								$ 20,951	$ 580,003	$ 559,051	3.61%

[i] Offering Completion Date
[ii] Underwriting discount is calculated as the market price minus the offering price when not explicitly given in the prospectus.

The flotation cost adjustment is derived by dividing the dividend yield by 1 − F (where F = flotation costs expressed in percentage terms), or by 0.9639, and adding that result to the constant growth rate to determine the cost of equity. Using the formulas shown previously in my testimony, the Constant Growth DCF calculation is modified as follows to accommodate an adjustment for flotation costs:

$$k = \frac{D \times (1 + 0.5g)}{P \times (1 - F)} + g$$

Notes
(1) Capacity and energy production costs adjusted to capture elements occurring outside the Cost-of-Service Study
(2) Includes Non-SRM capacity related costs.
(3) Excludes IRM costs recovered through the IRM surcharge.
(4) Credit adjustments approved in Case No. U-21389

Date: June 2026

2025 Plan Year

Metric	50% Threshold	75%	100% Target	125%	150%	175% Max
Employee Safety						
a. Recordable Incidents Rate (30%),	a.1.24	a.1.12	**a.1.00**	a.0.98	a.0.96	a.0.94
b. High-Risk Injuries[1] (70%),	b.20	b.16	**b.12**	b.11	b.10	b.9
c. No fatalities[2]						
Culture Index						
a. Employee Engagement (33%),	a.71	a.72	**a.**73	a.74	a.76	a.78
b. Empowerment (33%), &	b.65	b.66	**b.**67	b.68	b.70	b.72
c. Diversity, Equity, & Inclusion (33%)	c.73	c.74	**c.**75	c.76	c.78	c.80
(Overall outcome = avg of each index award)						
Customer Experience [1] (Survey Measuring CXi)	**64**	**65**	**66**	**68**	**70**	**75**
Electric Reliability (SAIDI)	165 mins	160 mins	155 mins	150 mins	145 mins	140 mins
Waste Elimination[3] (O&M Savings through Waste Elimination)	$44M	$49M	$53M	$58M	$66M	$75M
Methane Emission Reduction (Reduce fugitive methane emissions associated with gas distribution)	74 MT	78 MT	82 MT	93 MT	114 MT	135 MT

1 High-Risk = Recordable or non-recordable injury caused by a release of high energy
2 A fatality = zero payout for employee safety
3 The Company is not seeking recovery of this measure as it is financial in nature.

OFFICER PLAN

Category	2026 MEASURE	Weighting
Safety	**Employee Safety** (Serious Injury Incident Rate (80% weighting) & Recordable Incident Rate (20% weighting) and Zero fatalities)	**5.0%**

(1) The amounts reported in this column include amounts deferred by the NEOs.

(2) The amounts represent the aggregate grant date fair value of the awards, which, with respect to those awards with a performance component, is based upon the probable outcome of the performance conditions, determined pursuant to ASC 718 and take into account the expected CMS common stock dividend yield associated with the 2023, 2024 and 2025 awards. See Note 12, Stock-based Compensation, to the Consolidated Financial Statements included in CMS' and Consumers' Annual Report on Form 10-K for the year ended December 31, 2025, for a discussion of the relevant assumptions used in calculating the aggregate grant date fair value pursuant to ASC 718. The TSR vesting condition related to the performance-based restricted stock awards is considered a market condition and not a performance condition under ASC 718. Accordingly, there is no grant date fair value below or in excess of the amounts reflected in the table above that could be calculated and disclosed based on achievement of market conditions. The EPS growth vesting condition is a performance condition under ASC 718.

The 2025 grant date fair value for the EPS growth performance-based restricted stock, based on the probable achievement of the performance goals at the time of grant, was $2,550,024 for Rochow; $787,515 for Hayes; $300,018 for Berry; $461,282 for Johnson; $344,968 for Hofmeister and $408,719 for Wells Jr.

The grant date fair value for the EPS growth performance-based restricted stock, assuming the maximum achievement of the performance goals, would have been $5,100,048 for Rochow; $1,575,030 for Hayes; $600,037 for Berry; $922,563 for Johnson; $689,936 for Hofmeister and $817,438 for Wells Jr.

(3) The amounts reported in this column for 2025 consist of cash incentive awards earned in 2025 under our Annual Incentive Plan.

(4) This column does not reflect compensation paid to the NEO but instead represents the aggregate annual increase, as of December 31, 2023, December 31, 2024 and December 31, 2025, in actuarial values of each of the participating NEO's benefits under the Cash Balance Plan. The actuarial values are calculated pursuant to Financial Accounting Standards Board Accounting Codification Topic 715, Compensation — Retirement Benefits (ASC 715), and take into account discount rates and implementation of the current 2021 mortality table. See Note 11, Retirement Benefits, to the Consolidated Financial Statements included in CMS' and Consumers' Annual Report on

Form 10-K for the year ended December 31, 2025, for a discussion of the relevant assumptions used in determining these amounts. Rochow is the only NEO covered by the Cash Balance Plan.

(5) Detail supporting all other compensation for 2025 is reflected in the *2025 All Other Compensation Table*, below.

(6) Berry was not a NEO prior to 2025.

Consumers Energy Company
Allocation of Base Salary and Incentive Expense for the 2025 Historical Period

1. *Base Salary and Short-Incentive Company Allocation*

Base salaries and short-term incentive of the officers are allocated to CMS Energy, Consumers and NorthStar. The following officers have a portion of base salary allocated to other companies outside of Consumers Energy based on an estimated percentage of time spent.

- President & Chief Executive Officer
- Exec VP & Chief Financial Officer
- Executive VP Business Transformation & Chief Legal & Admin. Officer
- SVP People
- SVP Strategy Sustainability & External Affairs
- VP Corporate Secretary & Chief Compliance Officer
- VP Regulator & Legal Affairs & Deputy General Counsel
- VP Applications & Analytics
- VP IT & Security and Chief Info Officer

No officers have a portion of base salary and short-term incentive allocated to other companies outside of Consumers Energy based on customer count.

The following officers have a portion of base salary and short-term incentive allocated to other companies outside of Consumers Energy based on Massachusetts formula allocation.

- VP Controller & Chief Accounting Officer
- VP of Investor Relations and Treasury

The remaining officer roles have 100% of their base salary and short-term incentive allocated to Consumers Energy based on the fact that 100% of their time is spent on Consumers Energy.

2. *Base Salary Business Allocation (ie Electric and Gas Split)*

Operating and maintenance allocation of base salaries for the following officers were based on the three factors: (1) Net Plant, Investments, Inventory and Goodwill (2) the 12-month ended operating revenue (3) and 12 months ended payroll.

- President and Chief Executive Officer
- VP Controller & Chief Accounting Officer
- SVP Strategy Sustainability & External Affairs
- VP Corporate Secretary & Chief Compliance Officer
- Executive VP Business Transformation & Chief Legal & Admin. Officer
- VP Regulator & Legal Affairs & Deputy General Counsel

Operating and maintenance allocation of base salary for, SVP & Chief Customer Officer; VP Supply Chain and SVP Chief Customer & Growth Officer is based on customer count.

Operating and maintenance allocation of base salaries and short-term incentive for the following officers were based on bank balances ratio. Bank balances ratio is calculated as average electric and gas percentages of total construction expenditures and total operating and maintenance expense.

- Executive VP and Chief Financial Officer
- VP of Investor Relations and Treasury

Operating and maintenance allocation of base salaries for the EVP & Chief Operating Officer is based on their time spent on electric versus gas work and customer count.

Operating and maintenance allocation of base salaries for the, VP Community & Media Relations & Chief Diversity Officer; VP Applications & Analytics; and VP IT & Security and Chief Info Officer; is allocated between electric and gas based on a corporate headcount.

Operating and maintenance allocation of base salaries for the VP of Grid Ops Restoration & Work Management, SVP & President Electric Distribution and SVP & President Electric Supply and are allocated 100% to electric.

Operating and maintenance allocation of base salaries for the SVP and VPs responsible for Transformation, Engineering & Operation Support, are allocated to electric and gas based on the weighted average of operating and maintenance and construction dollars expended in the various functions (Engineering, Operations Support, and VP Renewables Development & Enterprise Prj. Mgmt.).

3. *Incentive Business Allocation (ie Electric and Gas Split)*

Electric and gas allocation of annual incentive for all officers is based on total Consumers' labor allocation within historical 12 months period.

4. *Base Salary and Incentive Cost Allocation (ie O&M and Capital)*

Annual incentive expense has always been considered a labor cost; however it was not categorized as one in the MPSC chart of accounts. Prior to Case No. U-17735 it was a "disallowed" labor cost. In Case No. U-16191, the Commission staff requested that payments in excess of rate recoverable charges (for example: incentive compensation plan, supplemental executive retirement plan, etc.) be recorded to account 426.5 "Other Deductions". The Company followed this order and charged incentive expense to account 426.5. In Case No. U-17735, the Commission approved the recovery of the short-term EICP program, which then allowed the Company to charge the approved short-term incentive costs to operating and maintenance expense and capital as a component of labor for the Company. The Company is currently splitting the cost of short-term incentive associated with operating goals at threshold level (50% of non-officer labor costs and 30% of officers) between operating and maintenance and capital based on time spent. Based on Case No. U-17990 only approving the recovery of the short-term incentive cost associated with operating goals, However, 100% of the top 5 officer annual incentive labor costs is allocated to account 426.5 "Other Deductions".

5. Base Salary and Incentive Cost Allocation %

Date: June 2026

	2/22/2023 Storm	3/28/2025 Storm	Variance 2025 to 2023	Notes
Storm Type:	Wind/Ice	Wind/Ice		
Declared Statewide Storm:	2/22/2023	3/29/2025 1pm		
Undeclared Statewide Storm:	3/3/2023	4/6/2025 10am		
Restoration Duration:	200.5 Hours	189 Hours	(12)	
Customers Restored in 48 Hrs	50%	83%	33%	
Resource Information:				
CE Crews	180	193	13	
Electric Service Workers	93	82	(11)	
CE FTE's	812	854	42	
Contractor Crews	444	636	192	
Contractor FTE's	1,776	3,180	1,404	
Forestry Crews	300	306	6	
Wire Down Resources	359	350	(9)	
Damage Assesment Teams	59	46	(13)	
Exempt FTE's	522	689	167	
Nonexempt FTE's	231	229	(2)	
Outage Information:				
No. Customers Out	435,707	383,876	(51,831)	
No. Interruptions/Outages	10,839	8,552	(2,287)	
No. Customer Minutes	849,543,096	574,381,636	(275,161,460)	
No. Wire Downs	11,157	7,156	(4,001)	
Overall Cost Information:				
Total Storm Cost (w/ Corp. Overheads)	$ 100,486,793	$ 155,989,050	55,502,257	
Total Storm Cost (w/o Corp. Overheads)	$ 88,934,812	$ 134,840,224	45,905,412	
O&M Cost	$ 62,964,690	$ 51,996,958	(10,967,732)	
Capital Cost (w/ Corp. Overheads)	$ 37,522,103	$ 103,992,092	66,469,989	
Capital Cost (w/o Corp. Overheads)	$ 25,970,122	$ 82,843,266	56,873,144	
Resource Costs:				
Total CE Labor *(includes Indirect Labor)*	$ 17,184,829	$ 24,246,251	7,061,422	
CE O&M	$ 11,637,195	$ 12,134,703	497,508	
CE Capital	$ 5,547,634	$ 12,111,548	6,563,914	
Total Contractor Costs	$ 51,264,797	$ 75,852,369	24,587,572	
Contractor O&M	$ 41,681,067	$ 27,511,719	(14,169,348)	
Contractor Capital	$ 9,583,730	$ 48,340,650	38,756,920	
Total Forestry Cost	$ 2,051,604	$ 4,970,126	2,918,522	
Forestry O&M	$ 1,286,933	$ 3,219,910	1,932,977	
Forestry Capital	$ 764,672	$ 1,750,216	985,545	
Material Information:				
Quantity of poles	1,045	1,810	765	
Total cost of poles	$ 577,024	$ 1,250,130	673,106	
Unit cost per pole	$ 552	$ 691	139	
Quantity of transformers	410	636	226	
Total cost of transformers	$ 556,494	$ 2,295,714	1,739,220	
Unit cost per transformers	$ 1,357	$ 3,610	2,252	
Quantity of crossarms	1,917	3,678	1,761	
Total cost of crossarms	$ 266,853	$ 460,795	193,942	
Unit cost per crossarms	$ 139	$ 125	(14)	
Quantity of pole top capital	7,531	15,481	7,950	
Total cost of pole top capital	$ 182,170	$ 470,074	287,904	
Unit cost of pole top capital	$ 24	$ 30	6	
Unit Cost Requirements:				
Total unit cost for CE Crews	$ 95,604	$ 125,628	$ 30,024	
O&M unit cost for CE Crews	$ 64,741	$ 62,874	$ (1,867)	
Capital unit cost for CE crews	$ 30,863	$ 62,754	$ 31,891	
Total unit cost for CE FTE	$ 18,989	$ 25,904	$ 6,915	
O&M unit cost for CE FTE	$ 12,859	$ 12,964	$ 106	
Capital unit cost for CE FTE	$ 6,130	$ 12,940	$ 6,810	
Total unit cost for Contractor crews	$ 115,461	$ 119,265	$ 3,803	
O&M unit cost for Contractor crews	$ 93,876	$ 43,257	$ (50,619)	
Capital unit cost for Contractor Crews	$ 21,585	$ 76,007	$ 54,422	
Total unit cost for Contractor FTE	$ 28,865	$ 23,853	$ (5,012)	
O&M unit cost for Contractor FTE	$ 23,469	$ 8,651	$ (14,818)	
Capital unit cost for Contractor FTE	$ 5,396	$ 15,201	$ 9,805	
Total unit cost per crew (CE & Contractor)	$ 109,739	$ 120,746	$ 11,007	
O&M unit cost per crew (CE & Contractor)	$ 85,480	$ 47,824	$ (37,656)	
Capital unit cost per crew (CE & Contractor)	$ 24,259	$ 72,922	$ 48,663	
Total cost per support worker	$ 2,524	$ 3,142	$ 618	
O&M cost per support worker	$ 1,585	$ 2,032	$ 447	
Capital cost per support worker	$ 939	$ 1,110	$ 171	
Total cost per case of trouble	$ 9,007	$ 21,798	$ 12,792	Defined as total cost per wire down
Wire Down Response Times (minutes)	21,615,719	4,318,181	$ (17,297,538)	
Average Wiredown Duration (hours)	32.3	10.1	$ (22)	
Total cost per customer interruption	$ 9,271	$ 18,240	$ 8,969	
Total cost per customer minute of interruption	$ 0.12	$ 0.27	$ 0.15

Executive Summary

Consumers Energy Company ("Consumers Energy" or the "Company") is driven by its purpose to achieve world-class performance delivering hometown service, measured by a triple bottom line—people, planet, and Michigan's prosperity. The triple bottom line balances the interests of customers with other stakeholders, and captures the broader societal impacts of the Company's activities.

People – The Company's purpose and passion is to make life better for the people of Michigan. Consumers Energy is committed to providing safe, reliable, and affordable electric service to its customers, and dedicated to providing a great customer experience—what Company employees refer to as providing 'hometown service.'

Planet – Consumers Energy's ambitious *Clean Energy Plan* will lead to achieving net zero carbon emissions by 2040 by eliminating the use of coal, bringing additional renewable energy resources on to the system, and working with customers to use energy more efficiently.

Consumers Energy is proud to be a leader in the clean energy transformation here in Michigan and across the country, as we forge a path toward a more sustainable energy future.

Michigan's Prosperity – Consumers Energy is committed to helping Michigan and its communities grow and thrive. A prosperous Michigan cannot exist without financially healthy utilities that provide safe, reliable, affordable, and increasingly cleaner energy. The significant funding the Company receives each year from investors and lenders makes possible the electric system infrastructure replacements and enhancements that benefit customers and the state of Michigan. Ensuring Michigan's prosperity also includes investing in local communities and supporting local nonprofits in addition to helping Michigan businesses grow and create jobs.

The Company has proudly served Michigan families and businesses since 1886, with more than 1.9 million electric customers across the state today. Consumers is committed to providing an electric distribution system that delivers safe, reliable, clean, and affordable electricity to customers today and in the future. To do that, the Company must address infrastructure risk in the near-term while adapting to meet evolving customer expectations and technology advancements.

The Company's commitment requires a distribution strategy based on four customer-focused outcomes, as follows:

- **Safe** – The Company will continue to design and maintain its distribution system to ensure the safety and security of customers and employees is maintained and ultimately enhanced.
- **Reliable and Resilient** –To ensure system *reliability* during predictable weather variations under normal operating conditions, the Company will improve its capabilities and visibility to proactively operate the system and better manage power quality to provide customers with a grid that remains stable and available. To ensure system *resiliency* and performance, the Company will harden the system where necessary to withstand abnormal conditions driven by increasingly severe and unpredictable weather and climate events.
- **Clean and Equitable** – The Company is building a system that will be modernized, smart, and capable of accommodating changing customer technology adoption patterns (such as electric vehicles and distributed energy resources) for all communities served, ensuring members of disadvantaged communities have equitable opportunities to participate. The Company will deliver reliability and resiliency equitably across all communities.

- **Competitive** – Provide affordable rates that will create value for customers by attracting and retaining businesses that provide jobs and economic opportunities, while ensuring every community —especially our most vulnerable—sees maximum energy investment according to its needs with minimal impact and energy burden.

The Michigan Public Service Commission ("MPSC" or the "Commission") first directed the Company to submit a five-year electric distribution investment plan in Case No. U-17990 in 2017.

On March 1, 2018, the Company delivered its first *Electric Distribution Infrastructure Investment Plan* ("EDIIP"), meeting the MPSC's directive. The Company filed a second EDIIP on June 30, 2021. On September 8, 2022, in Case No. U-20147, the Commission directed Consumers Energy to file an updated EDIIP by September 29, 2023, and provided updated guidance on new and revised content for inclusion in the plan. That updated EDIIP was filed, and branded as the "Reliability Roadmap," a term we now use when referring to this document.

After the 2021 EDIIP was filed, the Company received feedback from stakeholders, customers, and the MPSC on what would make future distribution plans more useful and engaging. The Reliability Roadmap concisely describes how the Company is anticipating the future needs of customers, and is developing an enhanced distribution strategy, informed by industry best practices from around the nation, to deliver cost-effective reliability and resilience benefits.

Concurrent with the filing of its 2025 electric rate case (Case No. U-21870), the Company is filing this updated version of the Reliability Roadmap.

Highlights of the Reliability Roadmap

- **An Overview of Emerging Scenarios and How They Impact Planning**: In the coming years, the electric distribution system faces two substantial, externally driven changes: **increasingly severe weather tied to climate change**, and **technological advances that affect how customers manage their electricity usage**. To prepare for this future, the Company modeled three different risk scenarios and impacts to the grid from electric vehicles and heat pump adoption, as well as weather impacts from extreme heat, wind, and thunderstorms driven by climate change. Through this detailed modeling and analysis, the Company presents the future all Michiganders must prepare for, and the Company's plan to deliver a reliable and resilient energy grid that addresses these threats.
- **An Overview of the Company's Capital Project Planning Process**: The Company's multi-faceted planning **process prioritizes and sequences investments to meet system needs and deliver safe, reliable electric service to all customers and communities in its service territory.** The Reliability Roadmap details how the process maximizes customer benefits and ensures those benefits are equitable throughout Michigan. This process will be used to provide reliable and resilient power based on the future climate and technology adoption scenarios.
- **Asset Management Approaches for Distribution Assets**: In the Reliability Roadmap, the Company provides a **detailed overview of its distribution assets, including the system health of each asset group, the risks each group faces, and the proactive steps** the Company is taking to ensure they perform as intended. Asset subclasses are grouped based on whether they primarily ensure the reliability of the grid, resiliency of the grid, or the safety of the public and Company employees. The five-year investment plans for each asset, based on the need to address identified risks and deliver improved performance, are outlined in this report.

- **Additional Topics**: This section of the Reliability Roadmap particularly outlines technological and analytical innovations related to the distribution system, resource needs attached to the Roadmap, and distribution-related economic development proposals to help Michigan compete for prospective new large industrial customer facilities.

Throughout the updated Reliability Roadmap, the Company presents its vision for the electric distribution system, analyzed through the lens of the system's current state, and outlines an investment plan to bridge from the current state to the desired future state.

The Company fundamentally believes that the nearly $8 billion of total investments outlined in this plan will deliver the safety, reliability, and resiliency benefits that customers expect. The Company plans to seek recovery for these investments.

Timely recovery of the costs of the investments described in this plan is essential to delivering the desired improvements in performance. Projects will not be executed in a timely manner if cost recovery lags or is denied. This trimming of capital would result in lower customer benefits and a lower-performing system whereby the Company continues to deliver its customers 3rd to 4th quartile reliability.

The Company looks forward to working with the MPSC, Staff, and the broader set of stakeholders as this plan is implemented and further improved over time. The Company plans to file updates to this plan, adding future years of investment and accounting for additional years of actual spending, with each subsequent rate case filing as an exhibit supporting test year investments.

A Note on Reliability Metrics

One of the important ways the Company measures how reliable we are delivering energy to our customers is to use the **System Average Interruption Duration Index ("SAIDI")**. The Federal Energy Regulatory Commission ("FERC") uses this reliability measure as do utilities to drive improvements in services. Originally developed by the Institute of Electrical and Electronics Engineers ("IEEE"), these metrics are significant and useful when evaluating and improving the quality of services delivered to customers.

The SAIDI Index has two components for measuring and reporting reliability:

1. The **System Average Interruption Frequency Index ("SAIFI")** tells us how frequently outages occur due to system condition, configuration, and related external conditions (e.g., weather patterns, forecasts, etc.). This measure is calculated by dividing the total number of customers interrupted by an outage by the total number of customers in the system.
    - Essentially, the SAIFI reveals *how often* the average customer has an interruption of power.
2. The **Customer Average Interruption Duration Index ("CAIDI")** tells us *how long* the interruptions last due to system conditions, resources available, number of interruptions, and storm restoration activities.
    - This measure is calculated by the total number of minutes customer energy is interrupted divided by the total number of customers whose service is interrupted.
    - CAIDI score reflects just the customers who were interrupted and measures the average time to restore services to those customers.

SAIDI results are calculated by multiplying **SAIFI** x **CAIDI**.

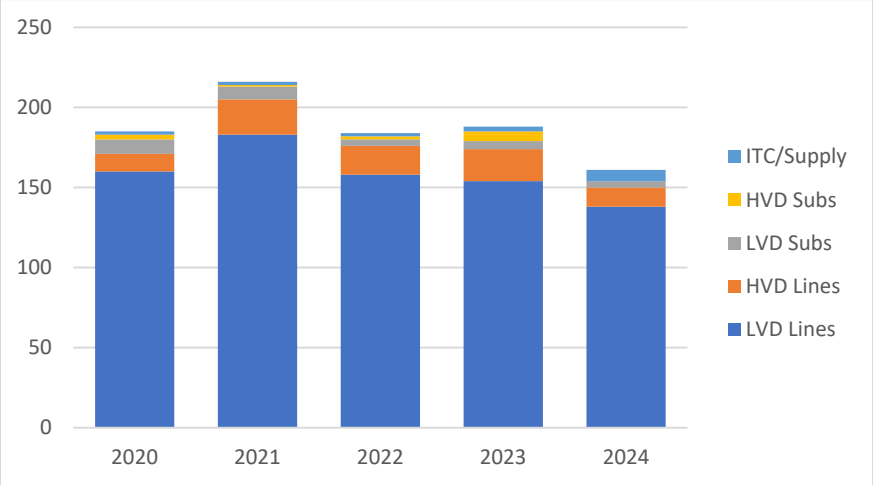
SAIDI is typically calculated excluding Major Event Days ("MEDs") to normalize performance data for unusually severe weather. The methodology for determining the level of storm activity to exclude in developing this chart is based on the *IEEE Guide for Electric Power Distribution Reliability Indices*[1].

However, the Company also tracks and reports its all-weather SAIDI, and discusses it at various points.

- The Company's SAIDI performance was 155 in the year 2024, which means the average amount of time a customer was without power that year was 155 minutes.

Understanding SAIDI is key to interpreting the Reliability Roadmap, which will quantify reliability in terms of SAIDI savings or outage minutes avoided because of specific investments.

As shown below in Figure 1, **Low Voltage Distribution** ("**LVD") Lines account for most of the Company's SAIDI minutes** due to the vast number of miles and territory served, exacerbated by its deterioration and exposure to trees and weather events. The Company's LVD system has 10 times more miles than its High Voltage Distribution ("HVD") system.



HVD Lines account for a smaller contribution to SAIDI—this is because SAIDI on HVD lines fell from 35.4 minutes in 2011 to just 12 minutes in 2024. This is attributable to increased investment in HVD assets over the last decade, in addition to the Company's aggressive and consistent *Forestry Line Clearing* program for HVD lines.

LVD and HVD substations account for a marginal amount of SAIDI minutes due to the redundancy built into the system, and maintenance and design choices that limit the probability of an outage. When substation failures do occur, the impact can affect tens of thousands of customers.

SAIDI minutes attributed to Michigan Electric Transmission Company ("METC"), the transmission provider (sometimes referred to by the name of METC's parent company **ITC**), also represent a minor amount of the overall SAIDI.

Figure 1

SAIDI MINUTES BY ASSET TYPE

[1] IEEE Standard 1366-2012 defines the methodology for calculating a MED. It is based on a statistical analysis of five sequential years of daily SAIDI values. In 2021, Consumers Energy adopted a refined methodology that transitions from a calendar day evaluation period to a rolling 24-hour evaluation period. This methodology better captures MEDs that straddle consecutive calendar days.

While the Reliability Roadmap accounts for growth in distributed energy resource penetration, the threats of extreme weather and existing system deterioration are too great to address through developing technologies.

Simply put, our customers and business need safe, affordable, and proven distribution assets to deliver the reliability we all deserve.

While distributed energy resources have an important role in the state's energy future, they are not the answer to achieving desired improvements in reliability and resiliency. To achieve the desired improvements in reliability and resiliency, the **Company must focus on hardening and improving the performance of its distribution system** through improving poles and wires.

- Effective increased investment in the LVD system is the key element needed to mitigate the worst effects of extreme weather and to begin to enable proactive planning for an increasingly electrified future.
- Enhancing the HVD system is also needed to maintain recent progress through proactively inspecting all assets repairing components on the HVD system to keep them within their useful lifecycle.

Vision for Our Grid

The Company is modernizing its electric distribution system to safely deliver clean, affordable, reliable power to customers throughout Michigan. **The goal is simple: fewer and shorter power outages for customers.** The vision for the grid is a blueprint for serving Michigan today and innovating to meet the challenges of the coming decades.

Customers depend on electricity to meet their everyday needs. They expect electricity to be delivered reliably on normal days with blue skies days under normal operating conditions, and the grid to be resilient in the face of increasingly extreme and unpredictable weather events.

Whether customers are using electricity to charge their electric vehicles, run their electric appliances, or are sending their on-site generation back to the grid, the Company must deliver reliable and resilient energy, and it is building the grid of the future to meet these customer needs.

Historic, once-in-a-lifetime storms are now the norm, resulting in more damaging storms that occur more frequently. The Company's analysis of weather patterns in recent years shows **that wind speeds and gusts continue to present a significant challenge for the distribution system**, as shown in Figures 9 and 10. While the Company is making an important transition in electric generation to address climate change and its impact on the weather, the same transformation is needed with the distribution system.

These risks will require a significant shift in our investment levels and strategy to mitigate the risks from extreme weather and improve the reliability of electric power.

In the face of these challenges, the Company has developed the Reliability Roadmap to respond to the immediate threats through proactive investments in automation, grid hardening, and aggressive maintenance and inspection of its system. This plan is the first step in developing the grid we expect, and lays out the scale of the challenges we face as a State.

The Reliability Roadmap, provided investment levels are fully approved, will serve as a bridge from our current grid to a grid that will be capable of achieving the following objectives:

1. **Delivering reliability performance into the 2nd quartile of nationwide utilities[2].**
2. **Delivering a grid where no single outage event will affect more than 100,000 customers.**
3. **Delivering a grid where no customer will be without power for more than 24 hours following an outage event.**

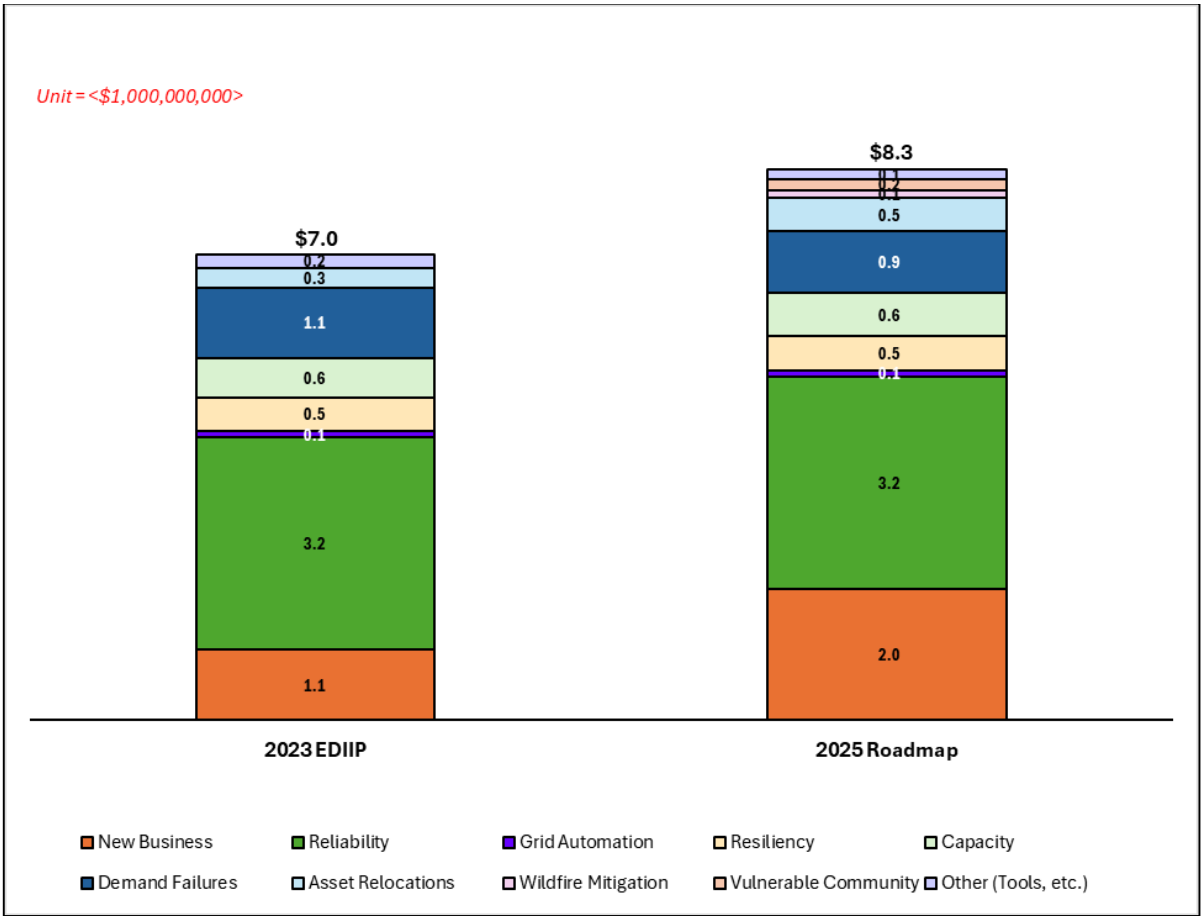
The Reliability Roadmap will significantly improve the Company's SAIDI performance over the next decade when compared to what would be delivered by recent electric rate case-approved levels of investment, providing a substantial improvement in performance over the Company's recent performance[3].

In the near term, the Company must address the timeworn infrastructure already on the system and proactively plan for increasingly severe weather.

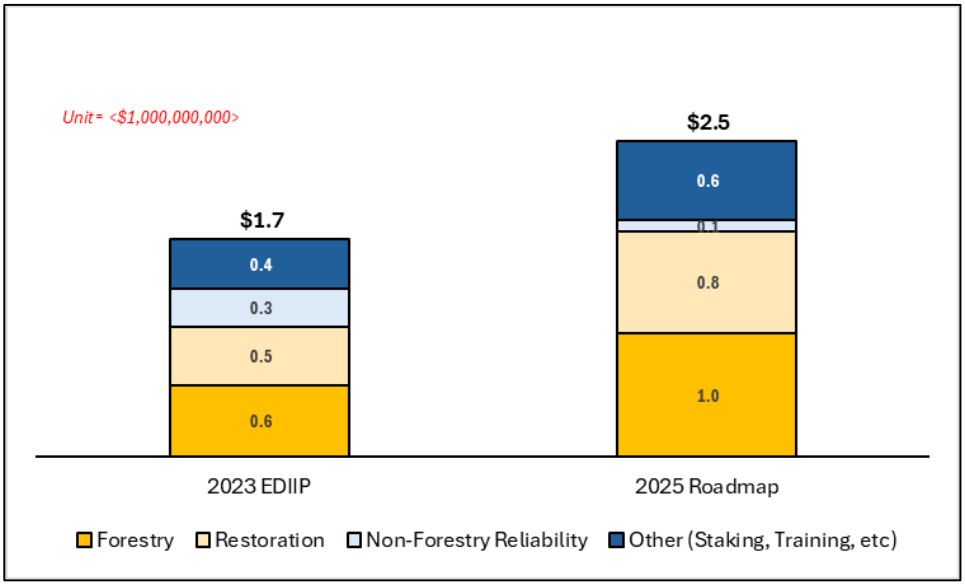
- The Company is preparing to meet these challenges through increased inspections, preventative maintenance, and aggressive investment in hardening the grid through programs like strategic undergrounding and use of automated tools, such as automatic transfer recloser ("ATR") loops, to shorten the duration of outages.
- When storms do strike, the Company works to keep the public safe and uses all available tools to restore power as quickly as possible.

In the longer term, the grid will need capacity to meet customers' growing energy needs from electrification of transit, and other consumer products such as heat pumps and electrified appliances. With this growing dependance on the grid, the Company's focus on performance improvements will need to move beyond the traditional SAIDI excluding MED measurement to All-weather SAIDI. Measuring performance in all conditions will better represent our customers' experiences every day of the year, whether it is on a mild spring afternoon or after a sudden summer thunderstorm.

The deep electrification of the future will require investments to maintain reliable service and ensure every customer can power their homes, businesses, and vehicles.



Investments in the next five years will total $8.3 billion—an increase of over $40 billion from what the Company outlined in its 2021 EDIIP. Operating and Maintenance ("O&M") increases to $2.5 billion over five years.

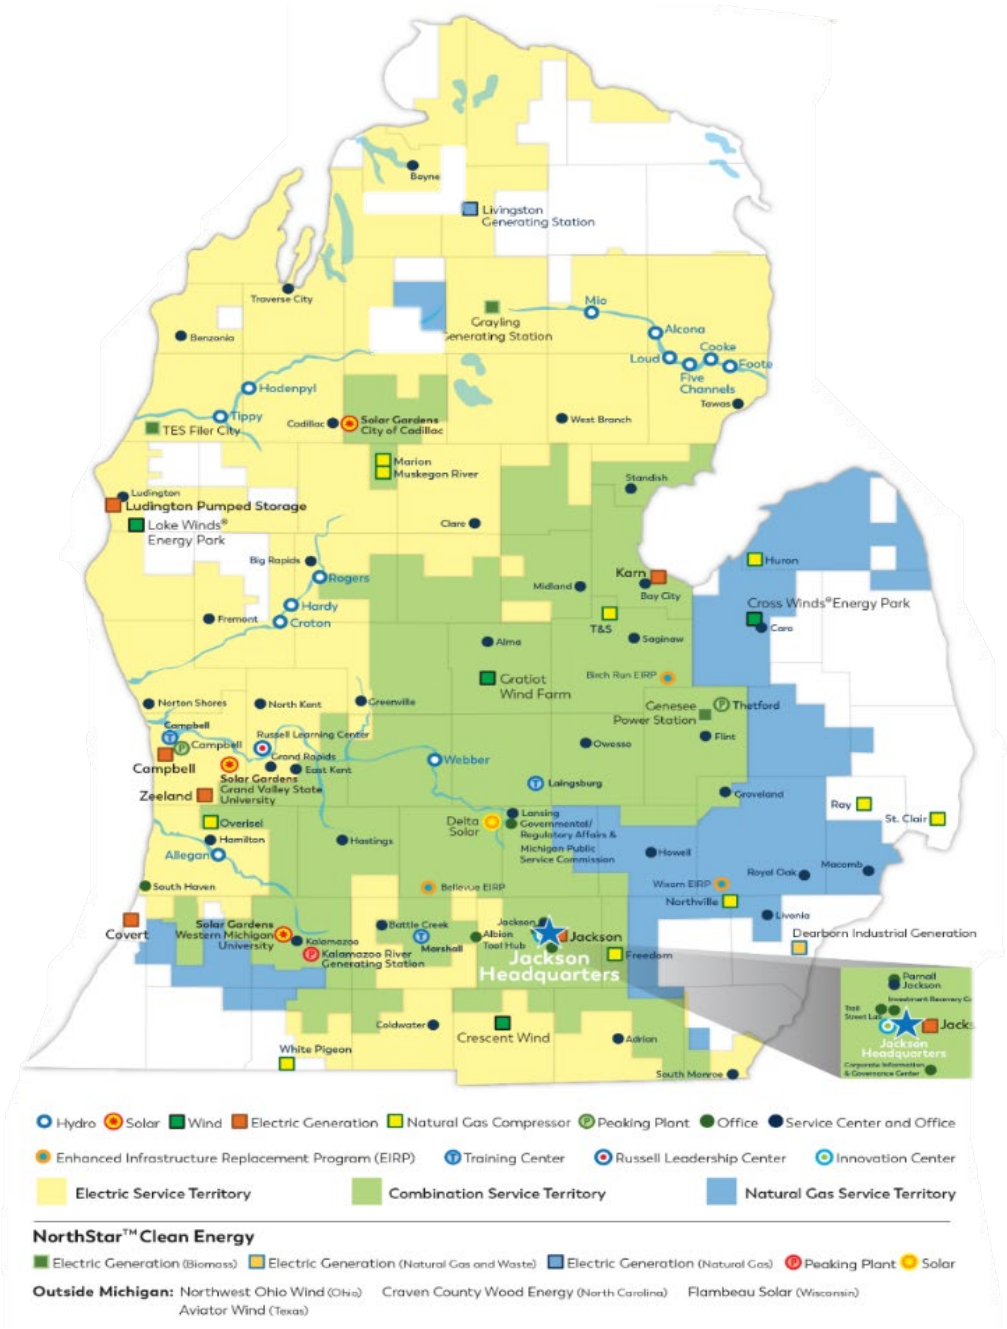


This investment is driven primarily by increased investments in Reliability, and to a smaller extent, by the Company's increased frequency of system inspections as well as the expectation that New Business, especially that tied to Economic Development, will continue to require investment in the system.

[2] 128 minutes for the 5-year average of IEEE Benchmark (2019-2023)
[3] 2018-2022 SAIDI excluding MED performance averaged 208 minutes

FIGURE 2

INVESTMENT FINANCIAL PLANS (2025-2029)



Distribution System Overview

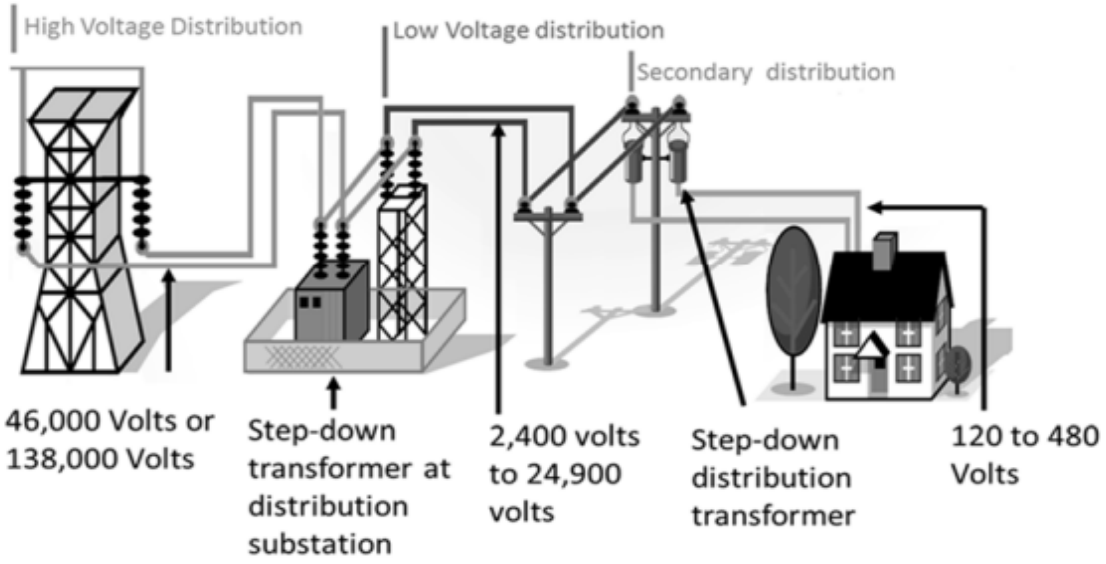
Overview of Service Territory and System Components

The Company's electric distribution system is an essential part of Michigan's infrastructure, serving 1.9 million customers across more than 111,300 miles of distribution lines and 1,135 substations in the north, central, and western portions of Michigan from Monroe County to Mackinaw City, as shown in Figure 3.

FIGURE 3

CONSUMERS ENERGY SERVICE TERRITORY

The distribution system is functionally separated by operating voltage into HVD and LVD.



- **HVD operates at the highest voltages,** taking electricity from regional transmission companies, and transporting it across miles of lines, where it connects into the LVD system at 828 substations throughout the Company's service territory.
- **At LVD substations, high voltage is stepped down**, or reduced to lower voltages, onto the LVD system. LVD voltage is then further stepped down at secondary distribution transformers to secondary voltages (120 to 480 Volts), serving businesses and residences.

A *circuit* is a combination of electrical devices and hardware that are connected to and emanate from an LVD substation to deliver electricity to customers.

The Company's system has more than 2,000 LVD circuits.

- The primary distribution system begins at the distribution substation and ends at the distribution transformer.
- The secondary distribution system begins at the distribution transformer and ends at the customer, as shown below.

FIGURE 4
DISTRIBUTION SYSTEM COMPONENTS

LVD and Metro System

The LVD system is comprised of more than 107,000 total miles of lines, made up of approximately 61,000 miles of primary overhead and underground (carries electricity from substations to transformers), and 46,000 miles of secondary (carries electricity from distribution transformers to customers).

The LVD system consists of 13 different voltages. More detail on these assets and the Company's strategy for ensuring these assets operate as intended is described in more detail in the LVD Lines under the Overview of Asset Management section.

The LVD system also includes a distinct component called **the *Metropolitan Underground system (Metro)*, which provides underground distribution service** in the downtown areas of six cities in the Company's service territory: Battle Creek, Flint, Grand Rapids, Jackson, Kalamazoo, and Saginaw.

- The Metro distribution infrastructure is installed underground to promote public safety by keeping energized infrastructure away from densely populated areas and protecting the aesthetics of downtown areas.
- The Company's Metro planning group focuses solely on these key downtown areas, reflecting the Company's commitment to investment in Michigan by dedicating specific attention to these areas.

More detail on the Metro assets and the Company's strategy for ensuring these assets operate as intended is described in more detail in the Metro chapter under the Overview of Asset Management section.

HVD System and Substations

The HVD system comprises all assets from the point of interconnection with the transmission provider through the point at which LVD lines exit LVD substations.

It is composed of three distinct asset groups:

1. HVD substations
2. HVD lines
3. LVD substations, which are organized as part of the HVD system to leverage substation planning, engineering expertise, and large equipment resourcing in a consistent and efficient manner.

The Company's substation network consists of 1,135 substations.

- The HVD substation network consists of 144 HVD substations and 163 dedicated customer substations in addition to the LVD and general distribution substations mentioned earlier. Additionally, there are five Company-owned substations providing wholesale distribution services to rural co-op and municipal systems.
- Beyond the Company's substations, there are also 35 customer-owned dedicated substations, and 30 customer-owned substations providing wholesale distribution services to rural co-op and municipal systems. Although the Company does not own these, they are still connected to the Company's system.

More detail on these assets and the Company's strategy for ensuring they operate as intended is described in the HVD Lines and Substations chapters under the Overview of Asset Management section.

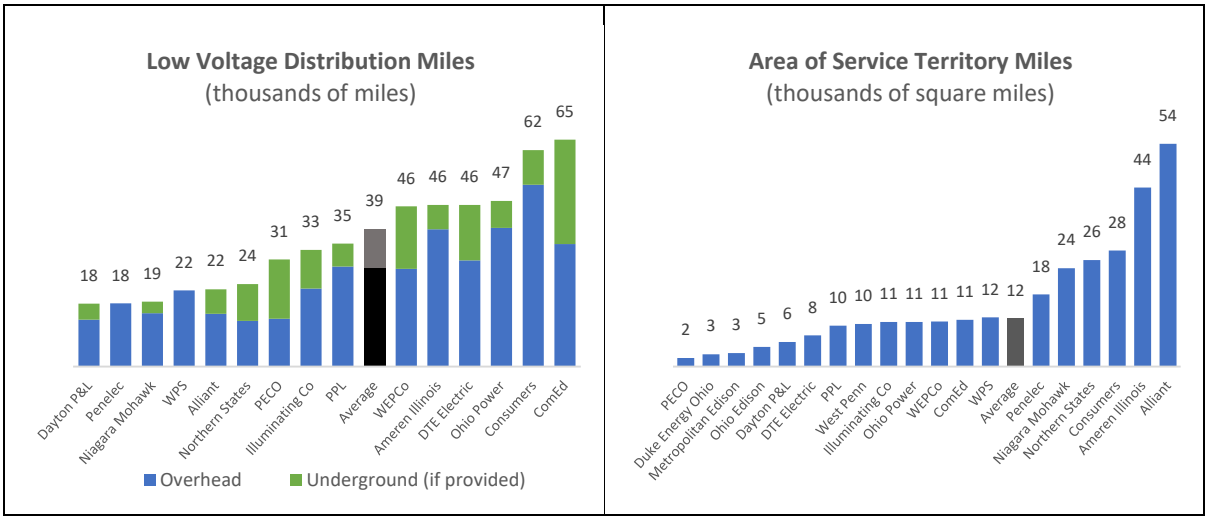
The HVD system is comprised of approximately 4,600 total miles, with about 4,400 of those miles being 46 kV and 69 kV overhead lines, and 19 miles being 46 kV underground lines, and approximately 200 miles being 138 kV overhead lines, and 4 miles being 138 kV underground lines.

System Condition

In accordance with the Commission's September 2022 Order in Case No. U-20147, the Company has benchmarked reliability performance against peer utilities, and the results of this are shown in Figure 5.

FIGURE 5

RELIABILITY BENCHMARKING AGAINST PEER UTILITIES



This benchmarking shows that, when normalized for capital investment per line mile, the Company provides average reliability, but outages tend to last longer than those of peers.

This long duration can, in part, be contributed to the size of the Company's service territory and the large number of overhead line miles used to serve its 1.9 million customers.

On average, the Company's employees maintain a system that is approximately 60% larger than its peers on both a line mile and 140% larger on a square mileage basis as depicted in Figure 6 below.

FIGURE 6

COMPARISON OF SERVICE TERRITORIES

The Company's service area has expanded to serve many new communities and businesses in Michigan throughout more than a century of distributing electricity. Much of this infrastructure—lines, poles, pole top equipment, and substations, among other assets—now needs replacement or upgrades to improve efficiency and reliability of the grid.

It is important to emphasize that age is *not* the only indicator of system health, nor is it the only driver of when an asset must be replaced—the pole shown below in Figure 7 is 86 years old and shows fewer reliability issues than some younger poles in the Company's service territory.

The Company thinks holistically about how to best serve customers reliably, and this means assets are replaced based on overall deterioration.

That said, age and deterioration are generally correlated, and the advanced age of many assets provides some indication of the general systemwide need for asset replacement.

Ultimately, the Company only replaces assets that are actually deteriorated based on inspection or performing poorly based on reliability data. The Company does not replace assets simply because of their age.

FIGURE 7
1936 VINTAGE 35-FOOT LVD POLE

The deterioration and health of assets vary based on field conditions (e.g., soil, weather, slope, wind patterns, etc.), location, and materials used by the manufacturer (e.g., wood type, porcelain, polymer, interrupting media, etc.). For example, poles deteriorate at a faster rate in wet soil conditions than in dry non-acidic soil conditions, and porcelain is more susceptible to freeze or thaw conditions than polymer.

The Company proactively replaces, rebuilds or rehabilitates assets before failure, when inspections or performance data indicate the asset is in a state of deterioration. Of course, when assets fail in the field and cause outages, the Company often replaces them as well, if doing so is more reasonable than fixing the broken asset.

Ultimately, the assets replaced, rebuilt or rehabilitated are done so to the specifications needed to meet future reliability and capacity needs of the grid.

The Company is enhancing its distribution asset management capabilities, as discussed in the Asset Investment Planning Optimization section, to address this issue.

Even as the Company's distribution asset management capabilities remain under development, the Company has developed new analytical approaches to assess system deterioration, particularly by using system performance data during adverse weather conditions.

Scenarios and Future Impacts to the Distribution System

Drivers of Change

Increasingly Severe Weather

The Great Lakes region is not immune to climate change; the Company has been monitoring the impacts of the changing climate and weather on its operations for years, and has been crafting an approach to remain resilient as new climate patterns emerge.

In 2022, the Company published its Climate Risk, Vulnerability and Resiliency report that identifies its susceptibility to the potential adverse effects of climate change, and discusses the Company's governance structures and proactive efforts to remain resilient to the potential impacts of climate change on its infrastructure.

The analysis completed through the development of this plan examines similar risks, including wind gusts, extreme heat, wildfires, and severe storms.

For much of history, the climate has gone through small changes, but the climate and associated weather patterns are now changing at an accelerated rate.

In recent years, the Company has experienced repeated instances of strong winds causing large-scale outages; since 2015, the Company has seen a general increase in the number of MEDs per year, as shown in Figure 8 below.

FIGURE 8
MAJOR EVENT DAYS BY YEAR

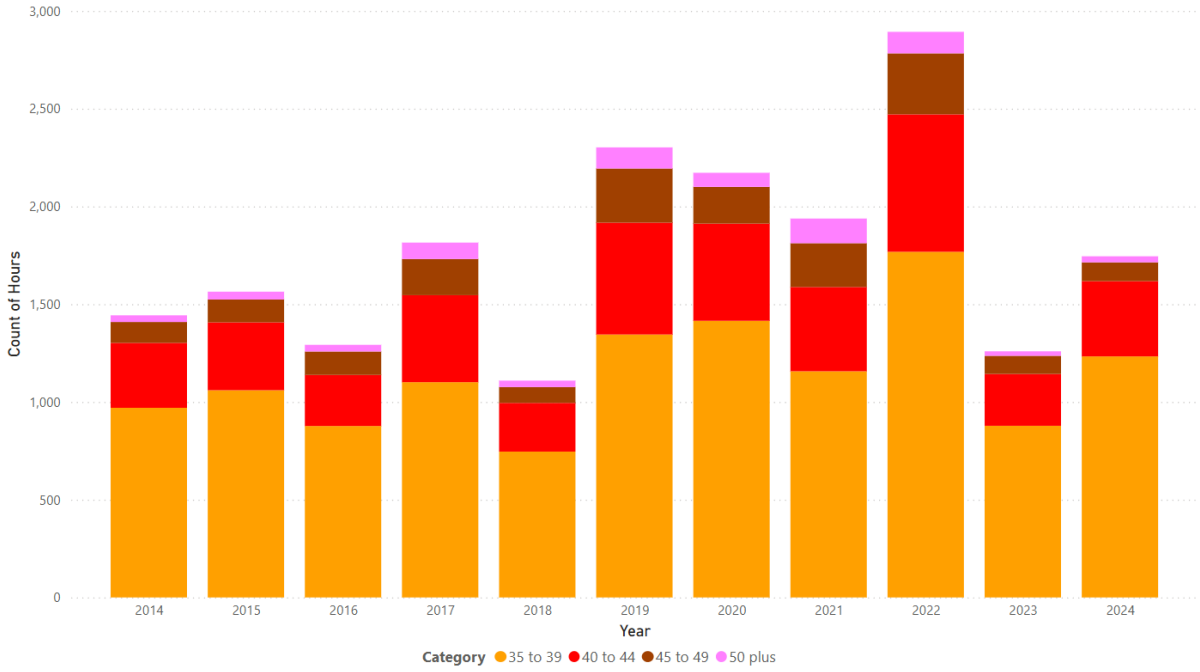
Year	MED Days
2015	3
2016	5
2017	8
2018	7
2019	9
2020	8
2021	11
2022	9
2023	11
2024	10

In general, the Company's service territory has experienced increased high and sustained wind speeds as well as wind gusts.

The Company monitors wind speed data from many National Weather Service stations throughout its service territory. Figures 9 and 10 below illustrate the hours each year of sustained high wind speeds and of high wind gusts.

