project would track more than 200 corporate risk tolerances from the Impact group within the Business Planning System (BPS). The Corporate Risk group tracks all of these risks and the number of risks is expected to grow over time.

Enterprise Service Bus Application 2020-2021 Upgrade

Report Pulled: 11/1/2024 **Item ID: 6734**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ESB BW6 Upgrade,Enterprise Service Bus Application Upgrade, Enterprise Service Bus Application 2020-2021 Upgrade

Description This project will upgrade and migrate the Business Works developer application to the next version.

Portfolio IT Services > Applications > Foundational Enterprise Applications > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-PROD TRANSF, ARCH & QUAL

WORK OBJECTIVES

Problem Statement

Newer Enterprise Service Bus (ESB) software versions offer improved integration with cloud-based services and applications. As the Company increasingly migrates to cloud-based Infrastructure, Platform- and Software-as-a-Service solutions, it is critical that this vital data tool or pathway, be more scalable, secure, and capable of working in a cloud-based environment. In addition, the messaging and event modules within the ESB are currently outside of their standard support windows. While it is possible to continue to get extended support by paying an estimated premium of $40,000, this is just temporary coverage and serves only to delay the need for an upgrade—not a prudent use of resources.

Objectives

The value this project provides the Company includes: (1) accelerated productivity; (2) continuous delivery and integration; (3) an open ecosystem for improved operational visibility; (4) real-time integration with web, mobile apps, and application programming interfaces; and (5) improved administrative and operational efficiencies.

Scope

The project scope includes: (1) implementing new versions of all applications that are part of the Tibco ESB software suite – BusinessWorks, Enterprise Messaging Service, BusinessEvents, API Exchange, and Hawk; and (2) a server refresh. The new products will be implemented on the latest version of the SUSE Enterprise Edition operating system.

Alternatives

Alternatives considered included: (1) Absorb the annual $40,000 maintenance cost and lose supportability. Given the critical nature of this application, it is not recommended to lose mainstream support for any of the applications involved. Any sustained ESB product deficiency would impact many areas of the Company, such as billing, revenue collection, and remote meters. The current implementation of the ESB platform was built with 5 years of growth in mind. This alternative was not chosen for these reasons, and the additional expense. (2) Replace the platform by moving it to cloud. Migrating the ESB to the cloud would be too early in the Company's strategy for cloud adoption, which may cause issues with operational stability and incur additional expenditure. A cloud migration would also take longer to plan, which would put the Company at risk of falling outside of the the current vendor support window for the product's current version. (3) Upgrade the existing application. This option was selected because it best suits customer and Company needs for the near future by restoring vendor support for hot fixes and patches, and enables product scalability to the measure required of the business.

Risk Mitigation	Consumers Energy will lose support on critical ESB software components that support OpenWay Collection Engine, SAP, ITRON, DIV, DRMS, MDM, IWP, PayGo, Grid Director, Field Service Solution, and Digital Customer Experience. Rebuilding the ESB Platform and ensuring the current production integrations will not be impacted as well as meeting or exceeding current service levels is critical.
Capacity	The current implementation of the ESB platform was built with 5 years of growth in mind. Upgrading the ESB on a regularly scheduled cadence will allow Consumers to grow the the application around the business' needs.

Enterprise Service Bus Application 2024-2025 Upgrade

Report Pulled: 11/1/2024 **Item ID: 11727**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ESB BW6 Upgrade,Enterprise Service Bus Application Upgrade, Enterprise Service Bus Application 2023-2024 Upgrade, Enterprise Service Bus Application 2024-2025 Upgrade

Description This project will upgrade and migrate the Business Works developer application to the next version.

Portfolio IT Services > Applications > Foundational Enterprise Applications > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement
Newer ESB software versions offer improved integration with Rest/API services and applications. It is critical that this vital data tool or pathway, be more scalable, secure, and capable of integrating to a service-based environment. In addition, the messaging and event modules within the ESB are currently outside of their standard support windows. While it is possible to continue to get extended support by paying an estimated premium of approximately $80,000 annually, this is just temporary coverage and serves only to delay the need for an upgrade.

Objectives
The value this project provides the Company includes: (1) cost avoidance to avoid extensive payments for extend support purposes; (2) avoid technical obsolescence; (3) operational resiliency; and (4) improved administrative and operational efficiencies.

Scope
The project scope includes implementing current version of all applications that are part of the ESB application, database version, and required database drivers.

Alternatives
Alternatives considered included: (1) Accept the annual $80,000 extended maintenance cost. Given the critical nature of this application, it is not recommended to lose mainstream support for any of the applications involved. Any sustained ESB product deficiency would impact many areas of the Company, such as billing, revenue collection, and remote meter management. The current implementation of the ESB platform was built with 5 years of growth in mind. This alternative was not chosen due to risk to Company operations , and the additional expense. (2) Replace the on-premise upgrade plan to implement a cloud-based solution. A cloud migration would also take longer to complete, which would put the Company at risk of falling outside of the current vendor support window for the products current version. (3) Upgrade the existing application. This option was selected because it best meets the Company needs for the near future by restoring vendor support for fixes and patches, and enables product scalability to the measure required of business capabilities.

OTHER VALUE

Type	Description
Risk Mitigation	Consumers Energy will lose support on critical ESB software components that support OpenWay Collection Engine, SAP, ITRON, DIV, DRMS, MDM, IWP, PayGo, ADMS, Field Service Solution, and Digital Customer Experience. Rebuilding the ESB Platform and ensuring the current production integrations will not be impacted as well as meeting or exceeding current service levels is critical.
Avoided Costs	Consumers Energy will need to purchase an extended support contract with the vendor to maintain support of the older version. Going too long without upgrading puts Consumers at risk of losing any level of support from the vendor. Current estimate is $80,000 of extended support
Capacity	The current implementation of the ESB platform was built with 5 years of growth in mind. Upgrading the ESB on a regularly scheduled cadence will allow Consumers to grow the the application around the business' needs.

Expense Reporting Improvements

Report Pulled: 11/1/2024 **Item ID: 11759**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Expense Reporting Improvements

Description The Expense Reporting Improvements project will increase productivity when creating expense reports; leverage workflows for expense processing and exceptions; improve adherence to company policies; provide insights through improved reporting; and minimize human intervention and struggle throughout the expense process.

Portfolio Corporate Services > Financial Services > Controller > General Accounting > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement Multiple problems exist with our current expense reporting system in the areas of usability, employee engagement, inefficiencies, compliance, and audit exceptions. Submitting expense reports is not intuitive, leading to errors and the need for manual intervention. In addition, employees have to manually scan and attach receipts. All these problems impact employees leading to poor employee engagement scores in regards to simple processes, productivity, and transparency leading to increased costs, inefficiencies, exceptions to policies, and compliance issues. An average of 13% of all expense reports have compliance errors, based on a sample audit of executive assistant submitted expense reports.

Objectives This project provides value for the Company by: (1) improving expense policy compliance and reducing exceptions, with a target measure of 0 compliance errors; and (2) offering a more user-friendly experience leading to improved employee engagement. Completion of these objectives would enable each employee to save 20 minutes creating an expense report for each of the 50,175 expense reports created in 2021, the Company would have avoided approximately $1.5MM of costs, based on a $90/hr. average rate.

Scope The project scope includes implementing a new software tool that: (1) provides upfront validation and controls to improve policy compliance; (2) provides electronic document retention for receipts; and (3) integrates corporate credit card data into expense reports.

Alternatives Three alternatives were considered for the project: (1) continue using the current solution; (2) choose a cloud-based solution with the expense reporting component; and (3) develop a custom front-end. The first alternative would result in waste due to the system not being user-friendly; and does not provide mobile options. The second alternative would introduce new licensing and ongoing maintenance costs; would require periodic upgrades and testing; and would require the SAP Enterprise Portal to be upgraded to integrate with the booking tool. The third alternative and selected option would result in improved user experience and employee engagement as well as mobile capabilities around expense entry.

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Risk Mitigation	An average of 13% of all expense reports have compliance errors, based on a sample audit of 2021. The target measure with the completion of this project is 0% compliance errors.
Avoided Costs	If each employee saved 20 minutes creating an expense report for each of the 50,175 expense reports created in 2021, that equates to ~16,725 hours saved x $100/hr average rate = $1.67M of avoided costs due to increased efficiencies.

Field Contractor Work Management Technology Enablemer Report Pulled: 11/1/2024 Item ID: 6740

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias FSS Release 4 - Contractor Enablement

Description The project provides the ability to electronically manage contractor work and increases accuracy and timeliness of information processing for field work deliverables. This project additionally creates new opportunities to measure and optimize field work processes supporting customer on-time delivery goals.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-WORK MANAGEMENT

WORK OBJECTIVES

Problem Statement Contractor field employees use manual, paper-based processes and generic communication technologies (phone, radio, email, collaboration sites) to perform work for the Company. Due to the non-electronic format, inaccuracy, and delay of information processing there are negative impacts to the availability and accuracy of work status. This limits the opportunity to measure and optimize field work processes that support customer on-time delivery and other goals.

Objectives The project will add value by: (1) improving on-time delivery of customer work by providing electronic work order information to contractors; (2) improving customer satisfaction through efficiency in scheduling work and reporting on the progress electronically; (3) increasing safety by tracking work and contractor status providing visibility into the last known location of the contractor; (4) improving material management; (5) making it easier to move emergent work to contractors to balance workloads and meet customer commitments; and (6) enabling real time updates to work order information, increasing data accuracy and reducing invoice reconciliation time.

Scope The project scope includes: (1) identifying requirements for a Bring Your Own Device (BYOD) field contractor work management technology solution and process; (2) developing, configuring, and testing interfaces, hardware, and software for the solution; (3) implementing the solution and process for the following work groups: Electric High-Voltage Distribution (HVD), Electric Low-Voltage Distribution (LVD), Mutual Assistance, Forestry, Gas Distribution, Gas Code Compliance, and Substation Operations Construction/Metro; (4) updating the following vendor contract types to support BYOD field contractor work management: zone, specific bid, ancillary, electric storm, and mutual assistance; and (5) training field contractors on the new technology and processes.

Alternatives The alternatives considered included: (1) Continue with the current paper-based process. This alternative was not selected because this approach does not allow for the timely, data-driven work management metrics required to improve service to customers. (2) Use the current Company mobile application. This alternative was not selected because the solution is not expected to receive long term investments by the vendor and the mobile application would require more upfront investment than the proposed option. (3) Use off-platform options such as ServiceBench. This alternative was not selected because contractors would not be able to leverage the benefits and integrations with the existing platform and it would require additional new integrations. (4) Provide Company-funded field devices to contractors. This alternative was not selected because the investment in hardware, management of on-boarding and off-boarding of devices to contractors, and training and change management is cost-prohibitive and introduces a risk of the loss of control of information security and corporate assets. Leveraging the existing field work management solution was chosen because it uses existing well-developed functionality while leveraging cloud-based, BYOD capabilities to move short-term and long-term contractors from paper processes to the established, standard work management system.

OTHER VALUE

Type	Description
Intangibles	"CE Way" Maturity - The project enables data to be more accessible electronically so that it can be visualized, access to data provides increased visibility to problem solving, and Service Suite forms allow for increased standardization.
Intangibles	Customer On-time Deliver (COTD) - Provides real-time updates for work order progression and completion, and provides increased efficiency in dispatching work to contractors.
Intangibles	Electric Reliability - Improves efficiency in dispatching of emergent work to contractors.
Avoided Costs	Engineering/System Owner Efficiencies: Estimated 1 hour per week @ 50 weeks for 10 system owners = 500 hours annually *$50/hr = $25,000 Annual $ Saved (Max). Annual $ Avoided (Min - 75% of Max) = $18,750 * 29.8% (O&M) = $5,588 annual avoided costs
Avoided Costs	Field Leader & Back End Efficiencies: 1 Hour per week for each long cycle field leaders/back office personnel - "200 people*50weeks= 20K hours * $50/hr = $500K." Annual $ Avoided (Min - 75% of Max) = $375K. $375K * 29.8% (O&M) = $111,750 annual avoided costs - ELECTRIC SPLIT
Avoided Costs	Field Leader & Back End Efficiencies: 1 Hour per week for each long cycle field leaders/back office personnel - "200 people*50weeks= 20K hours * $50/hr = $500K." Annual $ Avoided (Min - 75% of Max) = $375K. $375K * 29.8% (O&M) = $111,750 annual avoided costs - GAS SPLIT
Avoided Costs	Increase Back Office Productivity for Contractor Admins: 1 employee for 6 hours a week and 50 weeks per year. Total hours reclaimed annually = 300 hours * $50/hr = $15,000. Annual $ Avoided (Min - 75% of $15,000) = $11,250 * 29.8% (O&M) = $3,353.
Avoided Costs	Increased Productivity for Contractors: 150 hours reclaimed per month * 12 Months a year = 1,800 total hours reclaimed annually * rate of $71.70/hr = $129,060 total. Annual $ Avoided (Min - 75% of $139,060) = $96,795 * 29.8 (O&M)= $28,845
Technology Capability	Work Management

Field Mapping and Graphics

Report Pulled: 11/1/2024 **Item ID: 8771**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Condition **Work Type** Project

Alias ArcPad Retirement, Field Mapping and Graphics

Description This project will implement a solution for the mobile field mapping and data collection that can search and view facility map data, view work order designs, and create work order as-built construction drawings in the field. This software technology increases process efficiency by consolidating field graphics functionality, reducing IT complexity and testing, and increasing adoption in the field through ease of use. In addition, it allows the Company to move to a supported application platform and retire the unsupported ArcPad solution.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-WORK MANAGEMENT

WORK OBJECTIVES

Problem Statement The current mapping and graphics application was implemented in 2002 and is no longer sold or supported in any capacity, and the customizations developed for the application cannot be changed. Due to the improved accuracy of the CE landbase (streets, political boundaries, etc.), the outdated electric maps that are referencing that data causes the map to be unreadable which causes a safety issue. Additionally, field employees have considerable challenges when attempting to use the software due to slowness, an aged interface, and dated processes.

Objectives The project will add value by: (1) providing more accurate geospatial data, including facility map data, pre-construction designs, and as-built construction drawings; (2) consolidating daily tasks into a more simplified process; (3) eliminating the process waste from duplicating asset data in two systems; (4) enabling the adoption of the Geographic Information System (GIS) standard; and (5) making mapping and graphics data available on field devices.

Scope The project scope includes: (1) installing a new mobile field mapping and graphics application; (2) creating the ability to search and view the facility map data in GIS format along with the ability to search by address; (3) viewing pre-construction work order designs in a new GIS format; and (4) creating as-built construction drawings in GIS format for assigned work orders.