FIGURE 9

STATION HOURS EXCEEDING HIGH WIND SPEED THRESHOLDS



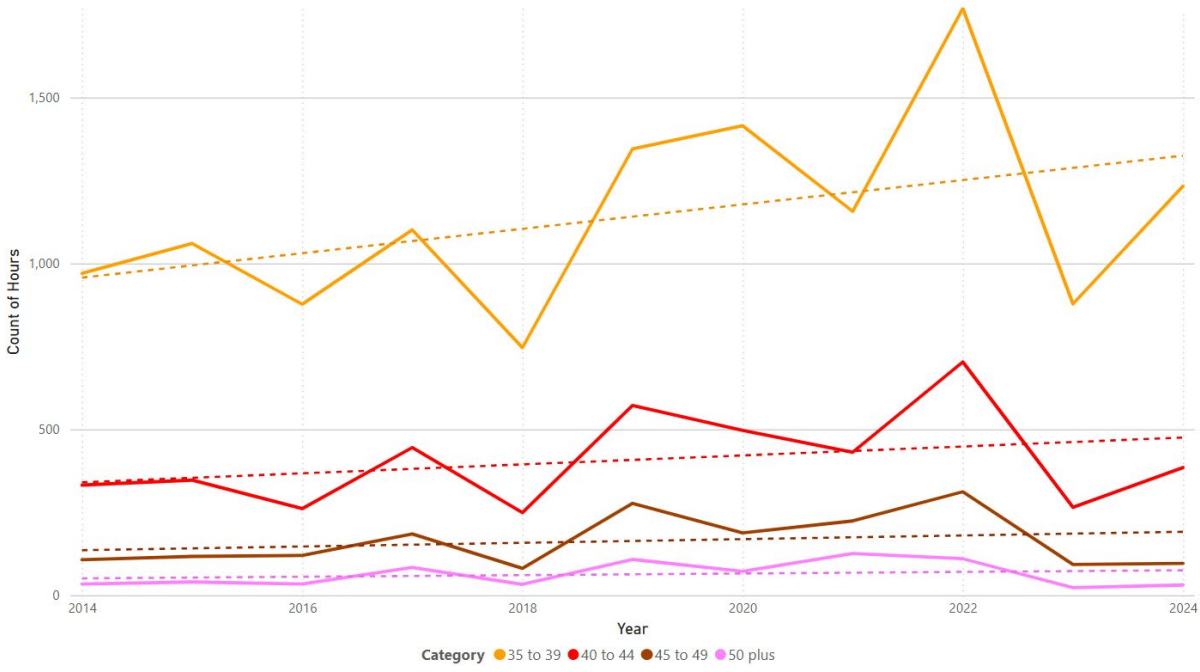


FIGURE 10

STATION HOURS EXCEEDING HIGH GUST THRESHOLDS

f

The number of large-scale storm outages, while increasing, is still consistent with normal weather variability. However, those severe weather events are likely to become more frequent as climate change increases the frequency of storms that cause high winds.

Climate change will also increase the frequency of extreme heat conditions, which tend to increase loading on the grid as customers use more air conditioning.

In assessing its investment plans, the Company is considering the likely resiliency risks from more frequent severe weather conditions, and what investments are needed to harden against those risks.

The Company is also considering how to best plan for increased load on circuits as rising temperatures result in more cooling degree days.

Technological Innovation

In the future, climate policies and targets related to decarbonization will likely lead to increased adoption of technologies that *will require* more electricity, although to date these new technologies have not experienced widespread penetration in the Company's electric service territory:

- Solar distributed generation ("DG") has an installed capacity of 135 MW across all customer types[4].
- Electric Vehicles ("EVs") currently represent less than 1% of total vehicles.
- Electric heat pumps have been adopted by 2% of total households.

Going forward, the Company expects increased adoption of these technologies, driving load growth that will have wide-ranging impacts for the distribution system.

In assessing its investment plans, the Company is considering whether individual circuits can accommodate rising peak demands, and whether they can accommodate increasing amounts of solar DG. This will inform the need for standard capacity improvements on the system but may also point to increased use of non-wire solutions to shave peak load or Distributed Energy Resource ("DER") management to interface with solar DG.

Scenario Analysis

As outlined in the previous section, the Company has identified severe weather and technological adoptions as the primary drivers of change on the distribution system, representing the most pressing challenges to the future grid.

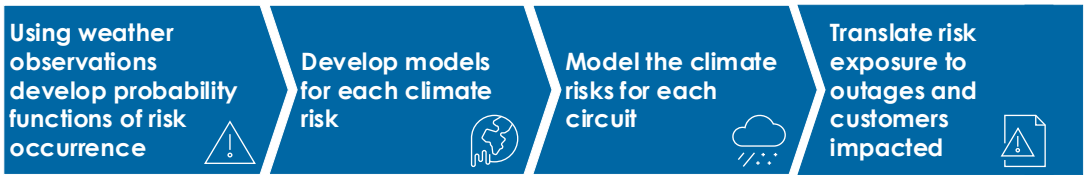
To further refine this broad assessment of threats to grid reliability, the Company pursued a detailed analysis to predict the circuit-level impacts from severe weather and customer technology adoption.

Beginning in 2022, the Company developed a strategy to develop a resilient and reliability grid. This included creating a comprehensive vision of the future of the grid and ensuring near-term investments meet the needs and mitigate the risks anticipated in the future. This process sought to answer two key questions:

- What is the holistic set of challenges that the future grid must address?
- What are the most significant potential grid impacts?

[4] See the Company's Form EIA-861 filing.

Key Impacts Modeled



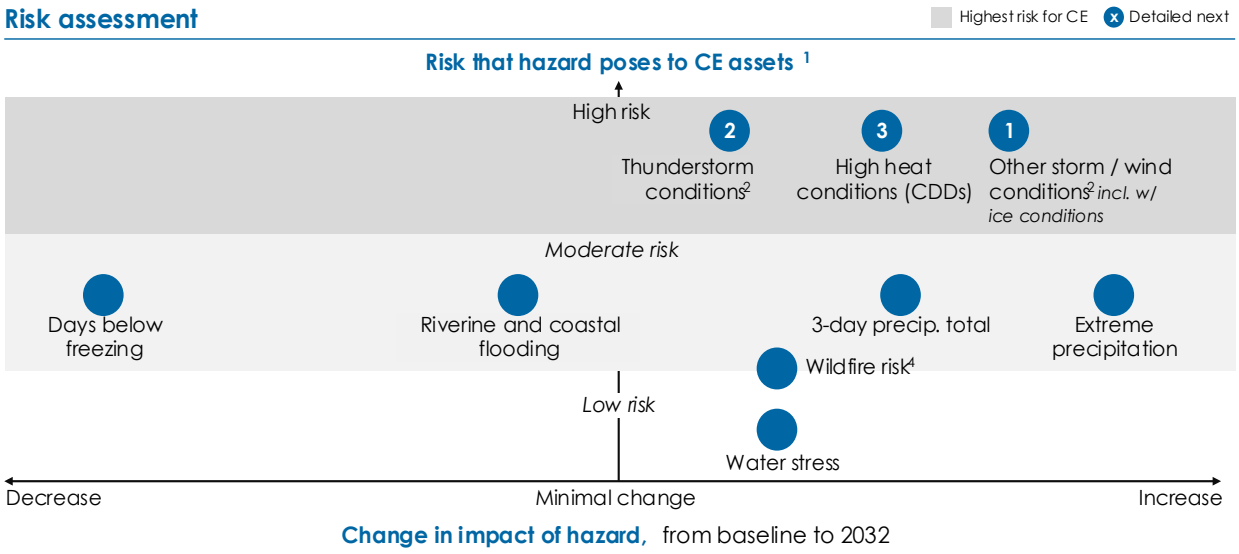
The impact of the two key drivers (climate risks and customer technology adoption) were modeled on the distribution grid.

- **Climate risks** included the highest-impact hazards for the Company's service territory: storm conditions, ice conditions, and extreme heat.
- **Customer technology adoption** included the impacts to the grid from projected solar distributed generation, heat pumps, and electric vehicles as well as organic load growth driven by population changes.

A climate model was used to identify climate risks specific to the Company's service territory and translates exposure to outages as detailed in Figure 11 below.

This model used more than 25 million weather observations from across the lower peninsula of Michigan to develop probabilities of the frequency of risk occurrence. These models predict the specific climate risks to individual circuits and translate the impact of these risks in terms of outages and customers impacted.

FIGURE 11
CLIMATE MODEL METHODOLOGY[5]



Actions	Using over 25 million weather observations from across the lower peninsula, we developed probability functions to characterize the frequency of risk occurrence	Built specific analytical models to identify storms, extreme heat and freezing rain in climate projection data using the historical probabilities	Using 620 GB of data and AWS cloud computation, we modeled key climate risks (storms, freezing rain, extreme heat) per circuit at daily or hourly resolution across scenarios	Grouped circuits according to headquarters to understand historical incidents; mapped climate risk exposure to incidents; projected changes in exposure to incident changes

After evaluating numerous weather-related hazards shown in Figure 12 below, the modeling focused on the highest-impact hazards to Company assets and grid integrity including:

- **Thunderstorm conditions**, featuring extreme wind and precipitation, can impact tree and pole stability and often lead to outages. These storms are fueled by warm air and are thus most frequently observed in summer months.
- **Other storm conditions**, featuring extreme wind and precipitation, including in some cases the potential for damaging icing and freezing rain. Like thunderstorms, these storms can impact tree and pole stability, leading to outages but are observed year-round.
- **High heat conditions** defined as days above 86 degrees Fahrenheit, which may simultaneously increase customer demand and reduce the efficiency of the distribution grid (e.g., line losses).

[5] Climate and Technical Adoption modeling was performed by an independent third-party consultant.

FIGURE 12
CLIMATE RISKS EVALUATED

1. The risk to CE assets was determined subjectively based on whether direct asset damage was likely to occur at CE asset locations for that specific hazard and if so, would the damage be disruptive
2. Storm conditions are based on the precipitation, wind and temperature conditions of declared storms. Winter storms include ice conditions
3. Ice conditions refer to the proxy for freezing rain conditions based on extreme heat and extreme precipitation increases. Ice storms are captured under Storm / wind conditions.
4. The risk of wildfires in Michigan is not zero, but it is relatively lower than many other states such as California.

While other risks (e.g., riverine flooding) are present, their more limited spatial footprint makes them less likely to drive frequent widespread outages.

Emergent risks, such as wildfires, and extreme precipitation were analyzed in this modeling and deemed less of an immediate risk to Company assets compared to the three modeled risks.

However, events like the June 2023 fire in Northern Michigan; the August 2023 wildfire in Maui; and other fires since then in the U.S. illustrate the need to more proactively address wildfire risk and mitigate that risk. **As a result, the Company developed a wildfire risk mitigation plan in 2024, discussed later in this report.**

In addition to climate modeling, the modeling also analyzed **the impact of new technology** adoption such as solar DG, EVs, and heat pumps, and how they will impact electric demand and corresponding grid capacity needs.

- The modeling forecasted the uptake of these new technologies to develop a discrete choice model based on customer demographics to **determine customer likelihood of acquiring these technologies** on each circuit and their usage profiles as detailed in Figure 13 below.
- With these two factors developed, the modeling calculated total load increase on the grid for each driver to determine which hours, months, and seasons have the highest load increases and how the increases evolve over time.

FIGURE 13

TECHNOLOGY ADOPTION MODEL METHODOLOGY

Actions	Forecasted service - territory-wide uptake utilizing adoption models, taking into account economic and non-economic adoption	Developed a discrete choice model that uses customer demographics to determine the likelihood of a customer acquiring each driver	Applied annual usage profiles to each driver to see the hourly impacts each driver has on the circuits load, as well as their cumulative impact	Looked at the cumulative impact to load from each driver to determine which hours, months, seasons have the highest load increases as well as tracking those increases over time

Identified Scenarios

The Company identified three scenarios governing the future through 2050. Each scenario assumes a given set of external trends encompassing both the rate of climate change and the rate of customer adoption of solar DG, electric heat pumps, and EVs.

The three scenarios are referred to as *Decelerated Transition* ("DT"), *Continued Momentum* ("CM"), and *Accelerated Transition* ("AT").

Federal policy, particularly as defined in the *Inflation Reduction Act of 2022* ("IRA"), makes a clear connection between the deployment and uptake of low-carbon technologies and achieving certain climate change targets. Correspondingly, these scenarios assume that uptake of low-carbon technologies will have a direct correlation with climate change outcomes.

In general, climate change will result in more severe weather and extreme heat, which creates increased reliability and resiliency challenges for the distribution system. Increased adoption of low-carbon technologies can also increase demand on the grid, at least in certain locations, which can also impact what investments are needed.

1. Decelerated Transition Scenario

The DT scenario assumes existing government climate policies, and other climate-related targets, are not fully implemented, and public action to mitigate climate risks slows down from current levels or even begins to reverse.

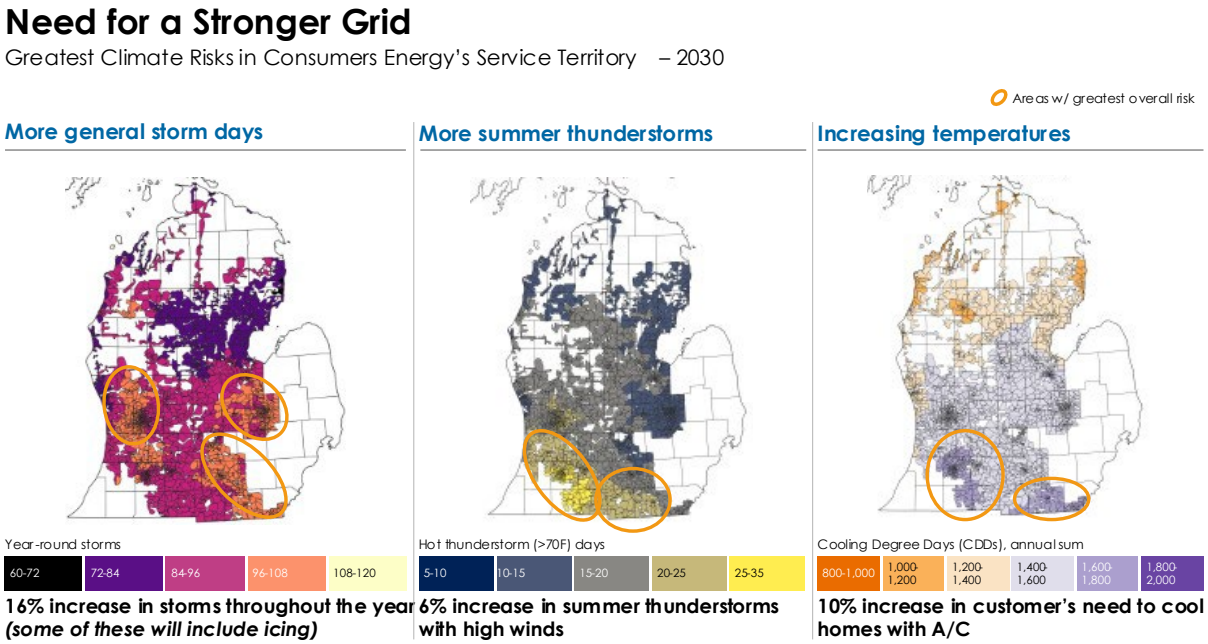
- In this scenario, uptake of low-carbon technologies is significantly delayed, with penetration levels remaining low overall. This scenario results in a temperature increase of ~2.5°C by 2050 compared to pre-industrial levels, with attendant increases in severe weather.

The Company's analysis generally assumes the DT scenario is the least likely, given the direction of climate policy and climate-related targets, although the Company has considered the impacts of this scenario to establish a worst-case baseline and conducted little analysis on it due to its improbability.

2. Continued Momentum Scenario

The CM scenario assumes climate policies already existing in law are fully executed, but that no new policies are implemented.

- In this scenario, public adoption of solar DG, heat pumps, and EVs broadly continue in their current post-IRA trends. This scenario results in a temperature increase of ~2.0°C by 2050 compared to pre-industrial levels; such a temperature increase still results in increased severe weather and increased resiliency risks to the grid, albeit not as large as under the DT scenario.
- The CM scenario makes further assumptions about electrification and decarbonization nationwide or worldwide. In particular, the CM scenario assumes the U.S. power grid becomes 80%-90% decarbonized by the late 2030s; that at least some heavy industry is deeply decarbonized in developed countries; that carbon capture and sequestration remains marginal; and that the U.S. and other developed economies transition to EV-majority vehicle sales during the period from 2030 to 2040.



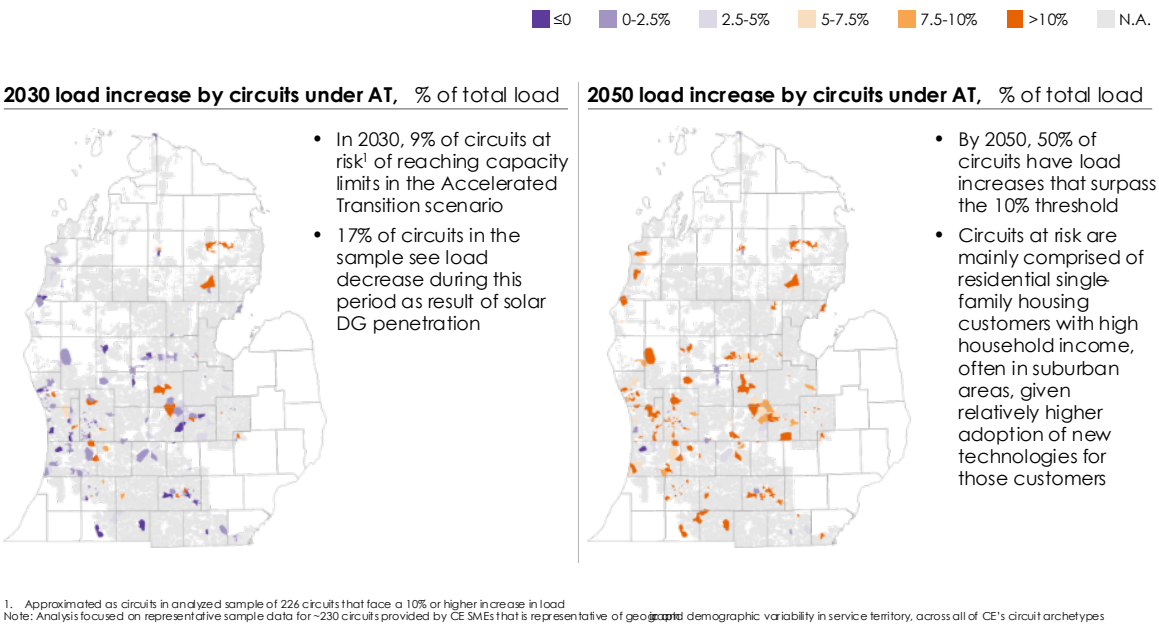
Without mitigation, the CM scenario projects that the Company's system would experience a 12% increase in the number of MED outages by 2030, and a 24% increase by 2050, due to increasingly severe weather.

Further, while the CM scenario only projects that 2% of the Company's circuits would be at risk of exceeding load constraints by 2030, this increases to 32% of circuits by 2050 as low-carbon technological penetration increases.

These increasing risks under the CM scenario are illustrated by the following maps that represent the projected situation in 2030, including where each risk is most acute.

FIGURE 14

CLIMATE RISK IN CONSUMERS ENERGY SERVICE TERRITORY



3. Accelerated Transition Scenario

The AT scenario assumes that, due to faster cost declines and increased financial incentives, solar DG and EVs are adopted even faster than on current trends, although heat pump adoption will remain stable as natural gas remains inexpensive in Michigan.

- In this scenario, temperatures increase by ~1.5°C by 2050 compared to pre-industrial levels, in line with targets set in the 2015 Paris Agreement and compatible with achieving global net-zero carbon dioxide emissions by 2050. This scenario minimizes the increased resiliency risk to the grid due to increasing severe weather, although there will still be increased resiliency risk compared to today.
- Like the CM scenario, the AT scenario makes several further assumptions about electrification and decarbonization nationwide and worldwide. The AT scenario assumes the U.S. power grid is fully decarbonized by 2035, and the global power system by 2040. It also assumes 90% of heavy industry is low emissions by 2050; that carbon capture and sequestration becomes widespread; and that no internal combustion cars are sold anywhere in the world after 2035.
- The AT scenario includes the greatest increase in risk of circuit overloads due to adoption of low-carbon technology. Under this scenario, by 2030 9% of circuits will face this risk based on a representative sample of over 10% of the Company's circuits. This risk only compounds after 2030, and by 2050 would apply to 50% of the Company's circuits.

FIGURE 15

ACCELERATED TRANSITION LOAD INCREASES

1. Approximated as circuits in analyzed sample of 226 circuits that face a 10% or higher increase in load
Note: Analysis focused on representative sample data for ~230 circuits provided by CE SMEs that is representative of geographic and demographic variability in service territory, across all of CE's circuit archetypes

Of these scenarios, the Company chose CM and AT scenarios for further analysis given their closer alignment to likely post-IRA pathways. As a significant fall below CM, DT was viewed as an unlikely worst-case scenario for heightened climate risk. For prioritized scenarios, load impacts of solar DG, heat pumps, and EVs were considered alongside organic load growth.

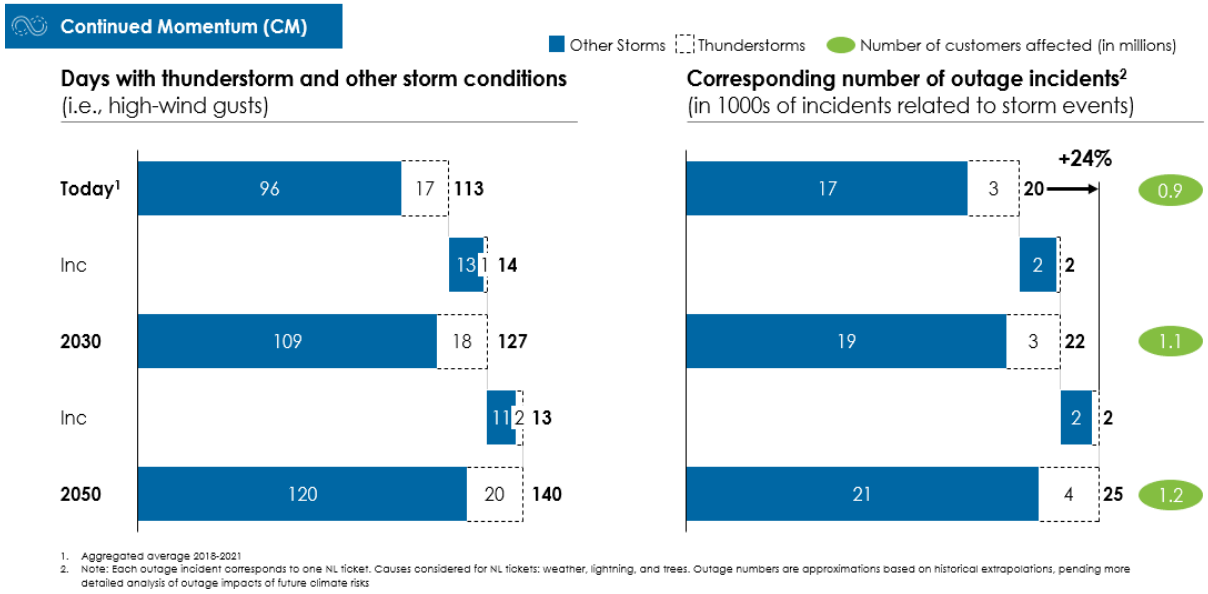
Impacts of Scenarios on the Distribution System

The modeled evolution of climate risks and customer technology adoption, and their impacts at an individual distribution circuit level, present the following types of grid challenges to the Company's distribution system:

1. **While there is long-term uncertainty around the pace of emissions and climate change, there is more near-term certainty around increases in warming and weather hazards.** In short, **climate change represents the most urgent threat** to the reliability of the Company's distribution system and must be addressed immediately.
2. **Without shifts in the Company's current investment strategy, outages from severe weather are likely to increase 10-15% relative to 2020 levels by the early 2030s regardless of climate policy actions**. In assessing its investment plans, the Company is considering the likely resiliency risks from more frequent strong wind and storms, and what investments are needed to harden against those risks.
3. **The largest relative increase in other storm (non-thunderstorm) days is likely to be in the winter** when outages are typically most difficult to restore.
4. **Depending on the trajectory of EV, heat pump, and solar DG adoption, the Company could see up to 1-10% of circuits reach at risk load levels by 2030[6].** By 2050, as many as 40% of circuits could see load more than 10% higher than current peaks.
5. **The long-term future of Michigan's energy system is a more electrified and distributed one.** There is uncertainty, however, over the pace at which this will occur, and therefore when challenges associated with peak loads and DER adoption will materialize. Understanding the pace of customer technology adoption will be critical for pre-empting peak demand challenges.
6. **With heightened heat pump adoption, there's the potential for Consumers Energy to shift from a summer to a winter peaking system.** The expected increase in winter load has implications for broader network design and planning (e.g., generation, equipment standards, etc.)

Challenges from Climate Risks

The magnitude of climate risk impacts likely to be seen in the Company's service territory represents a significant step-up from current levels as detailed in Figure 16 below.



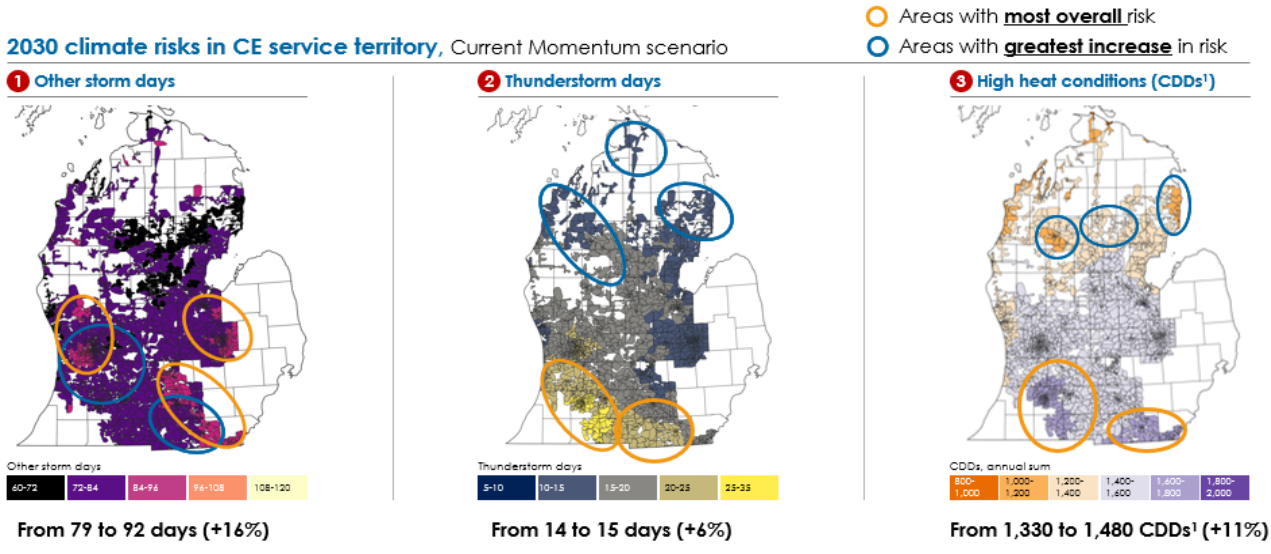
Key climate risks—storms with extreme wind, as well as high heat conditions—are projected to increase in the Company's service territory by up to 25% (20 storm days by 2030), and up to 45% (30 days by 2050).

These changes in climate conditions will compound with weather effects the Company has already seen over the last 15 years, such as a 9% or 7-day increase in storms and could lead to a 12% increase in the number of MED outages by 2030, absent countermeasures.

[6] Defined as increases more than 10% higher than current peak load, a typical threshold evaluated by CE.

Figure 16

PROJECTED DAYS WITH THUNDERSTORMS AND NUMBER OF OUTAGE INCIDENTS UNDER CONTINUED MOMENTUM



Risks are forecasted to materialize predominantly in northwestern and southern parts of the Company's service territory—by 2030, these areas see strong increases in thunderstorms (+30% / 3 days), other storms (+25% / 20 days) and high-heat conditions (+30% / 300 CDDs).

Climate risks and load impacts will significantly shape the grid environment—several areas in the Company's service territory will see their largest relative increase in climate risk as soon as in the next 7 years (e.g., 50% of increase / 20 days in storm days in Kalamazoo area may materialize by 2030), with another 50% increase realized by 2050.

Figure 17

2030 CLIMATE RISKS IN CONSUMER ENERGY SERVICE TERRITORY

Key changes, on average (maximum changes are greater) include:

Climate event	Today	Increase by 2030	Increase by 2050
Thunderstorms	17 days	~1 day (+4%)	~3 days (+17%)
Other storms	79 days	~13 days (+17%)	~21 days (+27%)
Cooling Degree Days	~1,330 CDDs	~147 CDDs (+11%)	~368 CDDs (+28%)
Days above 86°F	38 days	~12 days (+31%)	~26 days (+70%)

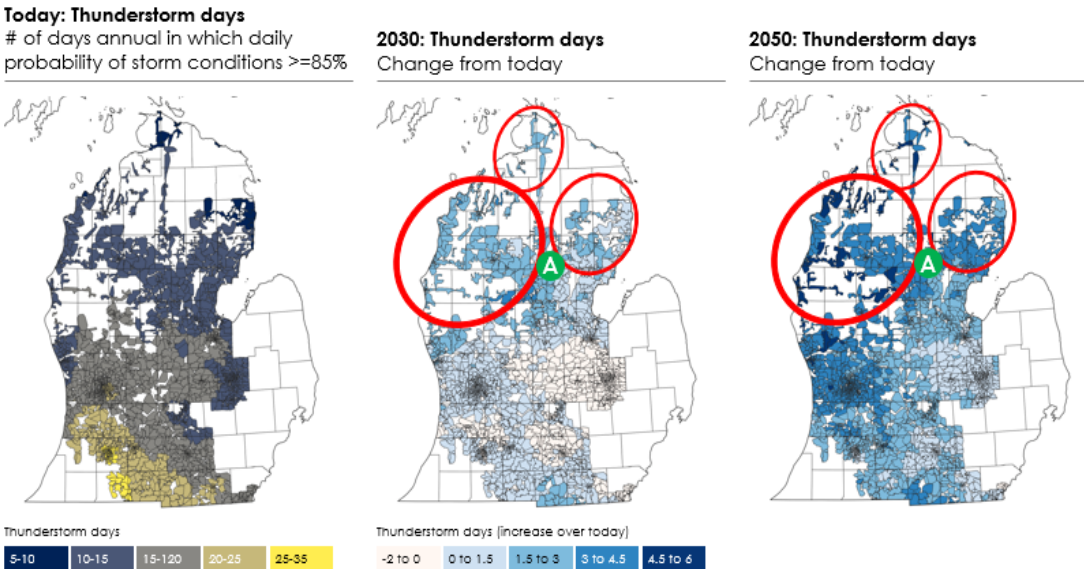


Figure 18 below depicts shifts in thunderstorm risk and the evolution from today's annual number of days with a daily probability of storm conditions greater than 85%.

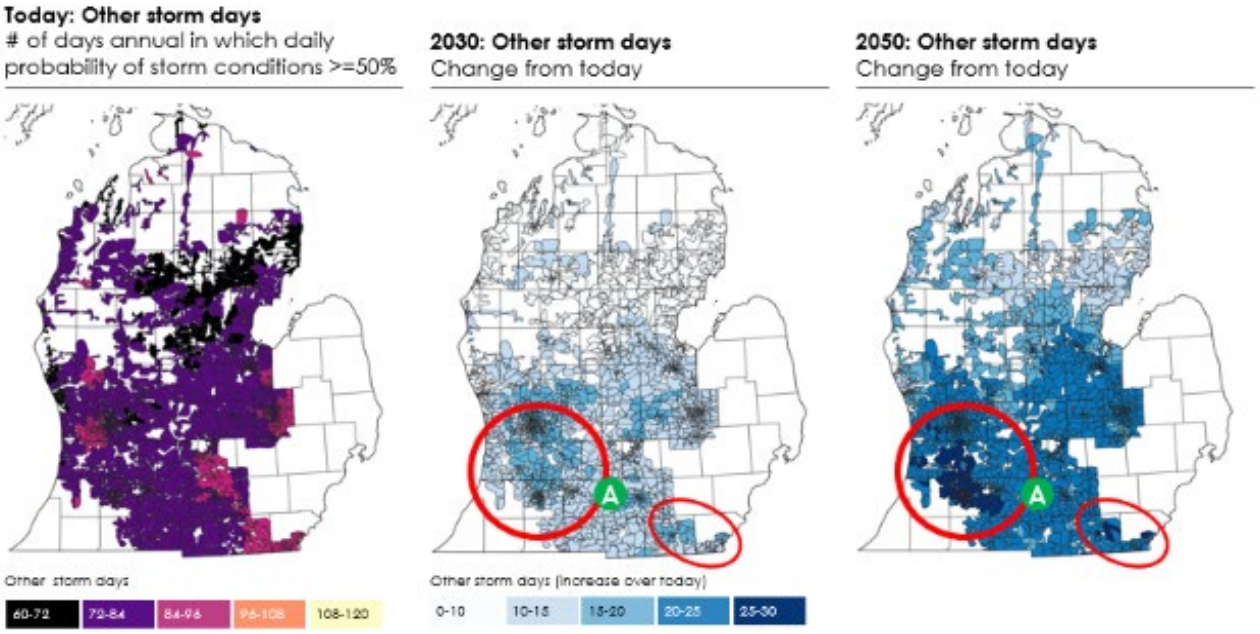
Thunderstorms, defined as *events with maximum wind speeds greater than 30 mph and temperatures greater than 70°F,* are more prevalent today in southern and lower central Michigan. These thunderstorms are most associated with the high wind speeds that can disrupt the grid.

Central, northern, and eastern Michigan may experience a 30-60% increase in thunderstorm risk by 2050 (indicated by the letter A in the chart below). By 2050, 660 circuits may see a >20% increase in likely thunderstorm days.

Figure 18

2030 AND 2050 THUNDERSTORMS INCREASE IN CONSUMERS ENERGY SERVICE TERRITORY

Other storm annual frequency has been studied using the number of days annually, in which daily probability of storm conditions are greater than 50%. Storms and connected occurrence of wind, have some of the highest damage potential for the Company's grid.



Almost all circuits (97%) are likely to experience at least a 20% increase in storm days by 2050 under a CM scenario, and nearly 20% of circuits are likely to see a 30% increase in storm days.

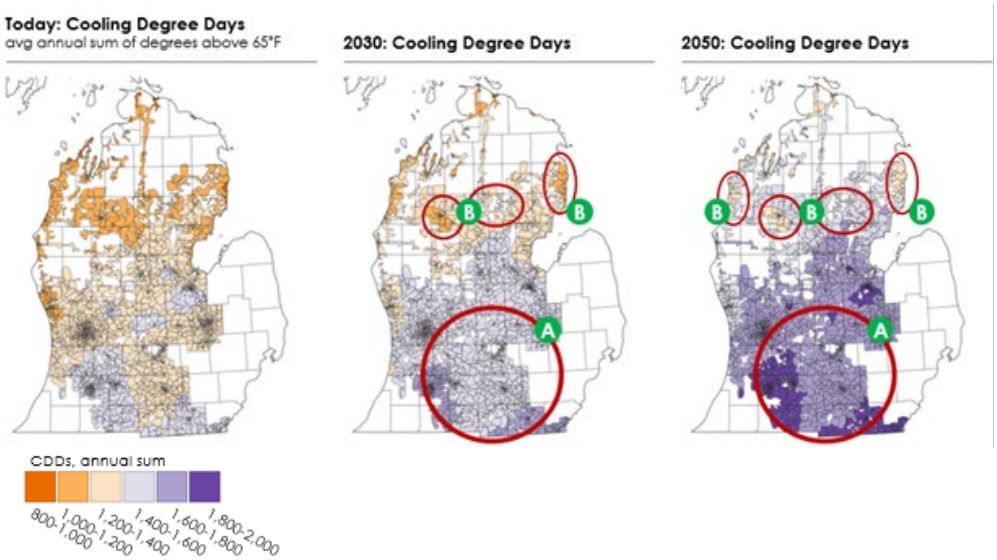
- As highlighted in red circles with a green letter A in Figure 19 below, **the Grand Rapids and Kalamazoo regions may see particularly large increases** with 25-30 additional potential storm days throughout the year by 2050.

As warming continues, these storms are increasingly likely to be accompanied by damaging freezing rain conditions like the catastrophic storm that swept through Michigan in February 2023, knocking out power to over 700,000 homes and businesses.

Figure 19

2030 AND 2050 STORM INCREASE IN CONSUMERS ENERGY SERVICE TERRITORY

Multiple measures of high heat conditions indicate a likely increase.



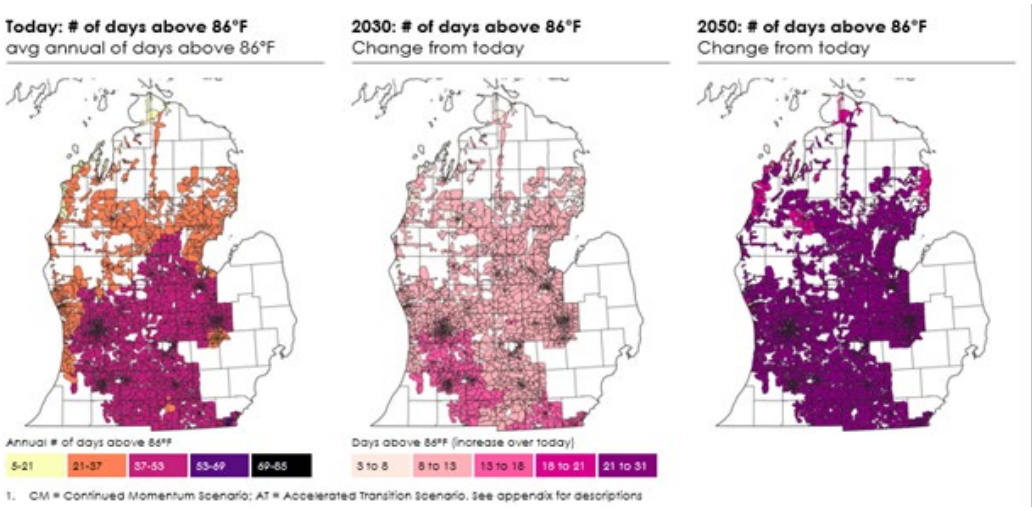
Increases in high heat conditions can result in lower line efficiency and higher customer loads, potentially bringing circuits closer to their rated capacity limits.

The largest absolute increases in cooling degree days, a benchmark used to measure broader heating, are in the southern Michigan circuits, which could see as much as 1,900 annual CDDs by 2050 (denoted by A in the Figure 20 below), an increase of 25% above today's conditions.

North central Michigan (denoted by B in the Figure 20 below) may see an even larger relative increase of as much as 33% in annual CDDs, up to 1,400 CDDs.

Figure 20

2030 AND 2050 COOLING DEGREE DAY INCREASE IN CONSUMERS ENERGY SERVICE TERRITORY



Days above 86°F, another measure of high heat conditions, can lead to reduced line efficiency of 7% and higher customer loads due to increased air conditioning usage, potentially bringing circuits closer to their rated capacity limits.

By 2050, almost all of Michigan is likely to experience more than 20 days of additional high heat. With some regions already experiencing ~50 days of high-likely air conditioning usage and line loss, this is a 40% increase from current levels.

The graph below in Figure 21 examines the average annual number of days with temperatures above 86°F in Consumers Energy's service territory.

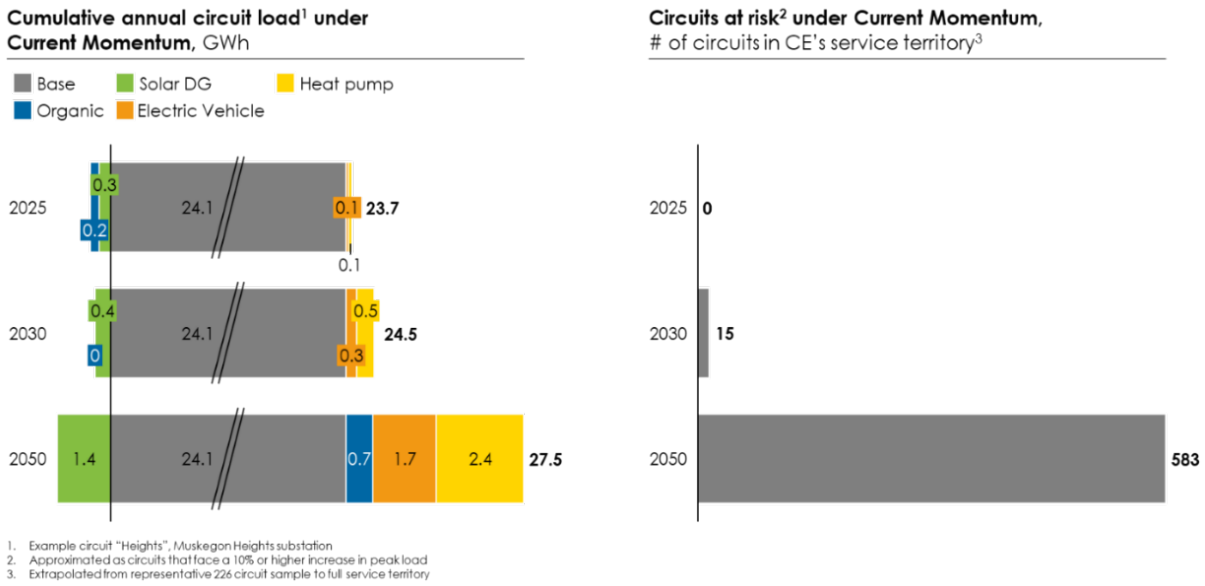
Figure 21

2030 AND 2050 DAYS ABOVE 86 DEGREES INCREASE IN CONSUMERS ENERGY SERVICE TERRITORY

Taken together, these insights can help focus grid-hardening investments today to reduce the risk of future outages.

Challenges from Customer Technology Adoption

The magnitude of modeled customer technology adoption represents a significant step-up from levels seen today.



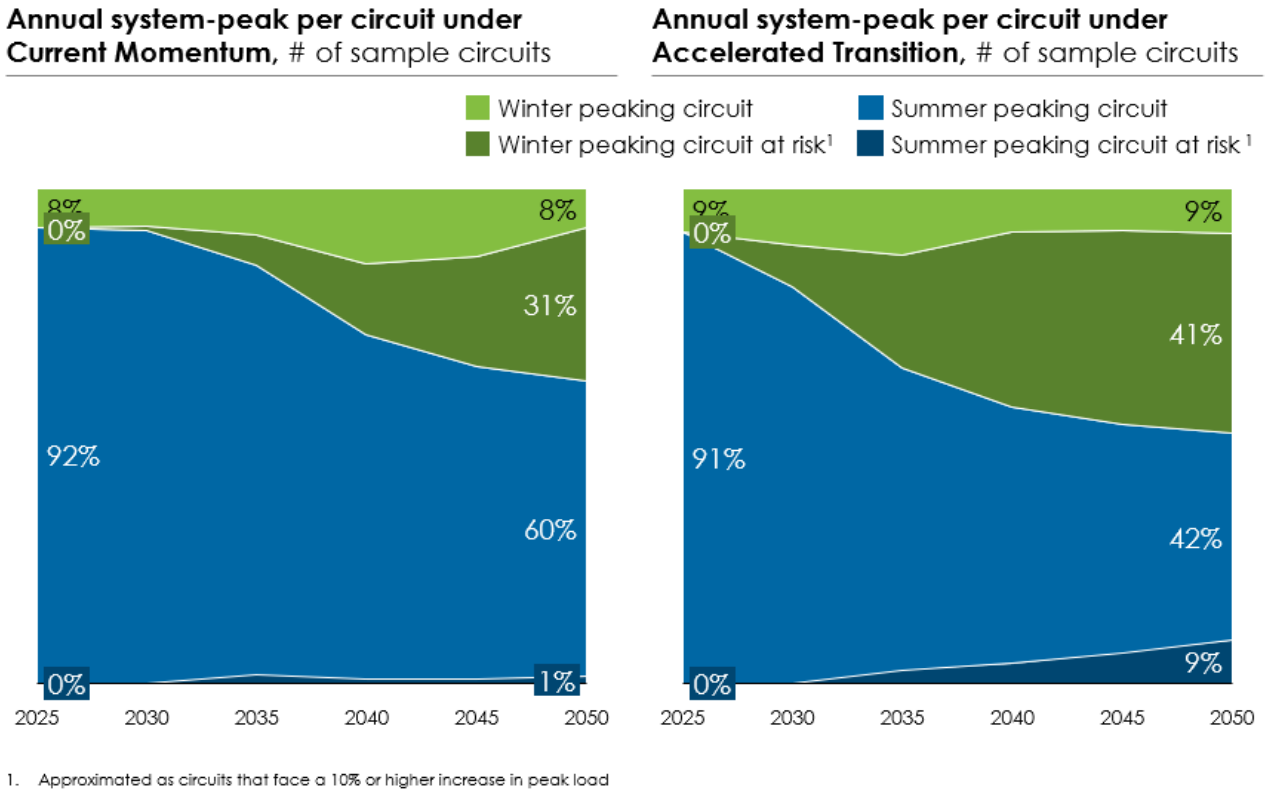
Even by 2030, and under a CM scenario, load-impacting technology adoption could greatly exceed current levels with statewide rooftop solar projected to increase to 1.3 GW, EVs projected to increase to 15% of vehicles, and heat pumps projected to increase to 15% of total households.

Load in the Company's service territory has been largely flat across the years due in part to the relatively limited adoption of electricity intensive heating and mobility technologies, coupled with the success of the Company's Energy Waste Reduction, Demand Response Programs, and summer time-of-use rates.

- Currently, EV adoption in Michigan is 1% of total vehicles and heat pump adoption is 2% of total households while solar DG encompasses 0.4 GW of installed capacity.
- Customer adoption of electrification is projected to lead to ~1-10% of circuits expected to see peak demand increase to at-risk levels by 2030 as shown in Figure 22 below.

This reinforces the Company's plan to first address the reliability impact from climate change, while continuing to develop the capacity of the grid to accommodate future low-carbon technologies.

FIGURE 22
CIRCUITS AT RISK UNDER CONTINUED MOMENTUM



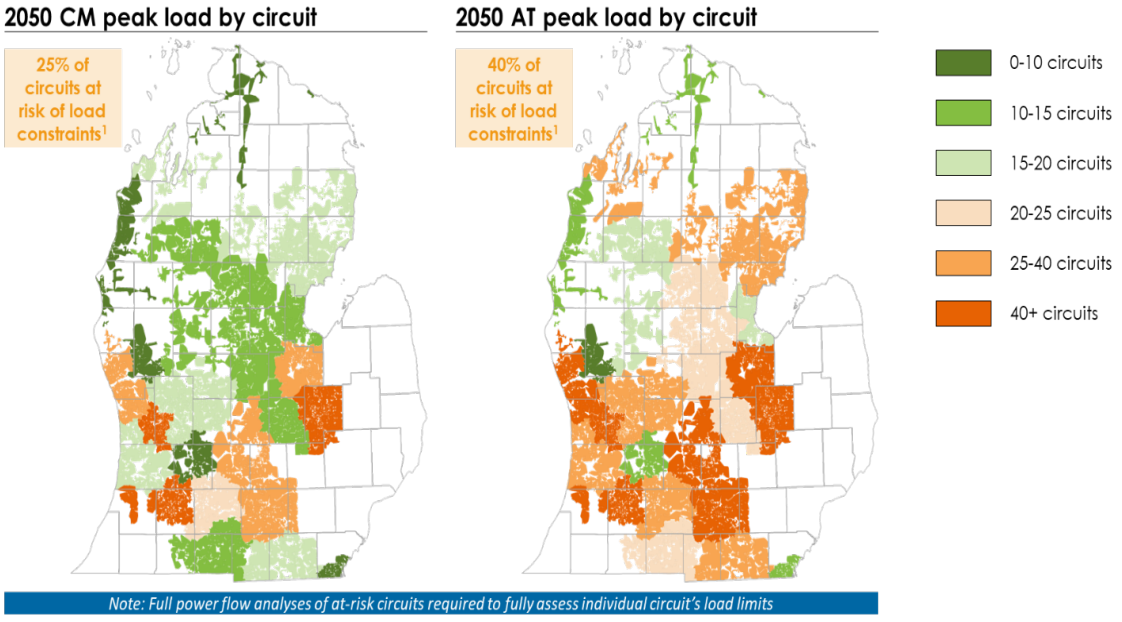
By 2050, peak load is projected to increase to at-risk levels, or greater than 10% increase in peak load, on ~25% of circuits in the CM scenario, driven by customer adoption of EVs and heat pumps.

Depending on the rate of heat pump adoption and the type of heat pumps adopted, hybrid versus fully electric, there is a potential shift from a summer-peaking system to winter peaking system with a ~50/50 summer/winter split by 2050 in the Accelerated Transition scenario as shown below in Figure 23.

FIGURE 23

ANNUAL SYSTEM-PEAK PER CIRCUIT UNDER CONTINUED MOMENTUM

1. Approximated as circuits that face a 10% or higher increase in peak load



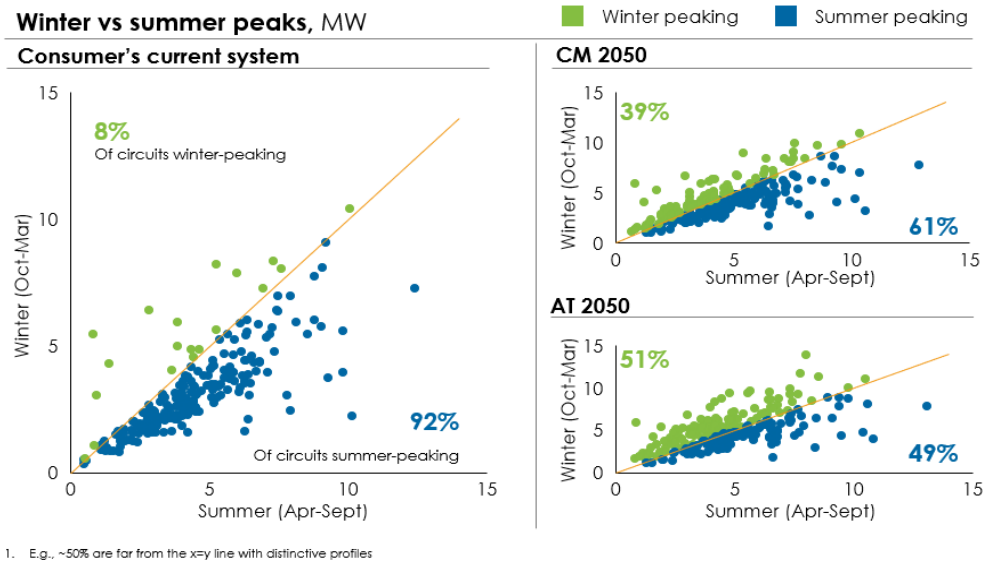
The highest levels of customer technology adoption are likely to materialize in specific circuits. Those at greatest risk of reaching load capacity limits are largely comprised of residential single-family housing customers with high household income, often in suburban areas, given a relatively higher propensity to adopt.

Circuits start reaching at-risk load threshold in 2030, and by 2050 there are 583 circuits out of 2,352 that see >10% peak load increase in a CM scenario.

In an AT scenario, 181 circuits are at-risk in 2030, with up to 40% of examined circuits at risk by 2050 (923 circuits) as shown in Figure 24 below.

FIGURE 24

PEAK LOAD BY CIRCUIT UNDER CONTINUED MOMENTUM AND ACCELERATED TRANSITION



Regarding peak seasonality, summer peak increases remain relatively small—with solar DG offsetting EV load and no heat pump driven load increases.

For now, the Company primarily manages a summer-peaking system. However, the modeling for this scenario suggests this would shift in the future to winter peaking.

As Figure 25 below indicates, summer peaking could shift to winter peaking for 51% of circuits by 2050 in the AT scenario, and for 39% by 2050 in the CM scenario.

FIGURE 25

CIRCUIT PEAK LOADS BY 2050

This shift, driven by projected adoption of heat pumps and their wintertime use, results in a growing number of new winter-peaking circuits, with a substantial fraction reaching the at-risk threshold.

As adoption of electrification technologies continues, the expected circuit-level risk will be heavily impacted by both the timing and character of adoption.

Assumptions around the scale of penetration and time of use for when EVs and heat pumps use the grid have a significant effect on the volume and timeline of forecasted load constraints.

Non-Load Challenges from Customer Technology Adoption

Besides the direct load impacts of customer technology adoption of EVs, solar distributed generation and heat pumps, there is indirect impact on the Company's grid that stems from second-order effects of the uptake of these technologies. They include:

- Bi-directional power flows, especially in circuits that show a propensity to higher-than average adoption of solar DG.
- Power quality issues, stemming from increased decentralized load and generation, could unbalance power factors and degrade voltage quality.
- Interconnections with third parties to facilitate control of distributed customer technology, and to influence load and consumption profiles for the benefit of the grid.

As part of the work going forward, CE must consider such indirect challenges and plan to take action to mitigate them, while simultaneously allowing and supporting the uptake of new load technologies in the service territory.

Such action can often be taken in tandem with actions that help increase resiliency to climate risks or to load increases (e.g., encouraging uptake storage on the LVD system can help mitigate peak load concerns, while at the same time reducing the occurrence of bidirectional power flows).

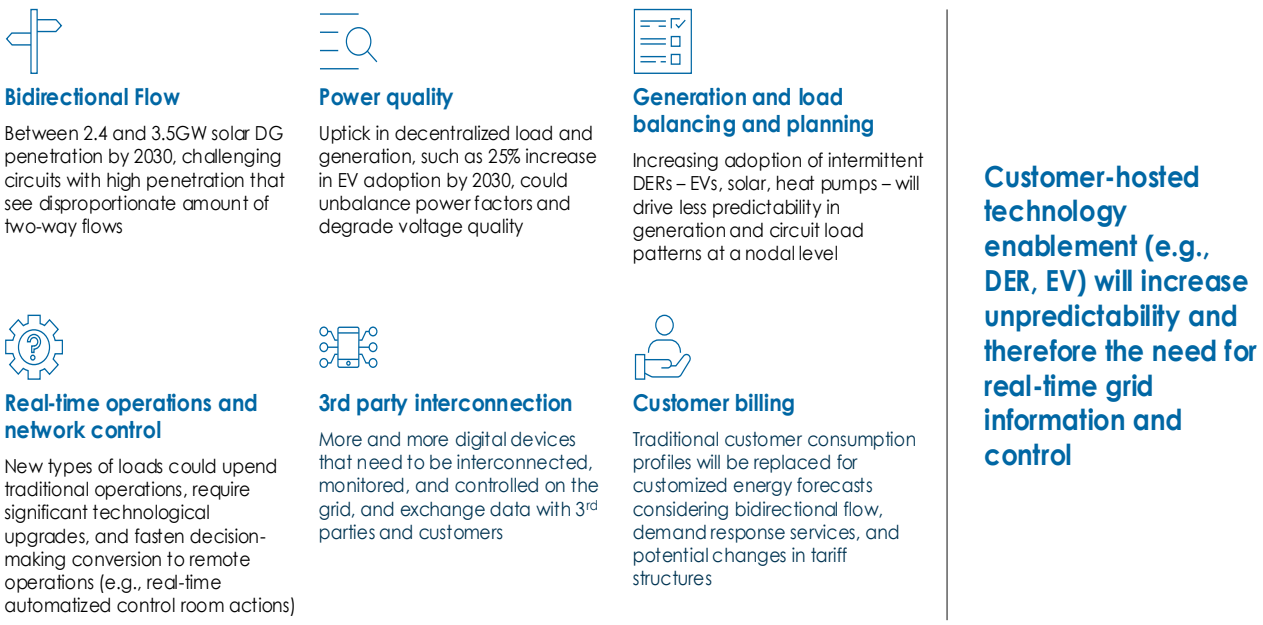
Federal Energy Regulatory Commission (FERC) Order 2222 mandates that utilities must facilitate the participation of Distributed Energy Resources (DERs) such as rooftop solar in the wholesale electricity market by allowing them to be aggregated and participate alongside traditional, larger scale power sources. Under this FERC Order, utilities must work with DER aggregators to enable them to bid into the wholesale market as a single unit.

The Midwest Independent System Operator (MISO) has proposed a two-phase implementation plan, which FERC has approved. This phased approach creates a DER market in MISO, gradually integrating DERs by 2026 with full implementation of DER Aggregators by 2030.

The Company plans to begin facilitating the participation of DERs beyond demand response (DR) in accordance with MISO's timeline. The Company currently allows for the aggregation and participation of DR, as allowed for by FERC Order 888. Given the lessons already learned from overseeing third-party participation in the wholesale market for DR, the Company expects to need a robust solution for managing, overseeing, and optimizing even more DERs.

A centralized DER Management System ("DERMS") will be critical to supporting system-wide optimization of DERs, especially as the volume of resources increases and the complexity of the relationship with the resources increases with the implementation of FERC 2222.

The Company defines DERMS as *an enterprise scale software platform that is located at the utility's operational center*.



- A DERMS monitors, controls, and optimizes DERs in a manner that maintains or improves the reliability, efficiency, and overall performance of the electric distribution system.
- This structure allows DER performance to be optimized for reliability and efficiency while simultaneously accounting for local, regional, and system-wide constraints and requirements.

Optimization at a system-wide level will be driven by bulk power constraints and requirements (e.g., frequency, capacity requirements, SAIDI, etc.).

A DERMS provides the functionality required to manage these wide-ranging factors to realize system-wide optimization. This includes coordination with other enterprise systems such as an Advanced Distribution Management System ("ADMS") detailed later in this report, and the Demand Response Management System ("DRMS").

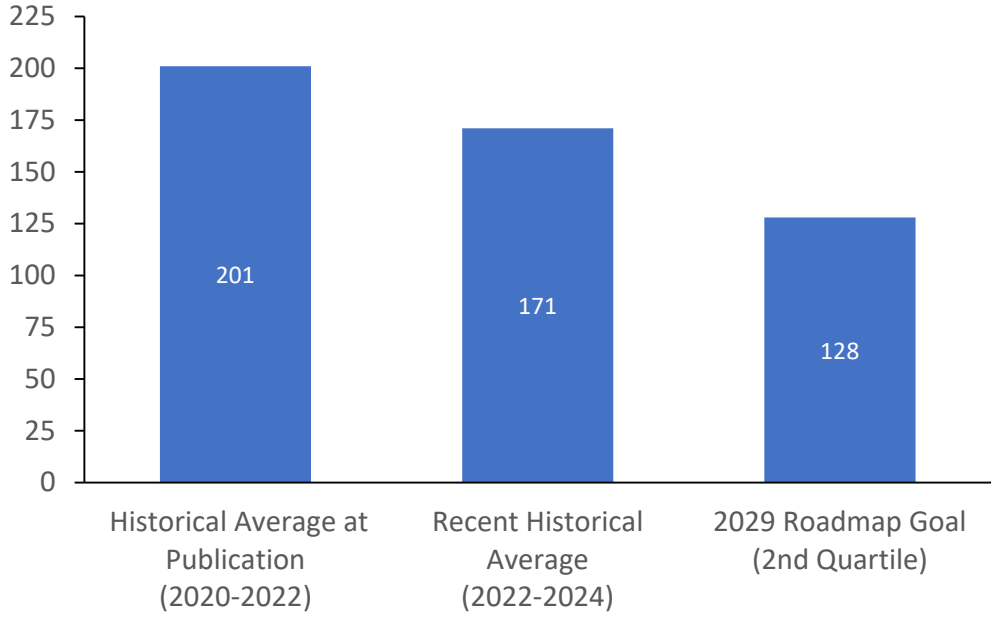
FIGURE 26

NON-LOAD CHALLENGES FROM CUSTOMER TECHNOLOGY ADOPTION

Defining The Reliability Roadmap

In the face of the challenges outlined above, the Company developed the *Reliability Roadmap* to ramp up its investment in developing a modern grid capable of mitigating the immediate threats from extreme weather.

- The *Reliability Roadmap* represents an increase in the scale of infrastructure investment, spending on Forestry Line Clearing, and increased equipment inspection relative to levels set in rate cases prior to Case No. U-21585.
- It also adds additional resiliency investment, such as overhead to underground conversions, and the fractionalization of circuits and substations.



Investment at this scale will also set the Company on a path to build a grid that will ultimately deliver on the following three objectives mentioned earlier in this document:

1. **Delivering reliability performance into the 2nd quartile of nationwide utilities.**
2. **Delivering a grid where no single outage event will affect more than 100,000 customers.**
3. **Delivering a grid where no customer will be without power for more than 24 hours following an outage event.**

Additionally, investment at the scale outlined in the *Reliability Roadmap*, if approved by the Commission, will deliver significantly improved SAIDI performance by the end of the decade, as shown in Figure 27 below. These investments will provide a substantial improvement over the Company's average 2020 to 2022 performance of 201 minutes, delivering 2nd quartile performance by 2029.

FIGURE 27

SAIDI EXCLUDING MEDS PROJECTIONS –RELIABILITY ROADMAP GOAL

The *Reliability Roadmap* differs in scope and scale from the 2021 EDIIP, which was developed prior to the Company's advanced climate and technology adoption modeling explained earlier in the Scenarios and Future Impacts to the Distribution System section of this report.

The Company anticipates the pace of reliability investment will level off after investments made to address rapidly changing climate and customer technology adoptions have been implemented.

Looking beyond 2030, the mix of investments will likely shift to ensure the system has capacity to service load from increased extreme heat days, and electrification of transit and home appliances.

The Company's SAIDI goal is achieved through numerous investments and work activities that all contribute to the overall reliability goal. These approaches can be considered in four categories: *Hardening*, *Inspections*, *Forestry Line Clearing*, and *Digital Automation*.

Hardening consists of capital investments to repair and replace HVD and LVD assets such as lines and substations.

- These investments address infrastructure on the system at risk from severe weather and allow for proactive resiliency plans, such as undergrounding or fractionalization.
- Further details on the investment categories including the 5-year investment plan and approaches to reliable operations are included in the *Asset Management* sections of this report under LVD Lines, HVD Lines, and Substations.

Inspections include ground and aerial inspections on both the LVD and HVD systems, and work related to addressing any identified failures.

- Company inspections of distribution lines and substations are used to locate and repair failed equipment, to identify specific areas to target investments based on probability of future issues, and to prioritize projects that will deliver the greatest reliability improvements for customers.
- Further detail on the investment categories including the 5-year investment plan and Company inspection cadence is included in the Overview of Asset Management section of this report under *LVD Lines*, *HVD Lines*, and *Substations*.

Forestry Line Clearing includes the work responsible for maintaining clearance between vegetation and energized Company equipment, and to eliminate the vegetation hindering accessibility to the Company's electric lines.

- This vital work is the most impactful towards improving system reliability and encompasses both HVD and LVD specific programs.
- Further detail on the Company's approach to Forestry Line Clearing including the 5-year clearing plan, best practices, and risks it responds to are discussed in the Forestry Line Clearing Program section of this document.

Digital Automation includes technology-driven solutions to increase efficiency of the Company's distribution planning work, service restoration, and line clearing operations.

- An example of this work is the Company's use of drones and Imagery Analytics to re-imagine the Company's inspection processes by providing a 360-degree view of its distribution assets in the field. This application shows **the potential to enhance employee and customer safety, reduce the cost of work, and to improve reliability and resiliency** through more targeted work.
- These investments are a key component of the Company's glidepath to achieving breakthrough SAIDI and reliability performance.
- Further detail on the Company's digital and automation can be found in the section of this plan under Grid Automation and Next Digital Investments.

FIGURE 28

IMAGERY FROM DRONE INSPECTION COMPARED TO VISUAL GROUND INSPECTION

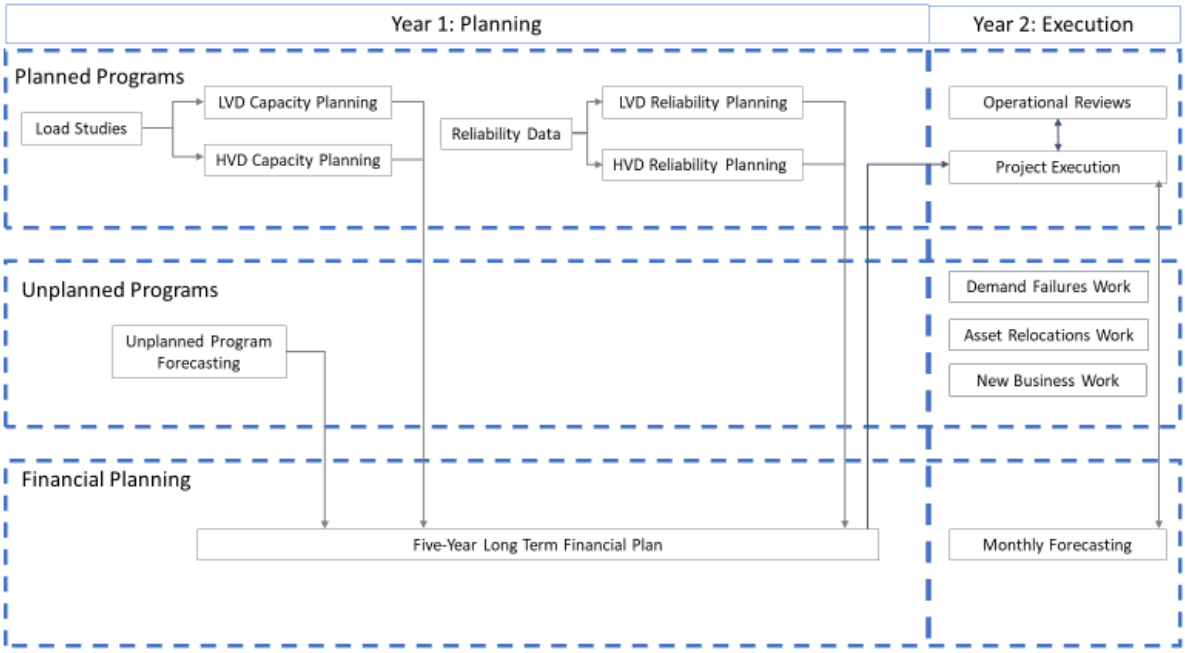
Planning Process

Annual Planning

Distribution planning is an iterative process in which planning engineers and operators identify projects and maintenance work needed to address system performance issues and meet the Company's goals and objectives for the electric distribution grid.

All work is planned in consideration of expected customer demand and emergent replacements, planned maintenance, and improvements to the grid.

As engineers and operators identify work, this informs planned infrastructure investments, inspections and maintenance of existing assets, projected customer-requested and emergent work, and supporting staff.



Repeating this process every year results in a rolling 5-year planning process in which one incremental year is added every cycle.

Depending on the nature of a given program, these identified investment needs are based on a combination of pre-planned or known projects, and anticipated volumes of emergent work, generally based on historical volumes of work accounting for observed trends.

Figure 29 shows how these planning activities connect with each other.

FIGURE 29

ELECTRIC DISTRIBUTION FINANCIAL AND ENGINEERING PLANNING PROCESS

To align with industry best practices, the Company has consulted the Electric Power Research Institute's ("EPRI") *Distribution Grid Resiliency: Prioritization of Options* report (EPRI, Palo Alto, CA: 2015. 3002006668) published in 2015 and made publicly available at the EPRI website.

EPRI published this report on the prioritization of options for grid resiliency incorporating research that EPRI conducted on overhead structures, vegetation management, undergrounding, grid technology, and storm response practices.

The report provides a benchmarking analysis of the costs and benefits of various options for improving reliability and resiliency, such as Undergrounding and Fractionalization, that the Company will apply to its distribution planning, as well as discussion on how to rank the reliability of circuits so that projects can be prioritized.

Engineering Planning Process Overview

The Company's electric distribution engineering planning process runs throughout the year.

The Company conducts engineering work in all programs to address specific objectives and issues on the distribution system, depending on the type of work, the affected customer profile, and the attributes of the assets in question (e.g., HVD, LVD, substations).

The Company makes capital investments under two broad classifications, known as *unplanned* and *planned*.

***Unplanned* capital investments** correspond to customer requests or emergent system needs, such as for new business connections, restoration of service after storms, or requests for asset relocations. In the Company's electric rate cases, these capital investments fall in the New Business, Demand Failures, and Asset Relocations investment programs.

These investments are not strictly 'unplanned' as the Company does anticipate having to make these investments but is usually unable to plan specific projects until an interruption or defect occurs, the Company receives a request from a customer or another project-triggering event occurs, such as a broken crossarm.

The defects identified from inspection and maintenance programs, described further in the Overview of Asset Management section, are unknown prior to identification but are prioritized for mitigation based on safety and reliability risk.

Instead, using a variety of external economic and industry indicators the Company can (to some extent) forecast related volumes of work, funding required, and detailed analyses of the state of the system in advance. For example, the Company uses data from the *Home Builders Association of Michigan* to estimate new housing starts to help forecast future spending on new service connections.

***Planned* capital investments** proactively improve reliability, address capacity constraints, and invest in new tools and technology. In the Company's electric rate cases, these capital investments fall in the Reliability, Capacity, and "Electric Other" investment programs.

For these investments, the Company prioritizes investments to maximize customer benefit in the most cost-effective manner. Specific investment prioritization varies based on the type of asset, but broadly speaking the Company uses several critical inputs and analyses to aggregate multiple data sources to best target and prioritize customer reliability, identifying specific investments based on the probability of future issues.

Different components of distribution planning—for example, planning for LVD lines or HVD substations—are overseen by respective program managers, who are responsible for developing plans in those areas.

Under these program managers, engineering planning leads and individual engineering planners have responsibilities for developing specific projects. Investment planning for the *planned* investments broadly follows three stages:

1. **Reviewing system needs** – Engineering planners review system needs to identify critical target areas at an LVD circuit, LVD zone, LVD or HVD substation or HVD line level, using a variety of asset-specific technical inputs and analytical tools, including real-time data and inspection results.
2. **Determining required actions and developing projects** – Once a customer or system need is identified, engineering planners determine required actions and develop concepts that compare alternatives and identify a recommended project based on the most economical and effective solution, such as to repair the damaged asset or replace it.
3. **Prioritizing and sequencing work** – Program managers and engineering planners prioritize, and sequence projects based on project timelines, customer benefits, system-wide workload balancing, and customer base balancing.

In certain investment areas, particularly for the LVD system, the Company uses an additional initial step in its process for grouping circuits and identifying projects, known as *Grid Archetypes*. Many larger individual projects are evaluated using a *Concept Approval* process. Both topics are discussed later in this Planning Process section.

In 2024, the Company also began using Copperleaf to further improve its planning process and its project optimization. Full implementation of Copperleaf will take time, but the Company expects to more fully integrate it into its planning processes throughout 2025. Copperleaf is described in more detail below.

Concept Approval Process

To ensure its electric distribution investments are reasonable and prudent, the Company considers many of its planned electric distribution investments against alternatives and develops concept approval documentation to demonstrate why the selected project is the optimal investment to make.

Through this internal concept approval process, the Company ensures the problem is clearly defined, alternatives are evaluated based on cost and solution to the problem, and there is a strong business case for the recommended project.

The general structure of a concept approval includes the following:

- Background and identification of problem
- Evaluation of alternatives
- Determination of costs and benefits of alternatives
- Selection of best alternative
- Approvals and revisions, where necessary

Based on the Company's identified goals, program managers provide direction to the Company's engineering planners regarding the types of work to be targeted.

Engineering planners gather data and perform problem solving to identify alternatives and eventual selection of a project. Once the engineering planners have identified alternatives, selected a project, and drafted a concept approval, they are reviewed by successively higher levels of management based on the projected cost for the selected project.

For small projects, no approval may be needed beyond that of the engineering planning director. In most cases, projects approved by the engineering planning lead go on to the program manager for review and approval, and may go higher for further review, depending on the projected cost of the project.

At each level of review, the reviewing party may request further revisions.

Once a concept has received all necessary approvals, it is considered an approved part of the Company's investment plan. It is released to the Company's electric design engineers for detailed design work, which consists of the following:

- During the design phase, costs may vary slightly from the original concept approval cost projections.
- If costs vary significantly based on design work, the variance may be reviewed by the program manager and engineering planner and, if necessary, resubmitted for approval with revised costs.

- If there are no significant financial variances between concept approval and the finished design, then the project proceeds to construction.

At this point, the Company's Planning and Scheduling group identifies and assigns either Company or contractor workforce resources to the project (depending on project specifics) and the project is scheduled for execution.

During construction, the program manager regularly reviews actual costs incurred against the budget. Unexpected cost variances during construction are managed through the Company's ongoing monthly budgeting process, with adjustments to the overall workplan made as necessary to manage to budget.

Asset Investment Planning Optimization

Copperleaf is an Asset Investment Planning ("AIP") decision analytics software solution, designed to support critical infrastructure investment planning for industries including electric utilities. Copperleaf combines financial and non-financial metrics to provide a comprehensive framework for evaluating, prioritizing, and optimizing investments, enabling organizations to make more strategic and data-driven decisions about their asset portfolios.

Copperleaf operates using a "Value Framework," a customizable set of models that quantify the benefits associated with various types of investments.

Copperleaf evaluates projects against specific "value measures" within these frameworks, encompassing multiple categories of benefits, such as risk mitigation, reliability improvements, cost savings, regulatory compliance, and customer satisfaction. By assigning a measurable value to each of these factors, Copperleaf enables organizations to compare projects objectively, weighing both their immediate financial returns and broader, long-term benefits.

- Copperleaf is particularly valuable because it can assess projects through both financial and risk-based valuations. Copperleaf employs risk-adjusted project prioritization, using a structured approach to identify high-risk assets and projects that, if left unaddressed, could lead to significant future costs or reliability issues.
- This risk-based approach includes metrics like Probability of Failure and Consequence of Failure, which provide a quantified understanding of the impact of each asset or project on the system's overall stability and resilience.
- Copperleaf's optimization capabilities will allow the Company to build a project portfolio that better supports its distribution objectives. By integrating projects into a unified system, the software can run different investment scenarios to determine the optimal plan that balances financial constraints with maximum system-wide benefits.

For Consumers Energy, implementing Copperleaf means distribution projects can be systematically analyzed and optimized. Systematic project optimization will enable the organization to proactively address aging infrastructure, improve system reliability, and meet regulatory requirements, all while enhancing customer satisfaction through reduced outages and optimized grid performance.

Grid Archetypes

Since 2018, the Company has developed and used an approach referred to as *Grid Archetypes* to consider additional LVD circuit characteristics beyond traditional reliability metrics of SAIDI, SAIFI, and CAIDI, when assessing grid performance.

This approach ensures no section of the grid is inadvertently left behind—that **both rural and urban customers, and residential, commercial, and industrial customers all benefit equitably** from the Company's investments, by making sure that investments are optimally made across the Company's distribution system.

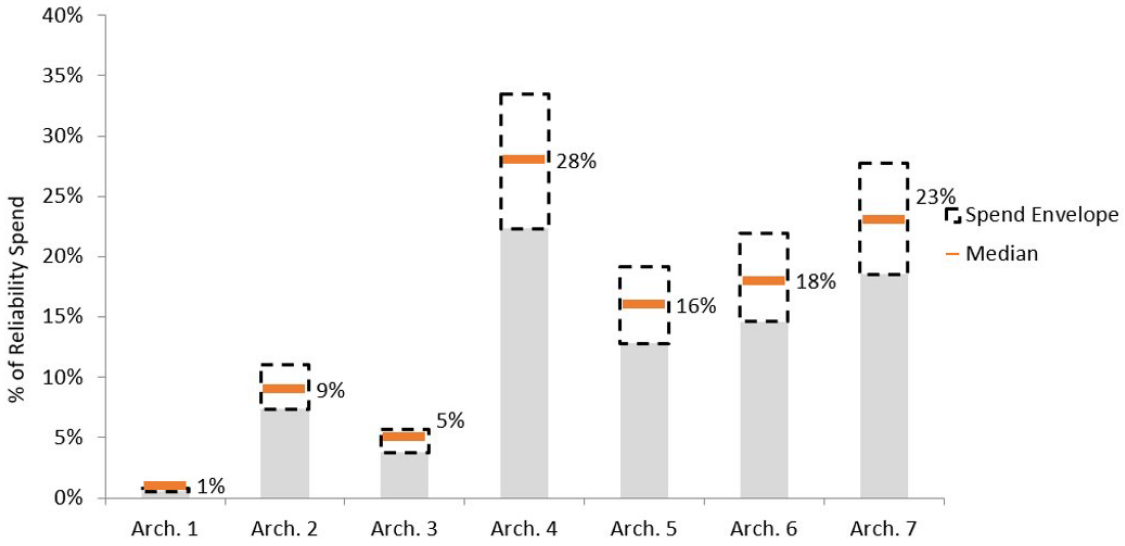
In the Archetypes approach, the Company groups each of its LVD circuits into one of seven archetype categories based on various circuit characteristics. Circuit characteristics include geographic characteristics (i.e., circuit line-miles, distance to Company service centers), customer mix, circuit load and voltages, and reliability metrics. Full details on all circuit characteristics and their use can be found in Appendix A.

Figure 30 below defines each Archetype and illustrates where each of the Archetypes are located throughout the Lower Peninsula.

FIGURE 30

GRID ARCHETYPES

Once the LVD circuits are grouped, Company leadership establishes multi-year goals and broad budget guidance. This guidance provides multi-year guidance on guardrails for how much investment should be allocated to each archetype.



During this process, the Company takes its planned, systemwide LVD capital spending for a given year and allocates the spending to each archetype based on different archetype characteristics or archetype performance measures.

The Company then takes the median allocation of all allocations and calculates spending guardrails for each archetype based on a certain amount of allowable variance. An illustrative example of these calculations is shown in Appendix A.

The result of this process is an illustration of targeted spending ranges for each archetype, as shown in Figure 31 below.

FIGURE 31

ARCHETYPE TARGETED SPENDING RANGES – ILLUSTRATIVE EXAMPLE

	Arch. 1	Arch. 2	Arch. 3	Arch. 4	Arch. 5	Arch. 6	Arch. 7
% of Line Miles	1%	6%	4%	18%	25%	17%	29%
% of Customers	1%	8%	9%	41%	14%	9%	18%

If the Company's planned spending in each archetype falls outside the "spend envelope" guardrails, then spending can either be reallocated to better ensure optimal prioritization of investment across the LVD system or the Company can develop a justification for why spending outside of the guardrails is necessary.

Equity and Environmental Justice in the Planning Process

Analyzing Equity of Distribution Performance

Since the Company filed its second five-year EDIIP in June 2021, the MPSC and other parties have indicated increasing levels of interest in EJ, energy equity, and other similar topics.

For purposes of distribution planning, these issues primarily concern how different communities experience reliability and resiliency, as well as future implications for grid access when it comes to customer adoption of EVs and other electric technologies and customer adoption of distributed energy resources.

Reliability and resiliency concerns are pronounced because people living in disadvantaged communities may have more difficulty replacing spoiled food and medicine following power interruptions, and may have fewer resources to secure back-up power or find alternative accommodations during extended power outages.

In its September 8, 2022, Order in Case No. U-20147 ("September 8 Order"), the Commission provided expectations around EJ and energy equity data to be shared in this EDIIP, directing utilities to provide information on the distribution system, particularly maps providing system information overlaid with socioeconomic context.

Additionally, in the settlement agreement for the Company's Electric Rate Case, approved by the Commission in Case No. U-21224 ("Settlement Agreement"), the Company agreed to further provisions around data that would be shared, as well as ways the Company would work to incorporate EJ considerations into distribution planning.

These concerns were substantially addressed in the 2023 version of this Reliability Roadmap, as well as in the Company's 2023 and 2024 electric rate cases (Case Nos. U-21389 and U-21585). Those analyses built on one another, and indicated that:

- On a systemwide basis, the Company's EJ communities have comparatively good reliability; but
- There are particular EJ communities that do face reliability challenges

The Michigan Department of Environment, Great Lakes, and Energy ("EGLE") has developed the MiEJScreen tool to assess the vulnerability of census tracts based on various inputs, creating a score from 0-100, with 100 indicating the most vulnerable communities. The Company has defined any census tract with a MiEJScreen score of greater than 80 as an "EJ census tract."

Electrical geography does not always match political geography, and the Company uses the term "EJ circuit" to refer to any LVD circuit that serves an EJ census tract in whole or in part. Because of this, some EJ circuits include individual customers who do not reside in EJ census tracts. When the context is more general, the Company sometimes uses the term "EJ communities" to describe the general concept of vulnerable customers in a certain defined area.

The Company has 249 total circuits overlapping in whole or in part with EJ census tracts, as defined in the Settlement Agreement; of these, 24 are customer-owned or single-customer-dedicated circuits, leaving 225 general distribution circuits serving EJ customers according to this definition.

The Company's data has consistently shown that EJ census tracts, when considered together, consistently have better reliability performance than other census tracts in the Company's service territory.

In the summer of 2024, the Company performed two different analyses to probe further into reliability concerns for EJ communities. These two analyses both address the same general concern, but they are independent of each other and there is no meaningful way to cross-reference them against each other; each one stands alone in its analysis.

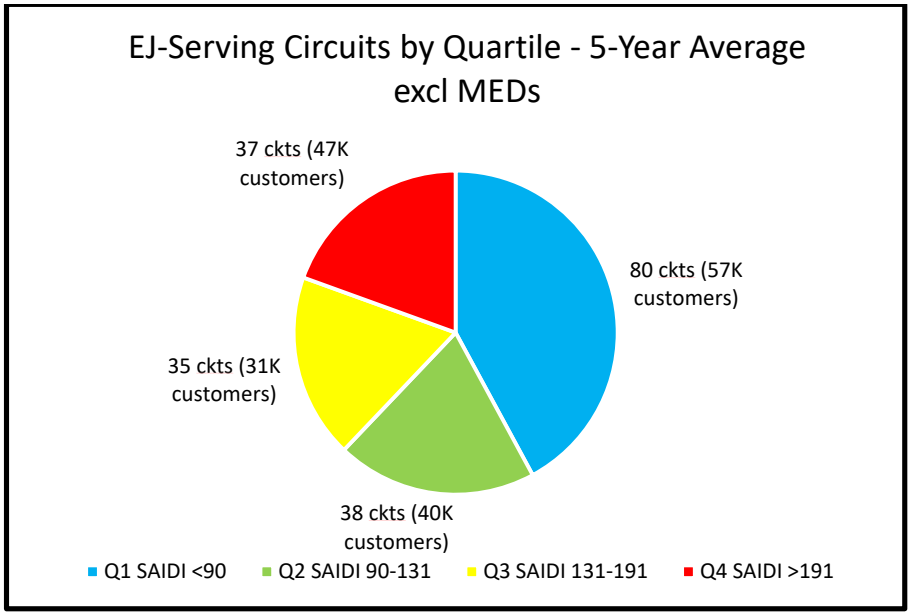
First, the Company analyzed how many individual EJ circuits have poor reliability that is being obscured by good reliability on other EJ circuits that averages out in a systemwide analysis. To do this, the Company compiled all 190 EJ circuits on its system and reviewed their individual SAIDI, both including and excluding MEDs, over the past five years.

The Company then compared each EJ circuit's SAIDI scores against the Institute of Electrical and Electronics Engineers ("IEEE") quartiles. The Company found that, over the period from 2019 through 2023, 118 of the 190 EJ circuits had average SAIDI excluding MEDs that were in the first or second IEEE quartile, indicating better than average SAIDI. A full 80 EJ circuits had first-quartile SAIDI excluding MEDs. These first and second-quartile circuits serve about 97,000 customers.

On the other hand, 72 EJ circuits had average SAIDI excluding MEDs in the third or fourth IEEE quartile; these circuits serve approximately 78,000 customers.

The Company found somewhat similar results for SAIDI including MEDs, but with proportionally fewer circuits and customers in the first quartile and more circuits and customers in the fourth quartile.

FIGURE 32



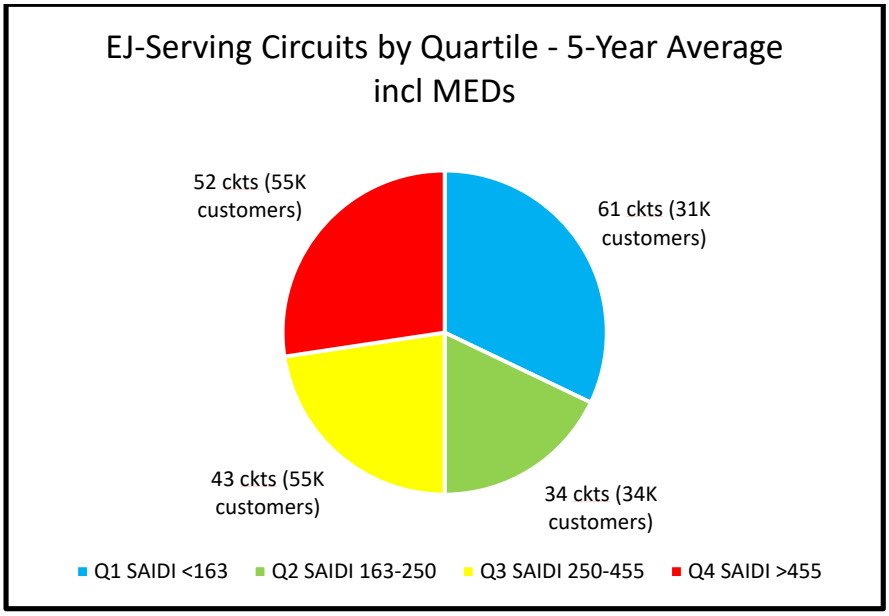


FIGURE 33

This analysis clearly indicates that some EJ communities face challenging reliability issues, which are only magnified by the vulnerabilities that these communities face when dealing with interruptions.

Second, the Company conducted another analysis over the summer of 2024 to more closely study how EJ census tracts perform relative to similar non-EJ urban census tracts. The Company has 56 EJ census tracts in its service territory, and all of them are defined as urban by the U.S. Census Bureau.

For this analysis, the Company compared the 56 EJ census tracts to similarly situated urban non-EJ census tracts. For *each* of the 56 EJ census tracts, the Company identified the five non-EJ urban census tracts that were most like the respective EJ census tract in terms of population size and housing density. Therefore, each of the 56 EJ census tracts was matched up with five corresponding non-EJ urban census tracts, meaning the Company could make 280 total comparisons of EJ census tract vs. non-EJ urban census tract performance (56 x 5).

The Company then made these 280 census tract performance comparisons for 12 different reliability metrics:

- SAIDI including MEDs
- SAIDI excluding MEDs
- SAIFI including MEDs
- SAIDI excluding MEDs
- Customer Average Interruption Duration Index (“CAIDI”) including MEDs
- CAIDI excluding MEDs
- Customers Experiencing Multiple Interruptions (“CEMI”)-4
- Customers Experiencing Lengthy Interruption Duration (“CELID”)-5
- All-weather 36-hour restoration percentage
- Catastrophic 48-hour restoration percentage
- Normal condition 8-hour restoration percentage
- Gray-sky 24-hour restoration percentage

The Company performed the 280 census tract performance comparisons for these 12 metrics for each of the five years from 2019 through 2023, yielding a total of 16,800 individual data points (280 x 12 x 5).

For each individual data point of comparison, the Company determined whether the EJ census tract or the non-EJ urban census tract with which it was being compared performed worse. To illustrate this, consider an EJ census tract *Y*.

- Census tract *Y* would have been paired with five non-EJ urban census tracts: *A, B, C, D,* and *E*. For SAIDI including MEDs in 2023, the Company would compare *Y*’s results with those of *A, B, C, D,* and *E* separately.
- The Company would count each time *Y* had the higher SAIDI, and each time one of the other census tracts had a higher SAIDI. For *Y*, this would then be done for each metric and each year.

The Company did this for all 56 EJ circuits, and totaled up how often the EJ census tract performed worse, and how often the non-EJ census tract performed worse.

FIGURE 34

Reliability Metric		Which Performs Worse on Average?	How Often is EJ Worse?
SAIDI	excl MEDs	EJ	51.29%
	incl MEDs	EJ	54.75%
SAIFI	excl MEDs	EJ	57.84%
	incl MEDs	EJ	58.27%
CAIDI	excl MEDs	Non-EJ	42.88%
	incl MEDs	Non-EJ	45.47%
CEMI-4		EJ	64.82%
CELID-5		EJ	50.22%
Restoration Time	All-Weather 36-hr	EJ	69.92%
	Catastrophic 48-hr	Non-EJ	41.58%
	Normal 8-hr	EJ	57.27%
	Gray-sky 24-hr	EJ	59.06%

These results indicate that if you take the Company's EJ census tracts and compare them, on a granular basis, with the most comparable non-EJ urban census tracts, the EJ census tracts often perform worse on key reliability metrics. The percentages indicate that the EJ census tracts perform worse on a moderately more often basis.

Vulnerable Communities Resiliency Plan

The Company does not believe it is "good enough" to point to systemwide averages, as good as they may be, and let it go at that, leaving some vulnerable customers behind.

To address the issue of customers in EJ communities facing poor reliability, the Company has developed its *Vulnerable Communities Resiliency Plan*. The purpose of this Plan is to make targeted strategic investments on EJ circuits so that every EJ circuit has SAIDI including MEDs that is in the second IEEE quartile or better.

In other words, the *Vulnerable Communities Resiliency Plan* will eliminate EJ circuits experiencing worse than the industry average, and it will do so including MEDs to account for the actual experiences of those customers.

The total proposed investments are as follows, to take place over 10 years:

- Fractionalization: $200 million of total investment
  - Six new substations – one for each EJ circuit with over 3,000 customers
  - 133 new circuit exits – one for each EJ circuit with over 1,000 customers
- LVD line rebuilds: $350 million of total investment
  - Rebuild 665 miles of primary LVD circuit to create a high-reliability mainline three-phase (i.e., aerial spacer cable or underground, based on local conditions)
- Other work: $50 million of total investment
  - 400 new reclosers to ensure no protective zones exceed 2 miles in length
  - 335 new switches (i.e. one every mile)
  - Approximately 3,000 additional fuses

While the new substations were already included in the Reliability Roadmap in 2023, the remainder of the investments are incremental. It is crucial to emphasize that t**he Company is not proposing to take reliability investments that are already in the Reliability Roadmap and redirect those to focus on the *Vulnerable Communities Resiliency Plan***, which would disadvantage customers in other parts of the Company's service territory.

The Company will maintain its planned reliability investments and then perform these targeted EJ investments in addition to those.

Note that in the Settlement Agreement as part of Case No. U-21224, the Company committed to "propose a plan to incorporate environmental justice and equity into the Grid…Archetypes analysis which the Company uses to prioritize its distribution investments in rate cases." The Company did so in the summer of 2023, and added a new reliability 'flag' to the Grid Archetypes process.

By adding EJ status to the list of reliability flags, an EJ circuit that previously only triggered one reliability flag (and therefore was not prioritized) would instead be prioritized.

However, the Company believes the new *Vulnerable Communities Resiliency Plan* effectively supersedes this EJ flag methodology. The purpose of the EJ flag was to modestly weight investment decisions in favor of EJ communities. The *Vulnerable Communities Resiliency Plan* will instead **directly steer critical investments to those communities** in a dedicated program.

Other Efforts in EJ Communities

In addition to the *Vulnerable Communities Resiliency Plan*, the Company is also proposing targeted replacement of open-wire secondary, which heavily impacts EJ communities in the Company's service territory. Furthermore, the Company is proposing to convert non-standard voltages to standard voltages.

These conversions of non-standard voltages will:

a. Eliminate ungrounded conductors, which can pose safety hazards.

b. More easily facilitate load transfers to reduce outage times.

c. Improve the capacity of the circuit to accommodate increased load in some cases.

The Company's plans for open-wire secondary and non-standard voltages are discussed in more detail later in the LVD Safety-Focused Issues and Investments section of this report.

Further Analysis

The Commission's final Order in Case No. U-21389 directed the Company to develop a regression analysis to statistically study the interaction between EJ issues and distribution reliability, in addition to the analyses discussed above.

The Company has developed that analysis, and it is being filed as an exhibit in Case No. U-21870, concurrent with this update to the Reliability Roadmap. Based on the Commission's final Order in Case No. U-21585, the Company anticipates it will update this regression analysis periodically going forward as well.

As the Company executes these plans for EJ communities, it recognizes the need to hear direct input from representatives of impacted customers in those communities, and the Company will explore avenues to get that input through appropriate channels.

- The Company has been an active collaborator in the MPSC Staff's Energy Affordability and Accessibility Collaborative; this ongoing workgroup provides a cross-functional way for utilities and other organizations to discuss challenges in energy equity, and the MPSC's process includes representation for low-income customers and other opportunities for those customers to be heard.
- The Company's Community Affairs team regularly reaches out through a variety of communication channels to local governments, community organizations, and individual customers regarding plans for major projects, including those designed to improve reliability in an area.
- The Company is willing to explore an annual meeting during which affected customers and their representatives can get information and provide input on the Company's efforts in EJ communities.

The 2023 version of the Reliability Roadmap included maps overlaying reliability data for EJ circuits and EJ census tracts. The Commission's Order in Case No. U-21389 directed the Company to work with Staff to develop a means for interested parties to access Geographic Information System ("GIS") data from the Company, and the Company undertook this effort during late 2024 and early 2025.

As one outcome of this, the Company has now posted interactive GIS maps to its public website that overlay EJ circuits and EJ census tracts with the ability to view SAIDI and SAIFI data both with and without MEDs. This is available at:
https://experience.arcgis.com/experience/1d84e089ff5e4a2382df340d15689488

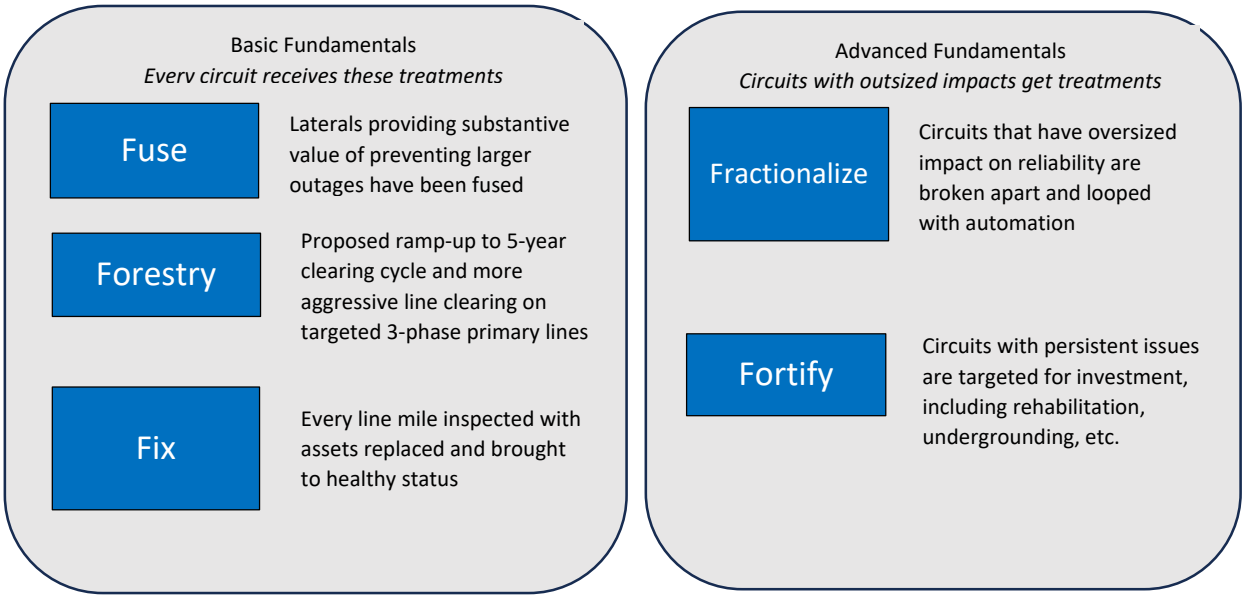
Hosting Capacity in EJ Communities

The Settlement Agreement in Case No. U-21224 also included a commitment by the Company to include data on hosting capacity in EJ communities in future filings. To date, the Company's hosting capacity analysis has largely been limited to an initial "go/no-go" analysis that was discussed in the 2021 EDIIP and published in detail on the Company's website in the fall of 2021.

Information based on that analysis relating to EJ communities was provided in the Company's 2023 electric rate case in Case No. U-21389. As discussed later in this updated version of the Reliability Roadmap, the Company is working in 2025 on further developing its hosting capacity analysis capabilities, which will deliver the ability to better study hosting capacity for EJ communities as well.

Overview of Asset Management

The *Reliability Roadmap* reflects the Company's strategy to meet the safety, equity, reliability, and resiliency needs of customers through the grid both now and into the future. This plan focuses on assets to modernize the Company's electric distribution system to safely provide power with fewer, shorter, and less frequent power outages for customers.



The Company's distribution system consists of several classes of assets. LVD lines, HVD lines, the Metro System, and substations were introduced earlier in the Distribution System Overview section of this report. In addition to these major classes, the distribution system also includes the protective system; distribution meters; distribution transformers; and streetlights.

The Company developed a strategic approach for each asset class to identify risks that affect reliability performance; developed countermeasures to mitigate those risks; created a workplan that implements those countermeasures in a prioritized manner; and defined an investment plan needed to support that work.

Each investment plan includes the planned Capital expenses to construct the distribution assets, and the Operations and Maintenance ("O&M") expenses for assets' annual inspections and upkeep, where applicable.

Each workplan is characterized by the Five Fundamentals Approach (Five Fs) shown in Figure 35 below, which succinctly covers the various approaches the Company uses to ensure reliable operations. By following this approach, the Company's investments are designed to improve system performance while ensuring circuits perform as expected.

FIGURE 35
FIVE FUNDAMENTALS APPROACH

The next several sections of this document will discuss the Company's specific asset management approaches for each asset class: LVD lines, LVD transformers and meters, Metro, HVD lines, substations, and system protection, plus additional topics like streetlights. In each case, the plan will outline the risks each subclass faces, a workplan tailored to address the most urgent risks, and the 5-year investment needs to execute this plan.

LVD Asset Management

LVD Lines Overview

This section focuses specifically on LVD Lines, which consist of several sub-classes of assets, each with a specialized asset management approach.

The entire distribution system contains approximately 107,000 miles of LVD lines, including 61,000 of Primary and 46,000 miles of Secondary as shown below in Figure 36.

FIGURE 36
LVD PRIMARY LINES MILES BY TYPE

	Overhead	Underground	Total
LVD Primary Line Miles	51,736	9,885	61,621
LVD Secondary Line Miles	31,209	18,474	49,683
Total	82,945	28,359	111,304

In 2024, the LVD system comprised approximately 2,400 circuits, although some of these circuits are dedicated to a single customer or are part of the Metro system.

LVD circuits are subdivided into protective zones, as shown in Figure 37 below. As November 2024, the LVD system was apportioned into approximately 156,000 protective zones, with the number continuing to grow as the Company makes investments into the system to increase sectionalization and decrease the size of outages impacting its customers.

- Beginning in 2022, the Company set out to fuse overhead laterals to mitigate the size of outages by reducing the average number of customers out for an outage incident or event, lessening the impact of a fault to a smaller number.
- By the time this program is complete in 2025, the Company will have added approximately 28,000 fuses, reducing 41,000 customer outages annually and saving an estimated 9 minutes of SAIDI.

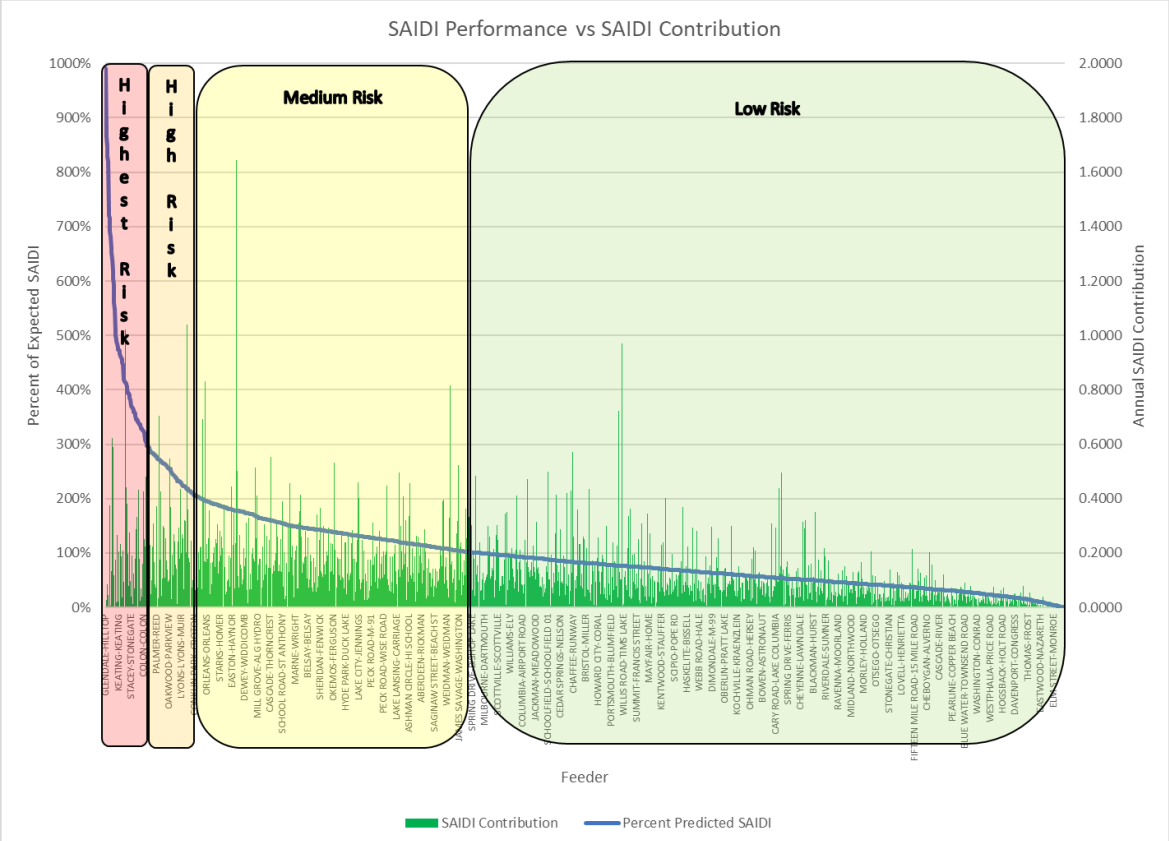
FIGURE 37
ILLUSTRATION OF CIRCUIT SUBDIVIDED INTO ZONES

Additionally, the LVD system includes approximately 1.5 million poles—1.1 million on the primary system, and 400,000 on the secondary system.

Based on the Company's historical data, the overall average lifecycle of an LVD primary circuit is expected to be 57 years. The average age of an LVD pole is 40 years.

The **largest reliability risks to the LVD lines system are those that lead to outages and interruptions to customers.** The two largest contributors to frequency of outages (measured by SAIFI) on the overhead LVD system are **trees and asset failures**.

Besides frequency of outages, **duration of outages (measured by CAIDI) contributes to LVD lines risk**. Much of this outage duration risk is addressed through the Company's Service Restoration efforts, but there are also outage duration implications of system configuration.



- The chart below in Figure 38 shows all LVD circuits within the Company's service territory on the horizontal axis with two measures of reliability performance on the vertical axis (the right side of the vertical axis shows actual SAIDI contribution, while the left side shows the percentage of expected SAIDI).
- The **100%** line on the vertical axis represents a circuit performing as it is engineered, while any green lines extending above this line represent circuits performing worse than expected.

Circuits on the left side of this figure, which present the highest risk to system performance if there is an outage, will need to be **Fortified** and in some cases **Fractionalized** to harden circuits against future risks and reduced in circuit line miles to minimize the impact of outages, respectively.

These approaches are detailed further in the Resiliency Investments section of this plan.

Circuits in the middle and right side of this figure that do not have an outsized impact when there is an outage may also be Fractionalized, but will primarily be addressed through **Fusing**, **Forestry**, and **Fixing** to improve the expected performance of most circuits, and are detailed further in the Reliability Issues and Investments for LVD Lines and Forestry Line Clearing sections of this plan.

FIGURE 38
LVD CIRCUIT SAIDI

LVD Safety-Focused Issues and Investments

The **greatest public safety risk from the LVD system comes from downed wires**, usually following weather events. Energized downed wires are dangerous and, if contacted, cause injury or fatality.

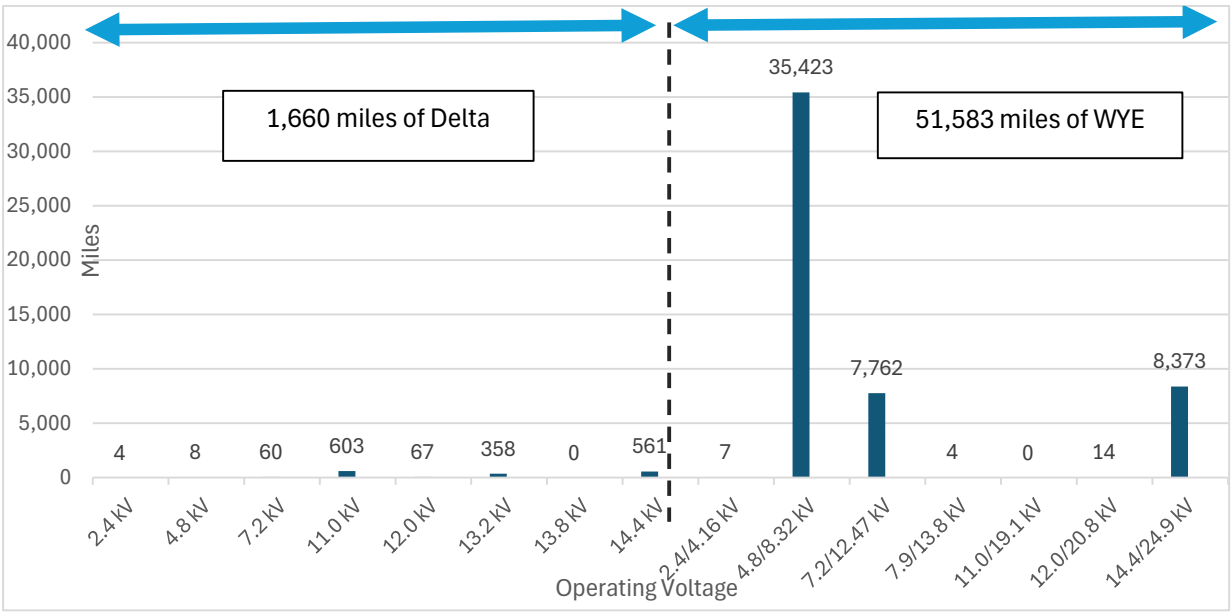
To mitigate this risk, the Company works to repair downed wires as soon as possible and has procedures to guard downed wires until they can be fixed (emergency responders will also do this, and the MPSC rules provide that the Company must relieve emergency responders in a timely manner).