Alternatives Four alternatives were evaluated and three were determined non-viable for the project: (1) Continue maintaining the current ArcPad application. This option was not selected because the Company is no longer able to make changes to the ArcPad application to mitigate issues if the application has critical defects. A total failure of the application could revert field crews back to paper-based facility maps, risking safety using static, outdated data; or require the creation of as-built construction drawings on paper documents. (2) Use the Adobe or Snagit applications for creating as-built construction drawings. This option was not selected because field users would have to use one solution for viewing facility maps and use rudimentary drawing tools like Adobe or Snagit for creating as-built construction drawings. This option was also not selected because it introduces additional costs due to the complexity and customization needed to integrate the applications. (3) Build a custom Mapping and Graphics solution. This option was not selected as existing industry solutions are available at a much lower cost with much less risk. (4) Implementing the new field mapping and graphics software was selected as this option will consolidate field graphics functionality into an efficient process and provide a current, supported solution.

B/C Ratio (Overall) -0.796

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	Medium	Consumers Energy employees are experiencing decline in application performance due to age, which produces the risk of application failure.

OTHER VALUE

Type	Description
Intangibles	Currently, there is a decrease in morale and increase in stress when redlines aren't processed in a timely way or get held up with technology problems. The current process is go back to the crew to inquire if the redline was completed. When this is a system issue, it causes frustration because then the field has to re-do work in the field. Doing this project will improve morale and improve the relationship between management and the Union by reducing administrative pain, human struggle and disagreements, and wasted time repeating work.
Intangibles	Make OVH (overhead) data available to the field device. The current OVH CAD files have not been maintained in over five years.
Intangibles	Make URD-(Underground Maps) assets readable on field device. This is currently a safety issue.
Intangibles	Reduced errors/defects and postings improves Safety by reducing lag time in data updates and if there's a revisit to the Asset. The correct information is on file.
Risk Mitigation	The application is at risk of failure. It is no longer supported, cannot be upgraded or changed in any manner. Retiring the application and moving to a new application must occur in order for the risk to be removed.
Technology Capability	Work Management

Field Network Director

Report Pulled: 11/1/2024 **Item ID: 12453**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Field Network Director

Description Design, develop, test and implement Cisco's Field Network Director (FND). FND is a network management solution for Field Area Networks (FAN). The solution is necessary for the management of the modems that have been selected as the new Company standard for modems, as the previous standard modem is no longer being manufactured.

Portfolio IT Services > Applications > Electric Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-TRANS, OPS SUPPORT AND ENG

WORK OBJECTIVES

Problem Statement The modems used for Electric and Gas field device deployments have been discontinued by the manufacturer and the existing inventory will be exhausted by September 2021. After an extensive analysis of 6 modems, a modem was selected as the new standard, replacing the discontinued device. Configuring and managing modems manually is an ongoing, time consuming and labor intensive effort with tasks that include; modem configuration, firmware updates and modem status analytics, exasperated by the need to apply cyber security requirements. With no centralized software to manage the modems: 1) every modem will need to be manually configured, resulting in deployment delays and/or head-count increases; 2) lack of centralized over-the-air device management will introduce increased cyber security risks. Modem management software is required in order to effectively introduce, monitor and manage the new modem type.

Objectives Support modem configuration, operations and management with a solution that provides capability to manage the new field based communications devices from a centralized platform.

Scope Purchase, install, configure and integrate Citrix's Field Network Manager (FNM) software.

Alternatives Alternative 1, Stock and install selected modems without implementation of the FND. This alternative was not selected as manual management of modems will require; 1) Additional FTEs (+1 in 2022, +1 in 2024); 2) cyber security vulnerabilities will not be mitigated: 3) quality will be degraded with many manual steps. Alternative 2, evaluate other hardware vendors was not selected because of the immediate need to replenish modem stock as the previous modem is no longer manufactured and current stock is expected to be depleted in September 2021, Alternative 3, to utilize Citrix Field Network Manager (FNM) Software, which is the most cost effective approach to support existing inventory of modems; support the new standard modems; automation in configuration and management upgrades in firmware, modem status analytics, and cyber security requirements through a centralized platform.

B/C Ratio (Overall) -1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Information Theft	High	Medium	Solution will provide enhancements to cyber security through; 1)digital certificates to authenticate devices; 2) device staging/quarantine for newly discovered devices; 3)automated encrypted tunnel creation based on device grouping/tagging and; 4)unique private key certificates per device/tunnel

OTHER VALUE

Type	Description
Intangibles	Centralized and secure, over-the-air device management for both device configuration, firmware and security patches.
Technology Capability	Improved device health monitoring and reporting capabilities will be leveraged by other initiatives.
Risk Mitigation	New geo-location capabilities including geo-fencing used to improve field device security.
Intangibles	Solution will provide enhanced troubleshooting capabilities with edge device awareness.
Avoided Costs	Without this software, the OT team would need to manually configure and support (patches, firmware upgrades...)all new modems deployed in the field. This would result in deployment delays and/or head-count increases; 2022 - 1 FTE- $150k + 2023 $150k 1 FTE.

Flexible and Advanced Payment Options

Report Pulled: 11/1/2024 **Item ID: 9030**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Flexible/Advanced Payment Options, Flexible and Advanced Payment Options

Description The project will address customer concerns regarding existing payment plan options. The effort will create payment plans for customers to increase successful payments and accommodate specific needs of customers requiring assistance paying their energy bill.

Portfolio Customer Services > Revenue Management > Payment Channels > Digital Payments > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement Currently, the Company payment arrangement offerings are insufficient or lack flexibility to support the needs of customers. On average, Inability-to-Pay Customers account for 874,000 calls into contact centers to resolve payment plan-related concerns. Existing payment plan options have a 5% success rate. In order to increase customer satisfaction, reduce calls to contact centers, and reduce payment plan defaults the Company needs to offer payment-challenged customers easier and more flexible payment options.

Objectives The project creates value to both the Company and its customers through: (1) improved customer experience by ensuring customers can set up payment programs within the channel of their choice (2) reduced defection for repeat callers by enabling customers to be successful in payment programs, (3) reduced active arrears by removing unnecessary risk and offering options based on customers' history, (4) reduced volume of customers entering dunning with successful payment plans, and (5) reduced complaints regarding payment options.

Scope The scope of this project includes: (1) identifying changes for new and existing payment plans to increase successful customer payments, (2) updating SAP with eligibility rules for payment plans, (3) updating the customer self-service portal and IVR to align with available payment options and self-service capability, (4) reviewing customer feedback to determine the right payment plans to support their needs, (5) implementing an installment plan guide on the digital platform enabling customers to self-serve and select the best plan for them, and (6) improving input screens for Customer Service Representatives (CSR) surrounding payment plans.

Alternatives The alternatives considered include: (1) Enable only CSR resources to set up customized payment plans. This was not selected as the customer is unable to self-serve, preventing call reduction in our contact centers. (2) Utilize a PrePay program for all customers needing payment assistance. This was not chosen as the pilot completed showed limited success as a small portion of customers chose to stay on the program. (3) Implement changes to Payment Assistance plans. This was selected as it provides the customer with multiple options to pay their bill while supporting the Company's cost savings goals.

Intangibles	Reduction in active arrears with increased success of customer payments. Decreased payment plan defaults would reduce the customers in dunning and reduce arrears.

Forward Web Proxy Services

Report Pulled: 11/1/2024 **Item ID: 13974**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Condition **Work Type** Project

Alias , Forward Web Proxy Services

Description This project will replace the current web proxy service platform with a new platform. A web proxy service is a type of proxy server that sits between a client and the internet. It acts as an intermediary that evaluates, modifies, and forwards the client's requests to the destination web server. This service offers many benefits for the Company such as advanced filtering. Advanced filtering in a forward web proxy service can filter out unwanted or harmful content from the internet, such as malware and phishing. This can protect the client's device and network from cyberattacks and improve their browsing experience. Without advanced filtering, the Company's cyber assets are at risk of attacks such as ransomware.

Portfolio Corporate Services > Security Services > Cyber Security & Shared Services > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-CYBER SEC ENG & STAN

WORK OBJECTIVES

Problem Statement The Company currently leverages an existing vendor platform for web proxy services that has been in existence since 2021. Since the implementation of the platform, is has caused ongoing operational issues related to web filtering and connectivity. When there is a degradation of service, company employees and contractors are unable to access internet or cloud-based resources. As the company continues its cloud and SAAS journey, it is imperative to provide consistent access and communication, while still protecting the company from cyber threats.

Objectives This project creates value for the Company by (1) increasing service reliability for employees and contractors to internet and cloud-based resources; (2) utilize technology to enable the Company to handle all types of different workloads from varying geographic locations and is highly available; (3) using a mature and scalable web proxy service provider; and (4) providing Zero Trust by continuously verifying every connection request.

Scope The project scope includes: (1) replacing the current web proxy services solution and implementing a new system; (2) replacing physical web proxy hardware; and (3) potentially changing SAAS cloud vendors

Alternatives The Security team did extensive research on alternative web proxy services solutions. Alternatives considered include: (1) continue to use and maintain the current web proxy services platform. This alternative was not chosen due to the consistent operational issues with the platform that make it unreliable. The result of an unreliable system means that employees and contractors are unable to access business critical services such as email, Teams, ServiceNow, SharePoint Online; (2) Route all internet traffic through the Company's corporate data center. This alternative wasn't chosen because the capabilities of firewalls aren't as effective in stopping sophisticated cyber-attacks as using a web proxy service; (3) replace current system with modern vendor platform for web proxy services. The option that was chosen is to replace the current solution with a new system. This option was chosen because it offers additional features such as browser isolation (the ability to contain web pages so that the web page can't affect the client workstation) and sandboxing (a way to safely execute malicious applications without impacting the Company's network). As part of the evaluation the Company reassessed based on outside advisors and industry trend analysis, focusing on the ability to execute and the vendor's company strategy.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Information Theft	High	High	Avoid the cost and disruption of data loss from users, SaaS apps, and public cloud infrastructure due to accidental exposure, theft, or double extortion ransomware.
Information Theft	High	High	Stop advanced cyberthreats with built-in protections against botnets, command-and-control traffic, risky peer-to-peer sharing, malicious active content, cross-site scripting, fraud sites
Information Theft	High	High	The ability to know when patient zero phishing attacks are attempting to infiltrate the Company with advanced AI-based inline detection
Information Theft	High	High	The application will give the ability to know when patient zero phishing attacks are attempting to infiltrate the Company with advanced AI-based inline detection
Information Theft	High	High	The new solution will have the ability to filter risky and malicious domains and stop the use of DNS tunneling to transfer of malicious payloads and sensitive data

OTHER VALUE

Type	Description
Technology Capability	Browser isolation (the ability to contain web pages so that the web page can't effect the client workstation)
Technology Capability	Empower employees and contractors to securely access web applications and cloud services from anywhere, on any device—and ensure a great digital experience where applicable in the Company.
Technology Capability	Increase service reliability for employees and contractors to internet and cloud-based resources for employees and contractors
Technology Capability	Provide Zero Trust by continuously verifying every connection request
Technology Capability	Sandboxing (a way to safely execute malicious applications without impacting the Company's network)
Technology Capability	The new solution will provide more reliable protection against unwanted or harmful content from the internet, such as malware and phishing. This can protect the client's device and network from cyberattacks and improve their browsing experience. Without advanced filtering, the Company's cyber assets are at risk of being attacked by ransomware.

Gas Compression Digital Work Management

Report Pulled: 11/1/2024 **Item ID: 12677**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias ER Mobility, Generation Operations Work Management Mobility, Generation Operations Digital Work Management, Generation Operations And Compression Digital Work Management, Generation Compression Digital Work Management, Compression Digital Work Management, Generation Compression Digital Work Management, Gas Compression

Description The project provides work management software and digital forms for Gas Compression facilities.

Portfolio Gas Delivery Systems > Gas Operations > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement The current work management process for Gas Compression is cumbersome, largely paper based, and is made up of multiple disconnected systems. This leads to poor visibility, process inefficiency and waste, re-work, regulatory risk, and human error.

Objectives This project provides value to the Company through: (1) increased productivity by direct data entry in the field; (2) improved quality through increased accuracy of updates completed at the time and place of the work; (3) elimination of the need to enter data into multiple disconnected systems, and (4) improved safety through access to real-time information used at work sites rather than printed procedures.

Scope The scope of the project includes: (1) Merging the existing work management tools into a single work management solution, (2) purchasing licenses to add Gas Compression users to the company's existing mobile work management software, and (3) configuring changes in SAP and the mobile work management software to replace the paper-dependent work management process with the ability to access and update maintenance, operations, and safety information for Gas Compression.

Alternatives Alternatives considered include: (1) Utilize an SAP work management mobile solution. An SAP work management solution is not preferred since it is a new solution and requires additional project and support cost. (2) Continue the manual paper-based process. Continuing the manual paper-based process was not chosen because of process waste, re-work, and human error. (3) Customize the existing electronic Shift Operations Management System (eSOMS) mobile application to add work management functions. A custom eSOMS mobile application was not chosen because it would require additional project cost and an ongoing support budget for a custom solution that the eSOMS product was not intended to support. (4) Adopt a cloud based SAAS solution. This option was not selected as it was a high-cost option. (5) Utilize the existing Service Suite solution currently deployed for similar work processes in Gas Transmission. Service Suite is in other Gas and Electric departments. The Service Suite solution is the preferred option because it is a proven solution at the Company and provides the mobility and digital benefits at a lower cost.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Intangibles	Employee Engagement improves as the more tech savvy candidate pool for these positions are looking for mobile tools to help them do their jobs.
Intangibles	Productivity increases by using electronic work packages and reducing the need to return to desktop kiosks for updates. With the electronic work packages, (1) employees have remote access to manuals such as the Gas Operations Manual for Gas Compression and local maintenance procedures to reference standard work, (2) it eliminates multiple physical hand-offs of work documents related to the work management process and (3) it frees up planners' time to focus on long-range and outage planning to adhere to goals such as the Periodic Factor metric and Gas Flow Deliverability goal for Gas Compression. Productivity can also be tracked and measured for further improvements. This level of tracking is not possible with the current process and information.
Intangibles	Quality is improved and rework decreases when updates are performed right at the time and place of the work instead of afterwards. For Gas Compression, it (1) eliminates the manual process to update work scope and ensures access to the most up-to-date work order package, (2) allows crews to input SAP Notifications while at the jobsite for improved accuracy of data collected (3) provides the ability to collect asset condition data accurately at the jobsite to feed the data lake for asset health, and allows for the development of electronic code forms with built-in validation to improve quality of compliance data being collected.
Intangibles	Safety is increased as the most current information is at the work site in the mobile device versus a printed procedure.
Avoided Costs	The labor savings on time charging on a toughpad versus re-entering time later in office is 10 mins/day/employee savings from the 15 mins/employee per day it currently takes to enter time. Employees currently take 15mins per day to enter time. 59 Gas Compression employees would save 10mins/day = .17Hour x 230 work days a year x 59 employees = 2,306.9 hours avoided per year * $61 Standard Labor Rate = $140,720.90 Avoided O&M Costs
Risk Mitigation	The project will mitigate the risk of work errors from using outdated procedures especially for performing Gas Compression code work inspections using electronic forms. Electronic forms will improve validation of required inspection data, thereby reducing the risk of MPSC audit findings and possible regulatory fines. It also reduces safety risk by having the ability to have jobsite access to Emergency Plans to meet corporate safety requirements.
Avoided Costs	With this project there are avoided costs in Gas Compression from eliminating paper work package assembly. The time for 6 exempt planners is 2 days per month; 8 planners x 2 days x 8 hours = 128 hours per month. The avoided cost for exempt planners is calculated at 128 hours/month x $48/hour x 12 months = $73,728 per year. Their capital/O&M split is 25/75 which breaks down to avoiding $18,432 in capital and $55,296 in O&M. Six non-exempt admins spend 8 hours/month; 6 admins x 8 hours = 48 hours per month. The avoided cost for non-exempt admins is calculated at 48 hours/month x $25/hour x 12 months = $14,400 per year. Their capital/O&M split is 15/85 which breaks down to avoiding $2,160 in capital and $12,240 in O&M.
Technology Capability	Work Management

Gas Construction Operations Enablement

Report Pulled: 11/1/2024 **Item ID: 6722**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias EIRP Technology Enablement, Enhanced Infrastructure Replacement Program Technology Enablement, Gas Construction Operations Enablement

Description The project will implement an electronic work management solution that will enable Gas Construction Operations employees to assign, manage, and complete field work orders, eliminating the manual processes used. The work management system will also enable improved time tracking and reporting.