The investments planned as part of the following LVD asset subclasses reduce this risk by preventing outages, downed wires, and other contact with energized equipment:

- Standardizing the Company's system voltages **through Voltage Conversions** to mitigate the safety risk from ungrounded wires and allow for quicker recoveries from outages.
- Removing **Subsurface transformers** to improve employee safety, avoid potential public contact and environmental contamination.
- Modernizing legacy **secondary distribution assets**, to provide a safer and more resilient final service to many customers after the final transformer.

Legacy open wire secondary presents a particular safety issue in the event of a downed wire because they are not well-insulated, are not always easily accessible to crews, and usually located in higher population areas.

Voltage Conversions



The Company's LVD system consists of 13 different voltages, a holdover from when the Company acquired smaller systems throughout its history.

Non-standard voltages restrict the Company's ability to install transfers between circuits and modernize the grid in a streamlined fashion because circuits of different voltages cannot be connected.

Figure 39 below, shows the Company's three standard voltages, which are 4.8/8.32 kV, 7.2/12.47 kV, and 14.4/24.9 kV, along with the 10 remaining non-standard voltages and associated overhead line miles.

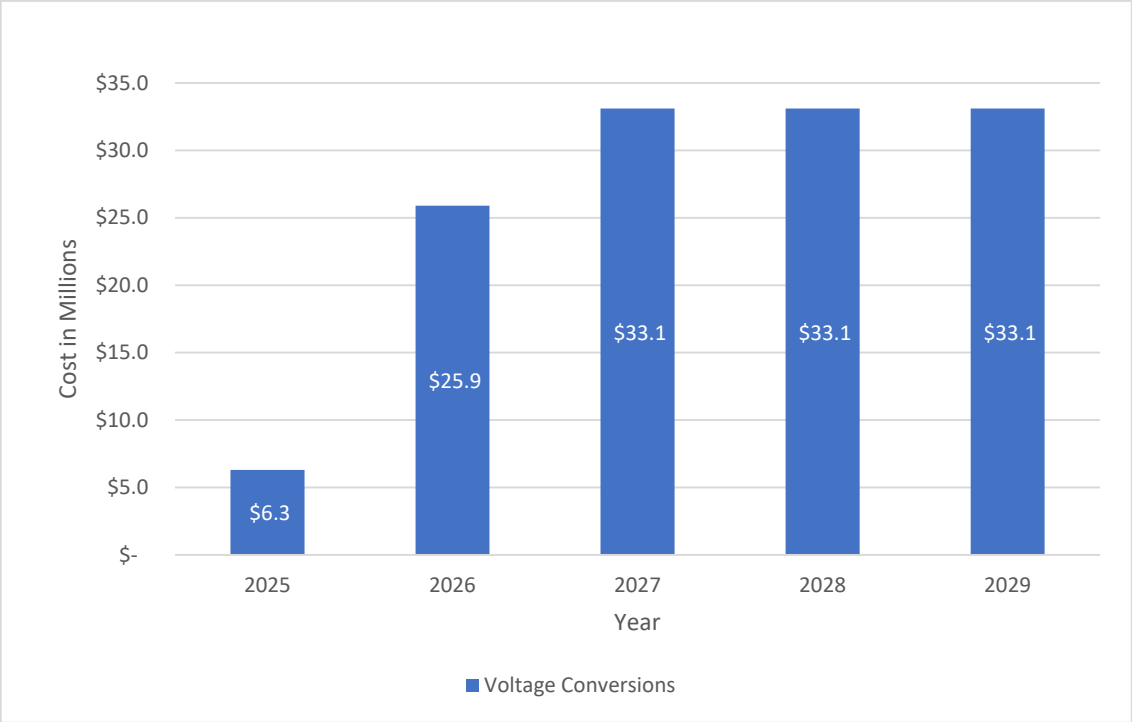
Figure 39

OVERHEAD PRIMARY LINE MILES BY VOLTAGE AND CONFIGURATION

While only a fraction of the overall system, the 1,660 miles of Delta are less safe to operate compared to a grounded wye system.

- Delta systems require two phase ground faults to be present before the phase protective device trips, which means a downed Delta wire will not trip a primary protective device until a second phase fault develops.

By converting non-standard components to one of the three standard voltages, **the Company will mitigate the safety risk from ungrounded wires and increase operational flexibility** by expanding the ability to transfer loads to reduce outage times.



Additionally, voltage conversion will increase efficiency and reduce the operating costs through requiring lower levels of inventory to serve the variety of voltages.

The Company plans to invest $33 million per year over the next 10 years to convert at least 165 miles per year of non-standard voltage overhead lines, with an end goal of converting all non-standard voltages.

The next 5 years of spending for this plan is detailed in Figure 40 below.

Figure 40

VOLTAGE CONVERSIONS 5-YEAR INVESTMENT PLAN

Year	Miles of Nonstandard Voltage Converted
2025	33
2026	210
2027	268
2028	268
2029	268

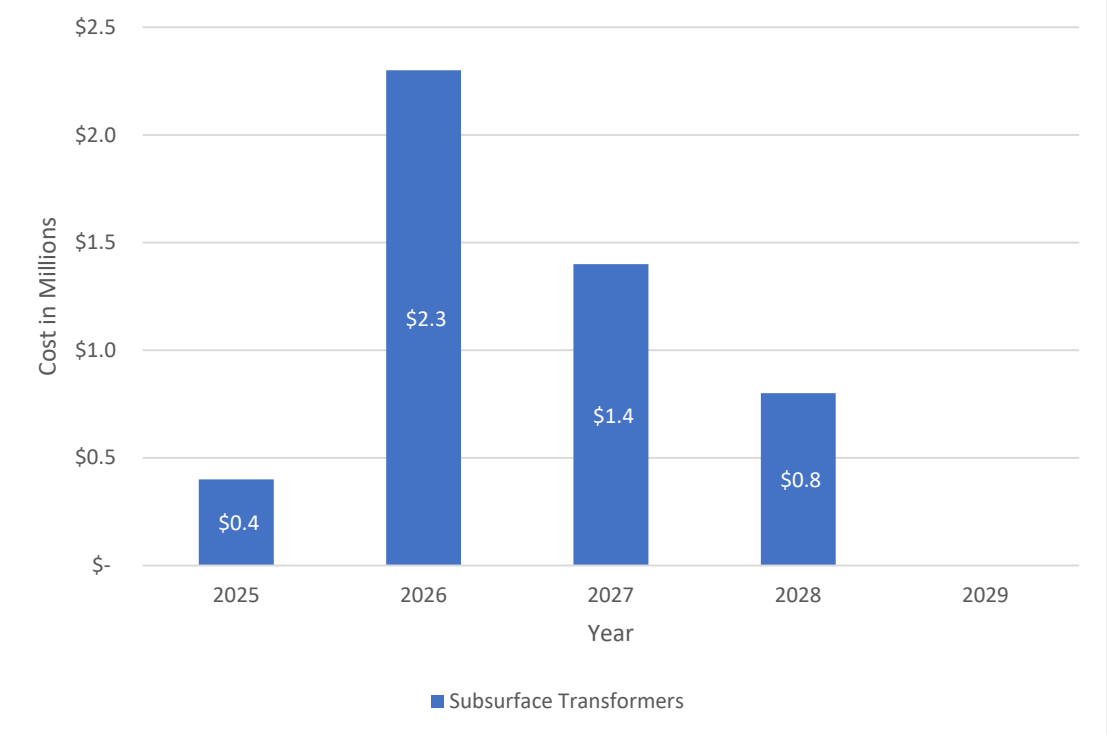
Subsurface Transformers

Figure 41

FIELD VIEW OF SUBSURFACE TRANSFORMER

In 2023, the underground system had 159 of its original subsurface transformers, representing 0.15% of the transformers serving the underground system. At the end of 2024, there are 139 remaining.

While few in number and while not having a major impact on reliability, **subsurface transformers present a safety risk for Company employees, the public, the local environment, and grid reliability**.



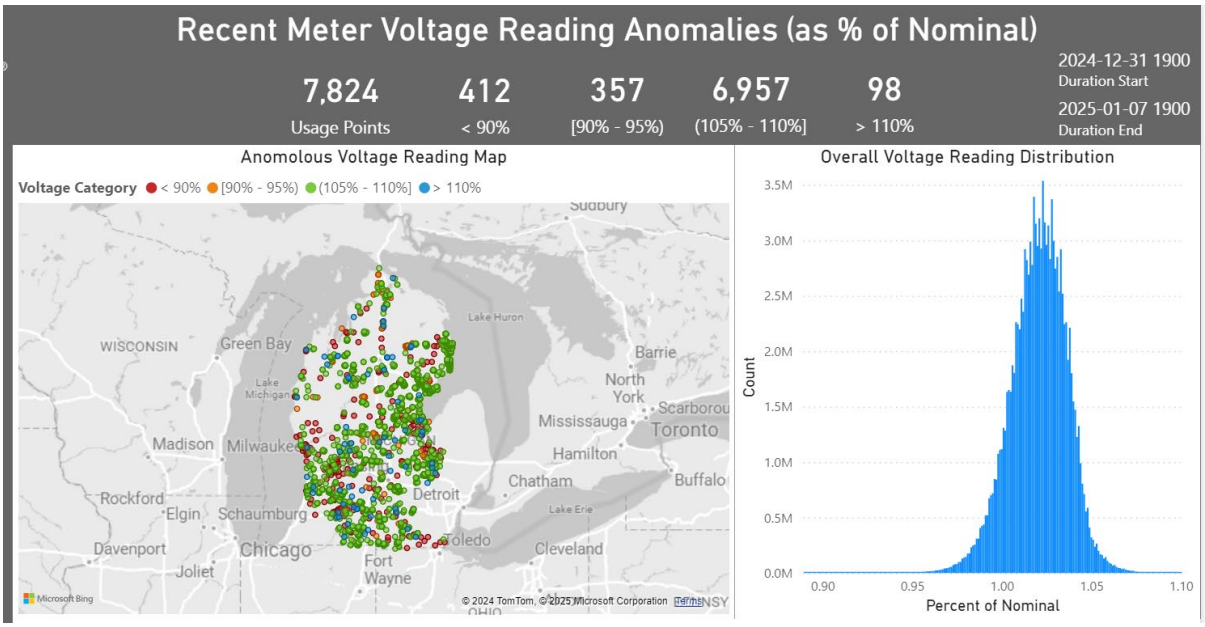
- Since these assets are located underground, Company employees have difficulty accessing and repairing them when they fail, leading to an outage lasting roughly four times longer compared to padmount transformers.
- The location makes it difficult for the public to recognize these transformers in the field, making it easier for them to come into contact with these transformers.
- Lastly, these transformers are more difficult to inspect when they do fail, making a subterrain oil leak more likely, contaminating nearby land and ecosystems.

To address this issue, the Company has begun proactively replacing all 159 subsurface transformers with padmount transformers, which are easier to inspect and repair. As of the end of 2024, there are 139 remaining on the system.

The 5-year investment plan is shown below.

Figure 42

SUBSURFACE TRANSFORMERS 5-YEAR INVESTMENT PLAN



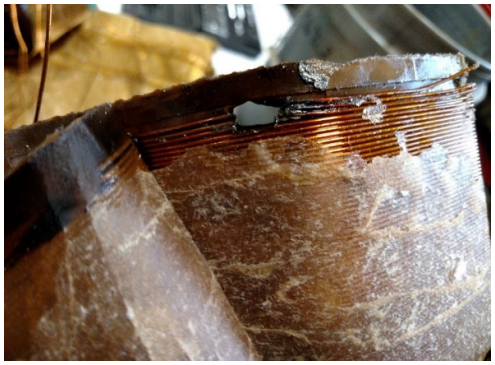
Year	Subsurface Transformers Replaced
2025	11
2026	40
2027	53
2028	35
2029	0

Meter Voltage Anomalies

The Company's AMI meters allow for continuous monitoring of customer service delivery point voltage levels. The criterion for acceptable voltage is outlined in Rule 702 of the MPSC Standards of Quality of Services, and in most cases is ±5% of nominal voltage. The vast majority (>99%) of service delivery points maintain this voltage level, as shown in Figure 43 below.

Figure 43

METER VOLTAGE ANOMALIES



As shown in the histogram in Figure 43, the majority of voltage anomalies are 5% to 10% above nominal voltage.

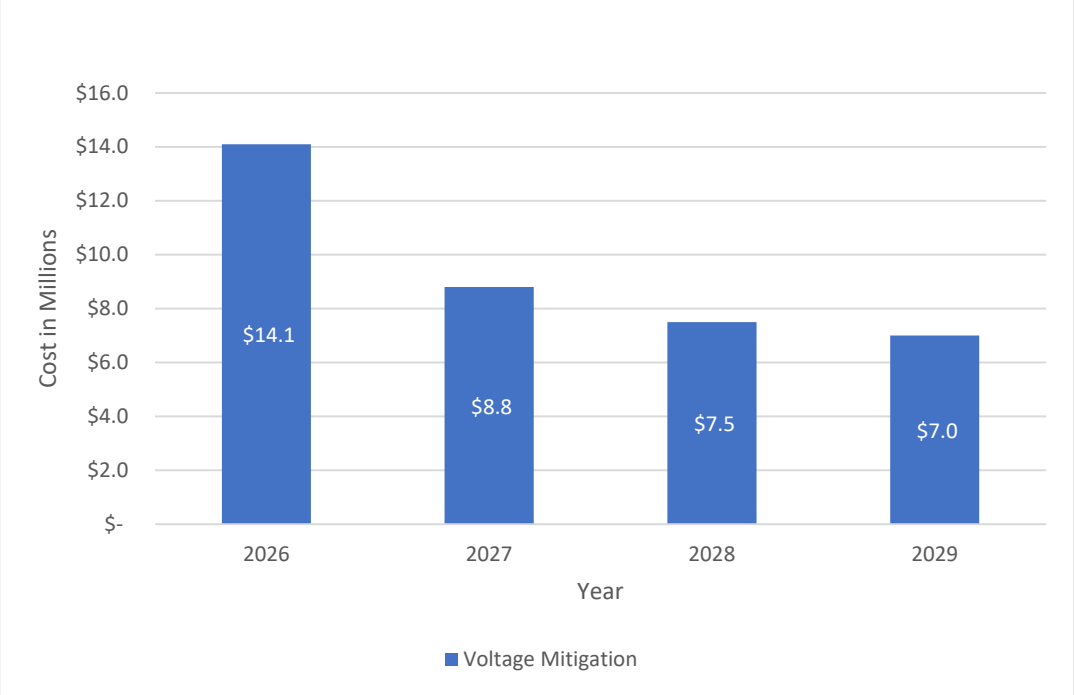
After several years of investigating and reactively correcting these anomalies as they arise and are reported by customers, there are three main causes of voltage anomalies:

- Low voltage (<95% nominal) is typically due to heavily loaded secondary and line transformers
- Moderately high voltage (between 105% and 110% nominal) is typically due to voltage regulation device issues
- More extreme (>110% nominal) high voltage typically is due to internally faulted but still energized line transformers. These internal faults result in the transformer turns ratio being altered, creating sustained high voltage on the load side of the transformer. Figure 44 below shows an example of this type of failure that requires replacement of the line transformer.

Figure 44

INTERNALLY FAULTED LINE TRANSFORMER

While the Company has been addressing meter voltage anomalies on a reactive basis as they are identified by customers, the Company is now planning to proactively address them, using AMI data to identify noncompliant locations.



In many cases, particularly where voltage is low, AMI data should let the Company identify locations even before customers recognize that their voltage is out of compliance.

The Company projects that, over the next five years beginning in 2026, it will need to complete the work shown in Figure 45 to address meter voltage anomalies on the system.

FIGURE 45

METER VOLTAGE ANOMALIES 5-YEAR INVESTMENT PLAN

Year	Line Transformers Replaced	Regulator Mitigations	Low Voltage Mitigations (Secondary Miles)
2026	650	125	25
2027	300	100	15
2028	300	75	15
2029	300	50	15

Secondary Circuit Assets

Secondary circuit assets are located between the distribution transformer and customer meter. Repairs are more challenging than primary repairs for crews for various reasons.

- In urban areas—in many cases in EJ communities—the secondary is typically located behind homes in backyards instead of roadside. When secondary is behind the home instead of roadside, it is more difficult to access with a bucket truck (e.g., along property lines with fences without an ally way) and may require Forestry assistance to access.

- Of the 31,000 miles of secondary on the Company's system, 27,000 miles are multiplex, and 4,000 miles are open wire. Examples of multiplex and open wire secondary are shown below in Figure 46.

Open wire secondary is more challenging to repair than multiplex secondary because breaks often occur mid-span, and if bucket truck access is not possible, repairs require splicing on the ground and then routing the conductor through trees.

- Much of the open wire secondary is nearing or at the end of its life, which causes the conductor to be brittle and not easily repaired.
- Open wire secondary is also more vulnerable to tree damage than multiplex. In general, the solution to issues with open wire secondary is to convert it to multiplex.
- Secondary outages occur at an average of 10 outages per day across the state and affect, on average, 3 customers per outage.

FIGURE 46
MULTIPLEX VS. OPEN WIRE SECONDARY

The factors that make secondary repairs more challenging contribute to higher average outage durations with an average duration of more than 10 hours. **These long response times present a risk to public safety, since wires are down for longer periods of time.**

These long duration, high frequency outages also cause the Company's line crews to spend more time, at a higher cost, to address emergent outages at the expense of planned work to proactively improve system reliability.

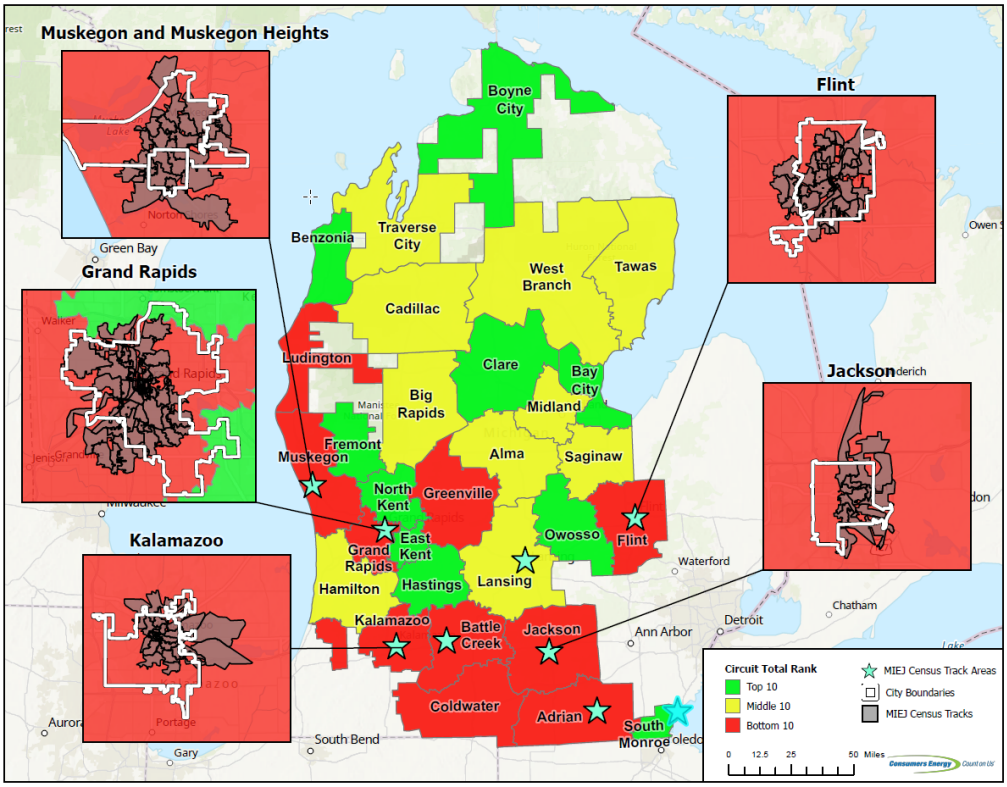
Outages overnight cause crews to have delayed start times, which further reduces the amount of planned work the Company can complete. They also drive costs higher as the repair work is done on overtime. Approximately 13% of secondary repairs are made during overnight hours.

The reliability and safety risks associated with secondary are particularly important for EJ communities.

- Approximately 18% of the Company's secondary in EJ communities is open wire. The long duration nature of secondary outages has a heightened impact on EJ communities, where customers are less likely to have back-up power generation, and experience financial and health impacts from long outages more acutely.
- Secondary in EJ communities tends to be in high population areas. This further increases the risks associated with downed wires.

A key benefit to secondary replacement is that it includes installing larger secondary conductors with more capacity, in anticipation of future electric vehicle loads and rooftop solar installations.

Installing larger secondary conductors will reduce the number of future upgrades required for our customers when they adopt new technologies.



The Company measures secondary asset health through a combination of impacts to customers and number of interruptions.

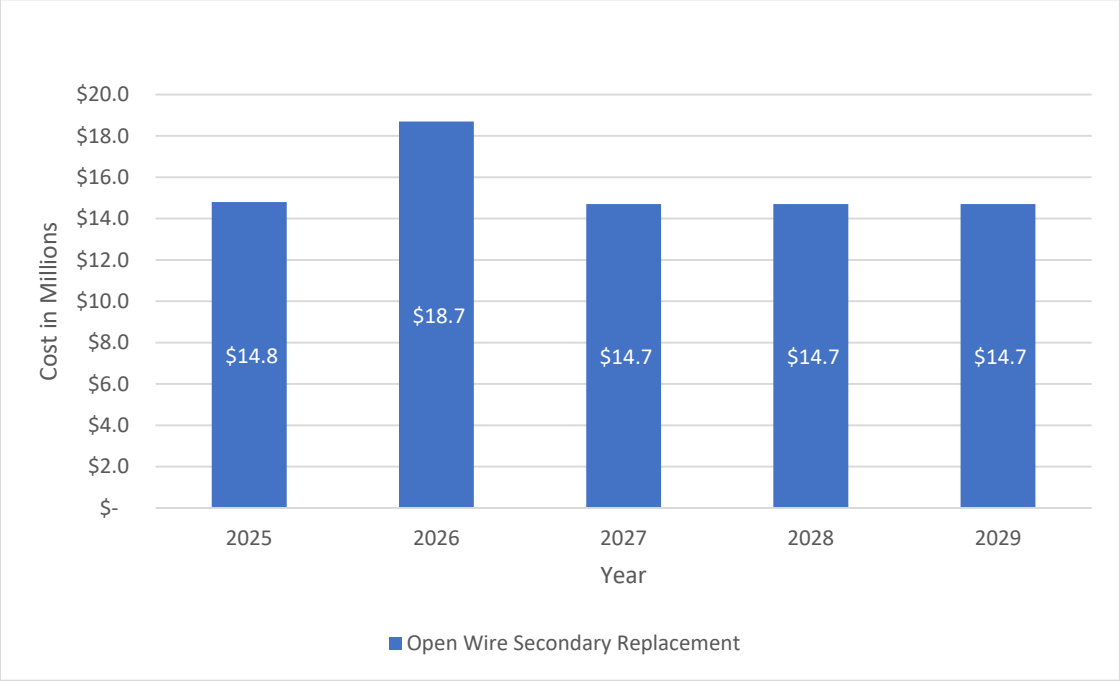
In Figure 47 below, the Service Center regions with the worst performing secondary across the Company's service territory are highlighted in red.

As the map shows, many of the regions with the worst performing secondary contain high concentrations of urban areas and EJ communities. Focusing our investments in these areas will result in the greatest cost benefit for improving reliability while investing in EJ communities.

Figure 47

WORK HEADQUARTERS WITH MIEJ CENSUS TRACK

When open wire secondary is replaced with multiplex secondary, reliability increases.



- Although the SAIDI impact of open wire secondary is not large, replacing open wire secondary is still beneficial. It reduces local outages, improves local CEMI and CELID metrics, facilitates employee training, and most importantly, reduces the risk of downed wires.

To address issues relating to open wire secondary, the Company is accelerating replacement of open wire secondary with a program of targeted replacements for the worst-performing circuits.

The Company plans to invest approximately $14.7 million per year over the next 10 years on the worst-performing secondary circuits in its territory, as detailed in Figure 48 below.

Figure 48

OPEN WIRE SECONDARY REPLACEMENT 5-YEAR INVESTMENT PLAN

Year	Miles of Open Wire Secondary Replacement

Wildfire Risk Mitigation

As part of delivering safe and reliable electricity to customers, the Company must address the growing wildfire risk brought on by changing climate in Michigan[7].

Over the last decade, wildfires have grown in number and severity throughout the United States, and become a significant public health and safety concern. In the last 13 years, there have been more than 100 wildfires in the Lower Peninsula each year, burning more than 2,000 acres in seven of those 13 years and more than 2,000 acres in three of the last four years.[8]

Given these trends, the Company developed a wildfire risk mitigation plan for its electric territory. This plan is a separate document that is provided concurrently with this updated Reliability Roadmap in Case No. U-21870.

This plan describes the Company's approach to mitigate the risk of wildfires caused by or impacting electrical infrastructure and surrounding communities throughout Consumers Energy's service territory, with safety as the top priority.

It outlines the steps the Company is taking or plans to take to develop competencies, invest in system hardening, and expand existing programs such as line clearing to alleviate the pressure from increased wildfire risk, all to improve the safety of customers, communities, and employees.

This plan will continue to evolve as the Company learns more about wildfire risk in Michigan, new wildfire risk reduction strategies and technologies, and how changing weather patterns impact the region.

As part of its wildfire risk mitigation plan, the Company intends to:

- Understand the current and probable wildfire risk areas in our service territory through development and maturity of assessment tools.
- Implement mitigation solutions that balance the risk of wildfires with safe and reliable energy delivery.
- Leverage existing programs, such as line clearing, to deliver benefits beyond reliability and resiliency.
- Implement procedures to inform customers and communities of wildfire preparedness measures and communication protocols in the event of a wildfire risk event, i.e., *Red Flag Warnings*.
- Engage customers and communities in the ongoing development of the wildfire risk mitigation plan, particularly as it relates to ensuring customer safety and electric reliability.
- Continuously improve this plan by leveraging industry experts and peers and learning about and deploying best practices.

[8] Michigan Department of Natural Resources - Fire Report Dashboard

Reliability Issues and Investments for LVD Lines

The Company makes planned investments in its LVD lines to improve reliability through the reduction of outage risks by:

- Identifying and mitigating problems with primary conductor, poles, and other supporting components through **Targeted Circuit Health Improvements** and addressing the worst-performing areas of the system.
- Replacing and upgrading deteriorated **LVD poles that** perform better in under extreme weather.
- Upgrading **overloaded components** to prevent overload-caused outages.
- Rejuvenating and replacing deteriorated **LVD Vintage underground cable**.
- Promoting safety, efficient operations, and aesthetics in the downtown areas of Battle Creek, Flint, Grand Rapids, Jackson, Kalamazoo, and Saginaw through the **Metro system.**

The Company also works through its **Forestry Line Clearing Program** to mitigate tree-related outages, which are the biggest external risk factor for LVD Lines. (Forestry Line Clearing also addresses tree-related risk on HVD Lines.) Forestry work, which is largely O&M, is discussed in the **Forestry Line Clearing Program** section of this document.

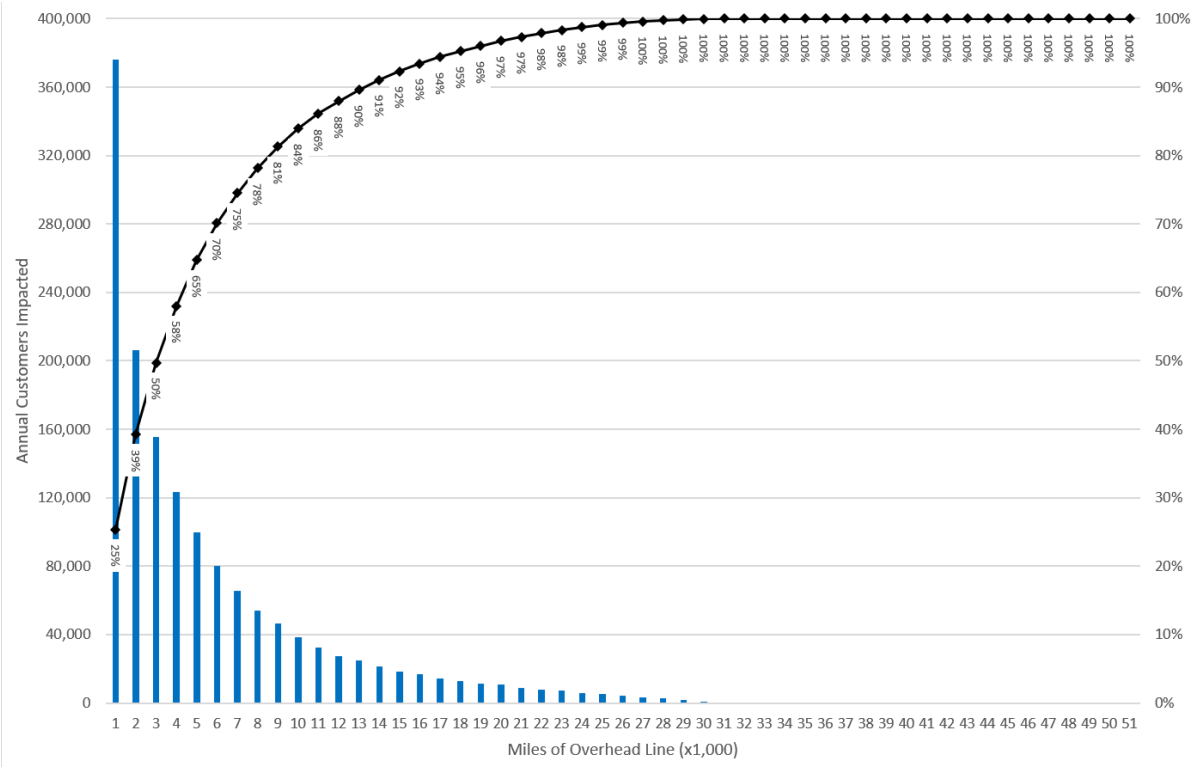
Inspection and System Maintenance

The Company is reducing reliability and safety risks through inspection and maintenance programs recommended by the *IEEE*.

The Company is proposing the following schedule, shown below in Figure 49, based on good engineering practice to help identify and correct problems before they result in outages.

FIGURE 49
LVD O&M INSPECTION CADENCE

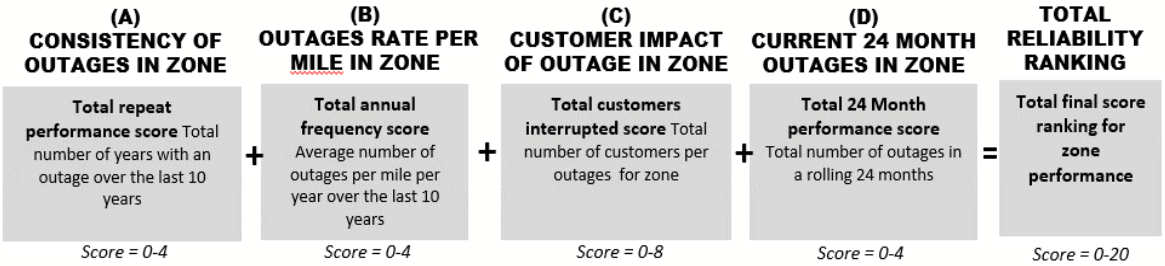
Inspection Task	Cadence	Components Checklist	Annual O&M Cost
LVD Line Inspections	2 Years	• Visual Inspection of pole and pole top components. • If a pole is suspected of failure perform test for strength.	$125K
Padmount Inspections	Significant Sample Annually	• Visual external safety inspection to identify if secure, holes or leaking.	$500K
Electronic Circuit Recloser	Remote Monitoring	• Monitor for any abnormality in performance and investigate for correction.	$400K
	4 years	• Replace battery and inspect reclosers without modems for any abnormality in performance and correct as abnormalities are identified.	$425K
Switched Capacitor Bank	Remote Monitoring	• Monitor for any abnormality in performance and investigate for correction.	$300K
Gang Operated Switches	3 Years	• Inspect and cycle the switch to ensure proper performance and correct as abnormalities are identified.	$450K
Disconnect Switches	4 Years	• Inspect, cycle and clean contacts to ensure proper performance and correct as abnormalities are identified.	$3.5M
Total			**$5.7M**



Zonal Health Assessments

In assessing LVD lines asset health, the Company has found that 91% of customer interruptions happen on just 25% of system miles, as shown in Figure 50.

Because of this, **the Company focuses on protective zones when assessing asset health and mitigating risk,** rather than on whole circuits. This enables the Company to focus on those parts of the system causing the most interruptions.



Furthermore, by focusing on the zones with the worst health, the Company can improve the reliability of customers downstream from the zone, not just the customers directly in the zone.

FIGURE 50
SYSTEM OVERHEAD MILES RANKED BY CUSTOMERS IMPACTED
(2015-2024)

When the Company assesses zonal health, it uses a 20-point scale based on inputs from the Reliability Analytics Engine, with four data points driving the score. These are shown in Figure 51 below.

FIGURE 51
ZONAL HEALTH ASSESSMENT SCORING RUBRIC

- Of the Company's approximately 156,000 total zones, approximately 22,000 of those zones currently have a score; the remainder do not have a score, which means they have had no outage activity at all for at least two years.
- In other words, more than four-fifths of zones on the system are working as intended and do not need to be prioritized for any investment at all at this time.
- The Company has found that customer interruptions in a zone begin to increase exponentially once the total zonal health score exceeds 10 and gets particularly severe once the score exceeds 15.
- Of the approximately 22,000 zones that currently have a zonal health score, just over 7,800 of them have a score of 10 or higher, representing approximately 4.5% of the Company's total LVD system.

When the Company identifies poor-performing zones on LVD circuits, it designs a zonal health investment project to address one or more zones to resolve the problem.

- Zonal health investments can include replacing equipment at end of life, hardening existing assets, installing new system protection devices like fuses and reclosers, and improving the capability to isolate and transfer load. Taken together, all these actions reduce the probability of an outage.
- Zonal health investments have consistently delivered reliability benefits for the LVD system because these under-performing zones have been strategically selected for rehabilitation.

As shown in Figure 52 below, SAIDI improves substantially following the completion of zonal health investment projects.

FIGURE 52
SAIDI IMPROVEMENT FOLLOWING ZONAL HEALTH INVESTMENTS

Project Year	Zonal Projects	% Improvement Prior 3 years Post improvement
2017	147	51%
2018	138	57%
2019	151	66%
2020	146	71%
2021	249	62%
2022	1,394	40%
2023	2,884	28%
Weighted Average Improvement		**64%**

It is important to note that the "zonal projects" column includes fusing work in 2022 and 2023 in addition to more traditional zonal health improvement work, which is why the number of projects increases by so much.

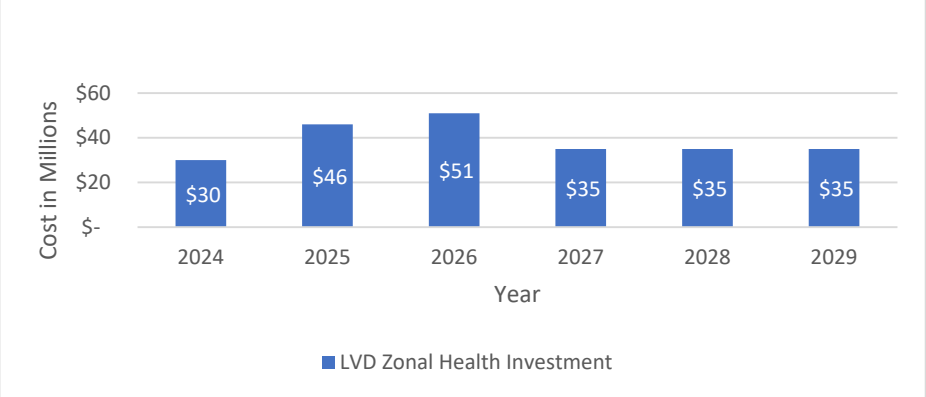
Fusing projects do not necessarily reduce the number of outages on a circuit, but they do reduce the number of customers impacted by any particular outage. This impacts the before and after outage numbers in the figure, and therefore the calculated percentage improvement.

Please note that traditional zonal health improvement work delivers substantial outage reduction benefits, as shown in the data from 2021 and earlier.

In addition to zonal health investments, the Company also installs ATR loops on the LVD system to automatically restore power to customers when an outage occurs. This is described later in this report in the section on Resiliency Investments.

LVD Zonal Health Investment Plan

The Company plans to address all zones with scores of 10 or greater, since interruptions to customers begin increasing exponentially once the zonal health assessment score exceeds 10 out of 20. This will require targeted zonal health investment projects for each of these zones.



At present, the Company plans to address an average of 85 zones per year.

The Company will rank zones from worst to best by zonal score, and address zones in that order, periodically reprioritizing to ensure that the Company's workplan is continually targeting the worst-performing zones.

The 5-year investment plan for LVD zones is shown below in Figure 53.

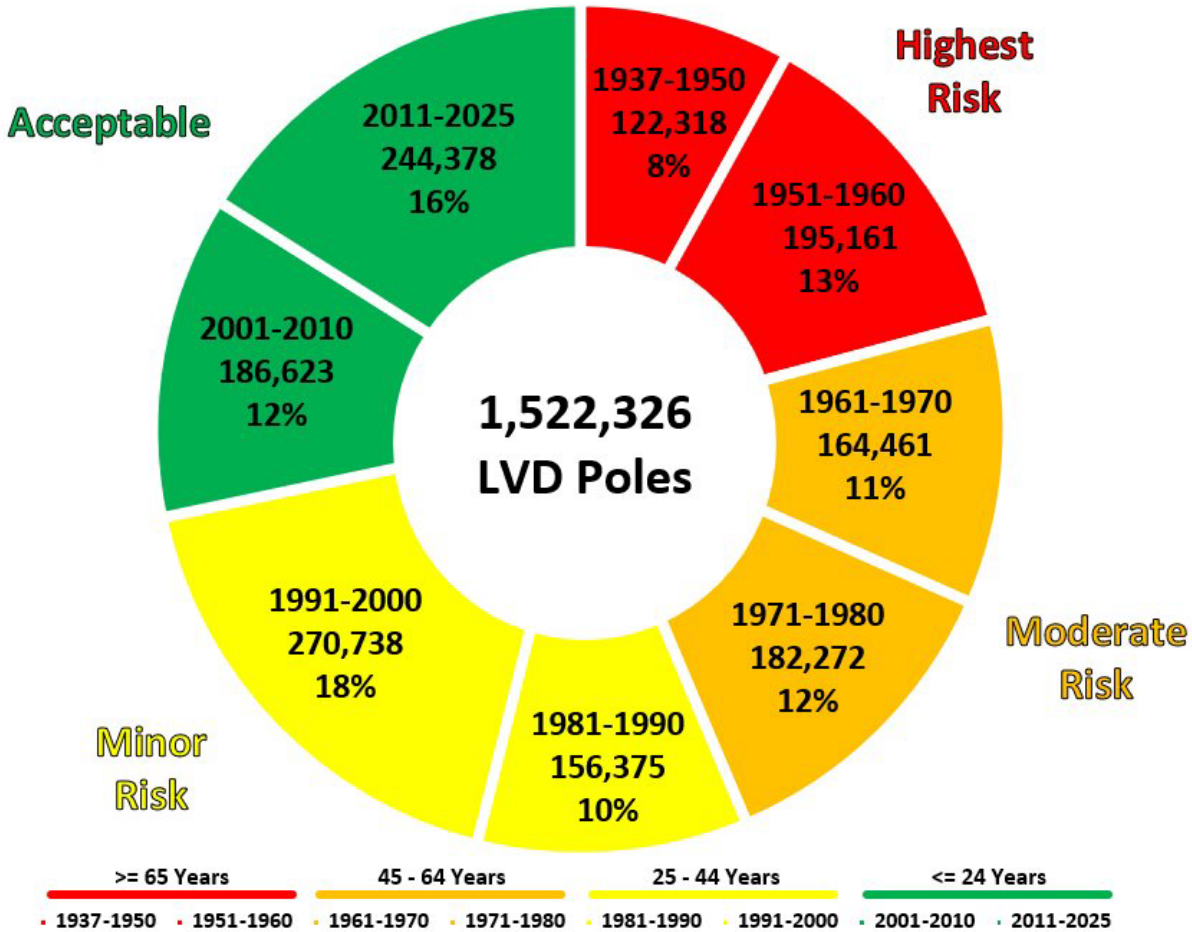
Figure 53

LVD Zonal Health 5-Year Investment Plan

Year	LVD Zones Addressed
2025	110
2026	340
2027	85
2028	85
2029	85

LVD Pole Health Assessment

As noted earlier, the average age of an LVD pole is 40 years. Pole failures take roughly twice as long to replace compared to replacing damaged pole top equipment, such as pins or wood crossarms.



Additionally, underground facilities need to be located by an outside agency prior to digging for safety reasons. These locate requests can take up to three hours in an emergency.

According to *National Electric Safety Code* ("NESC") standards, if a pole deteriorates to below two-thirds of its original install state, it is classified as "rejected" meaning the pole is more vulnerable to failure in car-pole accidents or by high winds, ice, trees, or other external factors.

Figure 54 below shows the number of poles on the LVD system by the decade in which they were installed, with the corresponding risk level for each vintage. The Company expects that the highest risk poles have a >15% rejection rate, the moderate risk poles have a 10%-15% rejection rate, and the minor risk and acceptable poles have a <10% rejection rate.

Based on this information, the Company estimates that 10% of the system, or approximately 150,000 poles, would be classified as rejected.

FIGURE 54
NUMBER OF LVD POLES BY VINTAGE

The Company is working to reduce risk from poles by performing visual security inspections, and replacing the most urgent poles identified from the pole inspection program. The Company is also beginning a groundline inspection program to inspect all poles on a 12-year cycle.

To build a more resilient system while aligning with industry standards, the Company has changed the minimum standard pole classes to provide greater capacity for LVD overhead lines and a more reliable outcome for the future.

- The Company went from Class 6 to a Class 3 for our primary applications starting in 2021, which will increase capacity by nearly 200% as shown in Figure 55 below.

Figure 55

2023 NESC CODE[9]

No Significant Pole Deterioration as Noted in NESC Table 261-1			
NESC Grade C Construction - LVD - NESC 250C&D Load Factors			
Pole Size Minimum	No ICE, Max Wind Speed Prior to Failure (mph)	½ Inch Ice, Wind Speed Prior to Failure (mph)	1 Inch Ice, Wind Speed Prior to Failure (mph)
Class 6	109 mph	54 mph	39 mph
Class 5	116 mph	57 mph	43 mph
Class 4	129 mph	64 mph	49 mph
Class 3	141 mph	71 mph	54 mph
Class 2	157 mph	79 mph	60 mph
Class 1	170 mph	86 mph	67 mph

The largest impact of this change is when the Company replaces existing poles in the field that failed during storm restoration and were originally sized using smaller pole class minimums, or for new overhead line construction.

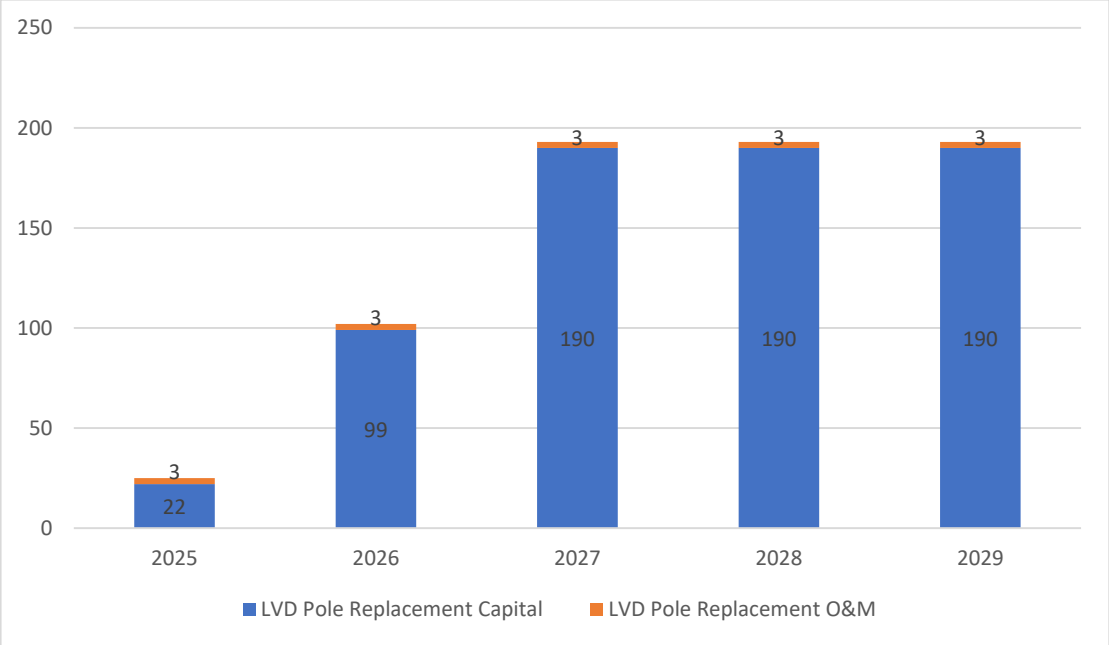
Based on the larger number of LVD distribution lines, it is estimated that 2-3% of our overhead LVD distribution system is replaced or newly installed with this new standard each year.

Additionally, poles are regularly replaced as a component of targeted zone improvement projects, plus other programs like Asset Relocations and New Business.

LVD Pole Investment Plan

Starting in 2025, the Company will initiate a groundline inspection program to identify and replace all rejected poles on a 12-year pole inspection cycle and inspect 125,000 primary and secondary poles each year.

- The Company will inspect a minimum of 50,000 poles in 2025, though if time and capabilities permit, up to 125,000 poles may be inspected. The Company plans to ramp up to where it consistently performs 125,000 pole inspections per year.
- Using the historical 10% rejection rate, the Company expects approximately 12,500 poles will need replacement each year, at least once the Company hits its full stride of performing 125,000 annual inspections. The inspections will cost $3 million annually in O&M spending.
- During the Company's regular 2-year circuit inspection cycle, the Company will continue to visually inspect poles and replace them as needed.



[9] 2023 NESC, linear analysis, 1/0 ASCR 3 phase conductor with #4 ACSR Neutral, 350-foot spans, 45-foot pole lengths.

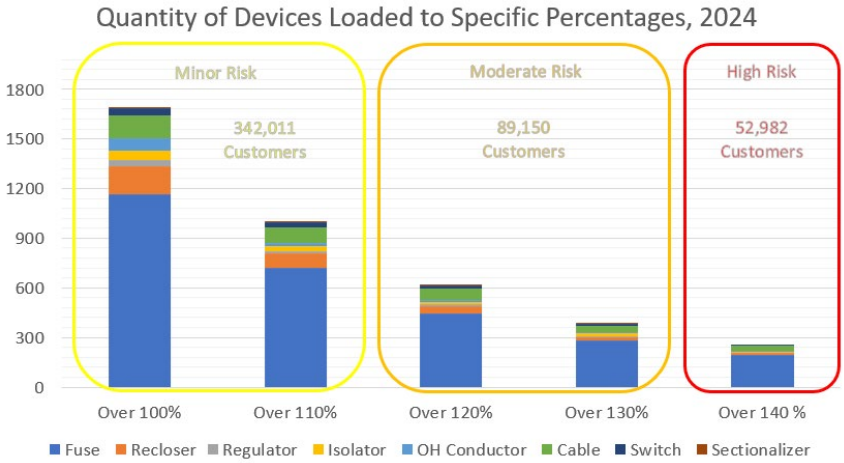
Altogether, this replacement plan based on groundline inspections will identify and replace approximately 12,500 poles annually and will cost approximately $190 million in capital spending per year.

The investment plan for LVD poles is shown below in Figure 56.

Figure 56

LVD POLES INVESTMENT PLAN ($000S)

Year	LVD Poles Replaced
2025	2,300
2026	9,700
2027	12,500
2028	12,500
2029	12,500



LVD Overload Risk Reduction

The LVD system also faces risks related to components overloading driven by local load growth.

When a component fails due to being overloaded, it results in an unplanned outage. These unplanned outages generally take longer to restore than planned outages, increasing SAIDI. The risks to customers due to component overloads are shown in Figure 57 below.

FIGURE 57

QUANTITY OF COMPONENTS LOADED TO SPECIFIC PERCENTAGES, SUMMER 2024

In general, individual components can withstand loading to greater than 100% of their rating for relatively short periods, such as a few hours on a hot summer day, but if overloaded too long or too frequently, they begin to deteriorate, introducing the risk of overload-caused customer outages.

Any component has a loading at which it will absolutely fail; these vary by component type, but the Company classifies components at the highest risk if they are projected to exceed 140% loading.

Components in the medium and high-risk categories may be able to continue operating normally if they are not regularly loaded past the 100%-130% range, as the components are designed to operate with that loading for short periods. However, those components still face risk because a modest increase in load, such as from an increase in EV penetration nearby, could quickly load those assets to 140%.

Ideally, the Company's investment plan will address any components that are loaded higher than 100% in order to fully mitigate the risks of overloads and eliminate overload-caused outages on the system

Of the overload-related risks on the LVD system, **isolators present the highest risk** because they are complex to replace, stock is limited, and outages tend to be for extended durations.

- Isolators are a specific type of transformer used to convert one primary voltage to another primary voltage.
- If an isolator fails due to an overload, it can create an extended duration outage.
- For comparison, a failed fuse can be replaced very quickly by crews throughout the state, which all maintain a sufficient inventory of fuses.

The number of isolators at risk is shown in Figure 58 below. Summer 2024 load data show there were 9,469 customers at Medium Risk level or greater of experiencing an outage due to overloaded isolators.

The Company intends to address overloaded isolators on the grid over the next 10 years to mitigate this risk to customers.

FIGURE 58

QUANTITY OF ISOLATORS LOADED TO SPECIFIC PERCENTAGES, SUMMER 2024

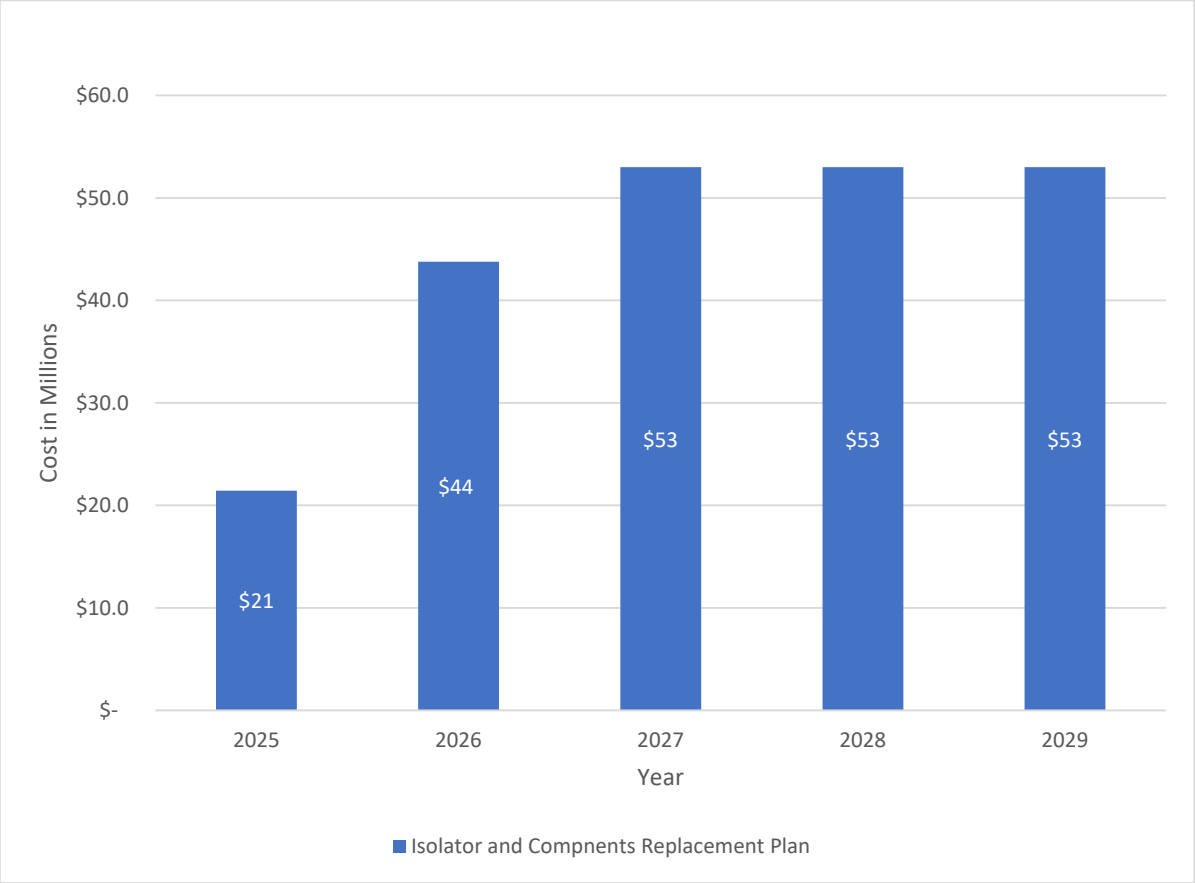
In addition to replacing overloaded isolators, the Company is replacing other overloaded components through its *LVD Lines Capacity Investment* subprogram, prioritizing projects based on the projected overload for the specific component and on a dollar-per-customer impacted basis.

The Company develops project proposals once components get loaded above the levels identified in Figure 59 below.

FIGURE 59

LOADING CRITERIA FOR OVERLOAD RISK REDUCTION

Device	Loading Criteria
Conductor	100%
Fuse	130%
Hydraulic Recloser	100%
Electronic Recloser	100%
Regulator/Booster	100%
Isolator	100%



LVD Overload Risk Reduction Investment Plan

The Company will address all the isolators and other components currently loaded at or above the component-specific planning criteria.