Portfolio Gas Delivery Systems > Gas Operations > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-OPERATIONS

WORK OBJECTIVES

Problem Statement The Gas Construction Operations department has operated on a paper process for work order completion since their initiation. Originally the work group was to be a temporary workforce; however ongoing improvements for the gas network have extended the need for the department. The current paper process creates additional work to produce and distribute to field operations. Also, the return of the completed paper process has a risk of human errors, lost paperwork, data lags, and readability. These manual processes often require additional contacts to field leaders and field employees to post-verify information. This project will allow the electronic system to automatically process meter orders in SAP, improving accuracy for Customers.

Objectives The project will add value by: (1) improving visibility to work locations of crews and job status updates in real time, (2) standardizing employee time-sheet management, (3) reducing closeout time by reducing data entry, (4) eliminating efforts to hand off paper copies of meter work orders, (5) reducing billing processing lag time for customers through direct updates on electronic forms, and (6) improving customer satisfaction with more timely meter installation dates.

Scope The scope of the project includes: (1) implementing an electronic work management solution for Gas Construction Operations, (2) enabling Gas Construction employees to assign, manage, and complete field work orders, and (3) developing the interfaces for management of the Gas Construction business unit.

Alternatives Alternatives considered include: (1) continuing with the existing paper process, and (2) SAP direct form order entry and completion. These two alternatives were not chosen because manual workarounds will not improve safety or reduce job and administrative time, and SAP does not support entry of information without cellular connectivity. In addition, with direct SAP, a method of work assignment would need to be developed. The electronic work management solution was chosen because it will improve safety and reduce job and administrative time, while supporting information entry without cellular connectivity. This solution is a Company standard which simplifies the implementation and keeps ongoing maintenance costs down.

Gas Distribution Probabilistic Risk Model

Report Pulled: 11/1/2024 **Item ID: 14010**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Gas Transmission Probabilistic Risk Model, Gas Distribution Probabilistic Risk Model

Description The project will implement a risk analysis model for comprehensive predictive risk analysis and modeling on gas distribution pipeline assets.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement

Relative risk models are unit-less measures of risk derived from input information using qualitative data and ordinal scales to produce "risk index" scoring; in simple terms, the relative risk model does not provide true statistical measures. The risk assessment used in the current model provides a score for likelihood, consequence, and risk that is relevant only in comparison to other scores. While the outputs provide a sense of relative risk when comparing one pipeline with another, the scores do not provide quantitative scores for probability, frequency, or expected loss of events. Although pipeline operators commonly use relative risk models, the quality of the relative risk ranking relies on subject matter expert inputs, human inferences, and opinions.

Objectives

Completion of this project will provide value to both the Company and its customers. Each party will benefit from safety improvements and risk mitigation through statistically-based risk modeling that leads to more informed pipeline replacement or improvement projects. Implementing probabilistic risk modelling supports the changes planned for in the Company's Natural Gas Delivery Plan (NGDP), including the Company Gas Management Safety System (GSMS). GSMS incorporates the Company's plan to implement the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems). Additionally, the implementation of a probabilistic risk model will: (1) calculate quantitative risk scores that include measures of probability, frequency, or expected loss of events; and (2) configure multiple data sources to make advanced statistical calculations for interacting threats, both of which allow the Company to make more informed decisions based on improved quality inputs in a measurable model; and (3) provide information for better decisions on Capital project improvements and integrity management. Unlike the current unit-less relative model a probabilistic model will be a unit based risk score, specifically in the unit of dollars, improving efficiency in interpreting risk results for business decisions.

Scope

The project scope encompasses the implementation of a probabilistic risk model for gas distribution. The project will: (1) install and configure risk model; (2) configure multiple data sources; and (3) develop reports and dashboards.

Alternatives

Alternatives considered for the project include: (1) Implement a custom, Excel-based probabilistic risk model through a consulting effort. This alternative was not selected because although the effort minimizes the IT cost of the project, the model requires the creation of secondary data sources, leading to multiple "sources of truth". (2) Implement a custom built probabilistic risk model. This alternative was not selected because the custom built solutions analyzed are not mature and have not been widely tested with transmission operators. (3) Implement a SaaS based solution. The option of implementing the SaaS probabilistic risk model was chosen because it is the most cost-effective long-term implementation approach, providing commercial, off-the-shelf capabilities, industry-proven and upgradable technology, and ongoing vendor support.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Asset Management
Risk Mitigation	Implementation of a probabilistic risk model mitigates risk through a comprehensive, statistical analysis of threats to pipe segments, ensuring focus on solving the right problems and resolving the highest risk items.
Risk Mitigation	Prevention of distribution incidents (i.e. home explosions) and avoided cost of these incidents: A probabilistic risk model would increase our ability to identify potential incidents before they occur. An incident such as a home explosion can have a significant impact on the company, including the dollars cost to repair the damage as well as the impact to the public's perception of the Company. It is anticipated that there will be a reduction in the potential for types of incidents with this improved tool. Although the model will not necessarily eliminate the possibility that these types of incidents could occur in the future, the model will reduce the likelihood that they will occur because we have a better understanding of our system. The project investment could avoid actual and reputational costs by potential avoiding one of these incidents. In addition the new model will help better quantify the cost of an incident.
Intangibles	Quality improvement - Implementation of a probabilistic risk model provides quantifiable results that are more reliable, transparent, and understandable, rather than relatively ranked; improving confidence in data and leading to improved decision-making for strategic planning, financial planning, and regulatory oversight.
Intangibles	Waste elimination through potential productivity improvements. A true statistical model may eliminate workarounds with the current model that are necessary to support planning efforts by reducing investigation time and increasing user expertise through quantitative analysis and insight to core model functionality.

Gas Distribution ProjectWise

Report Pulled: 11/1/2024 **Item ID: 10681**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , ProjectWise for Gas Distribution, Gas Distribution ProjectWise

Description ProjectWise is a suite of project collaboration software for engineering projects currently in use as the Company by gas transmission and generation engineering teams. It is capable of bundling, managing and handling the versions of records and documents related to designs, proposals, contract resources and record-keeping. The Gas Distribution ProjectWise project will expand the implementation of the software to gas distribution and be used to facilitate a management of change process for gas engineering design and gas system configuration changes.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement

SharePoint and a centralized Company data store are currently used as a data warehouse for gas distribution engineering design documentation. The current solution has limited ability to meet the functionality required for managing and approving the files and drawings that are unique to engineering design work. Gaps include: (1) inability to track design edits and document design change authorization approval; (2) inability to manage multiple outage windows and potential impact of planned projects; (3) inability to track gas system configuration changes, both temporary and permanent; (4) no current standardized structure of project documents for ease of viewing/editing; and (5) no current structure for tracking as-built/final record completion. In addition, the engineering teams lack an effective tool to centralize the management of change processes for gas engineering design and gas system configuration, leading to unapproved changes to projects without proper knowledge and authorization. Without the proper controls and versioning in place, the opportunity for rework is enhanced causing extended project time for completion, negative impacts on other projects and increased costs.

Objectives

Completion of this project will provide value to the Company through: (1) comprehensive documentation of all design review changes from key technical Subject Matter Expert (SME) groups, ensuring that the final design is inclusive of all approved changes; (2) end to end workflow tracking and approval sign-off from initial design and engineering through field operations and final sign-off, providing for a centralized historical record that is traceable and verifiable; (3) consistent gas technical records across project and asset lifecycles; (4) increasing public and employee safety and regulatory compliance with complete and accurate records that are readily accessible and easily searchable; (5) providing visibility to and improving tracking for system outage windows and/or temporary pressure changes/reductions providing the ability to align outage schedules with distribution construction schedules; (6) tracking temporary and permanent gas distribution system configuration changes in a centralized repository; (7) maintaining spatial relationships within drawings and documents such that all documents pertinent to a geographic location can be quickly accessed and maintained; (8) providing a universal system of record for complex operating procedures; (9) creating a universal system of record for all construction prints; (10) centralizing tracking of Supervisory Control and Data Acquisition (SCADA) commissioning and decommissioning activities; (11) tracking project as-built and final project record completion; and (12) providing a centralized repository for document retention, archival and version tracking, resulting in records that are traceable and retrievable. Collectively, these items support the Company's implementation of the American Petroleum Institute (API) Recommended Practice 1173 Pipeline Safety and adherence to regulatory requirements. The project provides additional value by implementing a management of change tool with capabilities that can be replicated in other organizations, including gas engineering metering and regulation, gas system integrity, and gas transmission.

Scope

The scope of this project encompasses implementation of ProjectWise software modules for use by Gas Distribution Engineering. The project will: (1) configure the software modules within the application, and (2) design and develop integrations with other Company systems.

Alternatives

Alternatives considered include: (1) Continue with current SharePoint and shared data store warehousing solution for versioning of Gas Engineering designs and system outage windows. This alternative was not selected because it does not resolve the identified problems. (2) Develop and implement an in-house solution. This alternative was not selected due to costs and lack of expertise in developing a custom solution. (3) Implement ProjectWise software. This alternative was selected for the following reasons: (1) ProjectWise is available in a Software as a Service (SaaS) solution with out of the box capabilities, and (2) ProjectWise aligns with the Company direction as it has been implemented and is in use in other areas of the Company including Generation and Gas Transmission.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Asset Management
Risk Mitigation	Implementation of the solution supports the Company's adoption of the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems) that is being implemented as part of the Company's Gas Safety Management System.
Risk Mitigation	Increased public and employee safety and regulatory compliance with complete and accurate records that are readily available through the new solution.
Risk Mitigation	Mitigate the risk associated with incorrect, incomplete or missing design changes by establishing document retention, archival and version tracking resulting in records that are traceable and verifiable.
Risk Mitigation	Mitigate the risk with having different versions of engineering designs by providing a single source of truth for Gas Distribution technical records.
Risk Mitigation	Mitigates the risk of losing or not finding project documents because the new solution has the ability to maintain spatial relationships within drawings and documents such that all documents pertinent to a geographical location can be quickly located and maintained

Gas Leak Asset and Work Management

Report Pulled: 11/1/2024 **Item ID: 6763**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias GCCP Leak Asset and Work Management, Gas Leak Asset and Work Management

Description The project will implement functionality to automate gas leak compliance tasks and track all gas leak activity in the Gas Geographic Information System (GIS), creating a single system of record for gas leak data, and providing a spatial display of leak data to improve leak management visibility.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement

The gas leak process utilizes two systems to complete work and monitor gas leak compliance: SAP and Inspection Manager. Gas leak information is manually transferred between SAP and Inspection Manager and vice versa by compliance technicians. An internal audit identified 7818 leak orders, resulting in a 61% defect rate, with inconsistent information recorded between SAP and Inspection Manager. Lack of quality controls to help ensure accurate leak information across systems may inhibit managements ability to effectively monitor gas leaks and could result in leaks not being re-classified or repaired in a timely manner. This has regulatory compliance and safety impacts such as missed compliance dates which may result in fines and increased public safety risk resulting from untimely or missed leak repairs.

Objectives

The project provides value to both the Company and its customers, including: (1) improving productivity and leak location accuracy; (2) enabling near-real time reporting and automated metric reporting on open leak backlog; (3) creating one system of record for all leak assets in GIS; (4) implementing quality improvements for scheduling and routing of leak crews; (5) reducing risk of future audit findings or non-compliance resulting from duplicate open leak orders; (6) optimizing resource allocation for gas service posting team by eliminating manual posting of leak repairs in GIS; (7) optimizing resource allocation for the gas compliance team by eliminating the posting of leak repairs in Inspection Manager; and (8) streamlining the leak survey workflow to improve the human struggle caused by use of paper maps and manual processes for leak order tracking.

Scope

The scope of this project includes: (1) design and implementation of an integration between the asset system and the work management system to create, update, and manage leak maintenance, repair, and emergent orders and inspection schedules through the Enterprise Service Bus (ESB) or similar; (2) configuration of new SAP and Service Suite work order completion forms required to support new work processes; (3) updating the business intelligence dataset to support reporting; (4) reconfiguring workflows in Inspection Manager to capture all leak data from GIS; (5) design and implement a solution to replace the use of paper maps in the leak survey process; (6) implementing a workflow to communicate first time and repeated customer contacts for a given leak; (7) implementing an open leak order geospatial map of all open leak orders, utilized across office and field technology; (8) creating a system indicator that flags duplicate leak orders at the same location; and (9) implementing functionality to provide visibility through a listing of all open leak orders within a specified radius.