The 5-year investment plan for LVD Overload Risk Reduction is in Figure 60 below.

FIGURE 60

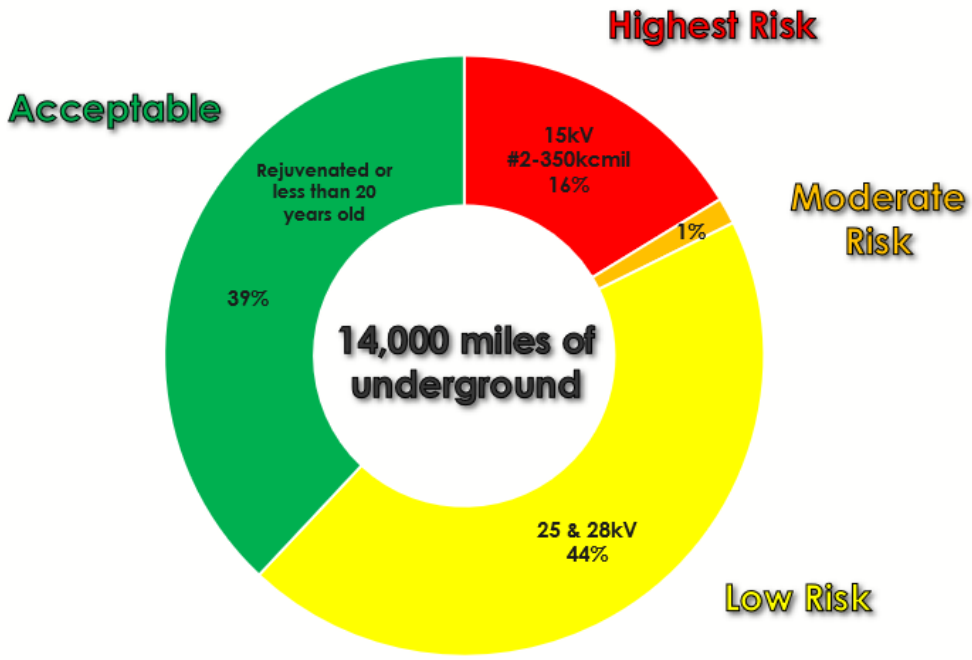
LVD OVERLOAD RISK REDUCTION INVESTMENT PLAN

Year	Isolators Replaced	Components Replaced
2025	6	40
2026	8	52
2027	11	68
2028	10	67
2029	9	66

As discussed in the Challenges from Customer Technology Adoption section, load-impacting technology adoption could greatly exceed present levels, depending on consumer behavior, leading the Company to anticipate where customer adoption is most likely.

Specific to EVs, the Company has completed studies to determine where residential EV charging is likely to occur by examining the likelihood of a customer having an EV based on several factors including income level, and customer proximity to another EV. Based on this user profile, the Company predicts the circuits with the highest density of EV adoption over the next 4 years and will continue to re-evaluate further in the coming years.

While historically EV adoption has been in higher income areas, the Company expects to see increasing adoption across all segments, given developments such as the used EV tax credit, the increasing range of EVs and low battery degradation over time, and more EV models coming to market in general.



LVD Vintage Underground Cable

There are unique risks applicable to the underground primary system. While underground cable has historically lasted beyond its expected lifespan, vintage underground cable does present a heightened risk of failure.

- Out of a total of approximately 14,000 miles of underground primary cable (that equates to 9,500 system line miles), the Company has an estimated 2,500 miles of 15 kV underground cable dating to before the 1980s.

Figure 61

LVD Vintage Underground Cable Risk

- As this underground cable ages, the insulating material begins to degrade, reducing the remaining service life of the cable. This at-risk cable is also unjacketed, leaving the neutral conductors exposed to accelerated deterioration from direct exposure to external elements, such as soil and moisture.

The Company has recently begun using cable injection to rejuvenate cable, initially rolling this approach out in the Grand Rapids and Flint communities.

Cable Rejuvenation is *the process of taking a cable out of service, performing neutral and air flow testing, injecting a fluid like insulation that solidifies over time, and then putting the cable back into service,* all **at a lower cost than replacing the cable with new**.

- Any cable that fails the testing portion of the process gets replaced with new, jacketed cable.
- Approximately 2,300 miles of the 2,500 miles is smaller cable serving residential subdivisions and small commercial businesses and is eligible for cable rejuvenation.

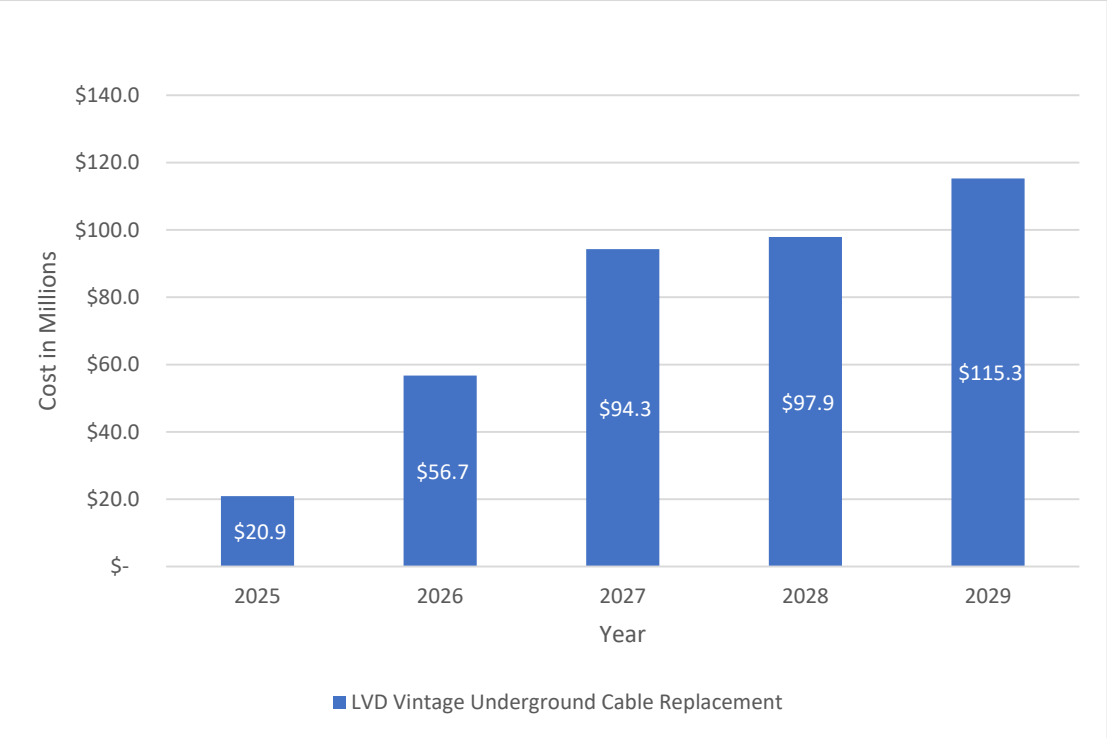
A third-party contractor performs cable rejuvenation work, and it is most cost-effective to have this contractor complete all work in one area before moving on to other parts of the system. Therefore, the Company has targeted the work in only two communities at this point—Grand Rapids and Flint, with projects planned additionally in the Traverse City area in 2025.

The Company plans to continue targeted 15 kV underground cable rejuvenation; prioritization is based on which underground zones have the worst zonal health scores as explained earlier in the LVD Zonal Health Investment Plan section. Additionally, project selection considers feedback from the Company's electric crews who provide insight into repetitive repairs or field conditions.

Cable that is not eligible for cable rejuvenation, whether because of size or insulation properties, requires additional funding for replacement as it also begins to approach end-of-life expectancy. Thus, as insulation properties of underground cables have improved due to advances in technology and manufacturing capabilities, the ineligible cable must be replaced instead of rejuvenated.

In addition to vintage underground cable rejuvenation, **the Company is planning an aggressive program to convert overhead lines to underground** to mitigate the risks from severe weather, and dramatically improve the resiliency of its electric grid. This program and its associated costs and benefits are detailed in the Resiliency Investments section of this report.

LVD Vintage Underground Primary Investment Plan



The Company will address all the 15 kV cable installed between the 1960s and 1980s, at a cost of $885 million over 9 years, beginning in 2025.

The program will ramp up each year until reaching a peak in 2031, then ramp back down through 2033 as the final cable replacements are completed. Near the completion of the program, the Company will evaluate the state of the rest of the underground system to determine the appropriate solution for the next highest risk cables.

The 5-year investment plan for LVD Vintage Underground Primary is shown below in Figure 62.

Figure 62

LVD VINTAGE UNDERGROUND PRIMARY 5-YEAR INVESTMENT PLAN

Year	Miles of Vintage Underground Cable Rejuvenated or Replaced
2025	51
2026	136
2027	226
2028	234
2029	276

Resiliency Investments

The increasing frequency of major and extreme interruption events due to severe weather has increased the Company's focus on ways to mitigate major weather events through resiliency investment.

Resiliency is defined as the *ability of the system to withstand a major event—particularly, a large or extreme storm—and the ability of the system to recover from a major event where damage occurs, minimizing the needed restoration and repair time.*

Reliability is defined as the *ability of the system to withstand normal variation and continue serving customers predictably*.

Resiliency and reliability are related.

- While *reliability* focuses on the typical days of the year, when conditions are normal, *resiliency* actions are focused on the much less frequent large or extreme storms. A resilient electric system yields reliable customer service by withstanding these extreme storms.

The following investment categories represent the Company's forward-looking investment in the grid to enable it to better withstand these extreme events, and to facilitate improved restoration times after these types of events occur.

LVD Undergrounding

The radial configuration of the LVD system and the proximity of large parts of the system to trees and other weather impacts necessitates additional investments to harden the LVD system to improve resiliency.

For one component of this, the Company has started to expand its underground system, strategically converting parts of existing overhead circuits to underground.

- Research conducted by peer utilities, most notably WEC Energy Group, has found that **undergrounding improves circuit performance by 90% or more,** as lines are no longer exposed to trees and other weather impacts.
- The Company estimates that **the cost to customers of undergrounding is comparable** to other means of hardening against trees and other weather impacts, such as by installing aerial spacer cable or tree wire.

The Company completed converting approximately 10 miles of overhead lines to underground in 2024 and early 2025, as approved in Electric Rate Case No. U-21389. This work was based on specific selection criteria. Following pilot completion, the Company retained most of its pilot selection criteria, but made adjustments to others, and is now using the following criteria going forward:

- Are single-phase sections of the system
- Have at least one outage in the last 24 months
- Serve between 10 and 200 customers
- Are operated at one of the three standard voltages
- Do not have other project work planned to enhance reliability
- Recent history of significant tree and weather-related outages
- Would have capacity available to account for future load growth

The Company plans to continue using these selection criteria to select undergrounding projects going forward.

Single-phase sections will have a lower conversion cost. Lines with at least one outage in the last 24 months were selected to provide more immediate benefit.

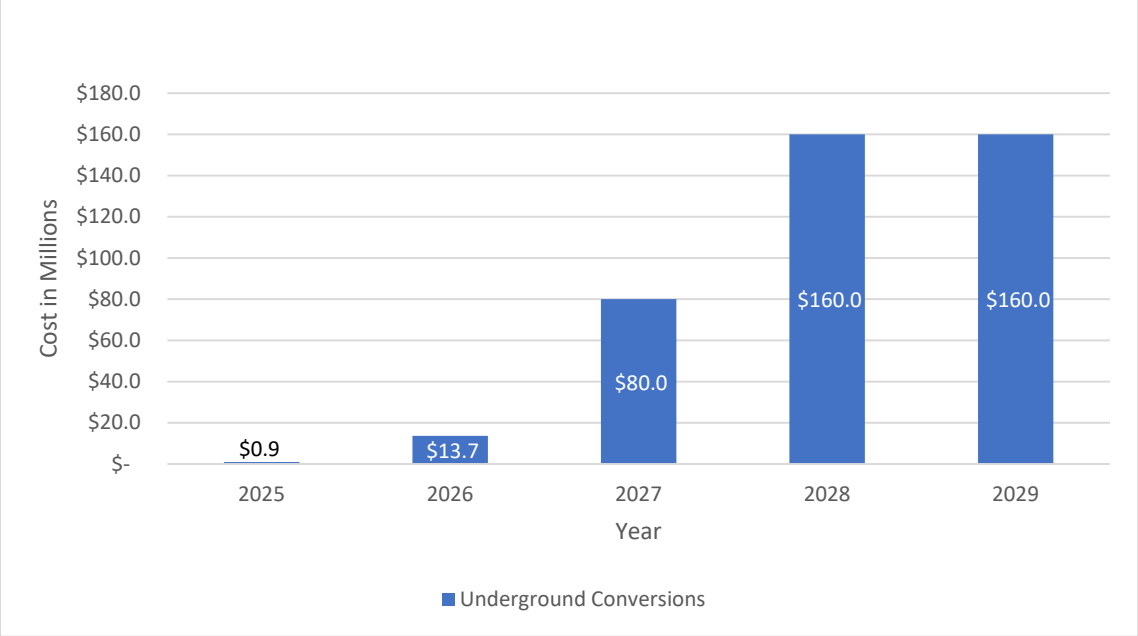
Limiting the customers served by the zone to between 10 and 200 ensures the project provides benefits to more than a few customers, while limiting the impact of any future outage on the underground facilities.

Underground conversion of only the three standard voltages ensures that additional costs are neither initially incurred on the additional equipment to accommodate delta configurations nor the conversion cost to a standard voltage later.

Similarly, selecting zones that are not considered for another reliability project avoids duplication of efforts. Underground conversion is considered an alternative when reliability projects are developed for targeted circuit improvement work.

Lines with recent history of significant tree and weather-related outages were selected to improve customer experience.

Actual costs and lessons learned from the undergrounding pilot has informed how the Company scales up its undergrounding work to ensure scaling the program will be successful.



- The Company is planning to ramp up undergrounding work to 400 miles of line annually. Future analyses will take place as the program progresses to determine if the scale of the program should be reduced or increased. Ultimately, approximately 3,200 miles of the LVD system may be evaluated for undergrounding based on the criteria listed above.
- In identifying circuits for undergrounding, the Company is considering whether circuits serve EJ communities, given that these communities are more vulnerable in the event they experience a long outage following a catastrophic storm.

The projected cost for this work is identified below in Figure 63, with the in the projects to begin again in 2026, and full annual capacity of the undergrounding work beginning in 2028. With only 16% of primary lines currently undergrounded, the Company has a much larger exposure to the elements than its regional and Michigan peers, who average 25% of their systems undergrounded.

Expanded, strategic underground conversion of more of the Company's system is imperative to bring the Company's system in line with its peers and thereby improve reliability and resiliency for customers.

Figure 63

UNDERGROUND CONVERSIONS 5-YEAR INVESTMENT PLAN

Year	Underground Conversion Miles

2027	200
2028	400
2029	400

Fractionalization

On average the Company's LVD circuits are 30 miles with an average of 1,045 customers. Circuits with mileage exceeding the average exposes our customers to a much higher risk of weather-related outages.

Fractionalization, described earlier in the Five Fundamentals Approach, is another approach used by the Company to improve resiliency on the LVD system and involves **segmenting existing LVD circuits into smaller sections with fewer customers.**

- At present, this work takes place in substations, adding new transformer banks and circuit exits so that more circuits with fewer customers can be served from that substation. **This reduces the number of customers affected when there is an outage on a given circuit.**
- Fractionalization also provides more opportunities for load switching if an outage occurs, allowing for improved fault isolation and faster restoration of customers.
- Additionally, fractionalization results in fewer line miles for line workers to patrol and repair, further reducing outage times.

In the near term, the Company is primarily focusing fractionalization on circuits in the top 3% of customer count, and overhead line exposure; circuits in this top 3% serve more than 2,400 customers or have more than 90 miles of overhead lines as shown below in Figure 64, with the 5-year investment plans shown in Figure 65.

Figure 64

Automatic Transfer Recloser (ATR) Loops

ATR loops have been an integral part of the Company's resiliency plan over the last decade.

Deploying ATR devices on adjacent LVD circuits enables **automatic transfer of customers if an outage occurs. This reduces customer outages and improves system reliability** by isolating a faulted section of a circuit.

- As of March 2025, there are 174 loops in service throughout the state.
- In 2024 alone, there were 138 instances in which an ATR loop operated, avoiding 21.9 million customer outage minutes, and preventing over 77,000 customers from experiencing an outage.
- Over the next five years, the Company plans to deploy between 25-35 additional loops annually to enhance automation on the grid and increase reliability savings.

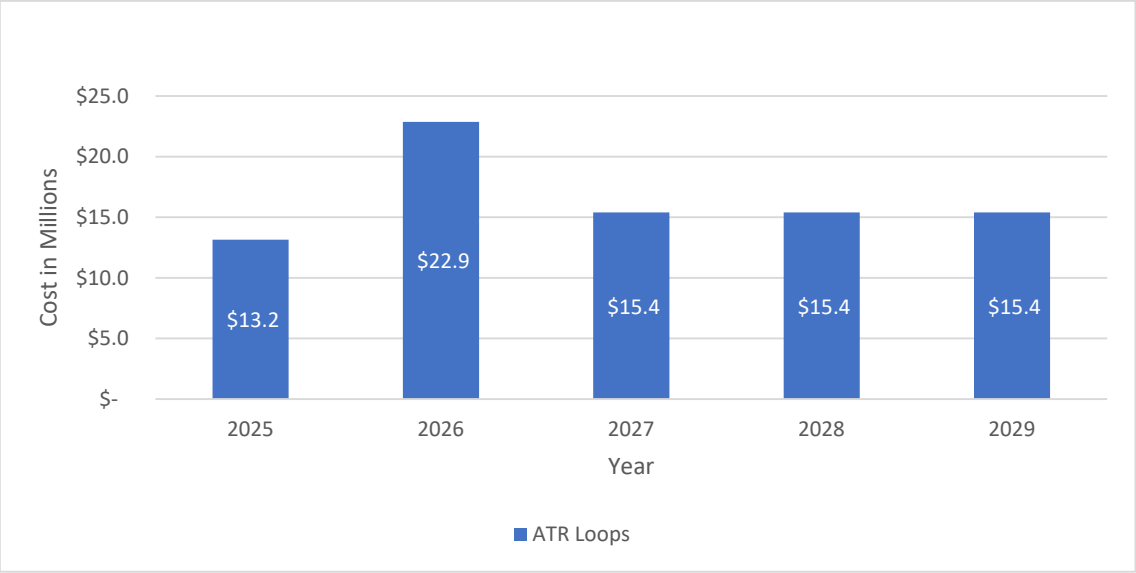
As the ATR loop deployment matures, the Company is employing new, complex planning techniques to maximize benefits.

Currently, the Company is using "load limited" and "mutually exclusive" loops to enable ATRs, and to get the most out of the distribution system's capacity to avoid costly equipment upgrades, while still achieving significant automation benefit.

Previously, the Company may have ruled out an ATR solution for circuits where peak load conditions would exceed the equipment's thermal or loading ratings.

- Using ADMS, the Company can create real-time alerts that inform system operators when a circuit is approaching its peak load. Loops on these types of circuits are called "load limited."

Similarly, the Company has expanded the ATR loop selection criteria to include circuits fed from the same substation as an existing loop.



- To avoid overloading a substation transformer, alerts have been set up to notify operators when one of these mutual-substation loops has operated. These alerts trigger established processes for the operator to remotely disable loop scheme capability. Loops on these circuits are called "mutually exclusive."

These "load limited" and "mutually exclusive" loops allow for more circuits to be considered in the selection process, and as a result the Company can increase the achievable benefits from this investment category.

The ATR loops 5-year investment plan is shown below in Figure 66.

Figure 66

ATR LOOPS 5-YEAR INVESTMENT PLAN

Other LVD Investment Areas

LVD Transformers

What Transformers Do

Distribution transformers convert voltage levels to enable customers to use standard equipment in their household or business.

- Within the overall category of LVD transformers, *isolators* are a specific type of transformer used to convert one primary voltage to another primary voltage.
- *Regulators* are a special transformer that ensure primary voltage remains in the desired range for reliable end-of line-voltage for customers.

In all, distribution transformers provide safe and reliable service to new and existing customers at an acceptable, reliable voltage. The correct transformer, sized to meet the customer's usage, is key to providing a reliable service experience.

Number of Transformers in Service Territory

There are roughly 600,000 padmount and pole mount transformers units active.

Lifecycle Analysis

The overall average lifespan of a distribution transformer as quoted by transformer manufacturers is approximately 25 years.

However, a typical transformer can exceed the manufacturer's lifespan, depending on different factors. The load and environment have the largest contribution on the health of a transformer and it's common to see transformers exceed 30 or 40 years of life.

The average transformer in the Company's service territory is 47 years old.

Supply Chain Risk

Across the industry, utilities including the Company face risk related to transformer availability.

The strain on raw materials, which began in 2020 because of the COVID pandemic, put a major constraint on transformer production in the United States. Resource scarcity also drove up the cost of transformers. However, the Company has been able to manage this supply chain risk through three strategies:

1. Using longer-term purchase contracts with vendors instead of spot purchases
2. Using a broader pool of vendors (see more below)
3. Planning further ahead for anticipated and forecast demand

High Load Risk

Transformers will be directly impacted by increased electrification of consumer appliances and transit.

The Company is anticipating the need to upgrade transformers more frequently due to the increasing loads with EV chargers, heat pumps, and other home electrification efforts.

In short, as customers begin using more electricity, the Company will have to replace more transformers more frequently to provide service for the new customer load.

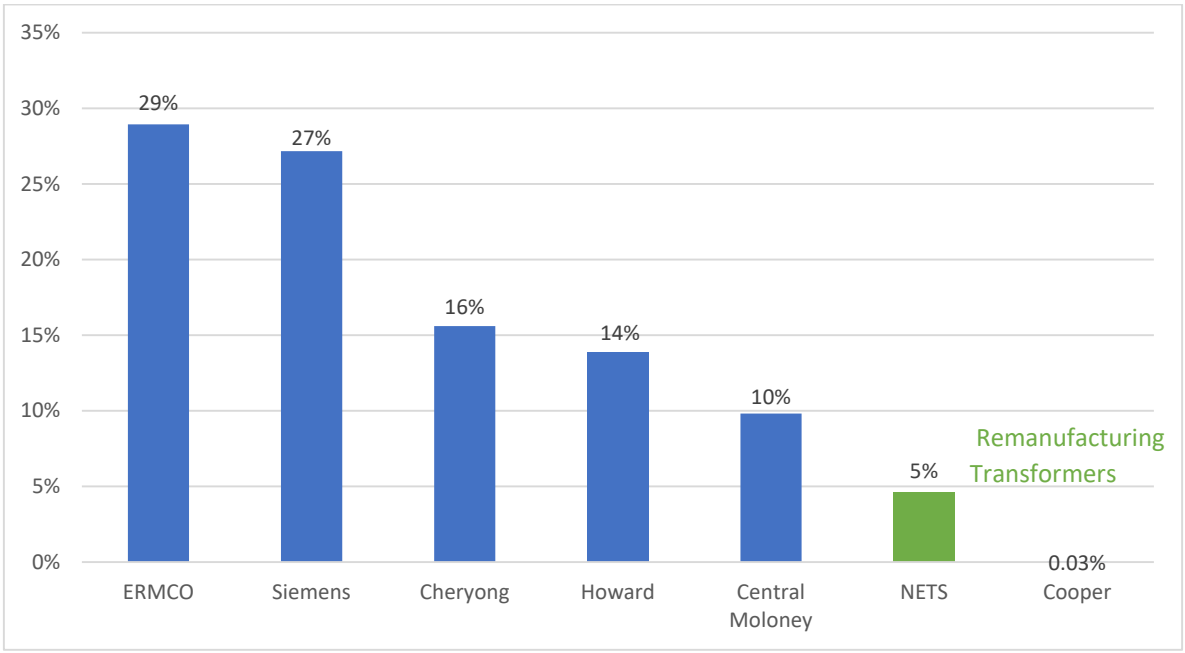
Load Growth Risk

Transformers also face risk when customers drastically increase their load without notifying the Company.

Residential transformers are sized to meet traditional residential demand load. However, when customers add load after a transformer is installed without notifying the Company, this can put a major strain on the transformer and other customers whom that transformer serves.

New activities, like indoor growing operations installed in a residential home, create voltage problems for customers as well as overloads on transformers, which can lead to an earlier than expected end of life for the transformer up to and including failure.

The Company is working to diversify its supply chain and enhanced the standards of new transformers to meet the increased customer load of the future. This will help ensure we have enough transformers on hand to support our existing customers as well as meeting any new requests for electric service.



- In addition to exploring new contracts with additional suppliers, shown in Figure 67 below, the Company is also reviewing different styles of transformers that are compatible with its grid, such as *amorphous core* style units and dry type transformers.

  NOTE: Amorphous core transformers differ from traditional silicon steel transformer cores in that amorphous cores are made up of ribbons of metal that are *not* grain-oriented versus a rolled sheet of grain-oriented steel that is used in a traditional silicon steel core. **This difference in construction results in lower voltage losses in the voltage transformation process.**

The Company is also updating its standards to account for the anticipated addition of EV chargers on new builds and remodels. Taken together, these strategies will ensure the Company is able to prepare for the future while continuing to provide reliable service.

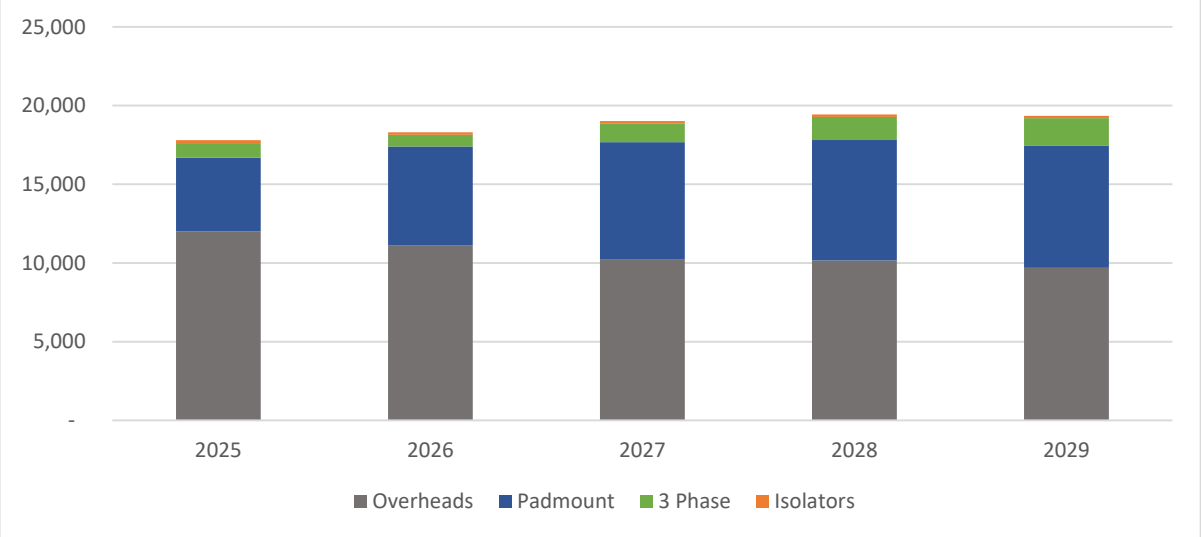
Figure 67

PERCENTAGE OF TRANSFORMERS ORDERED FOR 2025 BY SUPPLIER

The Company will procure enough transformers to serve new load requests and restore power in the event of unplanned outages on the system.

These estimates account for the drastic increase in transformer costs we have realized in 2023 as well as additional need for transformers to be available for EV adoption over the next 5 years.

The 5-year Investment Plan for LVD Transformers



As a result of delays stemming from the COVID-19 pandemic, the Company received increased deliveries of overhead transformers in 2023 and 2024 to restock inventories of those units.

In 2025, we expect purchase volumes to return to pre-pandemic levels with some additional demand factored in. From then on, we expect that purchases of overhead transformers will remain generally level.

The Company expects a significant increase in purchases of padmount transformers tied to increased undergrounding work and the need to support customers adopting electric vehicles. This is reflected in the 5-year investment plan and unit forecast in Figure 68 below.

Figure 68

PLANNED TRANSFORMERS TO BE PURCHASED

TYPE	*2025*	*2026*	*2027*	*2028*	*2029*

Meters

What Meters Do

Electric meters, meter sockets, and metering transformers are needed to **provide safe and reliable measurement of electricity usage** for customers.

LVD Metering investments support the Company's obligation to serve, and provide the means to measure customer electricity usage, provide the data required to generate customer bills, and provide usage data to customers safely and accurately.

Furthermore, smart meters provide customers with data to enable them to take greater control of their energy consumption.

Metering is an essential part of connecting new customers through its overall New Business Program, as well as replacing failed equipment. Additionally, *advanced metering* is an essential component in many of the Company's current and future demand response and renewable programs.

- *Advanced Metering* is defined as *an integrated system of smart meters, data management systems, and communication networks that enable two-way communication between the utilities and the customers.*

Number of Meters in Service Territory

There are roughly 1.92 million electric meters currently installed, of which 1.90 million are smart meters. The remainder are a combination of legacy (non-communicating) meters, and commercial or industrial meters.

Lifecycle Analysis

The overall average lifespan of an electric meter is 20 years. However, with the deployment of cellular smart meters, meter lifespan can be affected by the availability of the communications network, as meters contain communications modules that are network-specific, such as 3G LTE, 4G LTE and 4G CATM1.

3G Meters

From 2021-2023 the Company worked to exchange and upgrade 620,000 3G meters to 4G CatM1 technology, which is 5G forward compatible.

The goal of this project was to have all 3G meters off the system when Verizon retired its 3G LTE network. Beginning in 2023, Verizon retired the 3G LTE network making the remaining 188,000 3G meters obsolete. The Company has since completed the remaining exchanges. As of November 2, 2024, there are only 15 3G meters remaining, only 1 of which has a customer attached.

4G Long-Term Evolution ("LTE") and 4G CatM1 Meters

As of June 2023, there are 1.18 million 4G LTE meters installed on the Company system, and 700,000 4G CatM1 meters.

The Company's 4G LTE communications network provider, Verizon, has not provided a definitive date for the retirement of the 4G LTE network, but they expect to maintain the network into the mid- to late-2030s.

With that in mind, the Company is evaluating its existing metering technology, vendors, and software, including technology to support future electric and gas system integrations (e.g., Distributed Energy Management Systems ("DERMS") and edge-DERMS, among other systems).

By year-end 2025, the Company expects to have defined a strategy for eventually replacing 4G meters that accounts for Verizon's timeline.

The Company's strategy will be heavily informed by the overall investment required. Once a strategy is set, the Company will maintain the existing technology and the existing population of 4G LTE and 4G CatM1 meters for the next three to four years before transitioning to 5G meters.

The Company is also considering advanced metering infrastructure ("AMI") software that can be integrated with other grid operations software, including DERMS and edge-DERMS.

The choice between AMI technologies will not impact AMI purchasing decisions in 2025, but the choices the Company is evaluating may impact the Company's future meter purchases. Until a software decision is made, the Company cannot say what type of meter it may decide to purchase in the future.

In the meantime, the Company is currently purchasing 4G CatM1 meters, which are 5G forward compatible and therefore would not need to be replaced to use the 5G network.

With the current AMI technology in use, gas meter reads for combination gas-electric customers are transmitted to the collection system via the electric meter. Due to this interdependency, the Company must look at any future updates or changes to the AMI system holistically.

The Company identified scenarios in 2023, and in 2024 it began analyzing each scenario. The scenarios include maintaining existing technology (status quo), using a single meter vendor, and using multiple meter vendors. To test the scenarios, the Company is performing a SWOT (Strength, Weakness, Opportunity, Threat) analysis, evaluating each scenario's advantages and disadvantages.

The Company is also looking at similar functionality in use today, including automated reading, remote turn-on and turn-off, and other new functionalities being offered such as grid-edge computing.

The Company's business case for future AMI technology, when developed, will prioritize replacing technology that is obsolete.

Metro System

What the Metro System Does

The Company's Metro system provides underground electric distribution service in the downtown areas of Battle Creek, Flint, Grand Rapids, Jackson, Kalamazoo, and Saginaw.

Metro distribution assets consist of conductors contained in duct banks encased in concrete, with transformers and switching points placed below ground in larger working spaces called vaults and smaller working spaces called manholes.

Some of the cables are made of oil-and-paper-insulated, lead-sheathed conductor that is no longer manufactured.

The Metro system also includes padmounted switchgear, which consists of above ground switches and fuses in steel enclosures and padmounted transformers.

The Metro system promotes safety by ensuring the public does not encounter energized equipment. It also promotes aesthetics, and ensures it is less disruptive to the community and businesses to conduct repairs.

Number of Assets in Service Territory

As of 2024, Metro infrastructure includes 156 total vaults and 1,429 total manholes. Vaults and manholes are connected to each other through duct banks.

Lifecycle Analysis

The expected lifecycle of Metro assets is between 45 and 62 years, with civil assets lasting longer than electrical.

Much of the Company's Metro infrastructure was first installed from 1910 through the 1950s, and is still in service today.

The average lifecycles for Metro assets along with the average ages of these assets that were retired between 2017 and 2021, are shown in Figure 69 below.

Note that many assets are beyond their expected useful life, with some assets functioning for more than double the expected life.

FIGURE 69

METRO LIFECYCLE DATA

Device	Metro Conduit/Civil Infrastructure	Metro Conductor and Electrical Assets	Metro Transformers	Metro Services
Expected lifecycle	60 years	62 years	47 years	45 years
Average retirement age, 2017-2021	88 years	61 years	N/A	46 years
Maximum retirement age, 2017-2021	121 years	101 years	N/A	69 years

Public and Employee Safety Risks

Vaults and Metro system represent a minor public safety risk due to assets being located underground in public rights of way (typically under the sidewalk), making accidental public contact exceedingly rare.

Metro System Asset Health and Risks

The Metro system consists of two primary components:

- Civil infrastructure consisting of vaults, manholes, and duct banks.
- Electrical infrastructure consisting of conductor, transformers, and controlling devices.

Each infrastructure type has unique risks detailed below.

Civil Infrastructure Risks: The biggest risk to civil infrastructure is the age and physical size of vaults, manholes, and duct banks. Today's modern electrical cables, controlling devices and transformers require more physical space to safely maintain and operate this electrical equipment.

Electrical Infrastructure Risks: The biggest risk to the electrical infrastructure in the Metro system is driven by the live primary exposed parts in vaults and padmount switchgear, which presents a safety risk to the Company's workforce. Due to the enclosed space of the vaults, employees must take precautions to maintain working space clearances when working around these live metal parts.

Lead Risk: Another risk to the electrical infrastructure in the Metro system is driven using Paper Insulated, Lead Covered ("PILC") and Varnished Cambric, Lead Covered ("VCLC") primary cables. As noted above, this type of cable is obsolete and no longer manufactured; the existing lead conductor in the Metro system is more than 50 years old. Because of this obsolescence, if lead cable fails it cannot be replaced, and instead must be spliced back together, which is a laborious process. As of 2024 the Company has more than 240,000 feet, or approximately 11% of the overall Metro system, of primary lead-covered cables of various sizes in service interconnecting the vault system to the metro substations.

Modeling & Prioritizing Risk

Metro planning and design engineers use a model to assess multiple components of each vault which produce a vault health score ranging from 0 to 180.

These components are assessed first to determine whether the risk is present, then given a multiplier based on the severity of the risk.

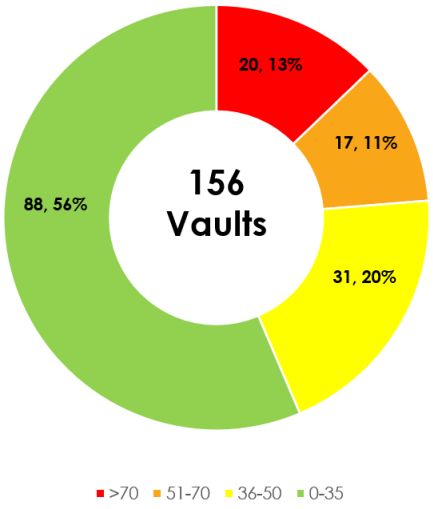
- Vaults with some risks present will receive a weighted score with the highest weighting given to wall, roof, and entrance condition as well as electrical connections.
- Based on the severity, a vault will be labeled as Yellow or Red, which will then multiply the score by 1 or 2, respectively.
- Vaults with no risk for a certain component are assessed as Green with a multiplier of 0.

Figure 70 below shows how the evaluation criteria is applied to a hypothetical vault.

FIGURE 70
METRO RISK ASSESSMENT MODEL

		Weighting:	10	10	10	2	4	3	1	10	7	2	5	5	4	3	4	3	3	2	2	180
			Civil							Electrical												
Asset Name	Reviewer	Review Date	Roof condition	Wall condition	Entrance condition	Entrance Location	Ventilation	Cable Rack Condition	Depth of water, as found	Electrical Connections live/dead	Working space	Switch type	Switch Condition	Transformer condition	Equipment sized for Fault Current	Grounding/Bonding Conditions	Lead cable	Splice Condition	Fireproofing/Arc Tape	Primary configuration (delta or grounded)	Alternate primary feed	Total Score
Sample Vault			R	R	R	G	G	Y	G	R	Y	Y	Y	Y	Y	Y	Y	G	R	G	G	119

Based on an assessment of these characteristics, a vault with a score above 70 qualifies for a red rating, which indicates major deterioration. A score between 51 and 70 is given an orange rating, showing moderate deterioration.



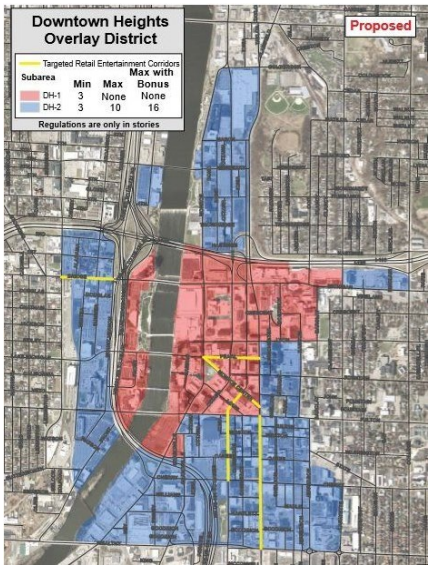
As of 2024, the most recent Company assessment of its vault health is shown in Figure 71.

This indicates that 24% of the vaults inspected show major or moderate deterioration, which the Company will prioritize.

In 2023, 27% of vaults had major or moderate deterioration; this drop is attributed to the reliability work executed over the past year. It is also important to note a drop in high-risk 'red' vaults from 28 vaults in 2023 to 20 today.

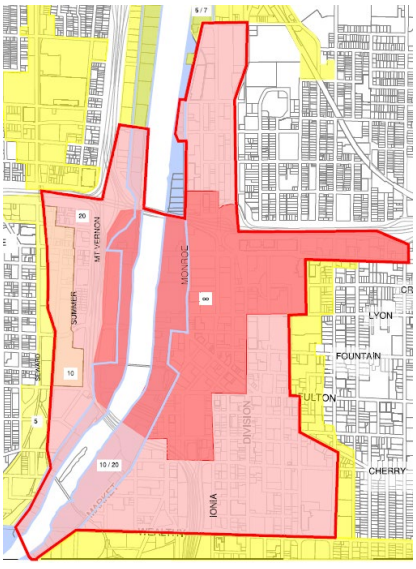
FIGURE 71

SUMMARY OF METRO HEALTH VAULT ASSESSMENT RESULTS



Metro System Growth & Expansion

In addition to the asset health risks on the existing Metro System, the Company is responding to major transformative plans publicly shared by municipalities that will spur economic growth, address housing shortages, and enhance urban vitality.



Grand Rapids is the leader in this effort. In 2023, the city approved zoning changes to allow for taller buildings in the downtown area, and expanded this area outside to the west, south and north of the traditional downtown area. These zoning changes built on earlier ones from 2017.

Figure 72

Grand Rapids Zoning Changes

2017 Height Overlay

2023 Height Overlay

In these maps, the red areas allow for unlimited building heights. In the 2017 map, the blue areas had a 10-story limit on building height. In the 2023 map, the pink areas now have a maximum building height of 20 stories.

Since the approval of the new height overlay district in Grand Rapids, developers have approached the Company with plans for new civic assets, including the planned Acrisure Amphitheater and Amway Soccer Stadium.

Each civic asset project includes additional housing development projects to address housing needs in Grand Rapids. The Acrisure Amphitheater and Amway Soccer Stadium site developers have proposed a 21-story mixed use building with 475 residential apartments near the amphitheater and a 18-story mixed use building to include 260 residential apartments.

These proposals include a Transformational Brownfield Plan approved by the Michigan Strategic Fund.

Additionally, Fulmar Property Holdings has proposed a major project with three high rise towers, including:

- 21-story, 420,000 sq ft office tower
- 43-story, 595-unit apartment tower
- 27-story, mixed use hotel and condominium tower

FIGURE 73

ILLUSTRATION OF NEW DOWNTOWN GRAND RAPIDS DEVELOPMENT

Similar developments are taking place in Kalamazoo, including a $300 million event center, along with other civic improvements including flood control and relocation of Arcadia Creek, and conversion of the city's one-way streets to two-way multimodal traffic flows. Existing Metro infrastructure under these one-way streets (Michigan Avenue and Kalamazoo Avenue) is at end of life.

The Company is taking the opportunity to rebuild the system as a 'coordination of utilities' project in 2026 and beyond.

FIGURE 74

ILLUSTRATION OF KALAMAZOO EVENT CENTER DEVELOPMENT

Additionally, the City of Saginaw, Saginaw Future, and other stakeholders have announced development of the Saginaw Medical Diamond Project, bringing medical education facilities, mixed-use commercial property, residential property, and a new waterfront park on the south side of Downtown Saginaw. The Company has committed to doing a coordination of utilities project with this development, converting existing overhead systems into a new Metro infrastructure.

FIGURE 75

ILLUSTRATION OF SAGINAW MEDICAL DIAMOND PROJECT

Investments to Address Metro Asset Health & Expansion

The Company's ideal end state would be to rehabilitate and deadfront all the vaults with moderate or major deterioration.

- The Company's strategy for civil infrastructure is to rehabilitate or rebuild at-risk vaults, manholes, and duct banks in a way that, whenever possible, aligns with projects undertaken by municipal governments, commonly referred to as 'One Dig' or 'coordination of utilities' projects.
- The preference for coordination with local authorities means that the Company cannot unilaterally decide to rehabilitate all 'red' or 'orange' vaults over a defined near-term period.

In some instances, the Company may still need to act unilaterally to execute Metro projects. Examples of this kind of situation happened recently in Jackson, where the Company rebuilt its civil infrastructure in Cortland Street between Martin Luther King Street and Mechanic Street. The Company was able to consolidate to existing vaults into one new structure. This work was done solely by the Company without coordination of other utilities or the municipality.

To ensure optimal performance and operation of the Metro system, the Company carries out the following actions to properly protect and maintain its assets:

Deadfronting and Vault Rehabilitation

The Company performs Metro vault rehabilitations and reliability deadfront projects to remediate risks to identified vaults.

The *Deadfronting* process is used to reduce employee exposure to live equipment and *involves replacing exposed primary termination points and bushings with covered or insulated components to reduce the risk of workers contacting energized components*.

Rehabilitation projects will typically replace the vault structure and its electrical components in its entirety.

The pictures in Figure 76 show the difference between exposed and deadfronted components on rehabilitation project, with a new vault installed to replace the existing structure.

FIGURE 76

VAULT BEFORE AND AFTER REHABILITATION PROJECT

The pictures in Figure 77 show a vault reliability project that rebuilt the electrical infrastructure and performed minor concrete repairs.

FIGURE 77

VAULT BEFORE AND AFTER RELIABILITY PROJECT

Replace Obsolete Electrical Assets

To remediate risks posed by obsolete lead cable, the Company has an initiative to modernize primary cables, allowing them to be more modular so additional cable can be added later if needed.

- Modernizing primary cable also improves capacity and resiliency and creates more capability to accommodate grid modernization components.
- Replacing PILC cable reduces environmental impacts during operations such as dewatering manholes or vaults and reduces occupational hazards when working on lead cable joints and splices.
- PILC cables are no longer manufactured, with replacement cable, joints, and splice materials becoming scarcer.

Metro Inspection and System Maintenance

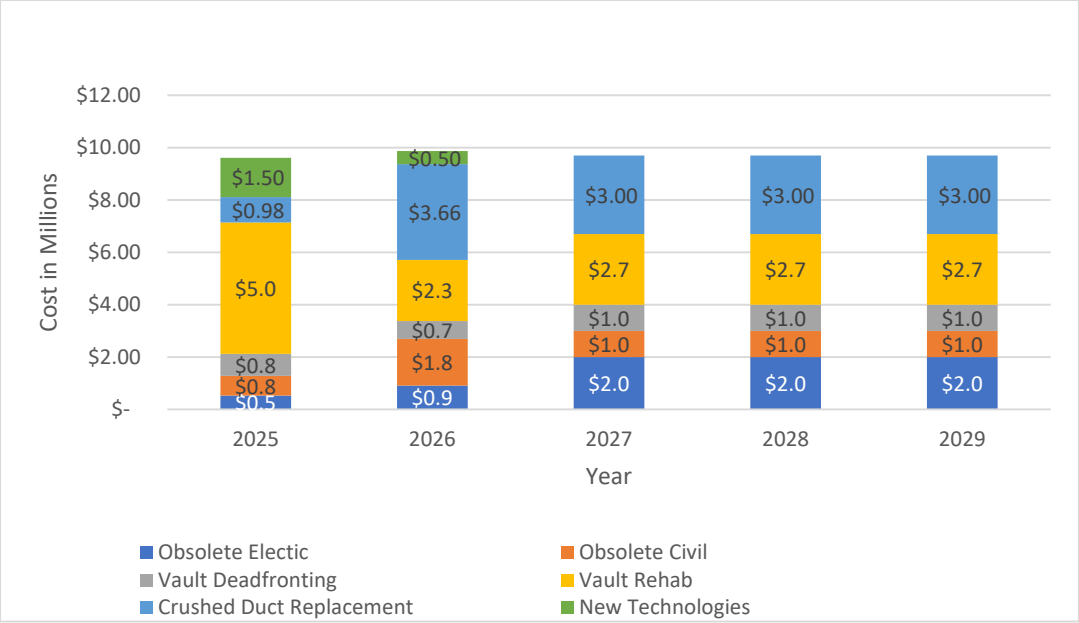
The Company is reducing reliability and safety risks through its metro inspection and maintenance programs based on recommendations by the *IEEE, NFPA (70B)* and industry best practices.

The Company is proposing the following schedule, shown below in Figure 78, based on good engineering practice to help identify and correct problems before they result in outages.

FIGURE 78

METRO INSPECTION AND MAINTENANCE SCHEDULE

Inspection Task	Cadence	Components Checklist	Annual Cost
Vault Inspections	4 Years	Visual Inspection of vault structure, transformers, switches, cables and other components	$ 650k
Manhole Inspections	4 Years	Visual Inspection of manhole structure, cables, splices, and other components	$ 1,100k
'Hi Rise' Vault Inspections	Annually	Visual Inspection of the room/structure, transformers, switches, cables, and other components	$ 125k
Infrared Thermography Inspections	As Needed	Inspection of electrical components. Can be performed with visual inspections	$ 125k
Total	**$ 2,000k**		



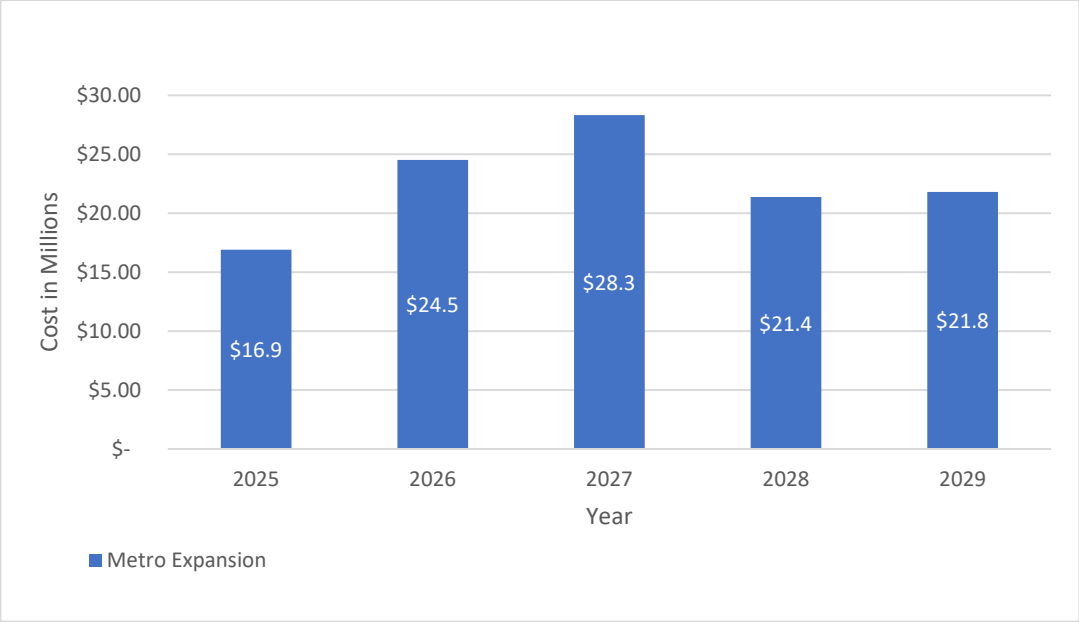
5-Year Capital Investment Plan

The Company will invest in its vaults and primary cable replacement in coordination with local governments to limit interruption of business and commerce in the municipality.

- This plan will enable the Company to complete approximately four vault rehabs, deadfront two vaults, and replace obsolete electric and civils assets on 4 or more vaults per year.
- The 5-year investment plan for the Metro system (shown below) will address workforce safety, reliability, and operational constraints.

Figure 79

METRO RELIABILITY CAPITAL INVESTMENT PLAN



Year	Electric Projects	Civil Projects	Vault Deadfronting	Vault Rehabilitation	Crushed Duct Replacement
2025	1	1	2	6	1
2026	3	2	2	3	1
2027	4	2	2	4	1
2028	3	1	2	4	1
2029	3	1	2	4	1

The Company will invest in new business by expanding its system as appropriate.

The Company will also increase its relocation program to do 'coordination of utilities' with our municipal and internal partners.

Figure 80

METRO EXPANSION CAPITAL INVESTMENT PLAN

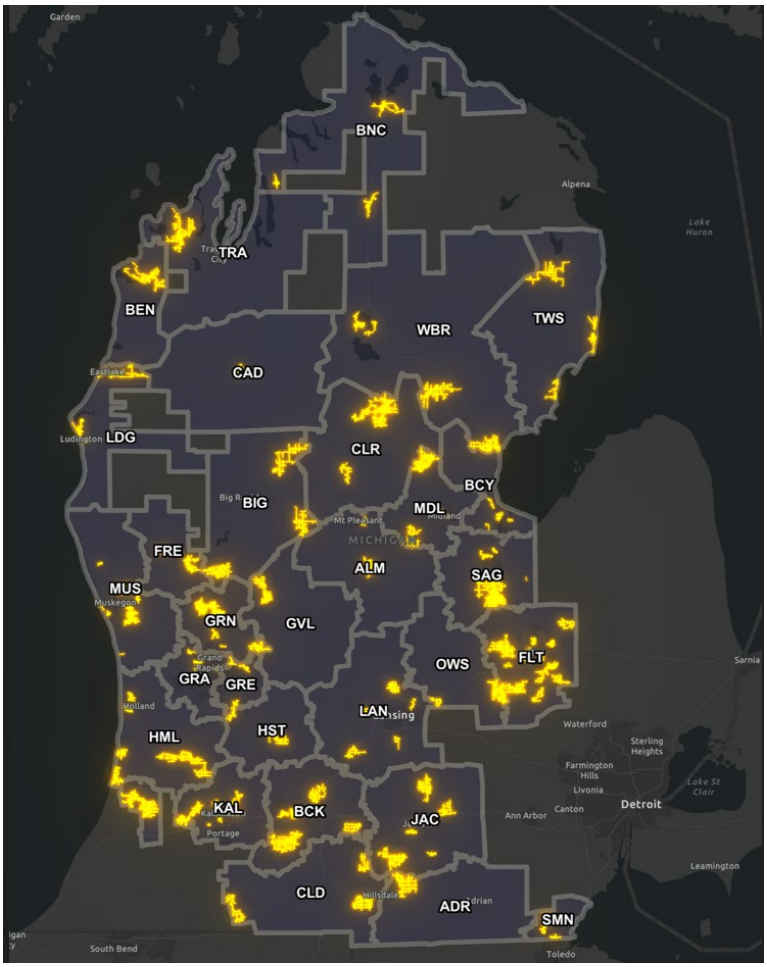
Year	New Business Primary Service	New Business Secondary Service	External Coordination of Utilities	Internal Coordination of Utilities
2025	10	20	25	5
2026	8	20	25	10
2027	5	15	20	10
2028	5	15	10	5
2029	5	15	10	5

Forestry Line Clearing Program

Trees are one of the greatest causes of interruptions to electric service to customers on the LVD system, contributing 43.4% of all-weather outages and 37.9% of all non-MED outages[10].

The Forestry *Line Clearing Program* manages vegetation (trees, bushes, vines, etc.) along its primary voltage systems and its secondary voltage systems, including service conductors.

[10] Percent of customers interrupted by unplanned outages in 2024 with cause code of Trees or Trees - Outside ROW.



Overview of the Line Clearing Program

The Company clears vegetation within a 30-foot-wide right-of-way ("ROW") for primary voltages to attain a minimum of 10 feet of separation between conductors and vegetation at the time of clearing. This is to maintain accessibility along the ROW for maintenance and repair of the line.

- The largest subprogram within the *Line Clearing Program* targets **full circuit clearing,** where advanced analytics identify work locations throughout the service territory on a full-circuit level.
- This portion of work, encompassing several thousand miles of LVD primary wires, is shown in the 2024 workplan snapshot in Figure 81 below, in which the geographic locations of circuits to be cleared are highlighted in yellow.

Figure 81

2024 LVD FULL CIRCUIT CLEARING WORKPLAN

The Company's *Line Clearing Program* also provides benefits that are not easily quantified, such as **improved habitat for many plants and animals (including threatened and endangered species) and decreased risk of wildfires from tree contacts with conductors.**

The Company has been continuously maintaining a four-year clearing cycle for its HVD system. For its LVD system, the Company has been working for several years towards attaining a seven-year effective clearing cycle, but has not yet attained this cycle.

The seven-year effective cycle describes a strategy of clearing one-seventh of the LVD system miles per year with different targeted cycle lengths of clearing for the three major primary voltages on the LVD system.

Upon achieving the seven-year effective cycle:

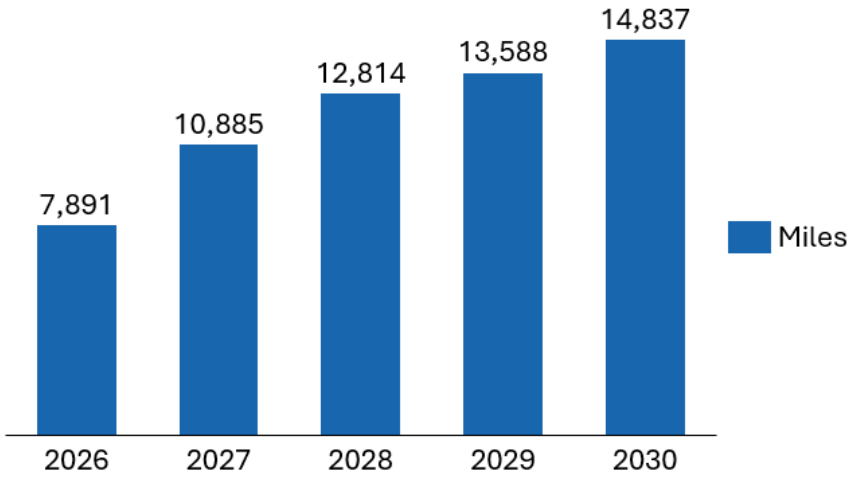
- 14.4/24.9 kV circuits would be cleared on average between four to six years;
- 7.2/12.47 kV circuits would be cleared on average between six to eight years; and
- 4.8/8.32 kV circuits would be cleared on average between eight to ten years.

Clearing timeframe in these ranges would be dependent on the circuits' historical performance, reliability predictions, and safety considerations.

Vision for the Line Clearing Program

The Company is proposing to maintain a four-year clearing cycle for its HVD system.

For its LVD system, the Company is proposing a ramp-up to a five-year clearing cycle, while performing more aggressive line clearing on targeted three phase primary lines.



The five-year cycle strategy will involve clearing one-fifth of the Company's LVD line miles annually in steady-state cycle maintenance, while maintaining the standard that all LVD circuits have been fully cleared within a five-year period.

The Company finds that this strategy aligns with other utilities, and it has carefully evaluated the projected costs and benefits of a shorter line clearing cycle for its LVD circuits. It has determined that a five-year line clearing cycle is the right approach to significantly improve electric reliability while responsibly managing customer bill impacts.

The number of LVD miles to be cleared annually over the ramp-up period to achieve the Company's vision are displayed in Figure 82 below.

Figure 82

LVD FULL CIRCUIT CLEARING MILES

In addition, the Company will conduct more aggressive line clearing on targeted three phase primary lines through the practice of canopy removal, which is the removal of all branches above primary wires. This practice is in addition to current line clearing specifications.

- The Company's specification for LVD primary has allowed some canopy to remain (i.e., healthy, non-weak-wooded tree species canopy is cleared to 10-15' from the conductors, and certain weak-wooded tree species canopy clearance is increased to 20' from the conductors).
- The Company performed a small canopy removal study on approximately 42 miles of three phase primary in 2022.

Figures 83 and 84 show examples of canopy removal on an urban and rural section of circuit respectively, pre- and post-clearing in 2022.

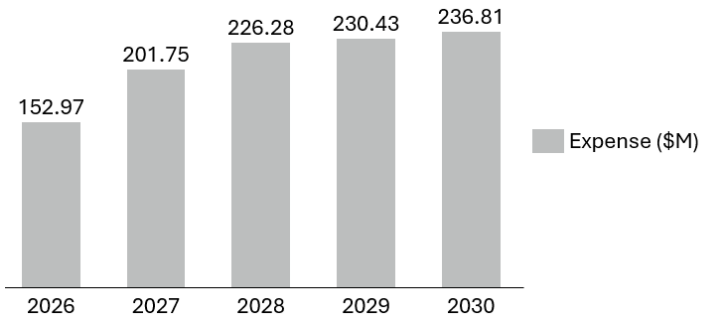
Figure 83

CANOPY REMOVAL ON AN URBAN SECTION OF CIRCUIT, 2022

Figure 84

CANOPY REMOVAL ON A RURAL SECTION OF CIRCUIT, 2022

The Company is proposing canopy removal on 10%, or roughly 5,500 miles, of overhead primary, targeting three phase portions of circuits. This includes targeting three phase lines that:



- Have the highest consequence of failure due to serving the most downstream and/or critical customers.
- Enable manual and automatic switching capabilities, reducing the impact of outages that may occur regardless of cause.
- Will inherently include first zones, some second zones, and may extend past the second zone depending on the zone attributes, like customers served downstream, and/or if the conductor is within the path of substation-to-substation connection to enable switching opportunities.

Enhancing the Company's Line Clearing Program by reducing the cycle will improve reliability and public safety. Reducing the amount of time that passes between clearings results in a smaller amount of growth, and therefore less biomass removed at the time of clearing. This results in a predictable result for customers on what their trees will look like after line clearing.

The projected LVD expenses over the ramp-up period to achieve the Company's vision are displayed in Figure 85 below.

Figure 85

LVD VISION PROJECTED EXPENSES

Reliability Benefits of the Line Clearing Program

- The Company's vision will result in clearing an increased number of miles each year to attain the reduced cycle. Line clearing reduces the risk of tree-conductor interference, which can cause customer outages. The prevention of outage incidents results in a better customer experience through reduced tree-caused SAIDI and SAIFI. For circuits cleared entirely in 2022, tree-caused primary outages including MED decreased 60% the year following clearing.
- For circuits cleared entirely in 2022, tree-caused primary outages excluding MED decreased 63% the year following clearing.

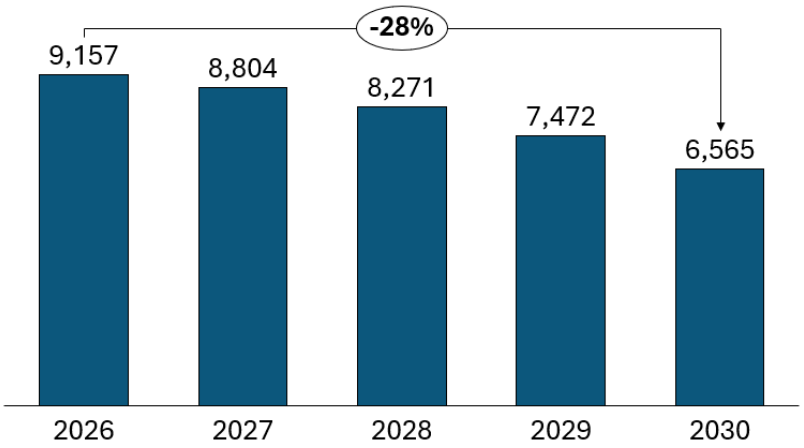
Previous analysis indicated, following completion of line clearing, the average LVD circuit reliability improves by:

- Approximately 300 fewer customers experiencing more than 3 outages in the year after tree clearing.
- Approximately 125 fewer customers experiencing outages lasting longer than 24 hours in the year after tree clearing.
- Approximately 225 fewer customer outages during catastrophic storm events within the year after tree clearing.

Figure 86 shows the projected tree-caused primary outage incidents including MED over the ramp-up period to achieve the Company's vision.

Figure 86

2026-2030 PROJECTED TREE-CAUSED PRIMARY OUTAGE INCIDENTS INCLUDING MEDS



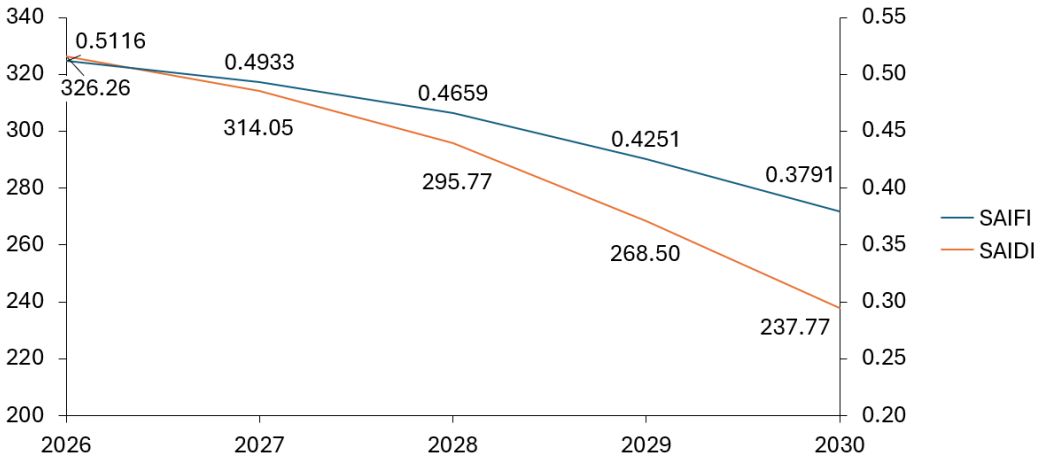


Figure 87 shows the tree-caused outage contribution to SAIFI and SAIDI over the ramp-up period to achieve the Company's vision, driven by a 28% projected primary outage incident reduction from 2026 through 2030.

Figure 87

2026-2030 PROJECTED TREE-CAUSED PRIMARY SAIFI AND SAIDI INCLUDING MED

Forestry Technology Enhancements

The Company continues to perform an in-house review of the line clearing process with the Company's Operations Performance group and Transformation departments to determine what opportunities exist to improve data analytics and performance.

- The Company recently identified an opportunity to modernize its forestry model by harnessing more sophisticated predictive and prescriptive analytics in Machine Learning and satellite imagery analysis to influence and guide its LVD full circuit clearing subprogram.
- This model is built into a web-based tool, called Forestry *Workplan Intelligence & Strategy Engine* ("WISE"), to allow for a consistent, stable, and sustainable methodology to optimize the yearly LVD full circuit clearing workplan, and to capture the most reliability and safety benefit for annual spend.
- Among the most impactful advancements in model maturity are integrating new data such as historical weather data, detailed circuit attributes, tree canopy cover data derived from *National Agriculture Imagery Program* ("NAIP") satellite imagery, and pole attributes.

These, coupled with increased analytic capabilities, **provide a more robust predictive outage model to inform the annual LVD full circuit clearing workplan,** thus allowing the Company to target its line clearing work where it will be the most impactful.

After careful consideration, the Company decided on an internal approach to technology-based enhancement of the work selection process through the development of the Forestry WISE tool.

An internal build of a digital product helps to ensure the tool is flexible in the event of change; for example, the tool currently analyzes and chooses work on a circuit-level, but the Company is pursuing opportunities to gain additional insights through pursuing LCP-level granularity in Forestry WISE.

This opportunity to take a more surgical approach to line clearing is especially impactful in areas of poorly performing circuit segments within an otherwise well-performing circuit. Not only does this **aid in selecting locations for line clearing,** but also provides higher-level data granularity, reliability prediction, and analytic tool integration that fuels intra-circuit strategy.

- For example, it can take several months for line clearing crews to clear trees along a large circuit, and it is in the best interest of both customers and the Company to first position crews at the worst performing sections of that circuit and prioritize those areas accordingly over the next several months of clearing.
- This strategy prevents more outages within the timeframe of clearing than otherwise clearing the circuit from one end to the other.

The Company is also capturing Light Detection and Ranging ("LiDAR") imagery to inform and support the execution strategy of LVD line clearing tactics in relatively high-risk wildfire areas. The Company is proposing to continue this annually to evaluate the benefits of utilizing this data on a small scale first, before re-evaluating expanding this to a larger scope, up to and including LVD system-wide utilization.

This supports the Company's phased approach to imagery analysis utilization: short- to medium-term utilization of zero- to low-cost satellite imagery analysis and focused LiDAR projects during the ramp-up to a five-year cycle, and long-term re-evaluation of larger scope LiDAR acquisition and utilization to further reduce outages once the LVD system is fully on the five-year cycle.

Service Restoration

The Company's Service Restoration program prepares for and executes work related to public emergencies and restoration activities for all outage categories, including MEDs[11] and Catastrophic Events[12].

This work includes addressing hazards such as broken poles, wire downs, and emergency orders. In addition to the workplan projections, this program includes the non-capital portion of standby costs and on-call costs for resources, such as travel, lodging, and food costs for storm responders.

Current Service Restoration Capabilities

In normal operations, the Company makes available approximately 140 crews and 60 electric service workers ("ESWs"); this can vary based on vacations, sick leave, and training. This enables the Company to respond effectively to approximately 40,000 customers experiencing an outage in a 24-hour period before additional resources are required.

When severe weather or a storm creates incidents beyond the Company's standard capabilities, the Company may need additional crewing and will reach out to off-system crews to supplement the Company's resources.

- Off-system crews are primarily obtained as necessary from other utilities, municipalities, and contractors, and are deployed when all Company resources are engaged.

The Company uses an Incident Command System ("ICS") to address emergency situations, and storm response is always addressed through an ICS.

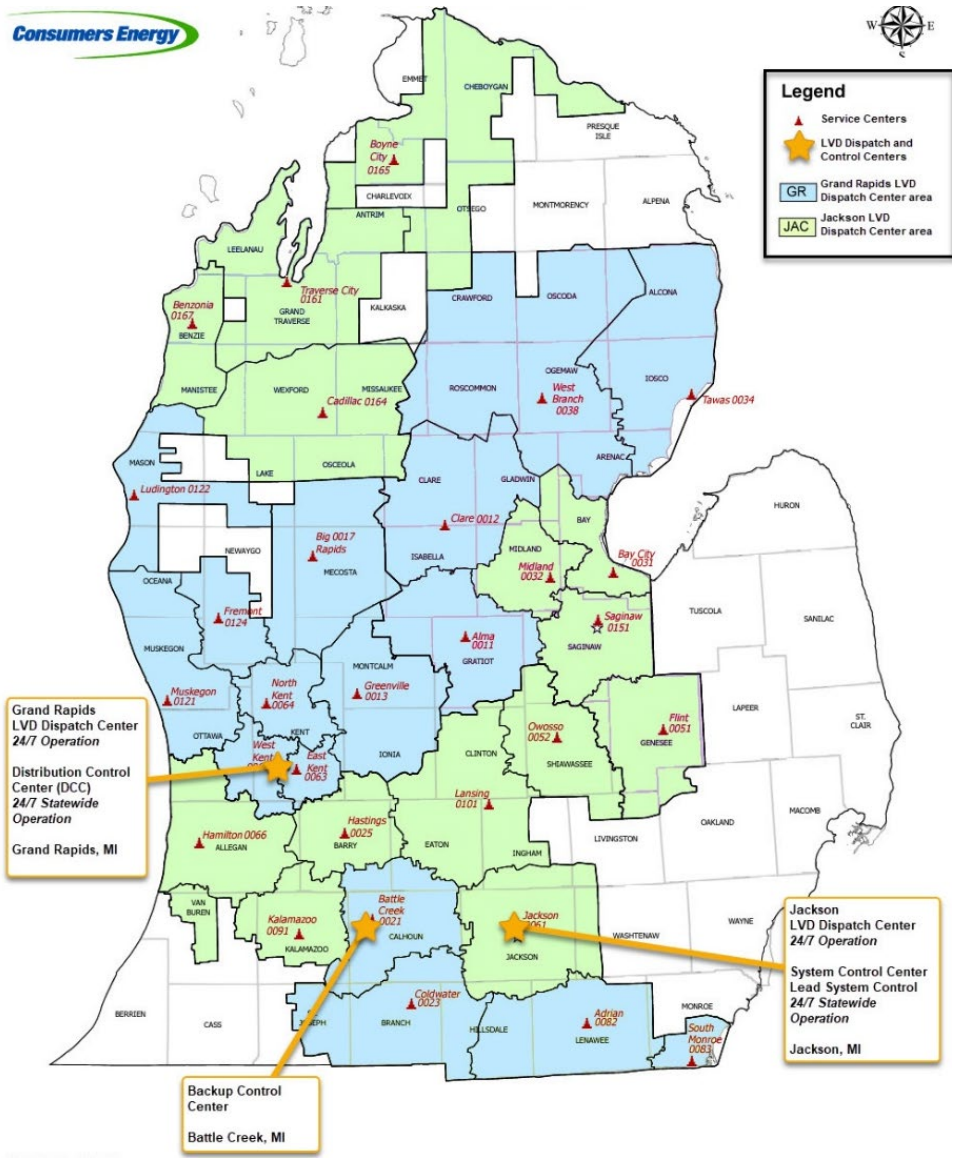
Within the Company's ICS, crew-to-dispatcher ratio is maintained at no greater than 15 to 20 points of contact with field personnel. To control the number of points of contact, field leaders obtain work from dispatchers and issue work assignments to five to seven crews, allowing for a greater span of control and efficiency with field personnel.

The Company uses an outage prediction model to analyze current weather patterns, past outage history, and machine learning to determine the approximate number of customers and geographic locations that may be potentially impacted. In some cases, the Company may pre-stage resources in locations where severe storm impacts are expected, meaning those resources can be ready to respond as soon as possible after outages occur.

The Company is currently operating four separate control centers, located in three separate facilities in Jackson and Grand Rapids as shown below in Figure 88.

These centers operate 24 hours a day, 7 days a week, with the following general areas of responsibility:

- **The System Control Center**, in Jackson, controls HVD lines and HVD substations.
- **The Distribution Control Center**, in Grand Rapids, controls LVD substations.
- Two **LVD Dispatch Centers**, one each in Jackson and Grand Rapids, controls LVD overhead and underground lines.



[11] IEEE Standard 1366-2012 defines the methodology for calculating a MED. It is based on a statistical analysis of five sequential years of daily SAIDI values. In 2021, Consumers Energy adopted a refined methodology that transitions from a calendar day evaluation period to a rolling 24-hour evaluation period. This methodology better captures MEDs that straddle consecutive calendar days.

[12] Catastrophic Events is defined in the Public Service Commission *Service Quality and Reliability Standards for Electric Distribution Systems* R 460.702(c).

Staffing in these control centers is increased as required during storm restoration. Storm support is operated from all four centers, depending on the severity and impact to the system, with statewide ICS operations managed from the Emergency Operations Center, also in Jackson.

Figure 88

SYSTEM CONTROL, DISTRIBUTION CONTROL AND LOW VOLTAGE DISTRIBUTION DISPATCH CENTERS

Gray Sky and Catastrophic Service Restoration

High impact Gray Sky storm events (greater than 1% but less than 10% of a utility's customers are out of power) and Catastrophic Storm events (greater than 10% or nearly 190,000 customers of a utility's customers are out of power) provide the greatest challenge and opportunity for the Company to improve Service Restoration performance.

The investments outlined in this plan will result in fewer outage events; the Company will realize savings from having to restore fewer outages, but those savings will be more than offset by the cost to add incremental Service Restoration resources to meet the improved restoration times required in the *Service Quality and Reliability Standards for Electric Distribution Systems* that were implemented in April 2023.

As a result, the Company's strategy is focused on controlling costs through improved productivity and waste elimination.

- To illustrate this point, in August 2023, the Company acquired a record level of Electric Line Crews to restore customers following a catastrophic storm (660 crews) but did not achieve the 90% customer restoration MPSC Performance Standard within 48 hours.
- Contrasted with the August 2023 Storm, the August 2024 Catastrophic Storm enabled the Company's fastest restoration of 150,000 customers (<42 hours), with 500 crews.

The Company was able to restore 95% of customers within 48 hours. This was tied to a deliberate approach to improve productivity and eliminate waste. Through month-end November 2024, the Company has spent $30M less O&M versus 2023; this is despite more storms (small and large) and more outages. Through waste elimination, Consumers Energy has improved field productivity by 13%.

To meet the MPSC Performance Standards and meet customer restoration expectations, the Company will need to continue to balance costs with productivity.

The Company's service restoration planning begins several days prior to an actual event. Meteorologists develop forecasts that are incorporated into an outage prediction model.

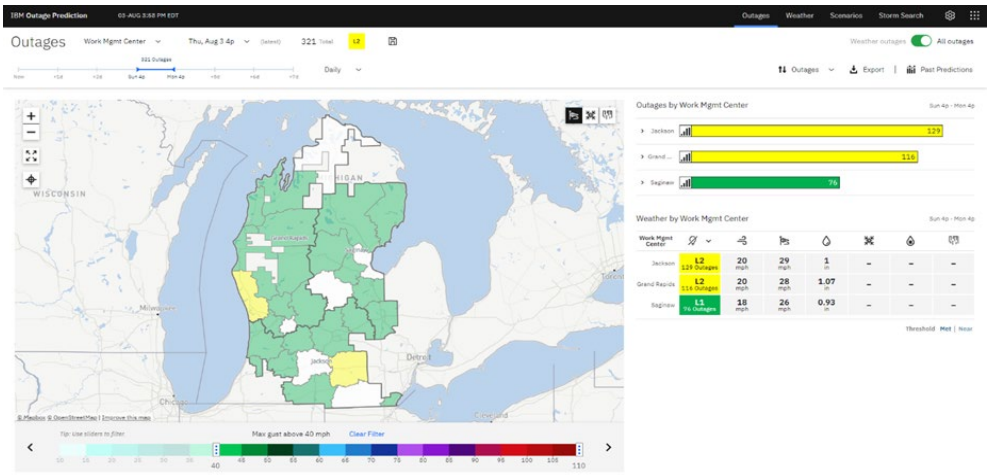


Figure 89 is a snapshot of our prediction model. The boundaries of our service centers are outlined within the State. The model is run every hour each day. Service areas with elevated outage forecasts are visibly displayed.

In the example below, our Emergency Response team used the model to ensure sufficient resource availability to respond to elevated outages in our Grand Rapids and Jackson Work Management Centers.

Written weather forecasts are received every 12 hours; 365 days a year to inform our prediction model. This ongoing planning cycle ensures we have restoration plans in place to meet or exceed acceptable levels of restoration performance.

Figure 89

OUTAGE PREDICTION MODEL

Workplan

In addition to meeting performance levels for customers set by the Commission[13], **the end goal for Service Restoration is a minimum frequency and quantity of outages,** as well as reduced response time for resources, optimal operational efficiencies between control centers, and maximum on-the-job time for field resources.

As described earlier in *Non-Load Challenges* from the Challenges from Customer Technology Adoption section, the electric grid is expected to become much more complicated with DERs coming online at the distribution level of the grid.

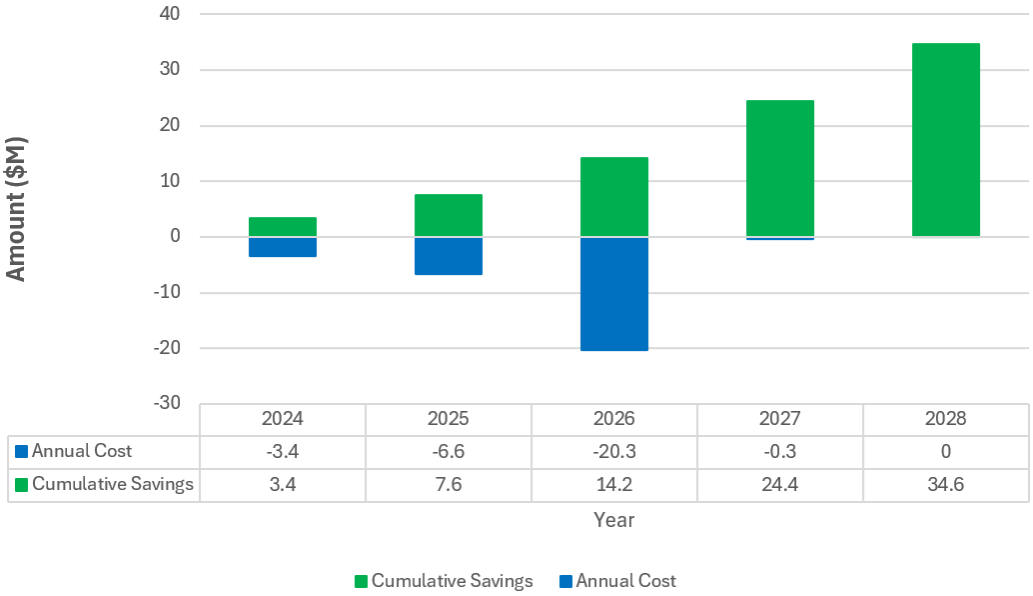
This increase in DERs will aid with the transition to a two-way power flow with more renewable generation; however, managing this shift in grid operations requires optimized communication with those employees who operate the electric grid.

To achieve both internal and MPSC defined goals, the Company is consolidating Distribution Control, LVD Dispatch, and System Control centers into two fully staffed Control Centers—one in Jackson and one in Grand Rapids. Each center will serve as a backup for the other, with associated process and organizational changes delivering significant customer benefits.

This consolidation is key for implementing grid operation improvements under all conditions including:

- Improving communications with the co-location of Grid Operators.
- Adopting an optimized demarcation of responsibilities among the groups managing the grid.
- Increasing the authority of field resources to manage outage incidents.
- Ensuring continuous operations during disruptions by having two fully staffed control centers that can back each other up.
- Faster and more effective response to emergencies, minimizing downtime and maintaining service reliability.
- Reduction in System Average Interruption Duration Index (SAIDI) through improved storm readiness and operational efficiency.

The cost savings will be attained by:



- Balancing storm and non-storm resources and workload to be able to run 70% of storms without activating ICS (typically storms below 50,000 customers).
- Improving processing efficiencies of outage incidents by using automation, and leveraging data provided by Line Sensors, ADMS, and other Supervisory Control and Data Acquisition (“SCADA”) devices.
- Reduction of overtime for field and office resources

The Company’s consolidation of the Distribution Control, LVD Dispatch, and System Control centers into the UCC will cost $30.7 million over four years.

[13] Unacceptable levels of performance are defined in the Public Service Commission *Service Quality and Reliability Standards for Electric Distribution Systems* PART 2.

Figure 90

UNIFIED CONTROL CENTER ANNUAL COST AND CUMULATIVE SAVINGS

In concert with UCC, investments in technology, analytics, and grid modernization are key enablers for our Restoration Management team to meet service restoration expectations.

HVD Asset Management

The HVD system comprises all assets from the point of interconnection with the transmission provider through the point at which LVD lines exit LVD substations.

The HVD system is the backbone for the entire distribution system. Investments in the HVD system ensure that the foundation of the distribution system is reliable and resilient, as HVD outages impact thousands of customers and entire communities at a time. Reliability is accomplished through addressing deteriorated, obsolete, and failing assets.

This section will focus on each HVD asset in detail, with a comprehensive overview of major risks, and the workplan to mitigate risks and five-year investment category for each asset class including:

- Mitigating the risks from deteriorated switches, poles, pole tops, and conductor through **HVD Lines investments**
- Mitigating the risks from deterioration through securing, inspecting, and upgrading **HVD and LVD Substations**
- Enhancing and modernizing the protective system with **System Protection Relays**
- Ensuring the HVD System can serve electric peak demand, new interconnections and support economic development through **HVD Load Growth & Interconnections**

Trees are a significant external risk factor for HVD Lines, and the Company has an HVD line clearing program to address this concern.

As with LVD investments, each HVD asset investment plan includes the planned capital expenses to construct the distribution assets, and the O&M expenses for preventative work, compliance requirements and emergent repairs.

Adequate funding for capital as well as O&M is vital to ensuring both the reliability and cost efficiency of the distribution system through taking proactive measures to address problems before they occur. Continued funding of O&M and adherence to O&M standards provides:

- Increased reliability and resiliency by avoiding outages due to equipment failure or mis-operation.
- Decreased costs by avoiding emergency repairs, allowing for more predictability in the workplan.
- Extension of asset life, avoiding emergent capital replacements and allowing for more predictable future capital investments.

HVD Asset Health Model

The Company evaluates the asset health of HVD lines and substation assets through annual inspections, maintenance, and diagnostic testing.

These key data points are reviewed and collected to build an asset health model, used as a tool for prioritizing investments by evaluating all assets that face declining asset health.

The asset health model considers multiple inputs like asset type, manufacturer, condition, age, actual outages, and level of degradation collected about the asset during inspections, maintenance, and/or annual diagnostic testing to provide a holistic view of the asset's health.

For each type of asset, the asset health model incorporates critical asset factors such as inspection results and testing results, plus known manufacturing issues that affect certain types of equipment. In the case of substation transformers and breakers, asset age is also one of the factors included in assessing risk, because these assets have a known correlation between age and failure.

An HVD line's asset health score combines multiple data points that include if it is a radial line or not, potential customer impact, type of conductor, configuration, number of trips, number of lockouts, red tagged poles, and victor insulators.

Figure 91 below shows the point value assigned to each factor of a line segment that helps generate its overall health score, and Figure 92 shows a sample calculation of a line segment health score.

FIGURE 91

HVD LINE ASSET HEALTH WEIGHTING

Radial line	Points per mile	5
Customers	Points per 1,000	2
Obsolete conductor	Points per mile	5
Unshielded conductor	Points per mile	1
Top 25 contingency	Yes	0
Trip	Points per trip	1
Lockout	Points per lockout	2
Rush red tagged pole	Points per pole	2
Planned red tagged pole	Points per pole	1
Victor insulators	Point per insulator	0.3

FIGURE 92

HVD SAMPLE HEALTH SCORE BY LINE SEGMENT

Line Name	Total Point	Radial	Customer Impact	Obsolete Conductor	Unshielded	Victor Insulators	Red Tagged Poles	Lockout
Line Segment A	133	30	6	0	0	60	25	12
Line Segment B	100	0	10	50	10	0	30	0
Line Segment C	86.6	25	5	0	0	3.6	45	8

An HVD substation's asset health score combines the scores of multiple components within the substation. Figure 93 below shows an example of an asset health score for a substation, showing how multiple component scores total the station score. Figure 94 shows how transformer factors impact the total score for the transformer.

FIGURE 93

HVD Lines

Figure 95

EXAMPLES OF HVD LINES

What HVD Lines Do

HVD Lines carry electric power at high voltage from a source substation to several substations.

HVD Poles are comprised of a pole top, which includes cross-arms, insulators, conductors, and switches that sit atop a wooden or steel pole.

Line miles in Service Territory

The HVD system is comprised of around 4,600 total miles, with approximately 4,400 of those miles being 46 kV and 69 kV overhead lines, and 19 miles being 46 kV underground lines. Approximately 200 miles are 138 kV overhead lines, and 4 miles being 138 kV underground lines.

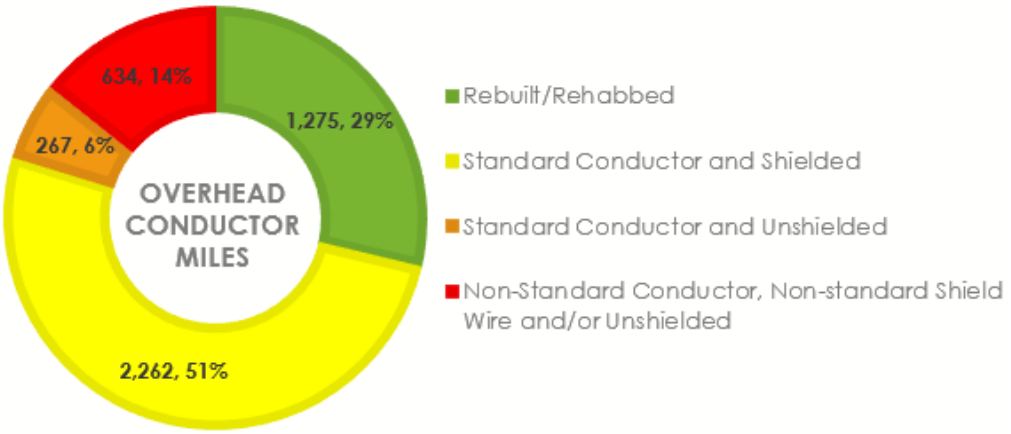
Lifecycle Analysis

The overall average lifecycle of an HVD line is 60 - 70 years for the physical HVD poles. The life expectancy for pole top hardware, such as cross-arms, insulators, and cross-arm braces, is 30 - 35 years or roughly half the life of poles.

Safety Risks to the Public

HVD Lines represent a minor public safety risk since the height from the ground makes public contact exceedingly rare, however, the deterioration of the Company's HVD poles shows that poles that fail can reach ground level either from deterioration, storms, or vehicle accident.

HVD Line Asset Management Health and Risks



Conductors

'Non-standard conductors' made from copper or small single layer aluminum conductors with a steel core wire do not meet the Company's present design standards. This is due to the increased probability of an outage from icing conditions, weather events or tree incidents compared to multi-layer aluminum conductors.

- Previously installed copper conductors have become obsolete across the industry, making maintenance and procurement of replacement parts difficult.
- These conductors were installed between the 1930s and 1950s on 40'-55' poles that are more susceptible to tree-related outages, due to their short height compared to today's design standards. Outages that occur on non-standard lines constructed with these styles of copper or small single layer aluminum conductors are regularly of longer duration and increased cost due to complexities in working with the degraded conductor.

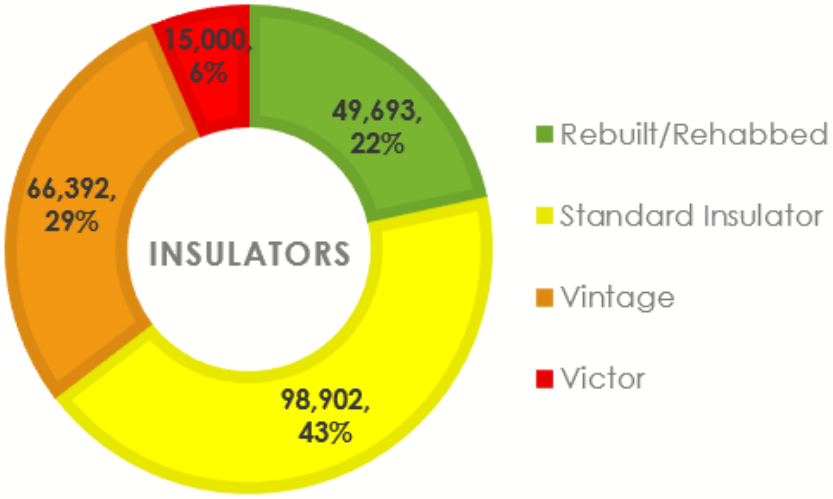
The most recent Company assessment of HVD conductor health shows nearly 14.4% of HVD conductors are a high priority for repair and replacement based on being non-standard conductor and/or unshielded. Another 6% are in the moderate concern category, based on being unshielded, as shown in Figure 96 below.

FIGURE 96
HVD LINES CONDUCTOR HEALTH

Insulators

Over the past five years, on average, **insulators have been the largest contributor to customer minute interruptions on HVD lines**. These failures are driven by vintage insulators, including victor type insulators.

- The Company has approximately 15,000 victor type insulators that were installed between 1969 and 1994, and their replacement is prioritized in this plan.



The Company has been leveraging artificial intelligence software and machine learning to automate the review of annual helicopter inspection video, which helps identify specific locations of vintage insulators, including victor type insulators.

As insulator locations are identified via machine learning, the Company can categorize the different types of insulators to enable improved planning of replacements.

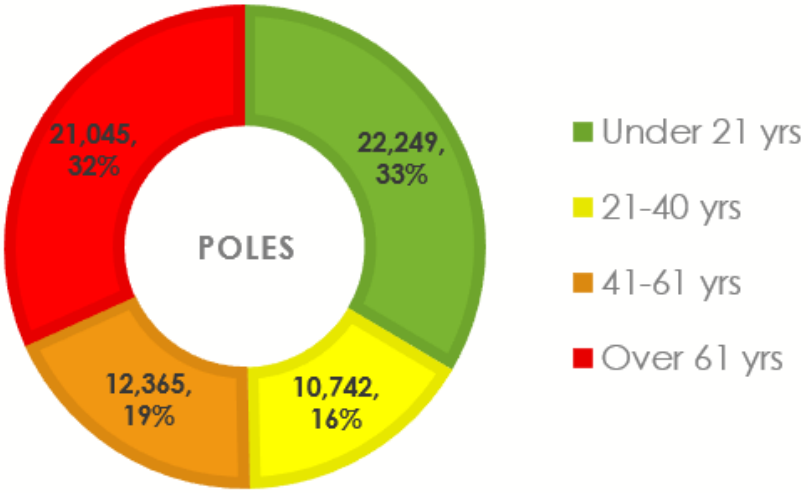
The most recent Company assessment of HVD insulator health shows 6% of HVD insulators are victor type insulators and are a high priority for repair and replacement, and another 29% are in the moderate concern category as vintage insulators.

FIGURE 97

HVD LINES INSULATOR HEALTH

Poles

The Company currently maintains a 12-year cycle for HVD pole inspections.



Pole inspections identify poles as candidates for replacement, regardless of pole age. Currently, the Company has a backlog of approximately 2,500 identified poles from inspections prior to 2025 that are in need of replacement, in addition to those newly identified in ongoing inspections.

The most recent Company assessment of HVD pole health shows one-third are over 60 years old, with 19% being between 40 and 60 years old, as shown in Figure 98 below.

While age is not determinative of the need for replacement, increasing HVD pole age generally indicates that to the Company will find increasing numbers of poles to replace during annual pole inspections, as more poles approach the end of their engineered lifecycle.

Historical data shows that 8-12% of HVD poles inspected each year will fail inspection and be identified for replacement. The Company incorporates this data into the overall system condition and defines a plan to replace the poles. This pole inspection is in addition to annual helicopter and ground patrol inspections of all HVD lines that are described in more detail later in this section.

FIGURE 98
HVD POLE HEALTH

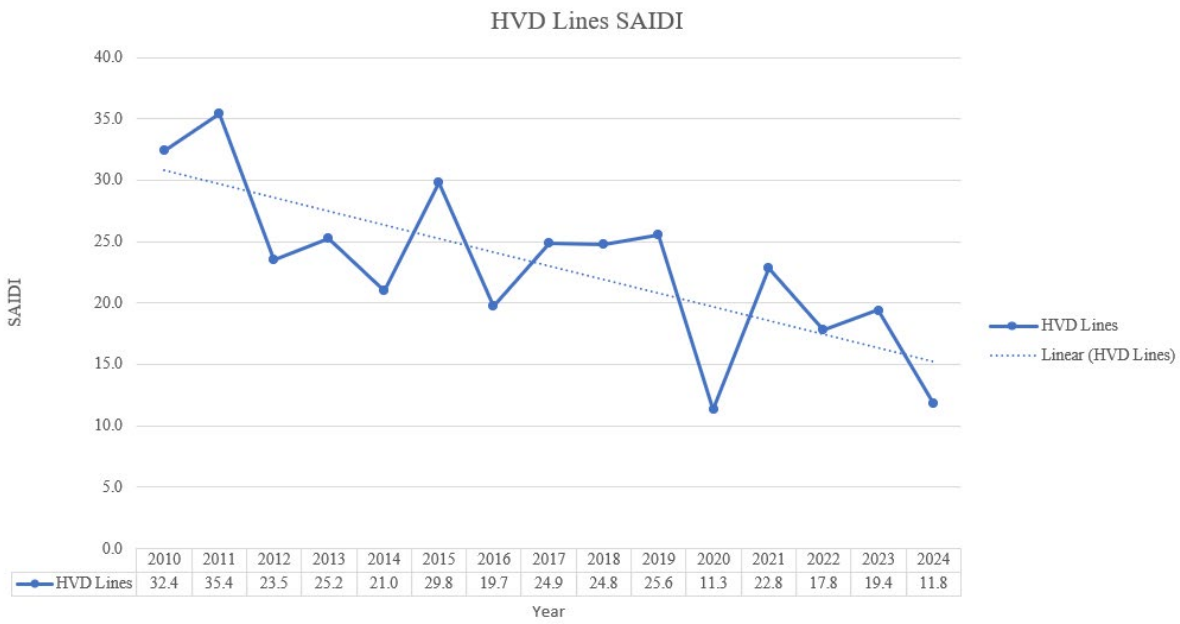
Trees

Trees present a potential risk of outage or interruption of electric service on the HVD system.

The Company's *Forestry Line Clearing Program* for HVD is designed to minimize the risk of these occurrences, improve reliable service to its customers, and decrease reactive maintenance and capital expense associated with interruptions during weather events.

The Company clears vegetation within an 80- to 120-foot-wide ROW for these voltages to attain a minimum of 15 feet of separation for 46 kV lines, and 20 feet of separation for 138 kV lines between conductors and vegetation at the time of clearing. This wider clearing standard ensures better reliability and fewer tree hazards on the HVD system.

The Company also manages vegetation within the ROW to maintain accessibility along the ROW for maintenance and repair of the line. The HVD Line Clearing Program is currently on a 4-year clearing cycle.



Investments to Address HVD Lines Asset Health

The Company plans to fix and fortify the HVD lines system by replacing deteriorated assets that poses a heightened risk of failure, as identified by inspections. In addition, the Company will address HVD lines identified through the asset health model as being in poor asset health, considering conductor type, configuration, outages, and insulator type.

The Company focuses on lines with consistently poor reliability performance and looks for the best remediation strategy to prevent future outages in the most effective and economical way. After addressing defects identified through inspection practices, the **primary driver for investment decisions is line performance**—lines with the highest average of incident rates and customer outage minute totals in a rolling three-year period are given higher priority for remediation.

As Figure 99 below shows, the reliability performance of the HVD system has steadily improved due to the Company's aggressive investment in HVD lines.

FIGURE 99
HVD LINES SAIDI PERFORMANCE

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
HVD Lines	32.4	35.4	23.5	25.2	21.0	29.8	19.7	24.9	24.8	25.6	11.3	22.8	17.8	19.4	11.8

The Company's HVD lines investment priorities address the system health risks of victor or vintage type insulators, non-standard conductors, and deteriorated poles, pole tops and switches identified through inspection practices.

While this has SAIDI benefits, the larger impact is the avoided outages that never occur when the Company addresses deterioration w a high likelihood of impacting thousands of customers per incident.

As can be seen in Figure 100 below, since 2022 the Company has seen a significant increase in avoided SAIDI identified through inspections, which indicates that the system is deteriorating faster than assets are replaced through planned work.

Based on regular inspection results and annual planning the Company will use the following approaches to improve the performance and longevity of all HVD lines:

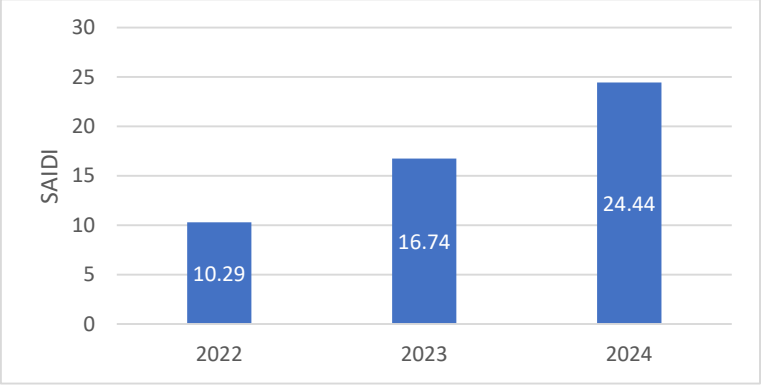
Repair and Replace Deteriorated Assets

The Company monitors the health of its HVD line segments based on multiple factors including actual outage history, conductor type, shielding, line configuration looped or radial, insulator type, and the potential customer impact if the line segment were to fail. This provides a first cut for Company engineers regarding where preventative outage work would be most beneficial.

The Company also performs an annual reliability planning review of its HVD line sections, considering both line performance and line condition, to determine which lines and line components need to be addressed in the next year or years, as some projects may be large enough to span multiple years.

The Company addresses asset and line health using a combination of line rebuilds, pole top rehabilitation, switch replacements and pole replacements to reduce the population of these risks and improve reliability performance.

- With few exceptions, lines that use non-standard and obsolete construction or equipment are rebuilt to the modern standard with a new insulator, conductor, cross-arms, structure replacements, tree clearing, and ROW procurement as needed.
- Lines that use standard construction and conductor, and have adequate pole health, but have deteriorated pole top equipment and/or, vintage insulators are rehabilitated via pole top rehabilitation instead of a complete rebuild.
- Switches found to be inoperable or failing are replaced with new switches equipped with SCADA controls, allowing them to open and closed remotely to reduce customer outage time.
- The Company's overall HVD Lines workplan to rebuild or rehabilitate lines and replace poles, pole tops and switches to address the long-term asset health of the HVD Lines systems will on average will touch 4,300 structures, impacting approximately 13,000 insulators and 50 switches per year.



HVD Annual Line Inspections

The Company inspects HVD lines annually, addresses the anomalies found, and fixes defects before they cause a customer interruption.

- More than 4,200 miles of HVD line inspections are performed by helicopter each year, using visual observation and with infrared and ultraviolet cameras to detect anomalies and deterioration before a failure occurs.
- For safety reasons, helicopters do not fly approximately 400 miles of the HVD system. This is because it is difficult to land quickly and safely in the event of an emergency. Most of these "no-fly lines" are in densely populated urban areas. To inspect these lines, the Company completes biannual ground patrols that may include infrared and/or corona inspection using handheld cameras.
- The Company's pole inspections not only identify poles that need to be replaced in the coming year, but also poles that require immediate attention. The poles are addressed in an expedited manner to prevent outages to customers.

As the Company identifies anomalies through its inspections, it mitigates any defects identified during inspections that would fail within months and cause interruptions to customers if not addressed (anomalies are typically addressed within one to two weeks of identification). The Company then calculates the SAIDI minutes that would result if the affected asset failed and caused interruptions to customers. These avoided SAIDI minutes in historical years are shown in Figure 100 below.

Figure 100
HVD SAIDI AVOIDED THROUGH INSPECTIONS

Operations and Maintenance (O&M)

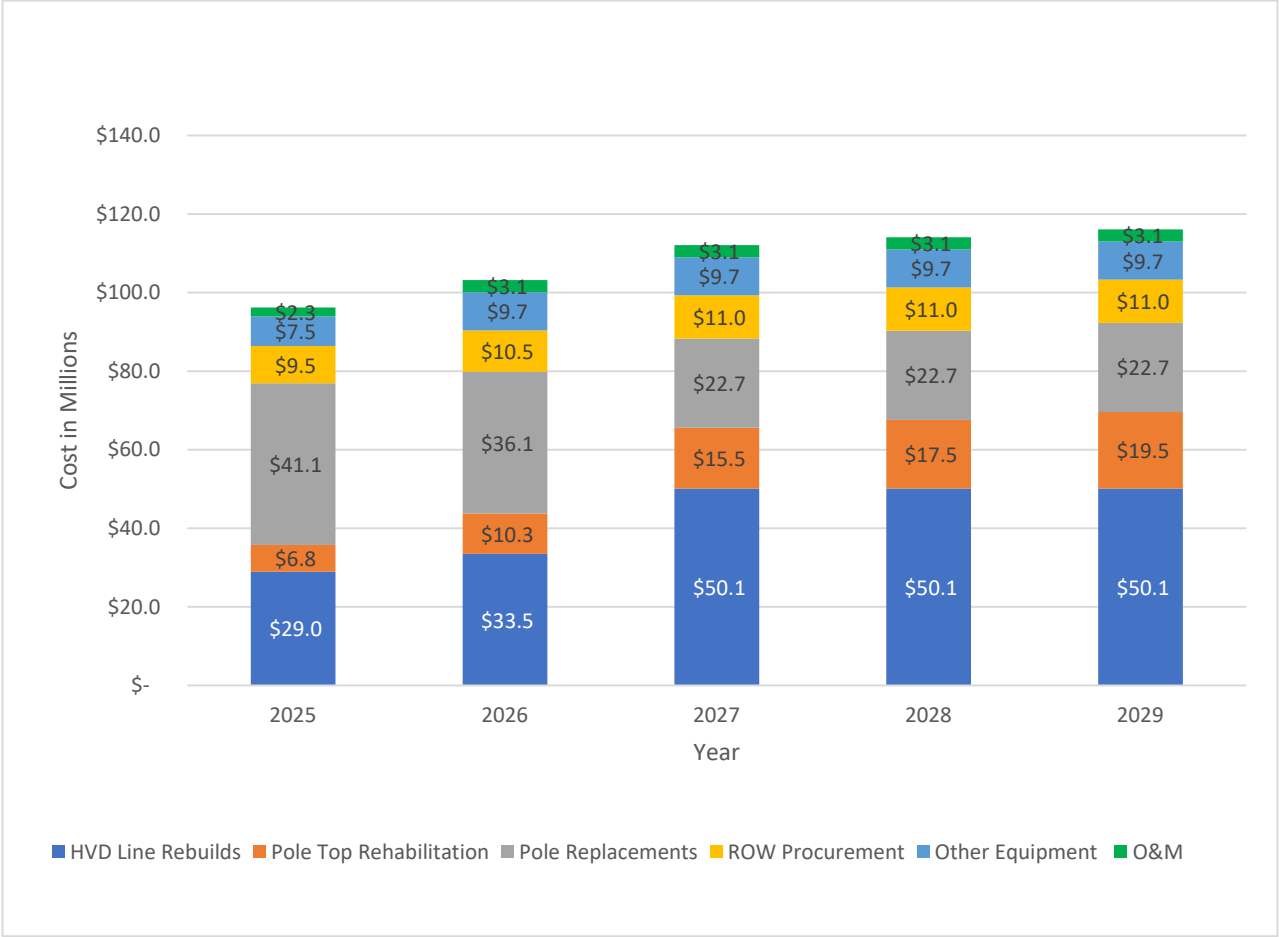
As described earlier, the Company uses aerial, ground, and pole inspections to assess the condition of the HVD Lines system.

Funding of the operations and maintenance program for these inspections provides increased reliability by identifying equipment nearing failure and making repairs before an outage can occur.

O&M funding is used to support inspections, as well as O&M related corrections to HVD lines assets like fixing hot connections, splices, broken guy wires, calibrating switches, and removing trees from lines during outages.

The Company has seen a continued reduction in HVD Lines SAIDI minutes because of an increased investment in HVD Lines asset health, with a focus on line and equipment inspections, and preventative maintenance.

Even with a downward trend in SAIDI, the *Reliability Roadmap* will require additional O&M funding to sustain this momentum. The increased O&M funding would be used to increase helicopter inspections, expand switch and pole inspections, and to repair all anomalies identified during the inspections.



5-Year Investment Plan

The Company will rebuild or rehabilitate an average of 175 HVD line miles per year and replace approximately 1,200 poles per year as part of this plan to support the company's reliability goal.

The 5-year investment plan for HVD Lines is below.

Figure 101

HVD LINES 5-YEAR INVESTMENT PLAN

Year	HVD Line Rebuild Miles	Pole Top Rehabilitation Miles	Pole Replacements
2025	10	41	1,508
2026	47	91	1,323

2028	77	115	830
2029	77	135	830

Substations

What Substations Do

The purpose of a substation is to receive power at one voltage level and transform that power to a different voltage level for different purposes depending on the type of the substation.

Types of Substations on Consumers Energy's System

The Company has HVD, LVD, SEC, and mobile substations, which all have a specific purpose. HVD substations receive power from the METC transmission system and reduce the voltage to feed the Company's HVD Lines system, which in turn feed the Company's LVD substations.

LVD substations take power at transmission or sub-transmission voltage levels and step it down to LVD levels, so it can be distributed to households and businesses. **LVD substations,** as shown below in Figure 103, **are the interface point between the HVD and LVD systems.** LVD lines emanate from LVD substations to deliver power to customers.

There is a subset of substations dedicated to serving single industrial customers; these are classified as *Strategic Electric Customer* ("SEC") substations, like the one shown below in Figure 104.

FIGURE 102
HVD SUBSTATION

FIGURE 103
LVD SUBSTATION

FIGURE 104
SEC SUBSTATION

The Company maintains a mobile substation fleet to provide electric service to customers during planned and unplanned substation outages where redundancy is not present or load transfers to adjacent substations are not available.

- Mobile substations are vital to the Company's ability to maintain and operate substations because substation projects and repairs can take several days to several months to complete.

Mobile substations are also deployed to support HVD Line projects, to prevent outages for emergent concerns, and to restore electric service during unplanned outages. An example of a mobile substation is shown in Figure 105.

FIGURE 105
MOBILE SUBSTATION

Number of Substations in Service Territory

The total substation network currently consists of 1,135 Company-owned substations and 64 customer-owned substations.