Alternatives

Five alternatives were considered for the project: (1) Implement a Quality Assurance/Quality Control (QAQC) process to ensure data is consistent between both SAP and Inspection Manager. This alternative was not selected because it requires an increase in labor costs for manual reporting and data checks. In addition, as demonstrated by the audit, manual processes, even manual QAQC processes, are subject to human error, and each error creates safety and noncompliance risk. (2) Implement a Robotic Process Automation (RPA) to sync data. This solution was explored but is not viable because the business processes are too complex. (3) Implement a new GIS-based compliance solution that can be integrated with SAP. This alternative is too costly, given recent investment in the current Inspection Manager solution. (4) Defer project implementation. The alternative selected is to implement this project now, rather than later, as a result of recent gas leak red audit findings. (5) Implement functionality to automate gas leak compliance tasks and track all gas leak activity in the GIS. This alternative was selected because it leverages existing solutions in a new way, optimizing resources and technology investment. The use of Cloud technology was not considered due to the enhanced functionality being added to systems and applications that are already on-premise.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Asset Management
Avoided Costs	Gas Distribution and Service leak classification reasonable expectancy (time estimate for completing the work) would be reduced due to better information being available to find the leak, because the employees will already know where the leak is versus spending time trying to find the leak again. It is estimated that annually approximately 2,500 leak investigation orders are duplicates from already existing leak orders 40% of the leaks are investigated by Distribution crews, and 60% are investigated by service workers. We could save 500 hours in reduced distribution crew labor, and 750 hours in reduced service worker labor. The expectation is that we would reduce the reasonable expectancy by 50% for each duplicate leak classification. 2,500*40%*1 hr*50%= 500 hours saved for distribution crew labor. 2,500*60%*1 hr*50%= 750 hours saved for service worker labor.
Intangibles	Implementation of a solution to replace the use of paper maps in the leak survey process will lead to improvements for scheduling and routing of leak crews.
Intangibles	Implementation of additional integration between the asset system and work management system for leak maintenance, repair and inspections will lead to improved productivity allowing gas compliance personnel to focus activity on higher value leak analysis versus time spent on data entry.
Risk Mitigation	Implementation of additional integration between the asset system and work management system will reduce the risk of future audit findings or non-compliance due to a reduction in data inconsistencies between the leak management and work order management applications
Risk Mitigation	Implementation of the application changes will reduce the risk of regulatory non-compliance due to a reduction in the duplication of open leak orders.
Avoided Costs	Leak Survey Compliance Technician would avoid 12 minutes per order of human struggle searching for new leak orders that should be tied to an already open deferred leak order allowing them to focus on higher priority work with the time saved.
Intangibles	Reconfiguring workflows in Inspection Manager to capture all leak data from GIS will enable creating one system of record for all leak assets in GIS.
Avoided Costs	Reduce gas compliance technician labor through the reduction in hours to support gas service GIS team by 2,000 hrs for compliance technician (nonexempt) to research and link leak repair orders.
Avoided Costs	Reduce gas compliance technician labor through the reduction in hours to support gas service GIS team by 6,100 hrs for compliance technician (nonexempt) to research and manually link leak classify orders to leak assessment orders in Inspection Manager and SAP.
Intangibles	Updating the business intelligence data-set will support more automated reporting on the open leak backlog.

Gas Measurement, Regulation, Pipeline, and Storage (MRPS) Report Pulled: 11/1/2024 Item ID: 6755

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias FSS Release 4 MRPS, Gas Measurement, Regulation, Pipeline, and Storage Field Work Management Enablement, Gas Measurement, Regulation, Pipeline, and Storage (MRPS) Field Work Management Enablement

Description The project will move gas MRPS work orders from the current paper process to an electronic solution that includes work management, compliance scheduling and tracking, mobile dispatch and work completion functions.

Portfolio Gas Delivery Systems > Gas Operations > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-OPERATIONS

WORK OBJECTIVES

Problem Statement The current field processes and activities within Transmission Operations are hindered by lack of technology. MRPS does not currently have a technology solution for work order processing, parts ordering, dispatch and scheduling, GPS routing, and access to Company applications. As a result, employees rely on manual paperwork processes, handoffs, and work order management. The current field device could be better utilized if not for technology limitations that hindering customer benefits and employee engagement.

Objectives The project will add value by: (1) increasing efficiency of order entry and management reporting through a digital solution rather than paperwork handoffs; (2) maintaining key compliance records without depending on paper processes and records; (3) improving productivity by eliminating the duplication waste of managing asset and compliance records management using paper binders; (4) reducing risk of MPSC non-compliance by digitizing system data, making it readily available for review and analysis by leadership; (5) increasing visibility to asset health using data available from a digital system to enable reporting and analysis; and (6) improving Safety by reducing risk to gas storage assets and adherence to standards by moving to digital systems and data. This enables future Safety initiatives such as a monthly well monitoring program that ensures accurate and timely data capture for identification and mitigation of asset risk, analysis, and data trending.

Scope The project scope includes: (1) SAP updates to enable gas MRPS work processes; (2) prioritizing agile methodology to evaluate and convert paper forms (up to 75 for compliance work, up to 75 for work order completion); (3) alignment of use with the compliance scheduling and tracking solution on routing and documenting work, tracking time, and work order costing; and (4) development of Training materials and train-the-trainer activities.

Alternatives Alternatives considered include: (1) utilize an SAP module to migrate field work orders to an electronic platform; (2) implement a new solution - Field Manager Solution, Go Canvas, ESRI, and Smart Sheet were evaluated; (3) continue manual paper-based process currently used by the gas MRPS work force; and (4) implement a Service Suite solution. The first alternative was not selected because it did not offer a scheduling solution or support information entry in offline setting, location and time tracking would need added integration, and a method of assignment and dispatch would need to be developed. The second alternative was not selected because the ad hoc applications that were evaluated were significant deviations from the field work management standard solution, reducing field crew usability through lack of integration and user adoption while increasing support complexity and cost. The third alternative was not selected because it does not eliminate the current process waste, rework, and human error risk. The alternative to implement the Service Suite solution was selected because it is the current field work management standard, providing work management scheduling capabilities, real time validation of field work order forms, and proven field crew adoption and usability resulting from four years of Service Suite usage by 2000+ Company field crews.

Gas SCADA Software Solution

Report Pulled: 11/1/2024 **Item ID: 6756**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias Gas SCADA System, Gas SCADA Software Solution

Description The Gas Supervisory Control And Data Acquisition ("SCADA") software solution project will replace the current Gas SCADA Software with a more standardized software package enabling the Company to more efficiently meet Federal and MPSC requirements.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement

The current Gas SCADA software solution was originally implemented in 2000 and was based on the gas system requirements at that time. While the solution has been maintained since its implementation, the Company's gas system has outgrown the current capabilities. As the solution ages, there is increased effort required to address obsolete application and database software architecture, and enhancements to the system are limited. To address the capability gaps, custom interim fixes and integrations have been developed where each requires maintenance and support. This environment adds complexity and cost to solution upgrades and troubleshooting issues. The current Gas SCADA solution will limit the ability to invest in digital solutions for increased system health monitoring and preventative maintenance capabilities due to the complexity to integrate these future capabilities with it.

Objectives

The project will add value by: (1) reducing risk of non-compliance by improving the ability to document and follow State and Federal requirements, improving customer safety; (2) improving efficiency and reliability when performing routine software upgrades, because standard out-of-the-box software has less risk of breaking during upgrades, as opposed to more custom-coded software; (3) reducing maintenance costs due to fewer individual software programs and less custom code; (4) improving Gas Control management capabilities that support the Federal and MPSC requirements for gas pipeline and Gas Distribution companies; (5) improving reliability by using proven gas industry standardized software with configuration features, rather than a fully customized system that has the possibility of being impacted by the next version update; (6) purchasing standard, out-of-the-box software that meets a high percentage of requirements and avoids multiple custom applications and specially coded programs to achieve results; and (7) providing a basis for capturing data required for use in computer-based preventative maintenance programs and more predictive technologies. In addition, implementing industry-specific software helps the collective gas industry users to encourage the vendor development of future version enhancements, which adds more value to gas industry users. The comprehensive Gas SCADA system is used to monitor and control the operating conditions of the transmission and distribution gas systems. The Gas SCADA system includes remote terminal units (RTUs), field devices (i.e. valves, meters, odorizers), and computers running SCADA software. This scope covers the Gas SCADA software solution only.

Scope

The project scope includes the following: (1) significant planning, including consulting assistance, to define the implementation strategy for the effort, given the magnitude of the technology effort; (2) selection and implementation of a new Gas SCADA software solution; (3) planning of a phased rollout of new hardware and software; and (4) retirement and decommissioning of the legacy gas SCADA solution and equipment once the new system is fully tested and operational.

Alternatives

Alternatives considered include: (1) continue to maintain the current solution, at the risk of increasing reliability issues that result in controlling and monitoring the Company's gas system; (2) invest in enhancing the existing Gas SCADA software solution which would introduce additional custom development and more specialized functions that may not be supported in future vendor releases; and (3) replace the solution with a gas SCADA software solution that meets requirements to support the NGDP. Alternative three has been selected to ensure sustainability for this critical solution. The current legacy system is operating at well beyond its original design specification, so the potential points of failure are not fully known or understood. If the SCADA project is not completed, the legacy system could become unstable and impact Gas Control's ability to operate and monitor real-time system conditions, maintain safe operations, and compliance with regulatory requirements. It could also impact the ability to commission new facilities which require remote monitoring or control or cause the need for 24/7 manual field monitoring of certain facilities.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	Medium	Medium	Server and Network Architecture is not current and does not meet current business needs due to: (1) SCADA Software and Operating System limitations require operation of Citect SCADA under a console session with administrative privileges which increases security risk; (2) SCADA Input/Output (I/O), SCADA Trend, and SCADA Alarm processes are hosted on the server as individual executables rather than services; and (3) SCADA functionality is hosted on a single server (with remote redundancy). Additional inefficiencies with the current solution include: (1) SCADA Services for Human Machine Interface (HMI), I/O, Trend, Alarm, Report; (2) file Services for Gas Control Procedure Documents, SCADA Configuration and Procedure Documents; (3) database Services - Reports, SCADA Configuration, SCADA HMI Configuration, SCADA HMI Navigation; (4) failover to Backup SCADA I/O requires manual processes and increases overall system outage time; and (5) current configuration is not appropriate for migration to an off-site data center

OTHER VALUE

Type	Description
Intangibles	A new SCADA software solution offers ability to: (1) improve On Screen Data quality; (2) implementation of Alarm Prioritization based on alarm severity; (3) GIS integration; (4) ability for schematic diagrams to include direction of flow; and (5) use of better screen resolution
Technology Capability	Energy Portfolio Planning
Avoided Costs	Gas Controller workload reduction due to the enhanced capabilities described within the new standardized software would be realized. New software functionality includes the ability to input data for log/archive purposes within the SCADA user interface. Current Controller documentation software, which exists on a separate corporate system and requires the Controller to move between secure SCADA environment and corporate computer systems, could be incorporated as a single working environment with the new SCADA system. Assumption is that Control Room is 24x7, 3 controllers x 24 hours x 10 min/hr time saved
Risk Mitigation	Implementation of a new SCADA software solution will mitigate the risk that our current SCADA solution may limit our ability to modernize the remote terminal unit (RTU) and electrical systems at city gates and regulator stations due to the customization that may be required to support this new equipment.
Risk Mitigation	Implementation of a new SCADA software solution will mitigate the risk with our current SCADA solution encountering performance issues as additional SCADA installations are completed at regulator stations. The Over Pressure Protection (OPP) program plans to install SCADA at 16-22 stations annually to reduce the possibility of MAOP (Maximum Allowable Operating Pressure) exceedance. The program has yielded past success as being partly responsible for decreasing the number of MAOP exceedances from over 30 annually to 1 in 2019.
Risk Mitigation	The current SCADA software solution requires changes to be performed in a linear fashion, which will create greater risk in implementing the Natural Gas Delivery Plan initiatives for adding remote control monitoring capabilities and accelerating the retirement of vintage materials
Intangibles	Upgrade or replacement of the old Gas SCADA software solution will improve stability and help to avoid issues with lost and unrecoverable data which could be considered non-compliant in reporting to the MPSC.

Gas Storage Probabilistic Risk Model

Report Pulled: 11/1/2024 **Item ID: 10513**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , Gas Storage Probabilistic Risk Model

Description The Gas Storage Probabilistic Risk Model project will implement a risk analysis model for comprehensive predictive risk analysis and modeling on gas storage wells.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement

The current Gas Storage model is a relative risk model that equates risk to dollars from input information using qualitative data and ordinal scales to produce a "risk ranking". In simple terms, the relative risk model is not capable of creating a statistically significant result. The risk assessment used in the current model provides a ranking for likelihood, consequence, and risk that is relevant only in comparison to other rankings. While the outputs provide a sense of relative risk when comparing one well to another, the ranks do not provide anything qualitative that relates to the failure of wells. Also, the current transmission model does not meet the requirements of the MPSC, as indicated in a letter of noncompliance (dated January 15, 2019), and rule-making for storage systems has historically followed transmission rule-making. Lastly, the current model introduces risk in PHMSA findings as a non-probabilistic model.

Objectives

Completion of this project will provide value to both the Company and its customers. Each party will benefit from safety improvements and risk mitigation through statistically-based risk modeling that leads to more informed well improvement projects and improved targeted plug and abandonment projects. Implementing probabilistic risk modelling supports the changes planned for in the Company's Natural Gas Delivery Plan (NGDP), including the Company Gas Management Safety System (GSMS). GSMS incorporates the Company's plan to implement the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems).
Additionally, the implementation of a probabilistic risk model will: (1) calculate quantitative risk scores that include measures of probability, frequency, or expected loss of events, and (2) configure multiple data sources, to make advanced statistical calculations for interacting threats, both of which allow the Company to make more informed financial and strategic decisions based on improved quality inputs and mitigate the risk of PHMSA findings. The probabilistic model will rank the wells in risk-associated dollars making it easier to interpret risk results for the purpose of making business decisions. Furthermore, the Pipeline and Hazardous Materials Safety Administration (PHMSA) has identified the probabilistic risk model as a potential best practice for storage operators over other risk models (PHMSA Pipeline Risk Modeling white paper, dated May 9, 2018), so the project adds value by aligning with industry best practices.

Scope

The project scope encompasses the implementation of a probabilistic risk model for gas storage wells. The project will: (1) install and configure risk model; (2) configure multiple data sources; and (3) develop reports and dashboards.

Alternatives

Alternatives considered include: (1) continue the use of the relative risk model, but invest in substantial effort to continually manually managing data inputs and quality checks (2) implement a custom, Excel-based probabilistic risk model through a consulting effort; (3) implement an on-premise probabilistic risk model, and (4) implement a cloud-based model. The first alternative was not selected because although the manual effort is possible, it is becoming increasingly difficult to complete as the model utilizes more data sources that need to be annually updated and validated. The second alternative was not selected because although the effort minimizes the IT cost of the project, the model requires the creation of secondary data sources, leading to multiple "sources of truth". The on-premise solutions analyzed are not mature and have not been widely tested with transmission operators, so alternative three was not selected. The fourth alternative of implementing the cloud-based probabilistic risk model was chosen because it is the most cost-effective long-term implementation approach, providing commercial, off-the-shelf capabilities, industry-proven technology, and an ongoing vendor support and upgraded model.