- The HVD substation network consists of 144 HVD substations and 163 SEC substations.
- The LVD substation network consists of 828 general distribution substations.
- In addition to the Company-owned HVD and LVD substations, there are 35 customer-owned dedicated substations, 5 Company-owned substations providing wholesale distribution services to rural co-op and municipal systems, and 30 customer-owned substations providing wholesale distribution services to rural co-op and municipal systems.
- The mobile substation fleet currently consists of 30 mobile units with varying electrical capacity, electrical configuration, and service function.

Lifecycle Analysis

Substations are a collection of several key components that determine the health and longevity of the Company's substations.

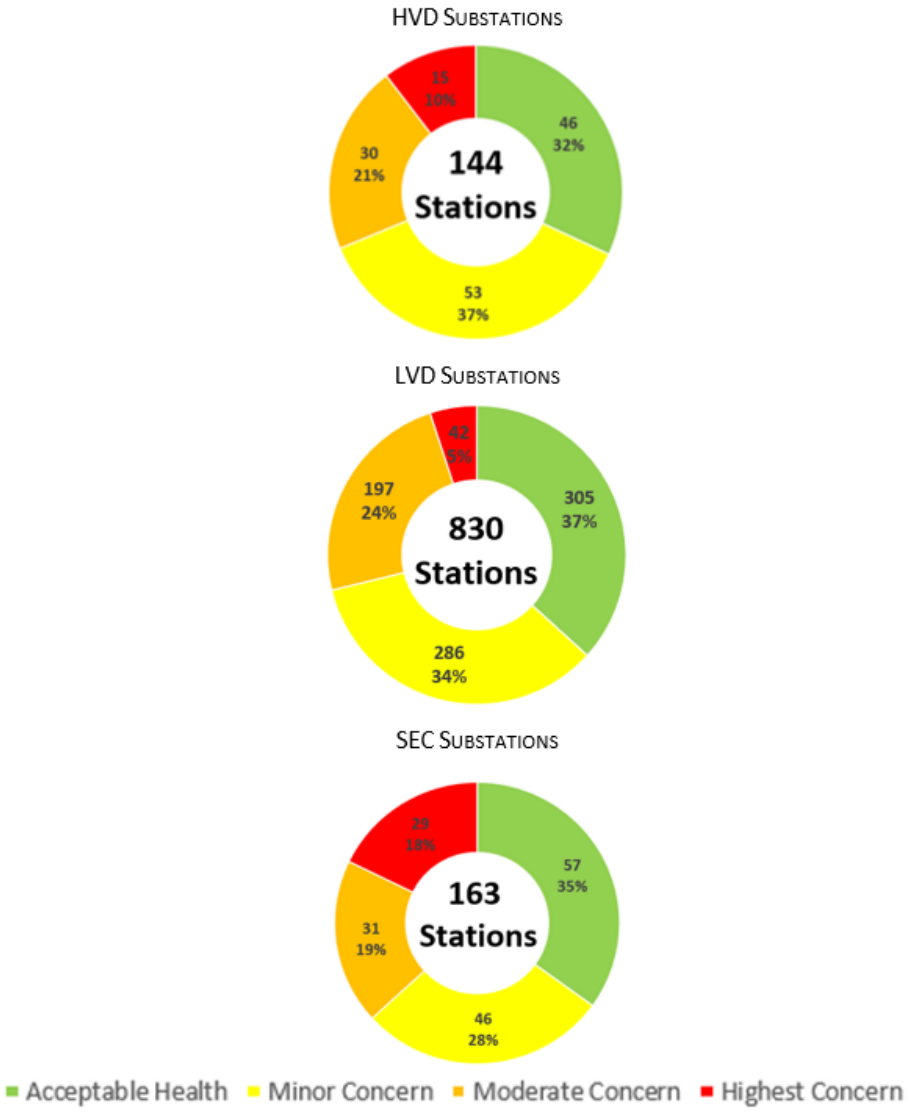
The overall average engineered lifecycle of key substation and mobile substation components average 50 years, including Power Transformers, Circuit Breakers, and Switches.

Safety Risks to the Public

Substations represent a minor public safety risk because of the barriers and fencing surrounding the assets, making accidental public contact exceedingly rare.

In the case of mobile substations, safety barriers can be erected inside of existing substations or outside with fencing.

Substation Asset Health and Risks



Substation health represents an overall assessment of equipment data and component evaluation for each substation.

Assessments include items such as equipment condition, equipment type, equipment age, visual inspection data, infrared inspection data, oil and gas test data, and electrical test data.

Four health categories have been created with action plans for each color rating as shown in Figure 106.

Figure 106

SUBSTATION HEALTH

HVD Substations

The most recent Company assessment of HVD substation health shows 10% are a high priority for repair and replacement, with another 21% in the moderate concern category.

Of the remaining HVD substations, 69% of substations are in acceptable health or only show minor concerns as shown in the figure above.

Strategic Electric Customer (SEC) Substations

The most recent Company assessment of SEC substation health shows 18% are a high priority for repair and replacement, with another 19% in the moderate concern category.

Of the remaining SEC substations, 63% of substations are in acceptable health or only show minor concerns as shown in the figure above.

LVD Substations

The most recent Company assessment of LVD substation health shows 5% are a high priority for repair and replacement, with another 24% in the moderate concern category.

Of the remaining LVD substations, 71% of substations are in acceptable health or only show minor concerns as shown in the figure above.

Key Substation Risks

Major Equipment Failures

Some substations in the Company's service territory were built in the 1920s and are approaching 100 years in age, and still employ original equipment.

Old and obsolete equipment such as Power Transformers, Circuit Breakers, and Switches can cause large customer outages if they fail, often at a significant cost.

- Failures at HVD substations are less likely to cause customer outages due to the redundancy built into the station design, but when customers are interrupted it can be upwards of 10,000 customers affected.
- Failures at SEC substations will impact only the customer being served.
- Failures at LVD substations are more apt to cause customer interruptions due to less redundancy in the design, but such interruptions typically affect fewer customers ranging from several hundred to a few thousand.

Physical Security Gaps

Animal contacts from birds, squirrels, and raccoons are some of the most common customer interruptions at substations.

However rare, due to the critical importance of substations to the overall electric grid, the Company must also prepare for the case of intentional coordinated attack at these facilities.

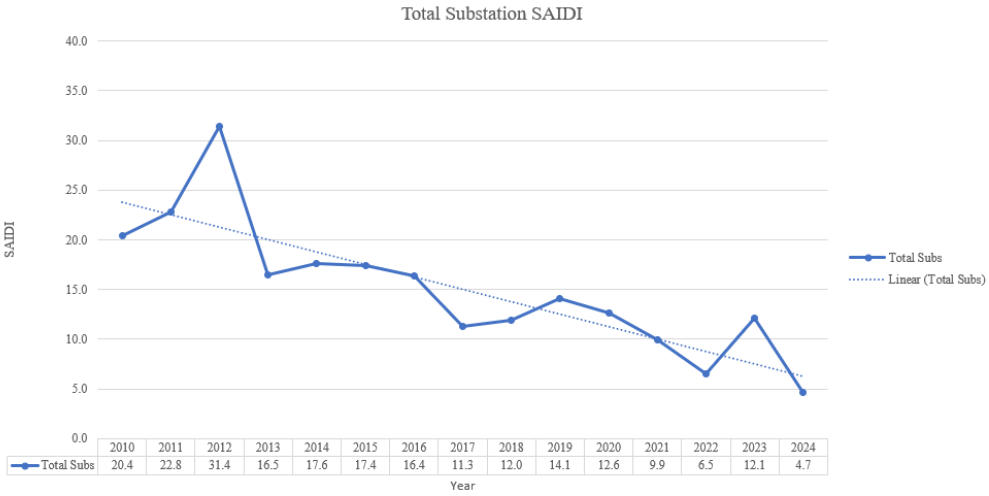
- The customer impact of such an attack would be like that of a major equipment failure.
- Opportunities to mitigate this risk are continually being identified and implemented by engineering and operations teams with support from Corporate Security.
- Opportunities include upgrading substation surveillance systems and adding additional security to equipment to prevent inadvertent operation.

Extreme Weather

Extreme heat or cold will increase loadings on substation equipment and may shorten equipment lifespan, which could result in more frequent replacement.

- Extended periods of extreme cold can affect the operation of breakers, circuit switchers, and other electromechanical equipment.
- While substations typically hold up well to violent winds, debris blowing into a station and creating faults in exposed conductors or equipment poses a risk to substations.

Investments to Address Substation Asset Health



The desired outcome for all substations is to monitor electrical loading, and to provide adequate inspections, maintenance, and end-of-life asset replacement for all substations.

End-of-life is not solely a reflection of asset age. End-of-life is a holistic evaluation of the asset that considers remaining life based on inspection and maintenance findings in addition to the cost of maintaining versus replacement.

The top priority for substations is providing reliable electric capacity to all customers through timely resolution of equipment loading and substation health concerns, new electrical load connections, and substation reliability improvements.

Like HVD Lines, Figure 107 below shows the reliability performance of substations has steadily improved due to the Company's investment in equipment replacement and animal mitigation for both LVD and HVD lines substations.

FIGURE 107
SUBSTATION SAIDI PERFORMANCE

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
Total Subs	20.4	22.8	31.4	16.5	17.6	17.4	16.4	11.3	12.0	14.1	12.6	9.9	6.5	12.1	4.7

The Company has shown that substations, if properly maintained, can operate beyond their average lifespan. However, these assets must be monitored, inspected, and maintained regularly, and repaired in a timely manner if a failure does occur.

To ensure optimal performance and operation of substations, the Company carries out the following actions to properly protect and maintain substations:

Repairing and Replacing Deteriorated Assets

The Company regularly reviews reliability data, inspection data, industry practices, and operation practices to identify end-of-life assets and modernization opportunities to improve overall customer service reliability, improve substation health, and mitigate customer outage risk.

Based on this data, the Company plans to rebuild substations that are at end-of-life or have working clearances that do not meet current standards and operating practices.

- The Company plans to rebuild over 70 substations over the next 5 years, accounting for HVD, SEC, and LVD substations.
- The Company will also purchase six new mobile substations to support planned and emergent projects that improve customer reliability and substation health, and to support outage prevention and outage restoration.

Where possible, the Company seeks to repair and replace degrading assets to prolong the substation lifespan and reduce cost to customers. The Company regularly reviews reliability, inspection, and operating data to identify where substation equipment is degrading, has reached end-of-life, or requires modernization.

Based on this data, the Company plans to replace equipment to mitigate customer outage risk and to resolve decreased service quality.

- The Company will replace degrading equipment such as transformers, breakers, regulators, switches, and reclosers as concerns are identified.
- The Company will replace all transformers and circuit breakers that are beyond end of life.
- This plan will replace an average of 2 HVD transformers, 10 SEC transformers, 30 LVD transformers, and 40 circuit breakers per year over the next 5 years to support the Company's Reliability goal.

Operations and Maintenance

The Company uses maintenance standards for both LVD and HVD substation equipment, referred to as the *Electric Substation Reliability Guidelines* or (ESR-1) that were developed based on vendor recommendations, industry best practices (including EPRI and IEEE) and collective experience by Company personnel. The recommended maintenance activities outlined in ERS-1 are shown in Figure 108 below.

FIGURE 108

ESR-1 RECOMMENDED SUBSTATION MAINTENANCE ACTIVITIES

Category	Activity
NERC/HVD/Strategic Substations	NERC/HVD/strategic substation inspections (monthly)
	NERC/HVD equipment test operating & profiling (annual)
	Motor Operated Air Break (MOAB) switch test operating (annual) and battery exchanges (every 4 - 5 years)
	NERC/HVD/strategic substation infrared inspections (annual)
	NERC required testing and battery maintenance (annual)
	Strategic customer online insulator cleaning (annual, select customers)
	HVD infrared inspections (annual)
	SF6 breaker gas quality testing
	HVD breaker inspections and maintenance
	Circuit switcher inspections and maintenance
	Spring operated ground switch inspections and maintenance
	Capacitor bank inspections and maintenance
	Transformer Load Tap Changer inspections and maintenance
	Station power transformer inspections and maintenance
Category	**Activity**
LVD Substations	LVD substation inspections (bi-monthly)
	Single-phase regulator maintenance
	Single-phase regulator oil samples and dissolved gas analysis (5-year program)
	LVD substation animal mitigation inspection (twice per year, Spring and Fall)
	LVD substation equipment test operating (annual)
	LVD infrared inspections (every other year)

Category	Activity
All Substations	Emergent and planned 'Broke-fix' work for NERC/HVD/Strategic/LVD substations and Metro
	Infrared repairs (Priority 1)
	Third-party switching and tagging support (strategic customers, ITC, third-party generation)
	Substation transformer oil sampling and analysis (annual), Total Combustible Gas testing (annual)
	Substation snow plowing (Every winter)
	Substation weed control (1 application per year)
	Substation mowing (typically twice per month per sub OR more frequent)
	Substation property clean-up and repairs (trash cleanup, homelessness encampment cleanup, control house repairs etc.)
	Misc. items such as: Substation eye wash station cartridge replacements (annual); switch stick, personal protective ground testing and fuse testing (annual)
	Misc costs (fleet loadings, access control/telecom costs, Doble Engineering membership etc.)
	Power transformer inspections and maintenance (limited by outage availability)
	Infrared repairs (Priority 2 and 3)
	Switch repairs
	Facilities O&M repairs

Funding for the O&M standards in ESR-1 provides increased reliability and resiliency by avoiding outages due to equipment failure or mis-operation at a reduced cost by avoiding emergency repairs, which can cost up to 70% more than proactive maintenance. Additionally, the Company's O&M plan **extends the life of assets by avoiding emergent capital replacements** and allowing for more predictable future capital investments.

The Company has seen continued reduction in SAIDI minutes because of an increased operational focus on preventative maintenance.

Despite the encouraging trend in SAIDI, the *Resilient Grid Plan* will require additional O&M funding to sustain this trend, execute required preventative activities, and continue to improve the internal processes to enhance asset management.

Physical Security Gaps and Animal Mitigation

All substations are enclosed within a fence or wall barrier to provide physical security and public safety, and additional measures are installed to mitigate animal intrusions that can result in substation outages.

The purpose of the Company's animal mitigation is to keep large and small animals out of the substation, and to insulate equipment to extend touch potential if an animal gets into a substation, with specific measures chosen based on substation characteristics.

The Company's current animal mitigation standards were developed based on research conducted at Michigan State University, experiments conducted at the Company's Marshall Training Center, utility industry reports and best practices (e.g., EPRI), and experience gained from previous animal mitigation projects.

The Company's animal mitigation measures include:

- 1-inch mesh fence (squirrels can squeeze through larger mesh)
- Concrete gate foundations (minimizes gaps and frost heave that create gaps over time)
- Polycarbonate panels (3-foot panels installed at the top of the fence to mitigate animals from climbing over the fence)
- Pole wraps and line discs (installed on poles and wires outside the substation to mitigate aerial access to the substation)
- Interior and exterior stone (eliminates gaps at the fence bottom to mitigate animals from crawling under the fence)
- Bushing guards on regulators and reclosers to extend touch potential to mitigate contact to energized components if an animal climbs on equipment
- Vegetation management

Animal-caused outages are typically the highest contributor to substation SAIDI, leading the Company to aggressively update animal mitigation at the LVD substations.

Approximately 90.2% of the LVD Substations now have standard animal mitigation measures installed. The Company plans to have animal mitigation installed at 99% of the LVD Substations within the next 5 years.

Distribution Supervisory Control and Data Acquisition ("DSCADA")

DSCADA is **the key component of substation automation, allowing the Company to monitor and control substation devices remotely** without requiring the dispatch of a human operator.

When DSCADA is installed at a substation it includes a Remote Terminal Unit (RTU), a local device that facilitates communications with substation devices and remote software systems and captures over 300 data points.

- The enhanced visibility into substations and the remote-control capabilities allow the Company to address outages more quickly and effectively.
- The enhanced visibility also allows the Company's planning engineers to perform more accurate load flow studies because DSCADA provides access to real-time circuit data.

The remote-control aspects of DSCADA are crucial in enabling advanced automation such as the ATR loops described earlier in the Resiliency Investments section of this plan.

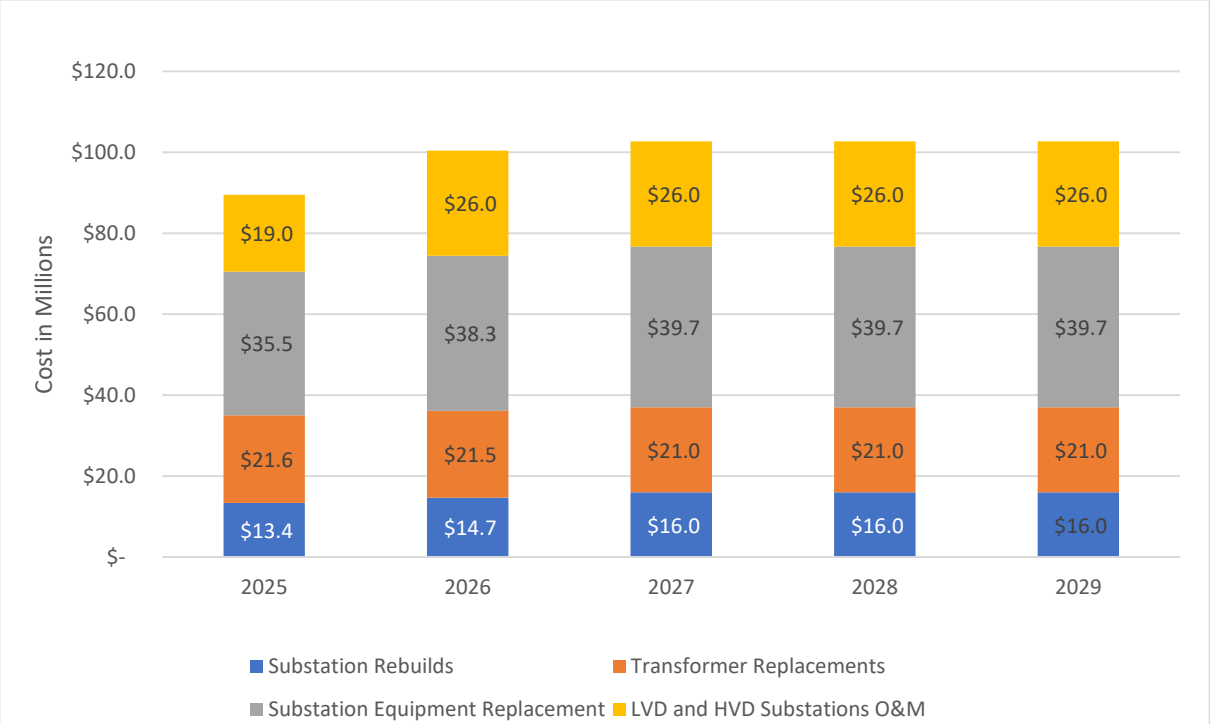
The Company plans to install DSCADA at 100 more substations over the next 5 years.

5-Year Investment Plan

For HVD and SEC Substations, the Company is working through a comprehensive plan to replace components that have failed inspections results and are at end-of-life, and rebuild whole substations where needed.

The plan requires $69 million of capital investment per year until 2035, along with a ramp-up of two years until fully implemented.

Also included is an increase in O&M spending across all Substation Reliability and Demand Failures programs to adhere to the recommended maintenance intervals as defined in ESR-1, provide best practice maintenance of all major equipment, and eliminate the backlog of inspection and repair orders.



The O&M for both HVD and LVD substations are included in the HVD Substation investment plan below.

- As shown in Figure 109 below, over the next five years this plan will, on average, rebuild 2-4 HVD or SEC substations per year, replace 2 HVD transformers per year, 10 Strategic Customer transformers per year, and 130 piece of substation equipment like breaker, switches, and capacitor banks to support the Company's Reliability goal.

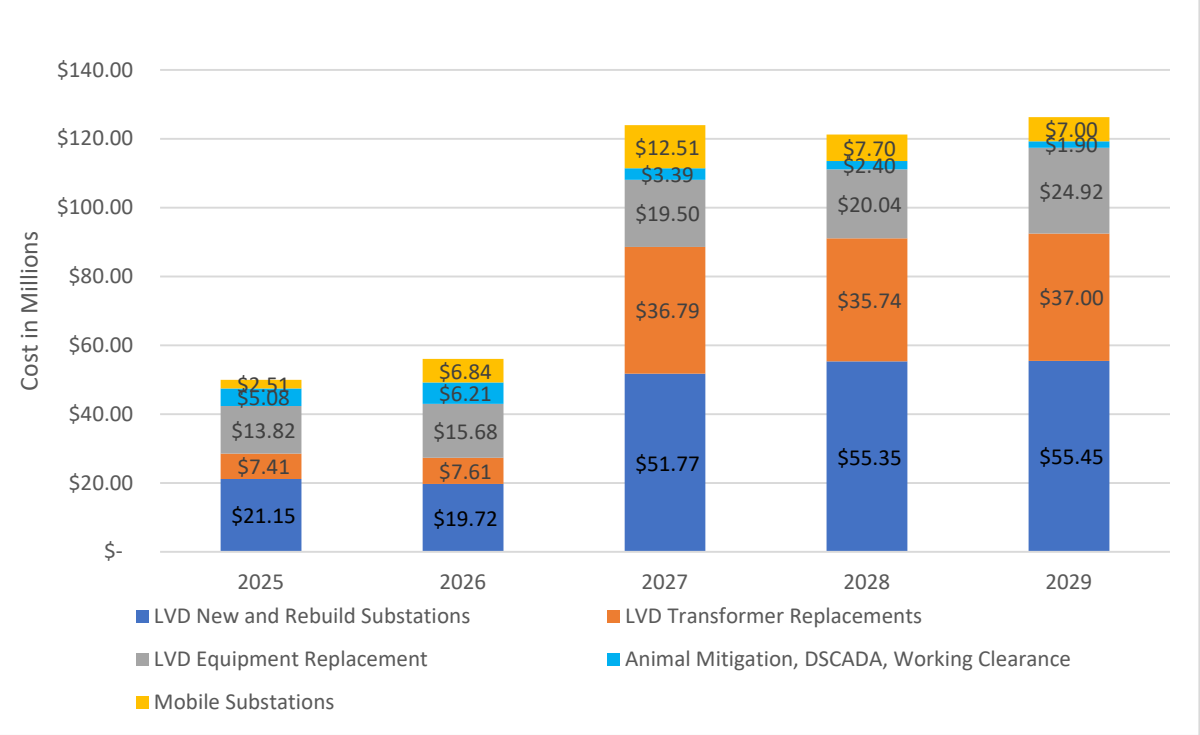
The reliability impact of this work is estimated to result in two fewer HVD or Strategic Customer Substation outages per year.

Figure 109

HVD & SEC SUBSTATION INVESTMENT PLAN

Year	Substation Rebuilds	Transformer Replacements	Equipment Replacements
2025	2	9	220
2026	2	3	190
2027	2-4	12	190
2028	2-4	12	190
2029	2-4	12	190

For LVD Substations, the Company is working through a comprehensive plan to replace components that have failed inspections results and are at end-of-life, rebuild substations, and build new substations where needed.



This plan will continue to maintain substations with industry best practices while installing DSCADA at substations for efficient control and monitoring.

- As shown in Figure 110 below, over the next five years this plan includes the building of 20 new substations, the rebuild of 58 substations, the replacement of 151 substation transformers, and the replacement other substation equipment (regulators, reclosers, switches, etc.) to support the Company's Reliability goal.

The reliability impact of this work is estimated to result in two fewer LVD Substation outages per year.

Figure 110

LVD SUBSTATION INVESTMENT PLAN

Year	New & Rebuild Substations	Transformer Replacements	Equipment Replacements	Mobile Substations
2025	13	7	20	2
2026	12	6	15	2
2027	16	35	15	3
2028	17	30	15	2
2029	15	34	15	1

System Protection Relays

What Protective Relays Do

The purpose of a protective system is to **de-energize as quickly as possible** the minimum amount of the electric network that has experienced an electrical fault, to **isolate the fault**, and **mitigate damage** to other equipment.

Protective systems within a substation consist of protective relays designed to trip a circuit breaker when a fault is detected.

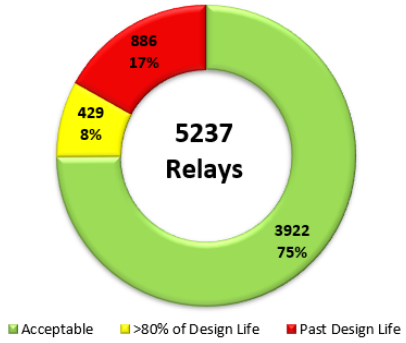
Protection systems have two modes of failure.

- The first is **incorrect operation**—when a protective device operates when it should not. This failure mode can cause unnecessary customer outages, and in severe cases, can lead to cascading outages that result in widespread blackouts.
- The second failure mode is **when a protective system does not correctly de-energize an electrical fault**. The failure of a relay to trip properly under fault conditions can lead to severe system consequences, including an extended outage, more customers interrupted than are necessary, equipment damage as lines or transformers burn up, environmental hazards due to ruptured transformers, and public safety hazards due to fires, shrapnel from exploding equipment, and electric shocks due to uncleared electrical faults. Proactively identifying and replacing relays that are prone to failure greatly reduces the risk of these consequences.

Number of HVD Relays in Service Territory

There are 5,237 relays in the Company's service area. A relay unit is defined as a relay panel consisting of 5 electromechanical relays, 10 solid state relays or 2 digital relays.

Lifecycle Analysis



The Company has determined design life for protective relays based on vendor recommendations, industry best practices as documented by the IEEE Power System Relaying Committee, and Company experience with failure of specific relay types.

Protective Relay Asset Health and Risks

The most recent Company assessment of Relay health shows 83% of relays are in acceptable health or have not yet reached the end of their lifecycle, as shown in Figure 111 below. Of the remaining relays, approximately 17% of the protective relay population is older than the designated design life.

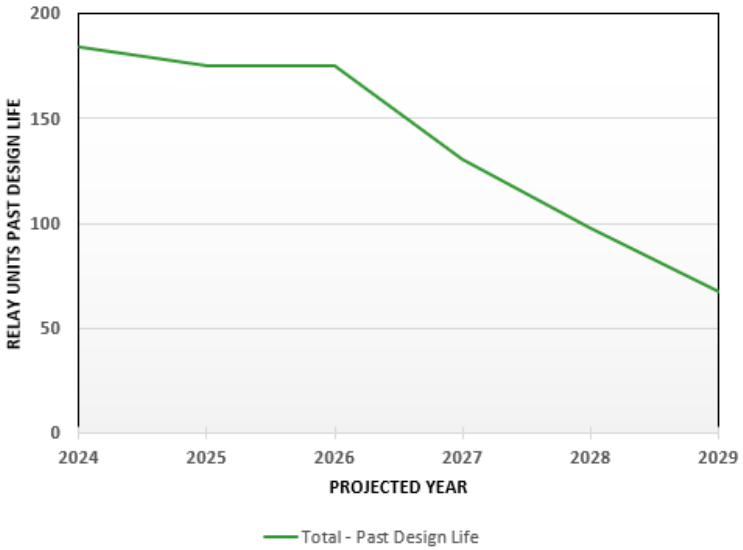
As relays age, they are more frequently out of settings tolerance, which can cause interrupting devices (like circuit breakers, circuit switchers, etc.) to open when they don't need to, leading to interruptions, or, not open when they should, leading to larger scale interruptions, equipment damage, and possible safety hazards. More frequent field testing and calibration is required to ensure proper performance.

FIGURE 111
RELAY HEALTH ASSESSMENT

Investments in System Protection Relays

The Company's primary desired outcome for relay health and reliability is to keep all protective relays within design life.

Relay Replacement Plan



The relay replacement plan is a capital program to replace end of life relays with new modern relays. Multiple factors are considered to assign a risk score to each relay.

- The factors considered include relay age, relay types with a history of malfunctions, substations without digital oscillography, etc.
- The relays are then prioritized based on this risk ranking for capital replacement.

Figure 112 below shows the projected number of relay units that are past design life based on the proposed capital relay replacement plan.

The relay replacement plan will maintain all relays within lifecycle by 2032.

FIGURE 112
PROJECTED NUMBER OF RELAY UNITS PAST END OF DESIGN LIFE

Operations and Maintenance

All relays on Consumers Energy's HVD system are tested and maintained on periodic intervals, and all testing done on the relays is based on manufacturer recommendations.

The intervals are based on the type and function of relay, informed by best practices as defined by NERC Standard PRC-005, and trends observed from historical testing data.

Relays that test out of tolerance are recalibrated or replaced as necessary.

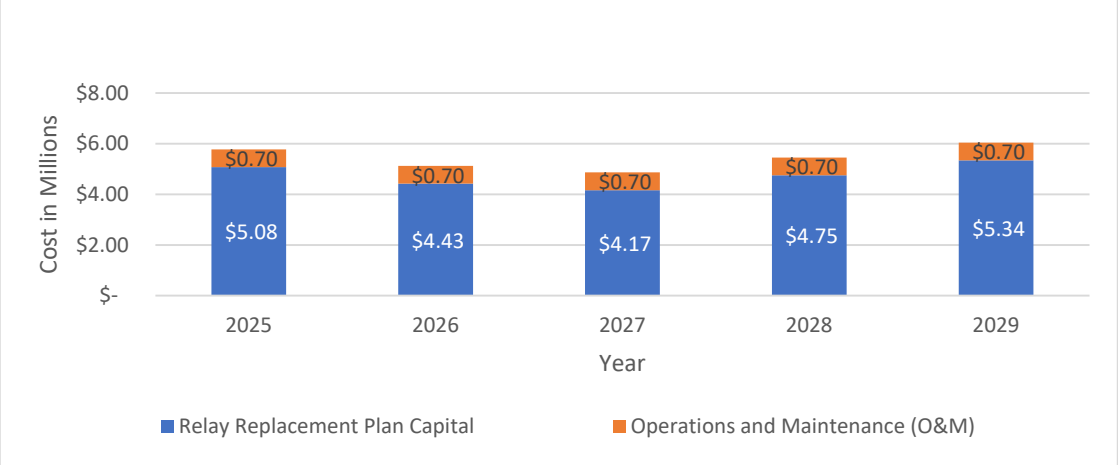
Event Analysis & Corrective Actions

The Company investigates every event on the HVD System to ensure correct operation of the protective systems.

- For all incorrect operations, the immediate cause is identified and resolved.
- For any systemic problems identified, long term corrective actions plans are developed.

System 5-Year Investment Plan

The Company will implement the relay replacements identified above, which requires $5.41 million in 2025, and $4.07 million in 2026, in capital investment.



In 2027, the annual spend will increase with inflation as shown in Figure 113 below. The annual investment will increase by $500,000 in 2028 and 2029.

This plan will replace approximately 47 relay units in 2025 and 36 relay units per year in 2026 and 2027. The number of relay units replaced increases to 41 relay units in 2028 and 46 relay units in 2029 to account for digital relays beginning to reach end of life.

The ongoing operational maintenance and corrective actions described above will require $700,000 in 2024, and beyond.

FIGURE 113

SYSTEM PROTECTION INVESTMENT PLAN

Year	Relay Replacement Plan
2025	46
2026	31
2027	36
2028	41
2029	46

HVD Load Growth and Interconnection

HVD Load Growth and Interconnection projects consists of the following:

- HVD enhancements to ensure the HVD system can serve electric peak demand in accordance with HVD planning criteria
- Work to accommodate new interconnections
- Work to improve functionality through standards
- Upgrades to protection
- Operability of the system
- Coordination with transmission infrastructure additions

HVD Load Growth and Interconnection also supports Real Estate and ROW acquisition supporting projects.

Because the HVD system is the backbone infrastructure of the electric distribution network, projects in this sub-program must be completed on an as-needed basis to serve customers and maintain the safety and overall reliability of the grid.

Investments in this sub-program improve system reliability by preventing future overloads. These investments also help avoid dangerous wire downs and equipment failures due to overloads and exceedance of equipment interrupting capability, improving system safety.

Investments for HVD Load Growth and Interconnection

The Company's primary desired outcome for HVD Load Growth and Interconnection is to ensure the HVD system can serve electric peak demand in accordance with HVD planning criteria, accommodate interconnections to the HVD system, and ensure current standards to support improved functionality of the system.

Load Carrying Capabilities and Voltage Support

Load Carrying Capabilities and Voltage Support projects eliminate unacceptably low voltage, and loadings above line and equipment ratings.

The Company studies the HVD system using power flow analysis to calculate the base power flow and voltages, and changes in power flow and voltages resulting from single outages for present and future versions of the HVD system.

New Interconnections

The New Interconnection category encompasses **new interconnections to other utilities and to generation facilities** that must be completed as requested by the interconnecting party.

Costs to interconnect other utilities and generation facilities to the Company's HVD system are reimbursed by the other utilities or generators being interconnected.

Improved Functionality

The Improved Functionality category comprises **projects completed to meet changes in standards, and upgrades** to protective schemes on a planned basis over a period.

- An example of this is the Company alleviating substation NESC working space issues systematically over a 10-year period.
- These projects are often coordinated with other major projects when they occur at the same location.

Configuration changes to improve operability are made at the request of the Grid Management group or through coordination with other major projects when they occur at the same location.

Coordination with Transmission

The Coordination with Transmission projects, such as HVD relay upgrades associated with transmission upgrades, must be coordinated with those transmission upgrade projects that require the HVD upgrades to be completed.

These are completed as needed over time, in conjunction with the transmission owner.

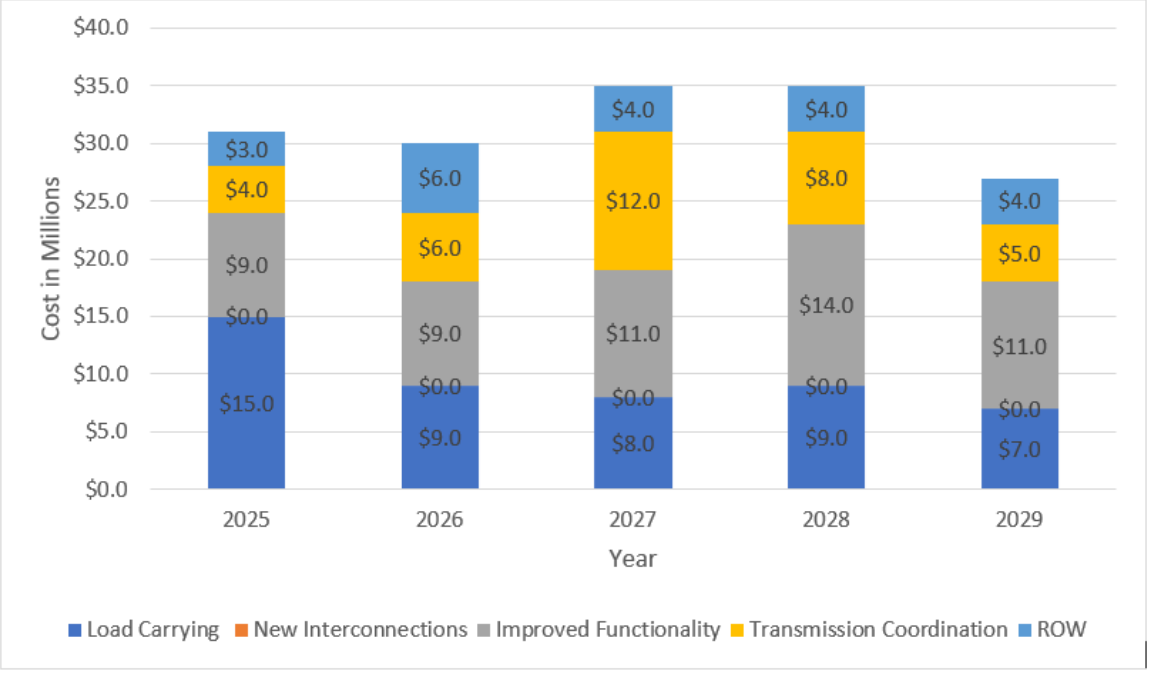
Right of Way ("ROW") Procurement

ROW Procurement projects are necessary to **procure HVD line rights or substation sites for new and/or expanded HVD facilities, as well as rights necessary to maintain existing HVD facilities**. These projects are critical to prepare for HVD construction and for maintaining existing HVD facilities ,and can require significant lead time.

Acquiring the necessary land or land rights is integral to advancing HVD lines and substation projects.

These projects must be prioritized to adequately support the project that is depending on the new rights (e.g., new HVD line, HVD line relocation or rebuild off-center, new HVD or LVD substation, or improved easements where rights are determined to be inadequate).

Through the process of monitoring and studying load profiles, properties are sought and procured to build electric infrastructure at the right point in time needed to serve customers.



HVD 5-Year Investment Plan

The Company's investment plan is projected to cost $140 million over the next five years.

The 5-year investment plan (shown below in Figure 114) will ensure that the HVD system has the capacity to accommodate peak system load including potential changes to load profiles needed for new and changing technologies, maintain safety and reliability, and accommodate interconnection to the system.

Figure 114

HVD LOAD GROWTH AND INTERCONNECTION 5-YEAR INVESTMENT PLAN

***NOTE:** New Interconnections is listed above as $0 and not listed in the unit table below because the projects expected in 2025-2029 in that category will be 100% reimbursed. Also, ROW projects are not listed in the unit table below as these projects vary in scope/size/timing such that units are not readily available

Year	Load Carrying Projects	Improved Functionality Projects	Transmission Coordination Projects
2025	4	18	11
2026	4	14	8
2027	3	15	12
2028	3	15	8
2029	3	15	8

Additional Topics

Streetlighting

What Streetlights Do

Streetlights provide illumination to enhance safety and the aesthetics of roadways, residential areas, and cityscapes in various applications throughout the Company's service territory. The Company operates and maintains all Company-owned lighting.

Quantity and Technology of Streetlights in Service Territory

Consumers Energy owns and maintains approximately 173,000 streetlights. Most of these streetlights are cobrahead fixtures (see Figure 115 below for streetlight fixture count). Cobrahead, Center Suspension, and Post Top fixture examples are shown in Figure 116.

FIGURE 115

STREETLIGHT FIXTURE COUNT

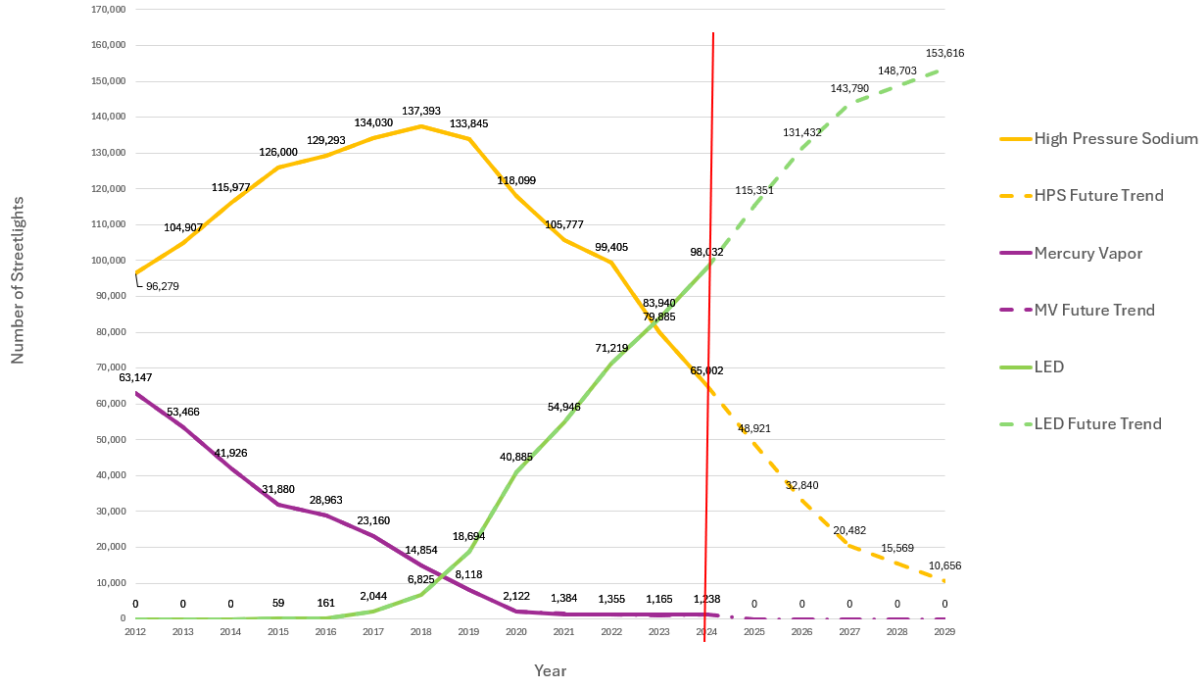
Fixture Type	Count
Cobrahead	119,000
Post-Top	43,000
Center Suspension	11,000
TOTAL	**173,000**

Figure 116

EXAMPLES OF STREETLIGHTS

Cobrahead Streetlight Fixture

Center Suspension Fixture



Post-Top Fixture

The Company's streetlighting portfolio includes three types of fixtures: *High Pressure Sodium, Mercury Vapor,* and *Light Emitting Diode* technology.

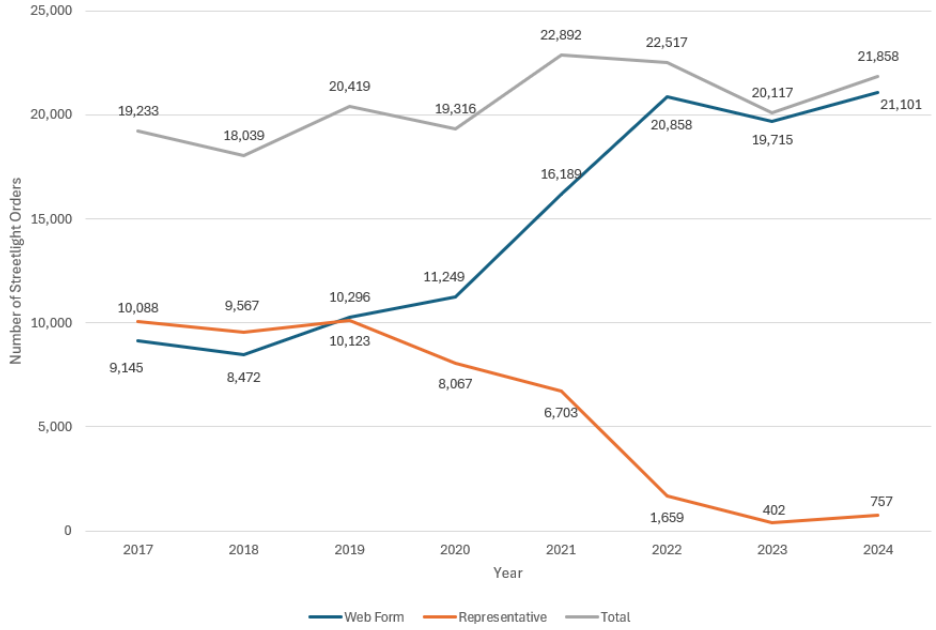
Figure 117 below represents historical and projected technology trends. The trends reflect the Company's transition from *High Pressure Sodium* fixtures to *Light Emitting Diode* fixtures due to the increase in efficiency.

FIGURE 117
Streetlight Technology Trend

Lifecycle Analysis

The shortest lifecycle component of a streetlight is the *lamp*, which drives the useful life of a streetlight.

- Lamps on the high intensity discharge ("HID") fixtures are rated for 24,000 hours of service.
- With approximately 4,200 hours of lighting service annually, the average life of the lamps in HID fixtures is approximately six years.
- Newer lighting technology light emitting diode ("LED") fixtures are more efficient and are rated for 84,000 hours of service bringing the average life of a LED fixture to 20 years.

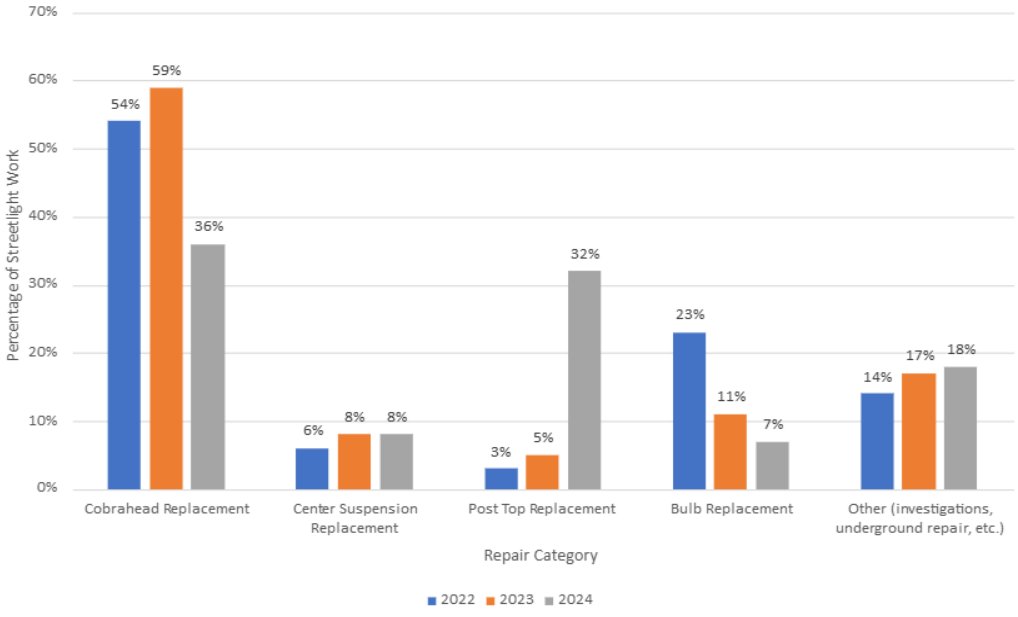


Streetlight Asset Health and Risks

As shown in Figure 118 below, approximately 22,000 streetlight outages and issues are reported each year.

- Non-third party related primary causes of streetlight outages are attributed to bulb failures.

FIGURE 118



Streetlight Orders by Creation Type

A breakdown of *work type* is shown in Figure 119 below.

FIGURE 119

WORK TYPE BREAKDOWN OF STREETLIGHT ORDERS

Workplan

The ideal state for the Company's Streetlighting program is to repair or replace streetlights only at the end of the component lifecycle. Extending the lifecycle of the luminaire reduces repair expenses across the Company's streetlight portfolio.

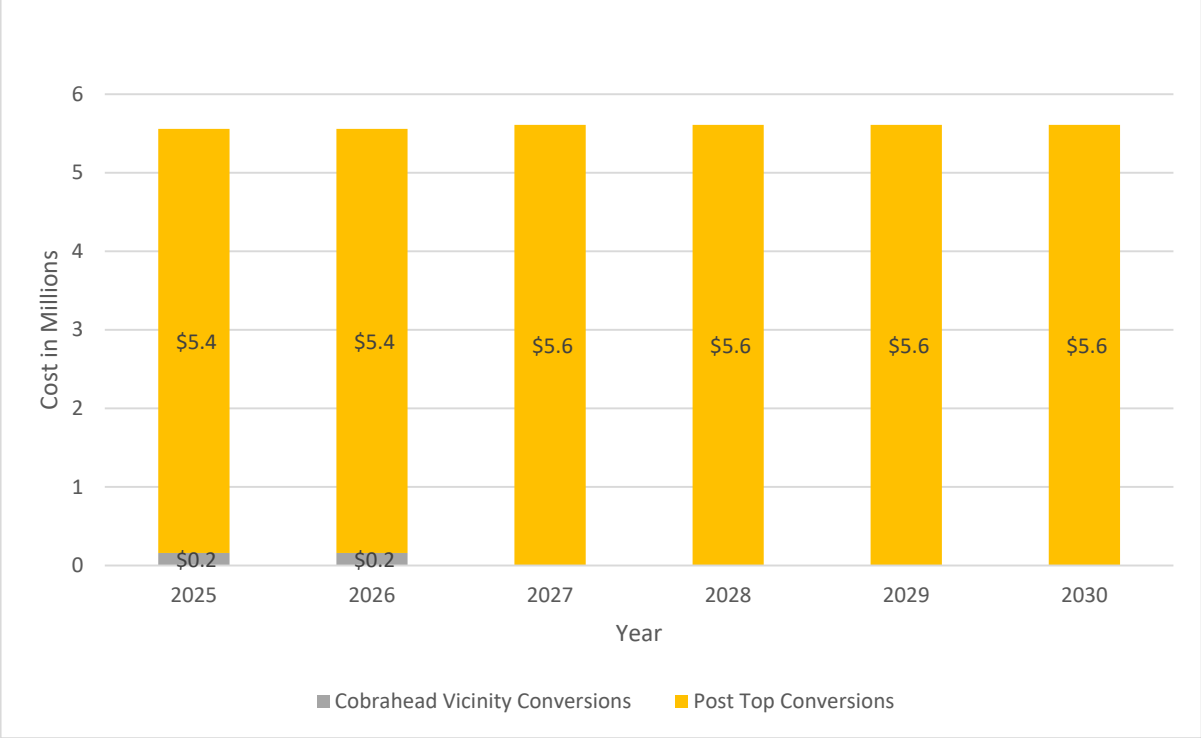
LED Conversion of HID lamps across all applications reduces the frequency of bulb-related outages.

To facilitate this, cobrahead, center suspension, and post-top HID installations are being converted to LED technology upon failure.

In addition, vicinity conversion tactics will be used for Cobrahead and Post-Top installations. Vicinity conversions upgrade in-service HID lighting in the vicinity of a failed luminaire, and this reduces costs per conversion by reducing frequency of repair worker mobilization to the same area.

Streetlight 5-Year Investment Plan

The Company will complete vicinity conversions across cobrahead and post top lighting types.



- The Company estimates 11,100 HID cobrahead lights will be converted to LED technology through reactive conversion and 260 HID cobrahead lights will be converted to LED technology through vicinity conversion, annually.
- The Company estimates all Cobrahead fixtures will be converted to LED technology near the middle of 2027. This plan will cost $0.4 million over two years.
- The Company estimates 3,910 HID post top lights will be converted to LED technology through reactive conversion and 800 HID post top lights will be converted to LED technology through vicinity conversion, annually.
- The Company estimates all post top fixtures will be converted to LED technology by mid-2033. This plan will cost $47.5 million over the next nine years.
- Post top vicinity conversions will increase to 1,000 annually once all cobrahead lights are converted to LED technology.

Failure costs of streetlight assets are expected to be reduced following the completion of LED conversions. The 5-year investment plan for streetlighting is shown below in Figure 119.

Figure 1219 includes vicinity conversion of cobrahead streetlights, reactive conversion of post top streetlights (began in 2024), and vicinity conversion of post top streetlights.

Figure 119

STREETLIGHTING INVESTMENT PLAN

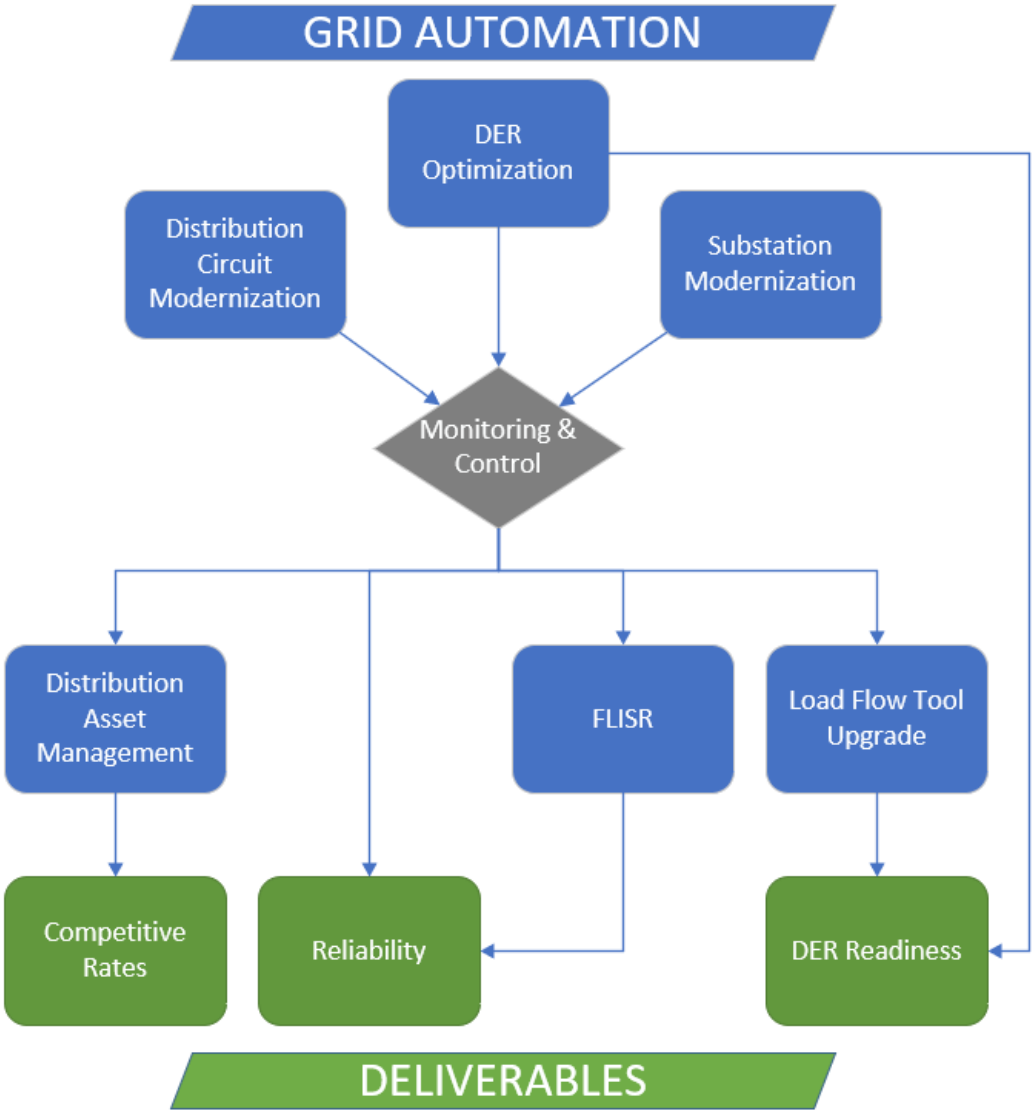
Year	Cobrahead Vicinity Conversions	Post Top Conversions
2025	260	4,710
2026	260	4,710
2027	0	4,910
2028	0	4,910
2029	0	4,910
2030	0	4,910

Grid Automation

Grid Automation (formerly "Grid Modernization") operationalizes proven technology to enable a reliable, resilient and automated electric grid that is secure and affordable for customers. Grid Automation delivers for the future grid by **incorporating new technologies and applications into the electric system to increase reliability**; **optimizing energy delivery**; and facilitating the **optimal use of DERs**.