B/C Ratio (Overall) -1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Asset Management
Avoided Costs	Assumes 540 hours in annual avoided labor due to reduced labor efforts in Gas Engineering & Supply areas for running existing risk models. The new model decreases 10-15 hours of data management and analysis per well, and assumes about 40-50 wells per year. The relative risk model utilizes large sets of data that are not consumed by any other company stakeholders. These are scoring-based data sets that are updated every time there is a change to the pipeline and periodically throughout the year. It is estimated that approximately 540 hours a year are spent updating these data sets, which can be avoided after the new model is implemented.
Risk Mitigation	Implementation of a probabilistic risk model mitigates risk through a comprehensive, statistical analysis of threats to wells, ensuring focus on solving the right problems and resolving the highest risk items.
Risk Mitigation	Prevention of wells failures and voided cost of ruptures: A probabilistic risk model would increase our ability to identify potential failures before they occur. A failure such as a well blowout can have a significant impact on the company, including the dollar cost to repair the damage as well as the impact to the supply of gas to the system and the public's perception of the Company and would cause a major unplanned release of methane. It is anticipated that there will be a reduction in the likelihood of these types of failures with this improved tool. Although the model will not necessarily eliminate the possibility that these types of ruptures will occur in the future, the model will reduce the likelihood that they will occur because we will have a better understanding of our system. The project investment could avoid large unplanned methane releases, actual costs, and reputational costs by potentially avoiding one of these failures, which has been estimated to cost the Company over $300 million. In addition, the new model will help better quantify the cost of a blowout.
Intangibles	Quality improvement - Implementation of a probabilistic risk model provides quantifiable results that are more reliable, transparent, and understandable, rather than relatively ranked; improving confidence in data and leading to improved decision-making for strategic planning, financial planning, and regulatory oversight.
Intangibles	Waste elimination through potential productivity improvements. A true statistical model may eliminate manual efforts that are necessary to populate and maintain the current excel-based model by pulling from populated databases that are centrally maintained by the data owners instead of a singular person.

Gas T&D Historian

Report Pulled: 11/1/2024 **Item ID: 6757**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias OSIsoft PI Historian, Gas Historian Implementation, GAM Historian

Description The Gas Transmission and Distribution (T&D) Historian project will replace the current historian for Gas T&D, eDNA (a traditional Supervisory Control and Data Acquisition (SCADA) historian product from Schneider Electric), and migrate to the standard OSIsoft PI enterprise historian system. The PI system is a suite of software products that are used to collect, store, view, analyze, and share operational data with system users and subject matter experts.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SEI

WORK OBJECTIVES

Problem Statement The historian for Gas Transmission and Distribution resides on a decades old platform and is not the Company's historian standard. Data access is cumbersome, requires multiple tools to access it, and does not provide for the storing, analysis or visualization of operational data in a timely manner with appropriate change management control. With the implementation of smart meters, the Company standardized on the more robust OSIsoft PI historian which is used for: (1) Renewable Generation; (2) Electric T&D; and, (3) Smart Energy. The Gas T&D historian has yet to be migrated to OSISoft PI, and the eDNA gas data has limited accessibility and usability in its current state and is no longer supported by the vendor. In addition, maintaining the older platform along with the new system requires duplicate resources and skills. This project will create a more accessible and centralized data source with better controls that can be leveraged as the system of record.

Objectives The project will add value for both Gas Engineering and Gas Operations organizations within the Company by: (1) informing decision-making based on real-time data; (2) improving real-time situational awareness of Operations personnel for information that does not need to be monitored by Gas Control; (3) improving the ability to respond to abnormal situations that do not require immediate intervention through that direct communication to Operations personnel; (4) providing information for the development of proactive analytics to reduce potential catastrophic events; (5) streamlining data access through visualization and analytics; and (6) reducing the waste of using multiple interfaces to interpret data. From an IT perspective, consolidating to one standard historian platform will result in savings in hardware, software, maintenance, resources and training.

Scope This scope of this project includes: (1) replacing the eDNA Gas T&D historian, a traditional SCADA historian, and migrating to the enterprise historian, OSIsoft PI; (2) developing analytics, visualization and reporting capabilities to support tracking of metrics and making operational decisions; (3) replacing the decades-old Microsoft Access-based custom Daily Gas Reports solution; and (4) retiring the legacy Gas T&D eDNA system (hardware and software).

Alternatives An alternative considered for the project was to upgrade eDNA Gas Historian to the latest version. This option was not selected because it requires a significant investment, and does not meet analytics, reporting, usability and accessibility needs as well as the software owner has announced the "sunset," for this software. Furthermore, the Company standard for historians is OSIsoft PI and maintaining two platforms results in redundant efforts in training, support personnel and technology. The option to replace eDNA with the Company standard OSIsoft PI historian was selected to eliminate duplicate training, support personnel, and technology, and to leverage the more robust data analytic capabilities in the OSIsoft PI tool set. Currently the plan is to implement the Gas T&D Historian with the Gas SCADA Software Solution to eliminate the need to have duplicative historians while the Gas SCADA Software Solution is being implemented. If this project is not completed, an interruption of our operational data reporting capabilities could occur and could result in a non-compliance and could potentially interrupt certain volumetric accounting and billing functions.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Gas Distribution System	High	Low	Avoid misstating cost of gas sold reducing company reputation risk. PI provides better controls for daily reporting and analysis, which reduces risk of misstating the cost of gas sold. The financial risk of misstating the cost of gas sold is $3,150,000 a year. This assumes: – Current CMS revenue of $6 billion – Misstated cost of gas sold was $60,000,000 – Misstated cost of gas was > 10% corporate threshold for having to restate financials – 282.5 million stock volume * $44.63 stock price (5/15/2018) – 1% probability of misstatement occurring – 50% probability being required to restate financials – 5% stock price lost (this occurred circa 2001) 282.5 million * $44.63 = $12.6 billion $12.6 billion * 5% = $630,000,000 $630,000,000 * 1% * 50% = $3,150,000
Technology Obsolescence	High	Medium	eDNA is multiple versions behind. The company has been awaiting for funding to transition to the company standard, Pi Historian.

OTHER VALUE

Type	Description
Avoided Costs	$10,000 avoided cost for Distribution System Pressure Exceeds Limit Report with benefit of being able to identify more MAOP exceedance events and be more proactive on the reporting of them, which supports public safety, company reputation, and compliance
Avoided Costs	20 hrs/yr time savings in Calibration Bottle Gas Process. Average of 10 Calibration Bottle Exchanges per year, 3 hrs per Calibration Gas Order. PI software will be need to interface with SAP. Using PI, Gas Measurement Technician (GMT) Specialist would just need to review, approve, and submit the order to the vendor (0.5 hrs), track bottle delivery (negligible), and install (0.5 hrs). - 45 hrs/yr time savings in Carrier (Helium) Bottle Gas Process. Average 90 Carrier Bottle Exchanges per year, 1 hr per Carrier Gas Order. PI software will need to interface with SAP. Using PI, GMT Specialist would just need to review, approve, and submit the order to the vendor (0.25 hrs), track bottle delivery (negligible), and install (0.25 hrs). - 30 hrs/yr time savings in Ultra Sonic Meters (USM) Health Assessment/Repair. Currently GMS Specialist dedicates 5 hrs per USM diagnostic/repair. Average 10 major repairs/yr. PI would be utilized to interface with Daniel Predictive Application as well as SAP for: work order creation & parts supply chain parts ordering. This would reduce GMT Specialist to ~2 hrs for diagnostic/trending/tracking and reduce on-site assessments. - 176 hrs/yr time savings in Fuel Metering Monthly Reporting. Currently GMT Specialist dedicates 200 hrs/yr to the monthly reporting of City Gate and Free Gas Users natural gas usage. Using PI data analytics and reporting, this would be reduced to 24 hrs/yr.
Avoided Costs	78 hrs/yr time savings for importing flow, pressure, and temperature data for pig run preparation, outage preparation, and pig run reporting as well as creating custom tracking sheets using real-time data.
Avoided Costs	Avoid additional Gas Control headcount - Replacing the DGR Database with a more robust PI historian will reduce daily reporting time and effort each month while providing results that are more accurate and available. (2 Gas Controllers * 1 hr/day * 365 days/yr = 730 hrs/yr)
Avoided Costs	Avoided IT Operational Technology Labor when eDNA retired, Savings from consolidating from two supported historian platforms to one: 6 hours per server times 6 servers saved from Critical Infrastructure Systems team, 160 hours saved from the effort that would be required to migrate to the new hardware and upgrading eDNA to the legacy fork of the software, including testing, 500 hours saved from not having to migrate eDNA to the modern architecture (&Step), 300 hours saved from not having to migrate custom (.NET 2.0) interfaces to new version of eDNA (SCADA to eDNA, eDNA to FlowCal, eDNA to Maximum Allowable Operating Pressure (MAOP) data)
Avoided Costs	Avoided Project to move forward to build a replacement for the DGR (Daily Gas Reports) Access Database [$300,000]
Technology Capability	Electric T&D, Gas T&D, Generation
Intangibles	Gas Control - Replacing the Daily Gas Reports Database with a more robust PI historian will enable the ability to remove non-PHMSA mandated monitoring from Gas Control SCADA and enhance public safety through reduction in Odorizer issues.
Avoided Costs	Gas Measeurement Engineering 80 hrs/yr time savings through more efficient data analysis.
Avoided Costs	Total of $46,961, projected cost avoidance from IT work related to CITECH for Non-Code Preventive Maintenance. (Based on 2019 work order data totaling $62,615/yr then reducing that by a total of 75% over three years). Projected future waste reduction in time saved annually by avoiding on site facility visits for equipment issue diagnosing is estimated at 183 hrs/yr ($18,117/yr). (Based on 2017 data which was 244 hrs , $24156/yr and reducing that by 25%). Assuming this to be 75% reduction in time charged (some time is still required for reviewing PI notifications & performing data analysis). Conservatively associating work with IM only. Reduced occurrence of pressure regulation equipment failures. September 2017 incident in Lansing ~ $450,000+. Assuming annual, levelized risk to be $100,000/yr (collateral and regulatory fines) *Assuming an hourly rate of $99/hr.

Gas Transmission Probabilistic Risk Model

Report Pulled: 11/1/2024 **Item ID: 8801**

Alias , Gas Transmission Probabilistic Risk Model

Description The project will implement a risk analysis model for comprehensive predictive risk analysis and modeling on gas transmission pipeline assets.

Portfolio Gas Delivery Systems > Gas Engineering & Supply > IT Projects > IT Projects > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-GAS

WORK OBJECTIVES

Problem Statement

Relative risk models are unit-less measures of risk derived from input information using qualitative data and ordinal scales to produce "risk index" scoring; in simple terms, the relative risk model does not provide true statistical measures. The risk assessment used in the current model provides a score for likelihood, consequence, and risk that is relevant only in comparison to other scores. While the outputs provide a sense of relative risk when comparing one pipeline with another, the scores do not provide quantitative scores for probability, frequency, or expected loss of events. Although pipeline operators commonly use relative risk models, the quality of the relative risk ranking relies on subject matter expert inputs, human inferences, and opinions. Furthermore, the current model does not meet the requirements of the MPSC, as indicated in a letter of noncompliance (dated January 15, 2019), citing gaps in the model with respect to known-failure data for welding and fabrication threats, inadequate depth-of cover calculations, level of corrosion, and inability to provide statistical validation. Inability to mitigate these non-compliances without a probabilistic risk model or through significant manual workarounds will likely result in continued non-compliances.

Objectives

Completion of this project will provide value to both the Company and its customers. Each party will benefit from safety improvements and risk mitigation through statistically-based risk modeling that leads to more informed pipeline replacement or improvement projects. Implementing probabilistic risk modelling supports the changes planned for in the Company's Natural Gas Delivery Plan (NGDP), including the Company Gas Management Safety System (GSMS). GSMS incorporates the Company's plan to implement the American Petroleum Institute (API) Recommended Practice 1173 (Pipeline Safety Management Systems). Additionally, the implementation of a probabilistic risk model will: (1) calculate quantitative risk scores that include measures of probability, frequency, or expected loss of events; and (2) configure multiple data sources to make advanced statistical calculations for interacting threats, both of which allow the Company to make more informed decisions based on improved quality inputs in a measurable model; and (3) provide information for better decisions on Capital project improvements and integrity management. Unlike the current unit-less relative model a probabilistic model will be a unit based risk score, specifically in the unit of dollars, improving efficiency in interpreting risk results for business decisions.

Scope

The project scope encompasses the implementation of a probabilistic risk model for gas transmission. The project will: (1) install and configure risk model; (2) configure multiple data sources; and (3) develop reports and dashboards.

Alternatives

Alternatives considered for the project include: (1) Continue the use of the relative risk model, but investing in substantial effort to build customization to bring the model into compliance. This alternative was not selected because although custom workarounds may bring the model into compliance, those work-arounds still result in arbitrary, relative rankings and do not provide confidence in the ability to provide statistical validation of results. (2) Implement a custom, Excel-based probabilistic risk model through a consulting effort. This alternative was not selected because although the effort minimizes the IT cost of the project, the model requires the creation of secondary data sources, leading to multiple "sources of truth". (3) Implement an on-premise probabilistic risk model. This alternative was not selected because the on-premise solutions analyzed are not mature and have not been widely tested with transmission operators. The option of implementing the cloud-based probabilistic risk model was chosen because it is the most cost-effective long-term implementation approach, providing commercial, off-the-shelf capabilities, industry-proven and upgradable technology, and ongoing vendor support.

DATES (phase end)

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Asset Management
Avoided Costs	Assumes 800 hours in annual avoided labor due to reduced labor efforts in Gas Engineering & Supply areas for running existing risk models. The new model decreases 20-30 hours of data management and analysis per transmission asset line, and assumes about 25-40 lines per year. The relative risk model utilizes large sets of data that are not consumed by any other company stakeholders. These are scoring-based data sets that are updated every time there is a change to the pipeline and periodically throughout the year. It is estimated that approximately 800 hours a year are spent updating these data sets, which can be avoided after the new model is implemented.
Risk Mitigation	Implementation of a probabilistic risk model mitigates risk through a comprehensive, statistical analysis of threats to pipe segments, ensuring focus on solving the right problems and resolving the highest risk items.
Risk Mitigation	Prevention of pipeline failures and voided cost of pipeline ruptures: A probabilistic risk model would increase our ability to identify potential failures before they occur. A failure such as a pipe rupture can have a significant impact on the company, including the dollar cost to repair the damage as well as the impact to the public's perception of the Company. It is anticipated that there will be a reduction in these types of failures with this improved tool. Although the model will not necessarily eliminate the possibility that these types of ruptures will occur in the future, the model will reduce the likelihood that they will occur because we will have a better understanding of our system. The project investment could avoid actual and reputational costs by potentially avoiding one of these failures, which has been estimated to cost CE up to $160 million. In addition, the new model will help better quantify the cost of a rupture.
Intangibles	Quality improvement - Implementation of a probabilistic risk model provides quantifiable results that are more reliable, transparent, and understandable, rather than relatively ranked; improving confidence in data and leading to improved decision-making for strategic planning, financial planning, and regulatory oversight.
Intangibles	Waste elimination through potential productivity improvements. A true statistical model may eliminate workarounds with the current model that are necessary to support planning efforts by reducing investigation time and increasing user expertise through quantitative analysis and insight to core model functionality.

Genesys Cloud Migration

Report Pulled: 11/1/2024 **Item ID: 13423**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Condition **Work Type** Project

Alias , Genesys Cloud Migration

Description The project will migrate the Company's existing on-premise customer contact solution and deploy it to the Genesys Platform As A Service ("PAAS") cloud-based solution. It will provide the Company with the ability to reduce operational costs for performing upgrades and maintenance, take advantage of new enhancements offered by the vendor, and ensure continued support of a critical customer communication channel.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CUSTOMER EXP & OPS

WORK OBJECTIVES

Problem Statement In 2028, standard vendor support ends for the current on-premise software and extended support is not available from the vendor. Without vendor support, the application no longer receives security patches, bug fixes, or functionality support from the vendor, which creates security, stability, and reliability risk. With the upcoming end of standard support, the vendor is no longer offering feature enhancements to the current on-premise solution limiting the Company's ability to invest in new ways to better serve its customers.

Objectives This project will provide value to both the Company and its customers through: (1) reducing costs with cloud allocated hardware scalable to current usage needs; (2) reducing operating costs with vendor managed feature updates and maintenance provided without service disruption; (3) providing access to new and innovative capabilities to enhance customer service; and (4) reducing security, stability, and performance risk by ensuring consistent, seamless vendor support.

Scope The project scope includes: (1) deploying the new PAAS cloud-based solution in the vendor cloud environment; (2) installing a new internet circuit to directly connect the Company's systems to the vendors cloud environment; (3) updating existing customer interactive voice response ("IVR") system to accommodate the new cloud implementation; (4) implement new features supporting analytics, quality, and reporting; and (5) implement a built-in customer survey tool.

Alternatives Alternatives considered include: (1) Defer to later years. This alternative was not selected due to requiring upgrades of existing on-premise hardware, impeding our ability to take advantage of new features offered by the cloud solution, and reducing cost savings opportunities presented by moving to the cloud. (2) Deploy Genesys on-premise solution to new on-premise hardware. This alternative was not selected due cost associated with purchasing new hardware and does not address the security, stability, and reliability risk resulting from the vendor end of support for the on-premise software. (3) Select and migrate to a new vendor software. This alternative was not selected due to the complexity of our existing internal integrations between the Genesys platform and the Company's other internal systems. As a result, selecting a new system with a new vendor would make the switch cost prohibitive. (4) Migrate to the Genesys Cloud platform. This alternative was selected due to it building on the Company strategy of moving to cloud, reducing operating and maintenance costs, and reduces risk by ensuring consistent, seamless vendor support.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Avoided Costs	Avoided costs of $1,000,000 associated with on-premise server upgrades which would require both internal and external labor to complete. Savings based on on-prem server upgrades estimated at a total of $970,000 and $30,000 in extended server support would not be needed for the year 2026.
Avoided Costs	Avoided costs of $2,669,170 associated with the Genesys indication of a 20% increase in on-premise software maintenance year over year until the on-premise end-of-life. Calculated by taking the difference between the IT forecasted on-premises software maintenance minus the estimated expected cost with 20% increase for each year starting in 2025. [2025: $1,717,174 (expected) - $1,623,397 (forecast) = $93,777] [2026: $2,060,608 (expected) - $1,638,077 (forecast) = $422,531] [2027: $2,472,730 (expected) - $1,638,077 (forecast) = $834,653] [2028: $2,967,286 (expected) - $1,638,077 (forecast) = $1,329,209] [Total Savings: $93,777 + $422,531 + $834,653 + $1,329,209 = $2,669,170]
Avoided Costs	Avoided costs of $365,000 associated with reduction of voice circuits. Savings based on $60,000 per year in SIP circuit costs + $60,000 per year in H&H voice circuit costs, minus $63,000 in annual costs for AWS direct connect. Assumes only partial year costs for AWS ciruict in 2024. [2024: $120,000 - $40,000 = $80,000] [2025: $120,000 - $63,000 = $57,000] [2026: $120,000 - $63,000 = $57,000] [2027: $120,000 - $63,000 = $57,000] [2028: $120,000 - $63,000 = $57,000] [2029: $120,000 - $63,000 = $57,000] [Total Savings = $80,000 + $57,000 + $57,000 + $57,000 + $57,000 + $57,000 + $57,000 = $365,000]
Avoided Costs	Reduces annual ongoing costs associated with running on-premise solution including virtual machines and storage. Approximate avoided cost of $728,092 per year which was estimated by including the monthly HCL management expense per virtual machine, Azure 3rd copy backup storage, VMware licenses, on-premise Commvault backup storage, operating system licenses, and other shared infrastructure costs.

HR Support Pack and Business Software Inc Upgrade 2023 — Report Pulled: 11/1/2024 — Item ID: 12506

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Comply - Interval — **Work Type** Project

Alias , HR Support Pack and Business Software Inc Upgrade 2023

Description The HR Support Pack and BSI upgrade will update the SAP system with HR Support Packs that are released annually by SAP to comply with HR and tax changes.

Portfolio IT Services > Applications > Foundational Enterprise Applications > * > * > *

Org CX&T — **Bus Unit** INFORMATION TECHNOLOGY — **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax changes, resulting in the inability to calculate and distribute payroll.

Objectives This project creates value for the Company by: (1) ensuring that its systems are in compliance with new financial rules and regulations; and (2) ensuring that it can calculate and distribute payroll.

Scope The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information by the Company.

Alternatives As this is an upgrade of an existing system, the alternative considered was to delay the upgrade. This alternative was not chosen due to the risk of not complying with financial rules and regulations.

HR Support Pack and Business Software Inc Upgrade 2026 — Report Pulled: 11/1/2024 — Item ID: 12755

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Comply - Interval — **Work Type** Project

Alias , HR Support Pack and Business Software Inc Upgrade 2025, HR Support Pack and Business Software Inc Upgrade 2026

Description The Human Resources (HR) Support Pack and Business Software Inc (BSI) upgrade will update the SAP system with HR Support Packs that are released annually by SAP to comply with HR and tax changes.

Portfolio IT Services > Applications > Foundational Enterprise Applications > * > * > *

Org CX&T — **Bus Unit** INFORMATION TECHNOLOGY — **Dept** CX&T-IT-APPLICATION PLATFORMS & SEF

WORK OBJECTIVES

Problem Statement SAP releases annual HR support packs to ensure compliance. Without them, the Company would be unable to comply with HR and tax changes, resulting in the inability to calculate and distribute payroll.

Objectives This project creates value for the Company by: (1) ensuring that its systems are in compliance with new financial rules and regulations; and (2) ensuring that it can calculate and distribute payroll.

Scope The scope of this project is to add SAP HR corrections to ensure proper reporting of financial information by the Company.

Alternatives Alternatives considered include: (1) Not upgrading to the current support packs which results in noncompliance with financial rules and regulations and inaccurate payroll; (2) there is no economical cloud solution, so this option was not entertained; (3) apply the appropriate support pack upgrades. Option (3) is the preferred option because it enables the company to comply with HR and tax changes, resulting in the ability to correctly calculate and distribute payroll.

ISIS Papyrus 2026 Upgrade

Report Pulled: 11/1/2024 **Item ID: 13461**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias ISIS Papyrus Upgrade, ISIS Papyrus 2026 Upgrade

Description This project will upgrade the Papyrus Objects suite of applications to the most recent version available per vendor recommendation. The ISIS Papyrus application is critical to creating electronic and paper correspondence for customers, including bills and dunnings.

Portfolio IT Services > Applications > Foundational Enterprise Applications > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement The application will be at least 1 major upgrade revision behind by 2026. It's imperative our customers retain unfettered access to their paper bills, dunning notices and other communications produced by ISIS. ISIS also makes customer bills available for online viewing through the website and mobile apps. Without the upgrade, our vendors make no guarantee that any substantial patches or hot fixes impacting application reliability, capacity and security will be forthcoming. The upgrade will address these problems and challenges, as well bring ensure all other platform components comply with our company operational and security standards.

Objectives The value of this project includes: (1) providing a more stable operational model by upgrading to the most recent version available; (2) maintaining the necessary vendor support; and (3) resolving tuning and stability issues with the vendors.

Scope The scope of the project is to upgrade the various licensed products that comprise the Papyrus Objects suite of applications.

Alternatives As this is an upgrade of an existing system, the alternative considered was to delay the upgrade and continue operating with the current version. This alternative was not chosen due to the risk of application stability and the inability to maintain cyber security patching.

B/C Ratio (Overall)	-1.000

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	Medium	An out-of-support version of Papyrus Designer means that ISIS Papyrus no longer provides hotfix support. This will put the company network at risk, which is critical to avoid as this is responsible for paper billing.

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Intangibles	Newer versions of ISIS Papyrus enable better integration with newest operating systems (Linux) and database (SQL).
Intangibles	Newer versions of ISIS Papyrus will improve performance and enhance productivity for billing and invoices.

IT Access Controls Governance

Report Pulled: 11/1/2024 **Item ID: 6830**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Comply - Interval **Work Type** Project

Alias SAP Access Controls, Access Controls Governance, IT Access Controls Governance

Description This project replaces the current software tool that manages and monitors Sarbanes-Oxley Act ("SOX") compliance for SAP transactions.

Portfolio IT Services > Applications > Corporate Services > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-PLANNING & GOV

WORK OBJECTIVES

Problem Statement

To comply with SOX controls, standard SAP user access is reviewed on a semi-annual schedule, sensitive access is reviewed quarterly, and emergency access management is reviewed as needed. The current solution for validating these controls is SAP's GRC (Governance, Risk and Compliance) Access Controls software application. The SAP GRC system is the backstop for the Company's IT General Controls, which ensures legal compliance. Problems with current implementation include: (1) increased risks as the current process is manually intensive and inefficient, and could lead to SOX audit deficiencies; (2) customized code makes it difficult and costly to maintain, including the application of fixes; (3) difficulty meeting SOX compliance when requirements change from auditors and the Public Company Accounting Oversight Board (PCAOB); (4) incomplete reports for segregation of duties and change logs; and (5) increased risks exist when elevated access is needed in SAP production.

Objectives

The project will add value through: (1) reducing risk and eliminating waste through new tools that provide higher levels of automation and process optimization to reduce inefficiencies, human errors and avoid SOX audit findings; (2) decreasing maintenance of $15,000 per month and upgrade costs by implementing an out-of-the-box solution without customization; (3) increasing the ability to meet requirement changes from auditors and the Public Company Accounting Oversight Board; and (4) creating complete and accurate report capabilities.

Scope

The project scope includes: (1) automating the SAP periodic user access review; (2) automating the emergency access management process; (3) displaying areas of risk and identifying how to mediate that risk; (4) tracking mitigations; and (5) converting the current rule set into the new tool.

Alternatives

Alternatives considered include: (1) Continue using the current application as-is, accepting the audit risks stemming from known issues. This alternative was not selected due to the risk associated withstandard SAP support ending on December 31, 2020. (2) Use robotic process automation in a limited scope to automate some manual tasks and reduce errors. This alternative was not selected as it would not mitigate risks and gaps in the current tool. (3) Develop a custom solution to perform some of the work. This alternative was not selected as it would be more costly and include higher maintenance and support costs. (4) Continue applying program patches and fixes from SAP for the current tool. This alternative was not selected as it does not address or fulfill all requirements, and requires support from an external vendor, which increases support costs. (5) Replace the existing tool with a new solution. This alternative was selected as it meets Company requirements, avoids hiring two additional resources, is more cost effective in the long term, adds more process automation, and increases SOX compliance.

Intangibles	If this project is not done, IT Corporate Services will need to hire two additional resources to manage sensitive access and segregation of duties risk management.

IT Operations Management - Service Operations

Report Pulled: 11/1/2024 **Item ID: 13929**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , IT Operations Management - Service Operations

Description This project will implement an application service mapping tool to effectively manage business-critical services through identification of infrastructure components and application interactions. This tool automates the mapping process to create a complete, up-to-date, and accurate record of the mapped application service in the Database. Application service mapping works hand-in-hand with asset discovery, building on discovered infrastructure data to identify all the assets that support a service, and along with their service-specific relationships.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement As the IT systems steadily increases in complexity and evolve faster than the IT organization can respond to system issues in an optimized and cost-effective manner, the current configuration of the system does not provide the clarity needed in order to understand how the infrastructure interacts with the applications within the IT System it supports and in order to respond to emergent IT incidents in the most rapid and costs effective manner. These constraints can lead to lengthy response and implementation times; negligible or ineffective resolutions; reduced functionality; and elongated outage times in the infrastructure and applications in the system.

Objectives This project will create value for the Company by mapping critical application services through discovery of the underlying infrastructure associated with application services and its relationship to parent business applications. Specifically, by creating application service maps, this project will: (1) increase visibility and understanding between Information Technology (IT) infrastructure and Configuration Items; (2) improve accuracy through real-time, automatically updated infrastructure and component changes; (3) reduce IT Subject Matter Experts time on emergent IT issues; (4) Utilize of IT Service Management processes; and (5) Reduce downtime by identifying dependences and impact analysis.

Scope The project scope includes: (1) implementation of On-Premise application service maps which have significant business impact; (2) establishment of process roles needed to support service maps built.

Alternatives Alternatives considered included: (1) Choose an alternate IT Operations Management System with Cloud capabilities. This alternative was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. This alternative was not chosen as there would be a correlation gap between application services and the underlying infrastructure and would not address the ever-increasing resolution costs. (4) Develop and implement an on-premises service mapping and process solution. This alternative was chosen due to the value in Information Technology (IT) Operations Management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can utilize the Configuration Management Database (CMDB) and work hand-in-hand with asset discovery.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Intangibles	By implementing ITOM application service mapping it enables the Top-Down Service aware CMDB that can utilize Information Technology Service Management processes and helps in quicker Business Impact determination which will help prioritize the actions and decisions for future enhancements.
Technology Capability	By implementing ITOM Application Service Mapping there will be better Administrative & General (A&G) Support, as this provides visibility into how the infrastructure is connected to applications. It will create a more Service aware configuration management which will improve technical impact Analysis and prioritization leading to a reduction in downtime, better root cause analysis of incidents for the operations teams, and efficient change management.
Avoided Costs	Improving the MTTR (Mean Time to Resolution) for major incidents is one of the primary uses for having services mapped. Understanding the relationships between all of the CIs that make up a service, and easily seeing recent Incidents and Changes on those CIs, provides invaluable insight in both ensuring the Incident is routed to the right team quickly, and in troubleshooting an active issue. Projected Cost Saving - 30% of total labor cost - about $420K on Non-MI MTTR (Customer impacting P2 incidents - Performance/Degradation) and $360K on MI MTTR (P1 and P2 Critical incidents).
Technology Capability	Service Mapping makes the IT process more reliable with Automated mapping services that reduces the time users are handling errors and also enabling the mapping to be updated in real time.

Itron Enterprise Edition 2025 Upgrade

Report Pulled: 11/1/2024 **Item ID: 11761**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias Itron Enterprise Edition Upgrade, Itron Enterprise Edition 2025 Upgrade, Itron Enterprise Edition 2024 Upgrade, Itron Enterprise Edition 2026 Upgrade, Itron Enterprise Edition 2025 Upgrade

Description This project will upgrade Itron Enterprise Edition (IEE), which collects the reads from meters to ensure non-estimated bill accuracy.

Portfolio IT Services > Applications > Foundational Enterprise Applications > Foundational Enterprise Applications > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-ELECTRIC

WORK OBJECTIVES

Problem Statement Itron Enterprise Edition (IEE) is the Company's keystone application of the Advanced Metering Infrastructure (AMI), that provides billing data that includes time of use data. If this application does not stay current, the Company increases the risk business operations could be interrupted or compromised. Itron Enterprise Edition (IEE) is a key component in keeping the Company current, with billing capacity, stability, and accuracy obligations.

Objectives This project creates value for the Company by: (1) ensuring the features and functionality needed to meet and exceed customer satisfaction and billing accuracy are available to business partners and IT; (2) meeting Information Security's requirement to keep applications patched and protected from cyber attack.

Scope The scope of this project includes: (1) upgrading the Itron Enterprise Edition (IEE) applications to the next appropriate versions; (2) migrating the database to the next version required by the application.

Alternatives Alternatives considered included: (1) Defer the upgrade. This alternative was not selected because it would decouple Itron IEE (CE's Meter Data Management) from the Itron security infrastructure introducing application instability, security and dependency risks to the utility, possibly negatively impacting critical customer electric and gas billing operations. It would also likely affect other business critical Itron applications use, creating more expense to support and no ability to leverage updated tool capability. (2) Replace the platform. Replacing IEE/MDM would require the application business owners to undertake a new initiative mirroring the expense and effort that went into the multi-million dollar project responsible for setting up and leveraging this utility. (3) Perform the upgrade. This option is superior for both our customers and our Company because it maintains vendor support for hot fixes and patches, and aligns with all upgrade projects related to other Itron products.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	High	If Consumers Energy does not upgrade this equipment, it would run the risk of losing support from the vendor, leading to security vulnerabilities and operational efficiency issues.

OTHER VALUE

Type	Description
Technology Capability	Technology Capability
Risk Mitigation	Without the upgrade, supportability and operational efficiency issues may increase over time. Resolving these issues becomes very problematic if vendor support is not available. It would also be difficult to keep the system current with security updates.

Next Generation electronic Shift Operations Management Sys Report Pulled: 11/1/2024 Item ID: 12483

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias , Next Generation Clearance Management, Next Generation electronic Shift Operations Management System Replacement, Next Generation electronic Shift Operations Management System (eSOMS) Replacement

Description The project replaces the eSOMS with updated clearance lock out tag out ("LOTO") management software for Electric Generation facilities, and narrative logs and mobile rounds functionality for Electric Generation and Gas Compression facilities.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-ELECTRIC

WORK OBJECTIVES

Problem Statement The vendor is replacing the current system used at the Company and other utilities with a new software package called Lumada. The software migration is necessary for the Company to retain vendor support, so that the databases continue to receive security patches, bug fixes, and functionality support from the vendor, and avoid security, stability, and reliability risk.

Objectives The project will add value by: (1) maintaining functionality of a critical life safety application; (2) reducing the human struggle that comes from manual workarounds and an older application; (3) empowering employees with proper electronic tools to meet customer expectations; (4) enabling process improvements to deliver outages more effectively; (5) reducing plant downtime; (6) increasing reliability; and (7) increasing standardization across the Company.

Scope The scope of this project includes: (1) configuring software for clearance management, logbook, rounds, automated emails, and reporting; (2) migrating and archiving data; (3) enabling additional offline capabilities, (4) integrating with SAP for equipment and current status of work orders; (5) adding new integration to SAP for notifications from rounds and clearance functions (6) testing the software, data migrations and integrations; and (7) updating configuration management database, runbook, system recovery plan, LOTO work procedure, qualification training and other standard documentation.

Alternatives Alternatives considered include: (1) continuing to use the eSOMS application, though without vendor support. This alternative was not selected because losing vendor support for this critical application increases risks for application security, reliability, and supportability that can result in an employee safety incident in the complex tagging process, an extended plant production outage, a prolonged plant reliability issue, or regulatory or compliance violations. (2) Instituting the manual business continuity process until the application replacement is possible. This alternative was not selected because it would also increase the previously mentioned operational risks. (3) Replacing the eSOMS application by customizing SAP. This alternative was not selected as it would be more expensive and introduce additional risk to employees due to poor application fit. (4) Migrating the existing eSOMS data to an out the box application such as the Lumada application. The option to migrate the existing eSOMS application to an out of the box solution was chosen to minimize cost and risk to the Company and its employees. Cloud hosting of the application infrastructure at the vendor's location was also evaluated, though due to the greater cost of this vendor hosting, the application infrastructure will be hosted on premise at the Company.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	4 - Electric T&D, Gas T&D, Generation
Intangibles	Having this electronic application available through a vendor supported version, empowers employees with proper electronic tools instead of requiring paper logging, switching and tagging and rounds processes.
Intangibles	The new software offers functionality improvements to better support plant outages (switching and tagging), logging, mobile and other functions more effectively.
Intangibles	The new software reduces the human struggle of using manual workarounds for known issues in the current application's connectivity requirements.
Risk Mitigation	This is a life safety application, therefore the risk of not keeping the application functioning risks the safety of Generation Operations' employees and contractors. If Consumers Energy uses an unsupported version and risks a critical application issue, it may result in a potential safety incident, prolonged plant production outage, prolonged plant reliability issue, regulatory or compliance violation.

Operational Technology - Service Management Upgrade

Report Pulled: 11/1/2024 **Item ID: 13924**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , ServiceNow OT Module, Operational Technology - Service Management, Operational Technology - Service Management Upgrade

Description This project will implement Operational Technology ("OT") service management capabilities. Service management provides automated asset tracking, maintenance, and incident management for the assets.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement The Company' Internal Audit team conducted an audit of the Operational Technology (OT) asset environment and identified significant gaps in the patch management program. The patch management operating model is decentralized, has limited and inconsistent standards, doesn't have a company-wide governance structure to monitor all business areas of the Company and lacks a complete and accurate asset inventory. Due to the lack of a complete asset inventory, as well as a significant number of gaps identified in the patch management governance, operating model, processes, and controls to manage all assets within the Company's environment, an unknown magnitude of risk exists that critical patches were not installed timely, which could create the potential for increased security vulnerabilities.

Objectives The project provides value to the Company in three ways 1.) Establishes a complete and accurate asset inventory. 2.) Creates a Company-wide governance structure with documented standards and processes to manage the assets and 3.) Defines a comprehensive patch management operating model with clearly defined roles and responsibilities.

Scope The project scope includes: (1) the implementation of an asset management tool (2) the implementation of an incident management tool, (3) and the establishment of process roles needed to support the assets.

Alternatives Alternatives considered included: (1) Choose a Cloud-based alternate asset management system. This option was not chosen as it would require introducing and integrating an additional vendor product into the technical landscape. (2) Develop a custom solution. This alternative was not chosen since the cost to build and maintain similar capabilities and to integrate the custom solution would not be feasible or cost effective. (3) Do nothing. Continue to manually track or not track Operational Technology (OT) Digital assets at the Company, which will not address the need to effectively track OT Digital assets and plan for their support. (4) Develop and implement an asset management and incident management tool and processes. This alternative ultimately chosen has strengths in Information Technology (IT) service management and its integration capabilities with other platform modules from the same vendor. It offers a unified platform that can help bridge the gap between IT and OT, enable the Company to manage both types of assets through a single interface.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Consolidating Operational Technology Assets into a single database establishes the groundwork for potential future service management capabilities such as incident management, change management, and vulnerability management for the Operational Technology Team, all of which are poised to enhance operational performance.
Intangibles	Having Operational Technology Assets in one database will improve efficiencies (with data stored in a single system, resources spend less time searching for information across multiple platforms, leading to increased productivity and faster decision making), increase accuracy (centralizing data reduces the likelihood of errors and inconsistencies that can occur when information is spread across disparate systems), better collaboration (one system encourages collaboration across teams. This fosters teamwork and enhances communication within the organization), better insights (having data in a single database facilitates comprehensive analysis and reporting. This allows for deeper insights into operations, trends and enable informed decision making). Overall, having data in one system simplifies operations, enhances efficiency, and empowers the company to make better informed decisions.

Operational Technology (OT) Datacenter Migration

Report Pulled: 11/1/2024 **Item ID: 13963**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Project

Alias , OT Datacenter Colo, OT Datacenter Migration, Operational Technology Datacenter Migration, Operational Technology (OT) Datacenter Migration

Description The OT environment consists of systems supporting the control and monitoring of electric grid, electric generation, gas compression, and natural gas pipeline. These systems are critical for safe and reliable natural gas and electric delivery. The OT Datacenter Migration project enhances the Company's capabilities by co-locating to an enhanced datacenter at a vendor facility.

Portfolio IT Services > Infrastructure > Data Center - Enterprise Computing > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement The Company's current datacenter for the OT environment needs modernization and relocation from the Parnall Data Center. The current location is not the preferred location to house servers and systems critical to the control of the Electric Grid or Gas Pipeline due to the close proximity to a railway system. The climate conditioners in the current OT datacenter are aging and have had faults resulting in unplanned shutdowns . The location of the datacenter in the basement of the Parnall building is nearby to the main water piping for the building. There have been instances of water infiltration in the past.

Objectives This project creates value for the Company by significantly strengthening capabilities through: (1) mitigating legacy physical and location risks at the current Parnall site; (2) migrating the OT infrastructure to a modern, highly secured environment with redundancy in climate conditions; and (3) better datacenter facilities support with a guarantee of redundant power.

Scope The scope of the project includes: (1) migration of the OT environment from the Parnall Data Center to a co-located vendor data center; (2) re-validation of the OT Production and Disaster Recovery procedures once migration is completed; (3) migration of IT systems required for supporting the OT environment; and (4) decommission the existing OT environment from the Parnall location.

Alternatives The Company performed an analysis of alternatives to expand capabilities as well as address constraints and risks: (1) Remain at the current Parnall Data Center; (2) migrate OT environments to the Cloud; and (3) relocate to a third-party co-location facility. Current industry best practices do not recommend migration of OT environments to the cloud. The co-location vendor provides the building, cooling, power, and physical security the Company lacks for its servers, storage, and other computing and networking equipment at the current Parnall location. Based on the analysis, the Company decided to implement the third alternative.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Intangibles	There could be impacts to business services, customer service, and Company reputation.
Risk Mitigation	There is a need for enhancement to Consumer Energy's DR capabilities. Without a clear understanding of the risks, mitigation of those risks, and communication to all key stakeholders, the Company may not be able to recover from a loss of the primary data centers at Parnall. This risk may result in impacts to day-to-day operations and customers, which could have broader financial, reputational, and regulatory impacts.
Risk Mitigation	Using a vendor managed co-location datacenter reduces Company risk as it relates to NERC/CIP regulatory requirement Physical Security CIP-006-6
Intangibles	With the OT Datacenter migration, there is a highly secured environment, heating and cooling redundancy, and a guarantee of 100% power efficiency.

Oracle Server Database Upgrade 2023

Report Pulled: 11/1/2024 **Item ID: 12407**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Interval **Work Type** Project

Alias Oracle Database Upgrade,Oracle Server Database Upgrade, Oracle Server Database Upgrade 2023-2024, Oracle Server Database Upgrade 2023-2025, Oracle Server Database Upgrade 2023

Description This project will upgrade Oracle server databases to the next version to support all business portfolios.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SER

WORK OBJECTIVES

Problem Statement The Company is currently managing Oracle server databases that run on multiple versions of Oracle: 8i, 9i, 11g, and 12c; all of which are currently unsupported as of 12/31/2020. Version 12c recently lost vendor support in July of 2019 and is eligible for extended support. Relying on extended support for Version 12c increases operational costs by $121,000 annually. Extended support is not available for version 11g and older. Without vendor support, the databases no longer receive security patches, bug fixes, or functionality support which creates security, stability, and reliability risks.

Objectives This project will create value for the Company and its customers by: (1) reducing the risk of system failure and the resulting impacts to business partners and customers; and (2) ensuring that systems are secure, supported, and have the latest features and functionality. and (3) will do what we can to be complaint with Cyber Security Published standards, when possible. Many of the Cyber Security requirements are application dependent.

Scope The scope of this project includes upgrading to the next version of Oracle across all impacted business systems. Systems that cannot support current version of Oracle, will be upgraded to the highest supported version.

Alternatives Alternatives considered were; (1) delay database upgrades. This option was not chosen because, as stated, it would introduce significant security, stability and reliability risks; (2) Upgrade only to Version 12c and pay extended support. This option was not chosen, where possible, to avoid increased operational costs. The alternative chosen is to upgrade to the next version of Oracle and where systems do not support the current version of Oracle, upgrade to Version 12c and pay extended support until those systems are upgraded.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
Technology Obsolescence	High	High	The Company is currently managing Oracle server databases that run on multiple versions of Oracle: 8i, 9i, 11g, and 12c; all of which are unsupported. Version 12c most recently lost vendor support in July of 2019 and is eligible for extended support, but it increases operational costs and is not available for version 11g and older. Without vendor support, the databases no longer receive security patches, bug fixes, or functionality support from the vendor, which creates security, stability, and reliability risk. The project mitigates these risks.

OTHER VALUE

Type	Description
Technology Capability	Administrative & General (A&G) Support
Risk Mitigation	If the upgrade is not completed, the organization is at risk of security vulnerability and system failure. Oracle touches many business partners who will lose their ability to adequately perform their job tasks and customers, who will not be able to interact with the Company website or receive information from contact centers. After July of 2019, there will be no bug or functionality fixes for versions 11g and older.
Risk Mitigation	In the case of hardware, industry best practices suggest a five- to seven-year asset refresh cycle, while software, operating systems (OS), databases, and firmware typically require more frequent updates. Five to seven years is the useful window, according to market research Consumers Energy is making specific risk-based decisions on individual assets at the end of five years.
Intangibles	Many of the business areas that use Oracle are customer facing, including the contact centers and the website. If Oracle were to fail, the reputation of the organization would be at risk.
Intangibles	The outage management system would be impacted by a system failure. In the event of an unplanned outage, it would affect timely response to gas leaks, down wires, worker deployment, and field services.

Physical Access Management and Alarm Response

Report Pulled: 11/1/2024 **Item ID: 13976**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Condition **Work Type** Project

Alias , Physical Access Management and Alarm Response

Description The project will replace the Company's Physical Access Management System to establish a centralized platform that manages user identities, authenticates users, authorizes access, and audits user activities. The intent of this project is to consolidate and modernize the Company's physical security systems that will enable enhanced security monitoring to prevent unauthorized entry into sensitive corporate areas while providing increased flexibility to the Company's valued employees and contractors.

Portfolio Corporate Services > Security Services > Cyber Security & Shared Services > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-CYBER SEC ENG & STAN

WORK OBJECTIVES

Problem Statement The Company's Security Fusion Center (the Fusion Center is the Company's combined physical and cyber security operations center) is experiencing operational issues with the current physical access management system. The installation is out of date and causes inconsistent behavior when given tasks by automations within the Company's Identity Management solution. Frequent issues have been reported related to frozen jobs in the Company's existing access management solution due to the current system's database. This results in significant waste in the form of (1) waiting, the business partner is waiting much longer than they should have to for the system to process their request as un-freezing jobs is a manual process; (2) lost productivity, that waiting can cause for the business partner as it can either prevent them from accessing sites they need, or slow them down unnecessarily while they work with others to be escorted; (3) rework, because frozen jobs don't always run correctly when unfrozen, meaning the business partner has to resubmit their request and/or Identity Operations has to do additional work to satisfy the original request; and (4) alarms can cause a frozen state that impact system stability and reduces security visibility as a result. Not moving to new technology also carries a growing risk of outright system failure which could result in unauthorized physical access and/or impact the Company's ability to efficiently function. The current installation of the physical access management system and the Company's current card readers do not support next generation physical access control methods, such as digital ID. This prevents the Company from adopting new methods and practices that can lower costs and improve control and responsiveness. All employees, contractors, staff, and visitors are impacted by the problem.

Objectives This project creates value for the Company by: (1) developing an alarm and event monitoring system, which will enable seamless orchestration of system alarms and cameras; (2) adding automation that will streamline remediation processes and orchestrate camera operations for efficiency; (3) refining access revocation and badge access management to ensure only authorized personnel have entry privileges; (4) introducing new access control readers that will modernize the system, allowing for the use of mobile device badges for employees, contractors, and visitors, offering a more flexible and user-friendly experience for those entering the Company's facilities.

Scope The project scope includes modernizing the Company's current physical access control system, badge system, badge access hardware and firmware, and all 3000 card readers across facilities and assets. This will require modernization of all physical badge access readers and the implementation of hardware and software necessary to run the physical access control system. In addition, there will be substantial automation and integration between the security orchestration solution and the physical access control systems to realize the full benefits of this initiative.

Alternatives Alternatives considered were: (1) Keeping the current physical access control system and processes as-is. This alternative was not selected as the current platform is outdated, increasingly expensive to support, and does not include modern capabilities, such as digital IDs. It also does not reduce waste, cost, and it does not improve speed to delivery; (2) Developing a custom, in-house physical access control solution that includes modern capabilities, such as digital IDs. This option was not selected as the Company lacks the expertise to build such a solution. Custom-developed solutions have higher long-term, and generally result in significant waste, as well as lower speed to delivery; and (3) Implementing a new physical access control system that includes modern capabilities, such as digital IDs, that reduces waste and cost and improves speed to delivery. There are vendors in the market that specialize in physical access control systems that offer proven capabilities the Company is looking to implement. This option was selected as it will allow the Company to meet its objectives of lower waste, lower cost, improved speed to delivery, by implementing digital IDs and enabling tighter integration between the physical access control system and the Company's other security platforms.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
System Failure (SAP & Other)	Medium	Medium	This system replacement will reduce current operating risk managing multiple physical access management platforms.

OTHER VALUE

Type	Description
Technology Capability	Access revocation and badge access management will be refined to ensure only authorized personnel have entry privileges
Technology Capability	Development of a sophisticated Alarm and Event monitoring system will enable seamless orchestration of system alarms and cameras. This will facilitate proactive camera monitoring and rapid response to incidents.
Technology Capability	The impact of the project is to allow physical entry for employees, contractors, and visitors who are authorized to do work for the Company while minimizing barriers.
Technology Capability	The new system will introduce new access control readers that will modernize the system, allowing for the use of mobile device badges for employees, contractors, and visitors, offering a more flexible and user-friendly experience for those entering the Company's facilities.
Technology Capability	The new system will seamlessly integrate with mobile badging, allowing for efficient contractor and visitor management, which is particularly crucial during emergency situations such as storms.
Technology Capability	The project will give the ability to integrate badge entry data with security camera data and other security platforms to perform cross system monitoring and flagging. This impact will allow the Company to build more effective alerts that can be responded to in a more deliberate manner.

Pipeline SCADA Security

Report Pulled: 11/1/2024 **Item ID: 10487**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Comply - One Time **Work Type** Project

Alias , Gas SCADA Cyber Security, Pipeline SCADA Security

Description This project will implement major modifications to the Gas Supervisory Control and Data Acquisition (SCADA) environment to ensure compliance to American Petroleum Institute (API) 1164 standard. API 1164 is an MPSC regulatory requirement with recent updates to the Gas Technical Standards. The project will implement IT, cyber security, and physical security equipment and site modifications necessary for regulatory compliance to API 1164.

Portfolio Corporate Services > Security Services > Security > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-COMPLIANCE

WORK OBJECTIVES

Problem Statement The MPSC requires the implementation of pipeline cyber security regulations pursuant to API 1164 on the Company natural gas pipeline system. The Company's Gas SCADA system is outdated and non-standardized, requiring significant modifications to be compliant with API 1164. Without the technology updates, the gas SCADA system is vulnerable to cyber-attacks that potentially risk disrupting delivery to customers. Interruptions in gas delivery and non-compliance to API 1164 mandated requirements could be subject to fines and penalties from the MPSC and other regulatory entities (i.e., the Transportation Security Administration).

Objectives This project will add value to the Company by: (1) modernizing and standardizing the Gas SCADA network at the Company's gas compressor stations and control rooms; (2) mitigating cyber security vulnerabilities in the Gas SCADA network; (3) allowing the Company to fully comply with API 1164 requirements; and (4) fulfilling the commitment to the MPSC to provide a secure gas system that meets customer needs.

Scope The project scope includes updates for multiple gas SCADA-related locations, including: eight gas compressor stations, two gas control rooms, two data centers, and multiple intelligent pipeline field devices. To establish compliance with API 1164, the project will: (1) design a holistic network architecture to implement both physical and technical changes; (2) implement physical enhancements to impacted facilities, such as additional closets or data rooms, and modified HVAC systems to provide necessary climate control for the SCADA equipment; (3) install additional security cameras and/or card readers necessary to control access to new and existing equipment; (4) complete technology upgrades requiring design, development, testing and implementation for the Gas SCADA network at each of the planned locations. Upgrades will consist of endpoint protection, identity and access management, vulnerability management, business continuity capabilities, cyber incident response, asset management, and commensurate test environments; and (5) implement additional security measures on field devices, including change default credentials, secure communications, change management, and patching activities.

Alternatives As this is a regulatory compliance requirement, there are no alternatives to completing this project. Without the completion of this project, the Company could be subject to noncompliance fines and penalties from the MPSC.

Risk Mitigation	modernizing and standardizing the Gas SCADA network at the Company's gas compressor stations and controls rooms will help mitigate unplanned outage and cyber security related risks seen with Gas Supply and Generation.

Product Family Enhancements-Application Platforms Service Report Pulled: 11/1/2024 Item ID: 13931

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Strategic/Grow **Work Type** Portfolio

Alias , Product Family Enhancements-IT/Digital Foundation-Capital, Product Family Enhancements-Application Platforms and Services, Product Family Enhancements-Application Platforms and Services-Capital, Product Family Enhancements-Application Platforms Services-Capital

Description The IT initiative will utilize both Capital and O&M funding to make enhancements to existing software and to address requests generated by changing business requirements. O&M is included in this project to complete expense activities associated with Capital enhancements.

Portfolio IT Services > Applications > Common Delivery Systems > * > * > *

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-APPLICATION PLATFORMS & SERV

WORK OBJECTIVES

Problem Statement As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment.

Scope Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management.

Alternatives Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

Org CX&T **Bus Unit** INFORMATION TECHNOLOGY **Dept** CX&T-IT-CORPORATE

WORK OBJECTIVES

Problem Statement As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives The value of software enhancements in the Corporate Services Portfolio lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment. Included in the implementation are small changes and functionality improvements to existing IT software application investments for Corporate Services.

Scope The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as People and Culture (Human Resources), Legal, Finance and Governmental, Regulatory and, Public Affairs.

Alternatives Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

WORK OBJECTIVES

Problem Statement As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives The value of software enhancements in Electric and Gas operations lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment.

Scope Included in the implementation are small changes and functionality improvements to existing IT software application investments for Electric and Gas Operations. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as Electric, Gas and Generation Operations, Operations Performance, Operations and Financial Reporting and, Operations Compliance and Controls.

Alternatives Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Companys ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

Problem Statement As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment.

Scope Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management.

Alternatives Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. WORK OBJECTIVES

Problem Statement
As business processes improve and change, new requirements surface that call for smaller-effort software application changes that typically emerge from new or changing business conditions, compliance requirements, needs for new capabilities, customer feedback, and other improvement ideas Enhancing applications requires a short timeframe between inception and implementation and cannot and should not wait for rate case approval at an individual line-item level. Failure to make these changes to applications can have a direct negative impact on key customer and business processes, increase support costs, and limit the Company's ability to consistently meet objectives.

Objectives
The value of software enhancements that benefit the IT organization lies in: (1) cost savings and cost avoidance; (2) technology and business process efficiencies; (3) improved customer experience; (4) risk mitigation; (5) safety improvements; and (6) achieving corporate goals, among others. While these small-work software efforts are neither projects nor operational work, funding for resources is still required to maintain business agility in the digital environment.

Scope
Included in the implementation are small changes and functionality improvements to existing IT software application investments that are utilized by IT employees in support of tracking hardware and software fixes and managing technology projects for the various business areas within the Company. The scope of application enhancements encompasses: (1) making necessary system changes, and (2) updating documentation related to the changes. Additionally, enhancement requests are fulfilled to provide functionality for areas such as IT resource management, IT project management, IT financial and regulatory, IT applications operations, and IT infrastructure management.

Alternatives
Prior to implementing an enhancement, a review is completed to identify the best solution. During that review, requests for this funding are governed by a cross-functional board comprised of representatives from each area that routinely evaluates and prioritizes the work and to assess requests for value using categorized benefits. In addition, the overall enhancements budget is reviewed annually, and the alternative of a zero-budget allocation for enhancements is considered. This project fortifies the Company's ability to make software changes as part of process improvements and regulatory changes, and to meet legally required system changes. Without funding for enhancements, the Company will be limited in its ability to quickly provide needed capabilities and improvements.

Public Key Infrastructure (PKI) Upgrade

Report Pulled: 11/1/2024 **Item ID: 13691**

EXECUTIVE SUMMARY

BASIC INFORMATION

Work Category Maintain - Condition **Work Type** Project

Alias , Public Key Infrastructure (PKI) Upgrade

Description Replace on-premise PKI to stay supported by the manufacturer.

Portfolio IT Services > Infrastructure > Data Center - Enterprise Computing > * > * > *

Org CX&T **Bus Unit** SECURITY **Dept** CX&T-SECURITY-CYBER SEC ENG & STANI

WORK OBJECTIVES

Problem Statement The existing PKI that issues certificates to IT systems for secure communications needs to be upgraded to stay supported by the manufacturer. If the PKI is not maintained, in the event of a system failure the Company would not have support in recovering. All IT systems requiring secure communications via certificates would go offline within three days.

Objectives Replace existing PKI with new PKI that is supported by the manufacturer.

Scope The project will build and configure the servers necessary to provide Public Key Infrastructure services, put in place physical token management for maintaining security, migrate certificate issuing and management to the new system and decommission the old system.

Alternatives The Company has a limited use service for PKI on the Internet only. (1) The Company looked into expanding the service to include usage on the Company network but found the solution to not be economically viable. (2) The Company also looked at full cloud solutions, but it did not meet the security standards currently being used around physical token use. (3) The Company looked at continuing extended support, however the continuing extended support is not available by the vendor. (4) The Company selected a hybrid solution of part cloud and part on-premise to meet all operational and security compliance requirements. The opportunity is to retain ownership of the keys on-premise prior to evaluating ownership through the cloud.

Risk Tolerance

Corporate Risk	Impact	Likelihood	Description
System Failure (SAP & Other)	High	Medium	Consumers Energy's vendor, Thales only offers full support for seven years after purchase of a solution. After the end of support no more operational or security patches are available and if an issue is encountered the manufacturer will not assist in resolving.

OTHER VALUE

Type	Description
Risk Mitigation	DR Risks/Impacts Description – If the Company doesn't upgrade to a supported version and the system becomes unrecoverable, we are at risk of the of the following: (1) Lost productivity of approximately 8,000 employees and 4,000 contractors who are unable to access system is estimated to be 3.12M (Half day – 13,000 *$60 *4 hours) to 12.48M (2 days – 13,000 people * $60 * 16 hours). (2) Deferred revenue – payment from customers estimated to be $12-44M daily. (3) Life Safety Incidents – loss of ability to report a down powerline, gas leak type events. (4) Negatively impacts our ability to assist with Storm Restoration. (5) Call centers will go down.