While many utilities share common themes for defining Grid Automation, every utility has a unique approach for implementing and enabling Grid Automation capabilities due to their unique customer, geographical, operational, regulatory, and business needs.

- Grid Automation plans include **standardization and deployment of new proven technology** in substations and on electric lines.
- Also included is the **development of new tools and systems** to improve the way the Company monitors, controls, and optimizes assets.



The Company continues to invest in new technologies and digital tools to build for the future through research, testing, and development of modern grid technologies that support key Company objectives.

To support enabling these capabilities and the overall Reliability Roadmap, the Company's Grid Automation organization is planning to develop a Grid Automation 5-year Strategy. This will inform future rate cases and needed investments by benchmarking the industry to help sequence new technology in a way that provides optimized benefit for customers.

As seen in Figure 120 below, the foundational technologies of Grid Automation enable monitoring and control of the distribution system. With increasingly wider monitoring and control, several other key Grid Automation systems gain connectivity to the grid, which is needed to deliver further benefits beyond the sum of the foundational technologies' parts.

All these initiatives significantly affect key Company deliverables such as reliability, competitive rates, and DER readiness.

Figure 120
Grid Automation Deliverable Mapping

New technologies are run through a robust *Technology Enablement Process* ("TEP") (see Figure 128 below) to ensure all facets of the technology solution are ready for use by Company stakeholders when the solution has reached go-live.

Figure 121
High-Level Technology Enablement Process

Distribution Circuit and Substation Modernization

There are many opportunities to improve substations and distribution lines to be ready to support the needs of the future grid. Therefore, Grid Automation continues to participate in utility research projects and innovation forums to understand utility best practices and identify the best technology approach for the distribution system.

- As **new LVD technologies** are shown to provide utility value, the Company considers including them within the strategic **Distribution Circuit Modernization ("DCM") roadmap,** a long-term plan to enable new technologies that build on the learnings and capabilities of others in the DCM roadmap. The DCM roadmap is a living document that evolves based on those learnings, as well as align with utility industry best practices and research.
- Similarly, the **Substation Modernization** program maintains a strategic substation technology roadmap with a vision to advance substation infrastructure to the next generation, including IP-enabled networking capabilities. Substation Modernization initiatives will also follow the *Technology Enablement Process* and build out progressively beneficial and interdependent substation systems and devices.

The technologies being pursued on these roadmaps are foundational to support general monitoring and control of distribution circuits and substations, and set the stage for future more complicated automation via ADMS, FLISR, and DER Optimization.

Distribution Energy Resources Optimization

The Company has launched an initiative to standardize and prepare the grid for the anticipated growth of DER, as discussed earlier in the Non-Load Challenges from Customer Technology Adoption section.

The DER Optimization initiative consists of a variety of hardware and software deployment projects to develop, evaluate, and standardize DER management capabilities across the spectrum of DER types.

- Projects will be sequenced so that initial deployments focus on grid-edge capabilities that include DER gateways.
- DER gateways optimize controllable resources based on local conditions, as well as provide communications and translation services to a diverse set of DERs.
- DER gateway projects on the grid-edge include solar arrays, batteries, EV chargers, and circuit-level deployments.
- As DER penetration increases, the Company plans to deploy a centralized DER management system (DERMS) that will provide system-level grid benefits such as peak shaving, market participation and compliance with FERC Order No. 2222.
- A centralized DERMS is critical for managing bi-directional power flows, power quality concerns, and interconnections with third party DER.

- High levels of DER penetration may negatively impact reliability, efficiency, and overall grid performance if not properly monitored and managed.
- The increase of the Distributed Generation program cap from 1% to 10% of the utility's average five-year in state peak load introduced by Public Act 235 escalates the reliability concern and accelerates the timeline for needing to begin DERMS implementation.

The DER optimization initiative will not only mitigate these threats but will lead to future reliability and efficiency improvements. **DER benefits can only be fully realized when they are comprehensively integrated into grid operations.** Therefore, DER must be visible to and controllable by the Company's grid operators to ensure reliable, affordable, and safe electric service.

Distribution Asset Management ("DistAM")

DistAM is the application of **asset management principles and processes to electric distribution assets to maximize the usefulness and realization of value over their lifecycle.**

Previous sections covering LVD and HVD assets described current state asset health and management practices. However, the Company is pursuing a centralized and standardized asset management strategy that encompasses all electric assets in a unified approach.

Our DistAM program will enhance existing lifecycle management capabilities by **collecting key asset data (*e.g.*, age, nameplate data, location) to drive a risk-informed, value-based decision-making methodology** to manage and optimize asset investments. This work is aligned with industry best practices defined in ISO 55001, as well as from the *Michigan Infrastructure Council Asset Management Program*.

Asset Management will standardize the Company's asset life-cycle processes, data, and technology, allowing for improved capture, analysis, and visualization of asset health, which will lead to more optimized investment planning scenarios.

The primary benefits of DistAM include:

- Reduced capital and maintenance costs.
- Reduced customer outages and restoration costs
- Reduced power quality issues and system losses
- Increased asset availability and deferred capital depreciation
- Reduced asset degradation risk
- Improved resilience of the electric distribution system
- Proactive condition-based asset replacement/maintenance

The DistAM strategy identifies three key components that will deliver a robust asset management system. These components are *Asset Repository*, *Asset Performance Management* ("APM"), and *Asset Investment Planning* ("AIP").

These components will leverage collected distribution asset data into a single centralized database, which provides enhanced integration into asset health performance analysis and investment strategy platforms.

- The Asset Repository software release, with four initial assets, is scheduled for the second quarter of 2025. After the software release, asset data can be added incrementally using the standard integration elements being deployed. The Asset Repository can then ingest asset data from other data collection methods to improve asset data quality.

- The APM software calculates asset health scores and utilizes Asset Repository asset data. With the incremental approach of the Asset Repository, the APM will need to accommodate sparse asset data by possibly augmenting static nameplate data with sensor technology. Exploration of automated sensor readings could provide measurements to the APM to improve asset health calculations.
- The AIP solution is now complete. The integration of additional asset data into the Repository and APM will only improve the benefits of the AIP system.

The Company envisions that as the technology of imagery analytics advances, so too will the benefits of DistAM.

DistAM is an essential part of the Company's broader initiative to maximize reliability and resiliency by optimizing how the electric distribution system is proactively maintained and managed.

Realizing the benefits of these assets requires effective management of the electric distribution system, which is the foundation that DistAM provides.

Reliability Analytics Monitoring Program (RAMP) *(formerly Anomaly Detection Analytics)*

The RAMP uses **line sensor data across our LVD and HVD systems to understand whether we are experiencing conditions** (asset deterioration, tree branch interference, etc.) **on our lines that are likely to cause an outage** such as asset deterioration and tree branch interference**.**

These analytics provide an opportunity to send crews to complete work to mitigate these conditions proactively at a lower cost to rate payers as opposed to addressing these in an emergent condition after the outage has occurred.

In 2023, more than 500,000 customer outage minutes were avoided by correcting outages before they happened.

The Company is pursuing a contract to maintain this service into 2025 and beyond. Over the next five years this project is expected to save 1 minute of SAIDI.

Load Flow Tool Upgrade

For nearly 25 years, various planning departments throughout the Company have relied on an industry-standard suite of CYME power engineering software products to assess the current and future health of the distribution system.

The modeling techniques and simulation capabilities enabled within these tools have met the planning requirements of a system with traditionally predictable load and short-circuit conditions but cannot accurately or efficiently capture the time-based complexities introduced by DERs and electrification. See the Challenges from Customer Technology Adoption, and Non-Load Challenges from Customer Technology Adoption sections for further discussion on these challenges.

To begin to address these challenges in planning tools, the Company entered the discovery phase of a Load Flow Tool Upgrade project in 2024, with plans to start developing and enabling advanced forecasting, modeling and simulation capabilities in 2025.

- At a high-level, this initiative will evolve our planning models from a snapshot in time approximation of peak conditions to a digital twin representation of the distribution system capable of identifying system constraints and opportunities for optimization at any hour of the year, under various customer technology adoption, weather, and load growth scenarios.

Planning tool enhancements will allow the Company to make the right infrastructure investment decisions at the right time to maintain the reliability, power quality, and efficiency of the distribution system as customer adoption of new technologies increases. They will also:

- Enable comprehensive review of the fast track and supplemental screens specified in R 460.946 and R 460.950 of the Michigan Interconnection and Distributed Generation Standards
- Increase the accuracy and value of the Company's hosting capacity maps
- Support Company compliance with the various distribution system impact analyses and data reporting requirements of the Michigan Transportation Electrification Plan
- Provide planning and interconnection SMEs with the insights needed to successfully navigate the increased Distributed Generation program cap required by Public Act 235.

Fault Location Isolation Service Restoration (FLISR)

The Company worked with EPRI in 2024 to develop a plan for full implementation of FLISR. FLISR consists of both hardware and software.

The hardware consists of communicating reclosers, switches, and line sensors. The Company has made significant progress with the installation of these reclosers and line sensors, and even more potential awaits with the DCM technologies described above including SCADA-enabled reclosers and switches.

The next area of focus in the Company's sequence is to use SCADA controlled switches to further sectionalize circuits, to limit outage impact to customers.

- Within the ADMS software, FLISR will use the communicating reclosers, switches, and line sensors to automatically identify where faults are on the system.
- FLISR can provide automatic functionality to isolate faults before analyzing load transfer potential for the remaining de-energized customers downstream of the faulted section. Additionally, it decreases the public safety risk of encountering energized downed wires. Patrol times and switching times for field crews are also greatly reduced.
- To enable this, updates and enhancements will be required to the ADMS software and to core applications that support ADMS, such as Distribution Power Flow, Substation Model integration, Spectra Insight and a simulation environment for Grid Operators to learn necessary skills before executing on the job.

By 2025, the Company will have deployed more than 12,000 line sensors across HVD and LVD.

These sensors provide optimal coverage of the grid to support the FLISR program. Line sensors are **devices that attach to primary lines to monitor current and faults, as shown in Figure 122.** They detect faults and determine a probable location of an event, making them critical in enabling FLISR.

Line sensors also provide information such as loading, phase balance, momentary outages, line disturbances, and other alarms.

- Line sensors can be used to improve the LVD planning process by providing more accurate load flow modeling. This more precise and real-time load information can be used to improve the load transfer process both for planned and unscheduled outages.
- This tool reduces the duration of the manual load transfer writing process and improve the accuracy of the modeled transfers.

FIGURE 122

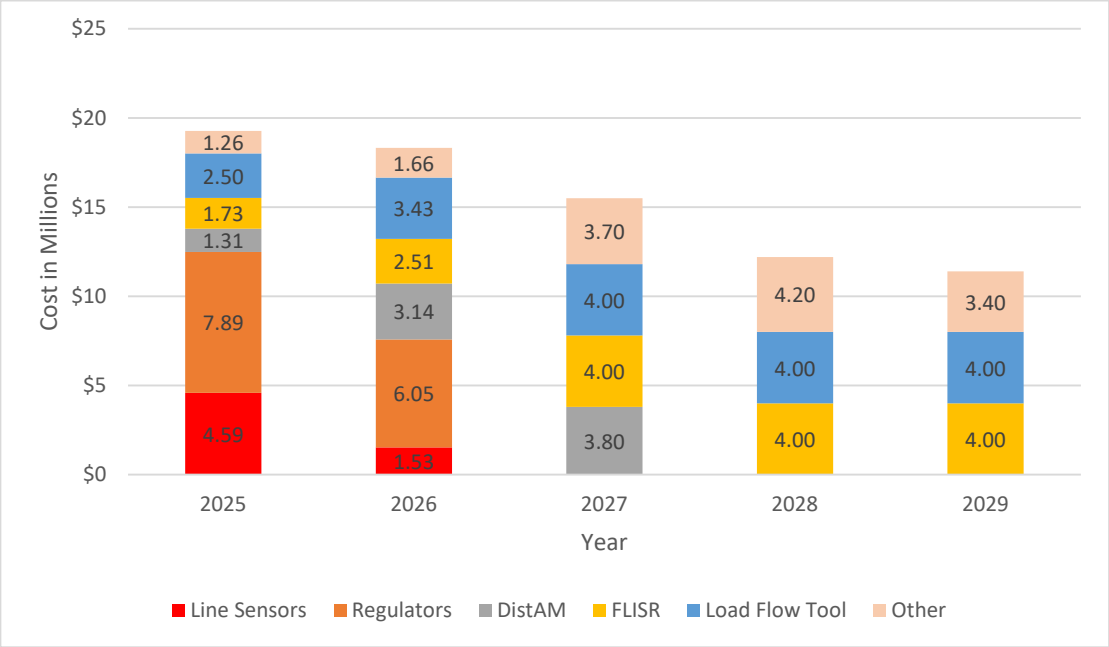
3-PHASE LINE SENSOR INSTALLATION

Weather Monitoring

Given the increasingly severe weather Michigan is experiencing, the Company needs the ability to monitor the weather at a localized level.

The current coverage of existing NOAA weather stations leave gaps in the Company's service territory. **To address this, the Company intends to install modern weather stations in 2025/2026 across its service territory.**

The number of weather stations is expected to expand through 2027, providing visibility across the service territory including wildfire risk areas. This will allow for quicker decision-making capabilities to aid in storm preparation and response. This includes repositioning Electric Line Crews to areas that are in a storm path and deploying Damage Assessment teams to survey areas that indicate severe weather based on the weather station real-time data.



Additionally, the Company will study these localized weather impacts against the performance of the electric assets, informing future resiliency investments. The Company plans to expand the number of weather stations throughout 2027.

Grid Automation 5-Year Investment Plan

Over the next five years, the Company will invest in the automation and modernization of the electric grid through various hardware and foundational software deployments.

This includes deployments of remote-communicating grid equipment such as Line Sensors, Voltage Regulators and Switches. It also includes foundational software deployments such as DistAM and FLISR that prepare the grid for the future.

Figure 123
Grid Automation 5-Year Investment Plan

Year	Line Sensors	Regulators
2025	750	221
2026	250	169
2027	0	0
2028	0	0
2029	0	0

Advanced Distribution Management System (ADMS)

ADMS is the **software platform that supports the full suite of distribution management and outage management** systems.

This platform brings together the Company's Distribution Management System ("DMS"), its Field Mapping Applications, and its Electra Outage Management System ("OMS")—which includes additional outage applications (tools that integrate with ADMS and aggregate outage-related information).

ADMS is dependent on the following:

- Supervisory Control and Data Acquisition or SCADA, as described in the Substations section.
- Geographic Information System ("GIS")
- Advanced Metering Infrastructure or AMI—a two-way communication system that collects detailed metering information throughout the Company's service territory.

ADMS real-time functionality drives improved decisions to make the electric distribution grid more efficient, enabling the Company to get customers' lights on faster.

There are two main enhancements to the ADMS platform planned, along with continued integration improvements with additional outage applications, including:

1. Implementation of the Field Mapping Application
2. Completion of the DMS platform to include:
    a. Fault Location Isolation & Service Restoration ("FLISR")
    b. Switching Order Management ("SOM")

The **Field Mapping Application** will extend the use of ADMS core functionality to the Company's field workforce.

This Application **will improve workforce efficiency by providing field employee precise real-time circuit maps and damage assessment information**.

Real-time damage assessment—when combined with 2024 implementation of Live Wire Down—will **improve customer experience** through the Company's current online outage map while also improving public safety through reduced restoration times.

Completing the *DMS* portion of ADMS will add enhancements focused on implementing all FLISR and SOM software modules. FLISR was described earlier in the Grid Automation section of this document.

- **SOM** is an ADMS **application that generates switching orders for field workers**, which will send automatic control signals via SCADA to perform and verify automatic switching operations. Using point-and-click interaction with graphical applications, a switch order is established and validated against real-time operating conditions via network interface (allowing pre-verification of the order before it is dispatched, saving time in outage response).

In addition to the two primary enhancements, the Company expects to **improve system Reliability and Resiliency through use of automation and digital tools to support ADMS.** Better integration of outage applications not currently incorporated into the Electra OMS or DMS will better integrate real-time data for restoration.

Aside from Reliability benefits, the Company will be less at-risk from catastrophic system failure.

FIGURE 124

ADMS COST and SAIDI

ADMS Enhancement	2023 Capital	2024 Capital	2025 Capital	SAIDI Savings (excluding MEDs)
OMS Electra incl Live Wire Down	$800k	$900k	$0	5 minutes
Field Mapping Application	$0	$1,600k	$0	4 minutes
DMS complete FLISR and SOM				
Outage Applications Integration	$250k	$250k	$0	4 minutes
AMI Automation Use Case	$150k	$0	$0	2 minutes
Total	**$1,200k**	**$2,750k**	**$0**	**15 minutes**

Next Digital Investments

Integrating emerging technologies, data, and analytics for Consumers Energy is instrumental in achieving our Company goals with great precision and foresight.

Our Next Digital Investment strategies provide valuable insights enabling **data-driven decision-making leading to enhanced efficiency, improvement to risk management, and cost reductions**—all to ensure our business remains resilient and reliable in a rapidly evolving digital landscape.

Additionally, using emerging technologies helps provide actional insights to tailor our tools and services to meet customer demands effectively.

By leveraging the next digital investments such as artificial intelligence, machine learning, and automation, we can **optimize processes, identify trends, and improve customer experiences**.

Outage Forecasting Model

Through a partnership with the University of Michigan, the Company is pursuing creating a suite of outage forecasting models. These models will predict customers without power, estimated incidents/trouble spots, wire downs, and poles that require replacement over the upcoming six-day period.

Asset, outage, damage, and weather data will be combined to inform the models and the output will be used to make informed decisions regarding pre-staging and staffing for weather events.

- Models for estimated incidents, damaged poles, and the number of wire downs will be delivered in the second quarter of 2025.

The customers without power model will be delivered in the fourth quarter of 2025.

Productivity & Utilization Analytics (Formerly the Restoration Wait Time Tracker)

In 2023, the Company established a dedicated group to address restoration costs. As a precursor to the Restoration Wait Time Tracker (a tool that will **provide the ability for storm response teams to understand in real-time what is happening in the field** during restoration activities),

- Productivity and Utilization Analytics have been created to measure effectiveness of restoration during storm events in 2024.
- **Work orders, crews, hazards, and outages were combined to provide visibility into the productivity differences between internal crews and contractor crews.** In 2024, post-storm analyses were standardized and real-time capabilities will begin construction in 2025.

Our storm response teams can then see in real-time when and where delays are occurring and take action to resolve barriers. This will lead to faster storm restoration.

This project is expected to result in 0.5 minutes of SAIDI savings and a 12% productivity increase during storm restoration activities.

Catastrophic Crewing Replacement

Catastrophic Crewing (“CatCrew”) is the Company’s 15-year-old home-grown resource management software tool used during storm restoration.

- This tool captures information about who is engaged in storm restoration, the Headquarters they are working from, and their work and rest time periods.
- CatCrew also captures lodging and food requirements needed for resources engaged in storm response.

The CatCrew tool **enables the Company to have a clear and up-to-date picture of resource capacity and engagement**, ultimately leading to a more efficient and faster restoration.

After restoration work is complete, we use the data captured within CatCrew to perform advanced analytics and identify improvement opportunities.

We are pursuing a vendor-provided software product to replace CatCrew due to our current software becoming outdated and difficult to maintain. The procurement of internal and external resources during storm restoration can be a prolonged process and **replacing the current software with a more responsive system will allow us to realize efficiencies** in procuring needed resources.

- Vendor-provided products exist with the functionality we need, including integration with hotels and food providers.
- The Company is in the beginning stages of the Request for Proposal ("RFP") process and estimates this will run through 2023, with selection occurring in first quarter 2024.
- The Company plans to have a new software solution implemented in 2025.

Forestry Workplan Intelligence & Strategy Engine ("WISE") Phase 2

As discussed in the *Forestry Line Clearing Program* section, the Company is working to enhance its use of advanced technology in this space.

In 2025, an internal team will be updating the Forestry WISE model to provide the annual LVD full circuit clearing workplan at the LCP-level. Once completed, this will enable the Company to be more strategic in forestry work selection, driving the replacement of reactive analysis with predictive analysis.

Imagery Analytics

The Company will re-imagine the inspection process across the various energies, **using drones and other image capture technology in a much more intentional manner, while investing in automation and machine learning** to increase the efficiency with which defects are identified.

- Currently, the Company performs cycle-based inspections on its Electric System through manual processes that require employees to physically walk or drive the system to perform a visual inspection, take photos, and manually document and classify their findings.
- Through investments in automation and machine learning, the Company can achieve Full System Inspection, including 360-degree views of assets created through automated image collection by various methods (drone, helicopter, robotics, video cameras, etc.) and trained machine learning models that identify and analyze assets to target reliability improvements.

For example, as mentioned above in the HVD Lines section, the Company is using artificial intelligence software and machine learning to automate the review of video from the annual helicopter inspection to identify specific locations of vintage insulators, which are the largest contributor to customer outage minutes on the HVD system on average over the last 5 years.

In 2025, the Company will create a single repository for images to be leveraged for forestry, asset & defect identification, and wildfire use cases. The Company will also purchase four autonomous drones and work to secure an FAA line of sight restriction waiver so that the drones will be able to complete autonomous missions within a defined five-mile radius.

Maintaining Digital Assets

Equally as important as investments in new digital capabilities is the ability to properly maintain technology assets after implementation—including the underlying foundational infrastructure, systems and platforms in the Company's digital landscape.

Prudent technology asset management and replacement programs, system monitoring, timely upgrades, and continuous system patching to mitigate cyber threats are required to sustain stability, support, and security of existing systems that directly and indirectly drive electric reliability.

Technology and Analytics Investment Plan

The plan for Next Digital Investments will cost $14 million over the next three years.

See Figure 125 below for the Next Digital Investments plan.

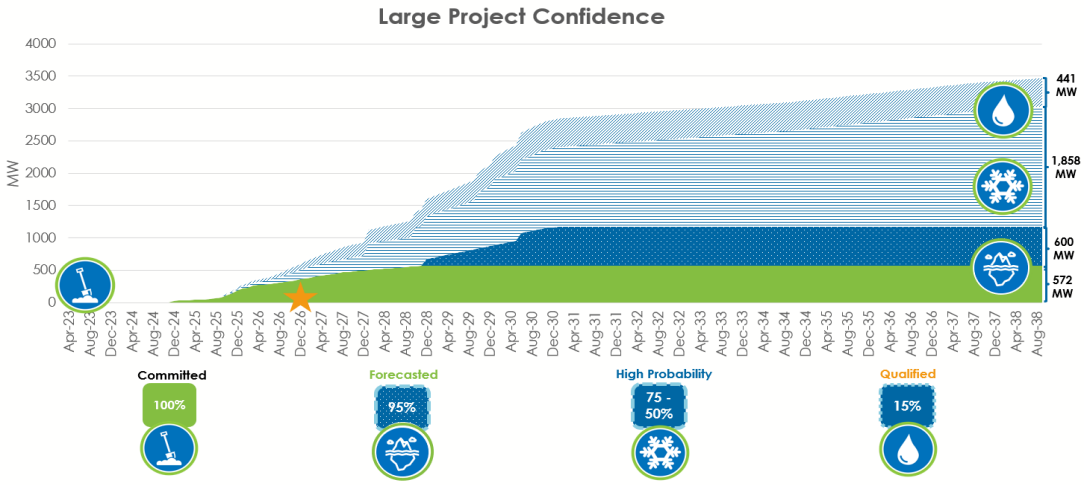
Figure 125
NEXT DIGITAL 3-YEAR INVESTMENT PLAN

Economic Development and "Mega-sites"

In June 2023, EPRI published a prospectus *The Impact of Industrial Onshoring on Electric Sector Demand Growth*, assessing the impacts of industrial onshoring and more recently the increase in data centers across the nation, both representing opportunities for the Company and State of Michigan to partner to win major industrial projects and boost the state's economy.

Business sectors and individual organizations continue to factor supply chain risks into strategic positioning and operational decision-making. Similarly, the U.S. government has been investing unprecedented sums in domestic manufacturing, infrastructure, and decarbonization to improve national security and create jobs.

In 2024, the Site Selectors Guild, in partnership with Development Counsellors International, published their *State of Site Selection* report and highlighted that these U.S. programs have resulted in construction spending on new manufacturing facilities, more than doubling from 2022 to 2023 in such industries as data centers, electric vehicles, battery plants, and semiconductors.



These events have created new conditions and opportunities for states to coordinate with utilities to address the complex needs associated with securing these projects. In the *State of Site Selection,* **electric power capacity is rated a 4.7 out of 5 point scale of having a significant impact on industrial project location decisions**. Of site consultants surveyed, 98% were in agreement that electric power capacity will significantly impact the future of industrial projects.

New manufacturing plants can generate significant local impact by adding large blocks of load. Serving new demand creates the need for new approaches to load as well as coordinated planning and development of grid infrastructure. This is because the demand growth created by industrial onshoring can have disruptive impact at local levels.

Figure 126 below shows the load projected to be added to the system as part of large projects greater than 35 megawatts ("MW").

Figure 126

ECONOMIC DEVELOPMENT LARGE PROJECT MW PROJECTIONS

Industrial reshoring continues to create demand growth in the Company's service territory, which is poised to play an outsized role in the EV battery industry, due to its proximity to existing American auto manufacturing plants.

Data centers also represent a growing sector across the nation, with many areas already seeing an unprecedented number of requests for large amounts of demand.

Currently, the Company has over 40 leads and opportunities, totaling more than 14,800 MW of potential load related to data centers alone. This potential load is not represented in the graph above. In the *State of Site Selection* report it was quoted from the Boston Consulting Group that data center electricity consumption was 2.5 percent of the U.S. total in 2022, and is expected to triple by 2030.

- To win these major projects, **increased coordination among the Company as well as manufacturers, system operators, development agencies, regulators, and other stakeholders is essential** to ensuring significant new demand can be met efficiently and in a timely fashion.

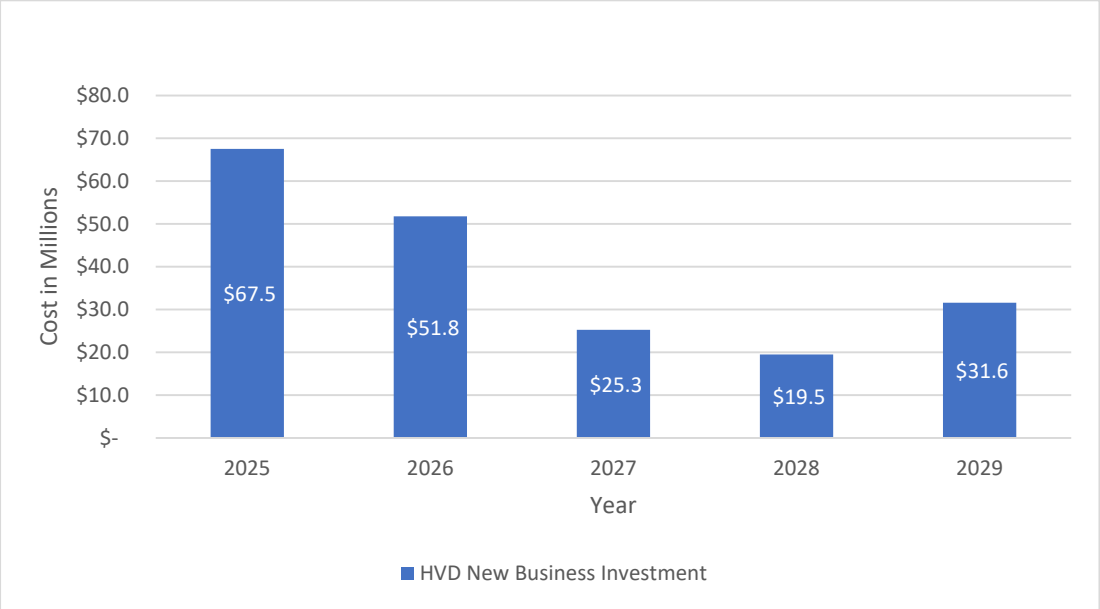
Workplan

The Company regularly works with the *Michigan Economic Development Corporation* ("MEDC") and other local economic development groups competing for prospective new large industrial customer facilities that are considering establishing a site in Michigan.

- We provide competitive electric service proposals as part of a broader Michigan response to RFPs.
- Many of these RFPs are very competitive in nature, and consider sites across North America, including considering if a site is ready and able to meet customer project timelines.

These RFP response efforts benefit the broader economy of the state of Michigan when a Michigan site is selected as the final location.

Large new customer connections and load additions provide the benefits of job creation, plus other state and local government revenue streams associated with business expansion.



However, the Company has learned that the lead time to install a large, new dedicated customer substation and the associated lines are often prohibitive for potential customers, who are looking for "shovel-ready" sites where they can start production as soon as possible.

- The Company is pursuing a solution for such a situation in advance by standardizing our design and equipment and pre-purchasing long lead-time equipment.
- This will reduce the time needed to provide electric solutions for potential customers, and create an advantageous position to attract large, transformational, and new business opportunities to the state of Michigan.

Figure 127 below represents the planned investment needed to support known and planned projects and potential projects that are known but not yet committed.

Figure 127

NEW BUSINESS PLANNED INVESTMENT

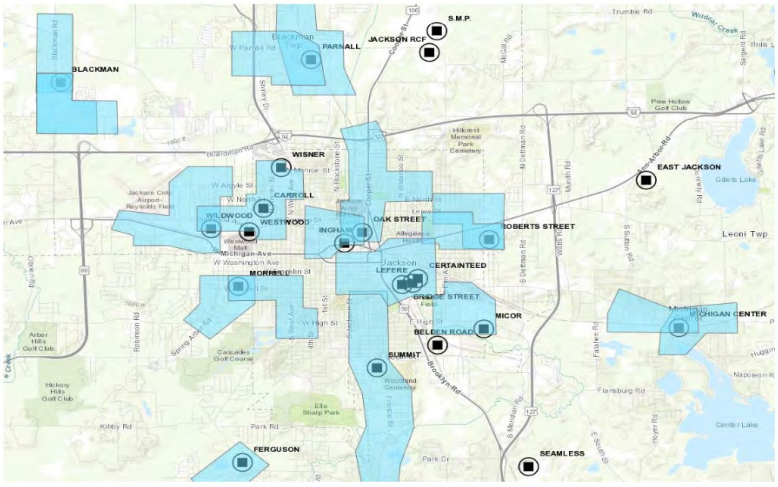
Hosting Capacity Analysis

Hosting capacity **is defined as "the amount of distributed energy resources ("DERs") that can be accommodated without adversely impacting operational criteria**, such as power quality, reliability, and safety, under existing grid control and operations and without requiring infrastructure upgrades."[14]

The Company interconnects DERs to its distribution system through an MPSC-regulated interconnection process. When a proposed DER goes through this process, the Company performs a resource-specific analysis to ensure that the resource will not cause any reliability or capacity issues, and to identify any necessary system upgrades. The analysis can range significantly in complexity based on the size of the proposed DER.

A *hosting capacity analysis* ("HCA") can improve and streamline this process by identifying locations on the system with a high probability of accommodating DERs. While resource-specific analyses are still required with an HCA, an HCA can help customers and DER developers avoid proposing interconnections and incurring study costs in areas that are not suitable for DERs.

In 2020, the MPSC directed the Company to pursue a 'phased' approach to developing HCAs, with two primary phases:



Phase I: A base-level approach with a zonal go/no-go map

Phase II: Specific, detailed analyses on areas of the distribution system with high DER penetration, incorporating this information into a more detailed map with circuit voltage-level information as DER penetration continues to increase.

The Company completed the Phase I analysis and reported the initial results in its 2021 EDIIP filing, with a detailed description of Phase I methodology. Since that time, the Company has updated its Phase I analysis as system conditions have changed, and the Company maintains a publicly available updated version on its website:
https://cms.maps.arcgis.com/apps/instant/lookup/index.html?appid=b90ff63b338043b7bcae43dd685a419d

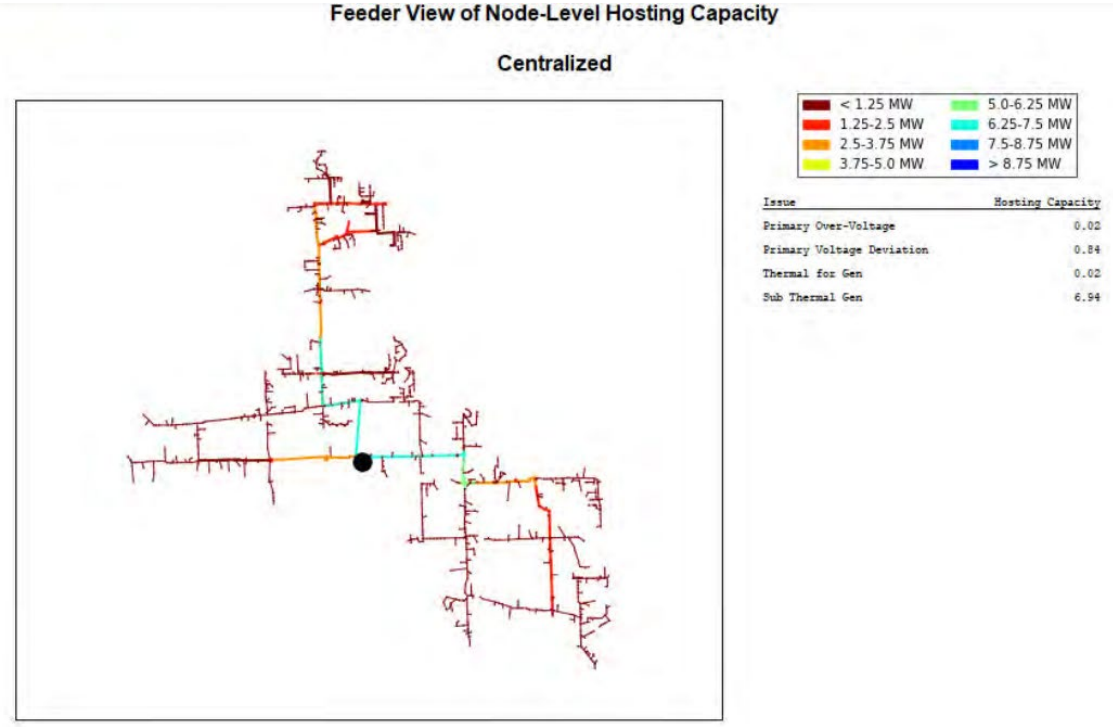
Phase I hosting capacity analysis shows circuits, in polygon form, that have at least 2 MW of hosting capacity, and result in maps such as this:

Figure 128
EXAMPLE OF PHASE I HCA MAP

[14] August 20, 2020 Order in Case No. U-20147

The Company's 2021 EDIIP also committed the Company to move ahead with a Phase II analysis.

To date, the Company has still not seen areas of high DER penetration on its system that would trigger the specific, detailed circuit analysis as originally contemplated when the 2021 EDIIP was filed. However, the Company expects to have a Phase II analysis available by the second half of 2025.



For its Phase II analysis, the Company will be able to use maximum load data from 2024 to create a snapshot of detailed hosting capacity information. This analysis relies on the Distribution Resource Integration and Value Estimation ("DRIVE") tool developed by EPRI, and also on the Company's CYME planning models.

Because manual analysis is still required with current capabilities, Phase II maps will be detailed but will not be updated in real time.

Phase II hosting capacity maps will show much more detailed circuit information, as follows:

Figure 129

ILLUSTRATIVE PHASE II HCA MAP – CIRCUIT LEVEL DETAIL

Going beyond periodic updates to Phase II maps will require the Company to complete the Load Flow Tool Upgrade proposed in its Grid Automation plan.

- The Load Flow Tool Upgrade will bring increased automation to the Company's CYME software, and will explore the use of EPRI DRIVE or CYME's Integrative Capacity Analysis module (ICA) for future hosting capacity analyses.
- The Load Flow Tool Upgrade will introduce time-series simulation capabilities in CYME, and will automate the modeling of existing and queued generation and load in the CYME network model. **This would enable a Phase III** of hosting capacity analysis, with much closer to real-time updates of the available maps.

Resources

Workforce

Field resources are an essential component for the successful continued investment into the electric distribution system. Resources both internal to the Company and externally contracted are staffed to match the work demand.

- The Company uses a **long-range resource planning process** to build workforce plans through a cross-functional planning methodology and deliver an optimally sized workforce that meets the Company's long-term needs.
- **This process reviews and aligns with a one-to-five-year resource plan**, factoring in demand, resource requirements, and resource availability to bring visibility to gaps and develop actions and scenarios to close them.
- The team leading the process **engages with Executive Leadership quarterly** to adjust resource plans and ensure resource adequacy.

This collaborative resource planning process works across the Electric Distribution organization to make informed decisions about the Company's electric field resources. The multi-year view ensures resource decisions are made with sufficient lead time to recruit, hire, and prepare Company field resources and external workforces for the work required.

The Company's field resource growth over the last five years has been deliberate to match the forecasted work demand and resource requirements for future years identified through the resource planning process.

This growth was due primarily to acquiring LVD field resources through apprenticeship hiring. These resources have been complemented during peak work demand months with a contractor workforce and have successfully met the work demand within each year.

Historical actuals below only include Company field resources over the last 5 years. This does not represent the entire workforce that was needed to deliver the work.

Figure 130

ELECTRIC DISTRIBUTION OPERATIONS: HISTORIC FIELD RESOURCE LEVELS (CE)

	2018	2019	2020	2021	2022	2023	2024
Year End Internal Resources	942	1,019	1,034	1,164	1,235	1,326	1,325

Ensuring Resource Adequacy

Using the resource planning process in collaboration with Electric Operations leadership, the upcoming multi-year resource forecast is available for field resources.

Figure 131 indicates the total resources required to meet our ambitious electric distribution investment strategy for 2025 through 2029.

Figure 132

Resources Required

	2025	2026	2027	2028	2029
LVD (including Underground)	1,160	1,547	1,589	1,969	2,000
HVD	496	538	542	494	492
Total Resources	1,656	2,085	2,131	2,463	2,492
Growth Percentage (YOY)		**26%**	**2.2%**	**15.6%**	**1.2%**

The previous 5 years incorporated resource growth with the Company's LVD workforce to meet identified work demand; however, implementing the *Resilient Grid Plan* will require that workforce growth accelerates more rapidly to meet the immediate resiliency investment needs of the grid.

- The increase in resources needed includes efficiency gains and increased productivity through leveraging predictive analytics, job-site reporting, and recruitment of qualified journey line workers.
- The Company supports its widespread LVD overhead system with a small workforce for its extensive mileage and coverage across the state of Michigan. This is executed with an efficient workforce and operations.

Even with this demonstrated efficiency, the scale of work outlined in this plan requires an even more aggressive growth rate to adequately support the planned investments.

Projected resource growth is driven by three main factors:

1. **LVD overhead field resource growth** of apprentices or qualified line workers to support the necessary system investment, which will be balanced with external contractors across peak time periods.
2. **Underground workforce growth** to match the proposed conversion work.

Maintaining a consistent workforce size or planning for growth—both require a reliable pipeline of talent to balance or exceed forecasted attrition.

Therefore, to ensure a talent pipeline for a long-term sustainable workforce, the Company initiated partnerships with strategic community colleges starting in 2008 to host line worker pre-apprenticeship programs.

These programs embody the triple bottom line by providing skilled trade training opportunities to local communities and future employees, investing in communities and their prosperity, and bringing diverse talent to the forefront of leading the clean energy transition.

- The *School to Work* program is one partnership that is currently investing in communities such as Flint, Muskegon, Alpena, Lansing, Grand Rapids, and Jackson, where career opportunities are immensely impactful, and continues to reinvest in the state of Michigan.
- This purposeful effort has yielded great success, as 74% of the Company's apprentice line worker hires have come through its *School to Work* programs since 2014.

Figure 133 and Figure 134 showcase some of these students and their training experiences.

Figure 133

SCHOOL TO WORK STUDENTS: MOTT COMMUNITY COLLEGE (FLINT, MI) & ALPENA COMMUNITY COLLEGE (ALPENA, MI)

Figure 134

Line Worker Pre-Apprenticeship Training: Alpena Community College (Alpena, MI)

The growth requirements of the underground workforce will be met as the Company will promote opportunities to other field resource roles in the Company who would be well-suited for this growing workforce.

The external programs that recruit these entry level roles confirm prerequisite skills for successful energy careers and have an extensive nation-wide pipeline.

To meet the investment into the electric grid that customers need and require, the Company's workforce plans also integrate the following methods to adequately staff for the future work demand, which will balance staffing growth:

- Drive towards increased efficiency in work or optimized scheduling, such as packaging similar work on a common circuit or within a single outage.

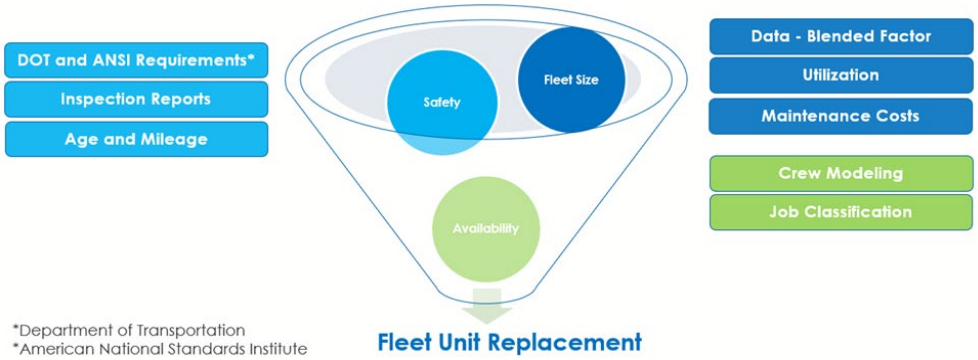
- Build work plans with agility to use the right workforce at the right time for the right response, allowing work to be levelized across months or peaks to be supported by contractor workforces.
- Manage workforce plans to inform talent pipeline programs with adequate lead time for apprenticeship training and hiring.

Using these methods will ensure work demand and field resource needs are identified for a minimum of a 5-year forecast. The Company's past successful hiring practices instill confidence that all forecasted resource requirements will be met, and will deliver a diverse and hometown-focused workforce.

Fleet

The Company supports its electric and gas businesses with a fleet that includes over 7,300 owned, leased, and rented units across 36 locations.

These units include light duty vehicles (approximately 2,800 units), medium and heavy-duty trucks (approximately 1,500 units), various types of equipment (approximately 1,400 units), and trailers (approximately 1,900 units).



Vehicles are ordered and upfitted to support specific work and are, therefore, specialized for the work they perform; however, the Company does seek ways units can be shared across the business when possible. Some Company fleet units, such as pick-up trucks, vans and sedans support both electric and gas work.

Much of the Company's fleet strategy is focused on its *Fleet Vehicle Capital Replacement Plan*, based on a *Fleet Replacement Planning Process*. This replaces vehicles as they reach the end of their useful life, using a three-phase process:

1. Vehicles are identified as being at the end of life using a tool called the *Blended Factor*, described below in Figure 135.
2. Vehicles identified for potential replacement are further analyzed by considering fleet cost data, crewing data, and fleet utilization data; qualitative inputs like maintenance reports are also considered.
3. Vehicles are confirmed for retirement based on these evaluations, and ordering begins, either through existing contracts or by putting out requests for proposal.

Figure 135

Fleet Capital Replacement Plan Filter

The Blended Factor calculation considers vehicle age, usage, and mileage to identify vehicles nearing end of life, as follows:

Figure 136

Blended Factor Calculation

$$\text{Blended Factor Rating} = \left(\frac{[\text{Age Factor} + \text{Usage Factor}]}{2}\right)$$

$$\text{Age Factor} = \left(\frac{\text{Actual Age in Months}}{\text{Expected Life in Months}}\right) - 1$$

Example: $\left(\frac{102}{84}\right) - 1 = .21$

$$\text{Usage Factor} = \left(\frac{\text{Estimated Mileage}}{\text{Expected Life Mileage}}\right) - 1$$

Example: $\left(\frac{223{,}180}{150{,}000}\right) - 1 = .488$

Blended Factor Example: $\left(\frac{[.21 + .488]}{2}\right) = .349$

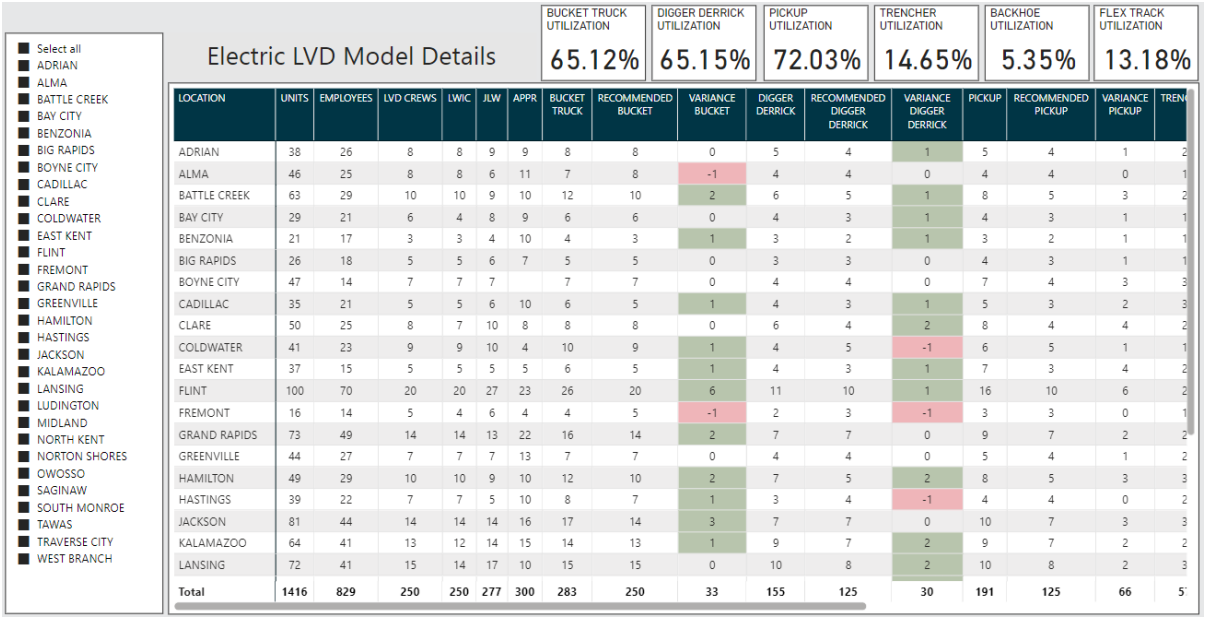
Equipment and engine operation hour calculation: 1 hour = 25 miles

The pool of vehicles identified by the Blended Factor analysis is narrowed by reviewing cost data to determine if it is more economical to continue maintaining a vehicle or to replace it.

- Crewing data helps determine how many vehicles the Company has relative to its workforce and that workforce's needs, ensuring that a replacement strategy continues to deliver the right number and types of vehicles.
- Fleet utilization data helps identify if any vehicles are not being fully used.

In addition to the Fleet Vehicle Capital Replacement Plan, the Company also expands its fleet as necessary to specifically support workforce expansion. As detailed in the prior Workforce section of this report, the Company's increased distribution investments require expansion of key parts of the workforce, which will in turn require an expanded fleet.

To support fleet expansion, the Company compares current fleet resources with projected crewing levels before expansion takes place, identifying any gaps indicated by the crewing model, and then develops a plan to procure vehicles needed to close those gaps, informed by qualitative inputs from the affected workforce areas with relevant knowledge about the work to be done.



To address immediate needs, the Company has established contracts with multiple fleet unit vendors. These vendors can supply trucks and equipment as necessary to bridge potential gaps with relatively short notice.

As the Company develops the scope of various projects, a clearer understanding of the specific equipment and resources required are determined based on the workforce needed. This process helps in identifying gaps where additional or different equipment might be needed.

The Company has developed a Crewing Model that helps forecast where potential gaps exist to aid in determining proper equipment levels throughout the business. An illustrative example of the Crewing Model is shown below.

Conclusion and Financial Summary

The Company is modernizing its electric distribution system to safely deliver clean, affordable, reliable power to customers throughout Michigan. **The goal is simple: fewer and shorter power outages for customers.** The vision for the grid is a blueprint for serving Michigan today and innovating to meet the challenges of the coming decades.

The *Reliability Roadmap*, laying out the investment levels summarized in the chart below, charts a new course for the Company in terms of reliability, resiliency, and investment.

The Company has identified **severe weather and technological adoption as the most pressing challenges** to the future grid and modeled the circuit level impacts from these risks through 2050.

This plan will underpin the Company's strategy for distribution investment planning to mitigate the current risk of severe weather and storms, and will serve as a bridge from our current grid to a grid capable of achieving the following reliability objectives:

1. **Delivering reliability performance into the 2nd quartile of nationwide utilities.**
2. **Delivering a grid where no single outage event will affect more than 100,000 customers.**
3. **Delivering a grid where no customer will be without power for more than 24 hours following an outage event.**

The *Reliability Roadmap* will also **significantly improve the Company's SAIFI performance** over the next decade when compared to what would be provided by recent electric rate case-approved levels of investment.

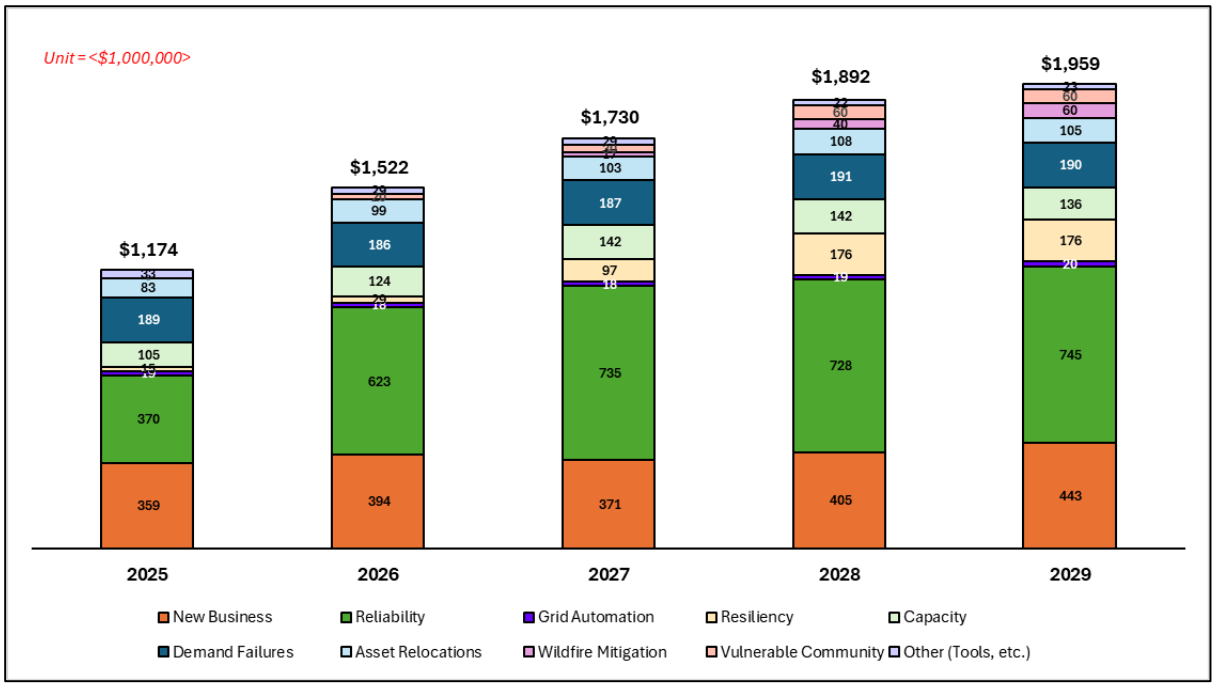
Increased risks from weather and technological adoption will require a significant shift in investment levels and strategy to mitigate the risks from extreme weather and improve the reliability of electric power.

The *Reliability Roadmap* features a unique approach for each voltage system, and a detailed work plan for each asset type.

- The plan for the LVD system will mitigate the worst effects of extreme weather and begin proactive planning for an increasingly electrified future, while the plan for the HVD system will focus on maintaining recent progress through proactively inspecting all assets repairing components on the HVD system to keep them within their useful lifecycle.
- This plan will focus on assets to modernize and harden the Company's electric distribution system to safely provide power with fewer, shorter, and less frequent power outages for customers through the Five Fundamentals Framework: **Fix, Fuse, Fractionalize, Fortify** and **Forestry**.

To execute on this vision, the plan proposes to invest over the next 5 years in the following areas:

FIGURE 138
INVESTMENT PLAN (2025-2029)



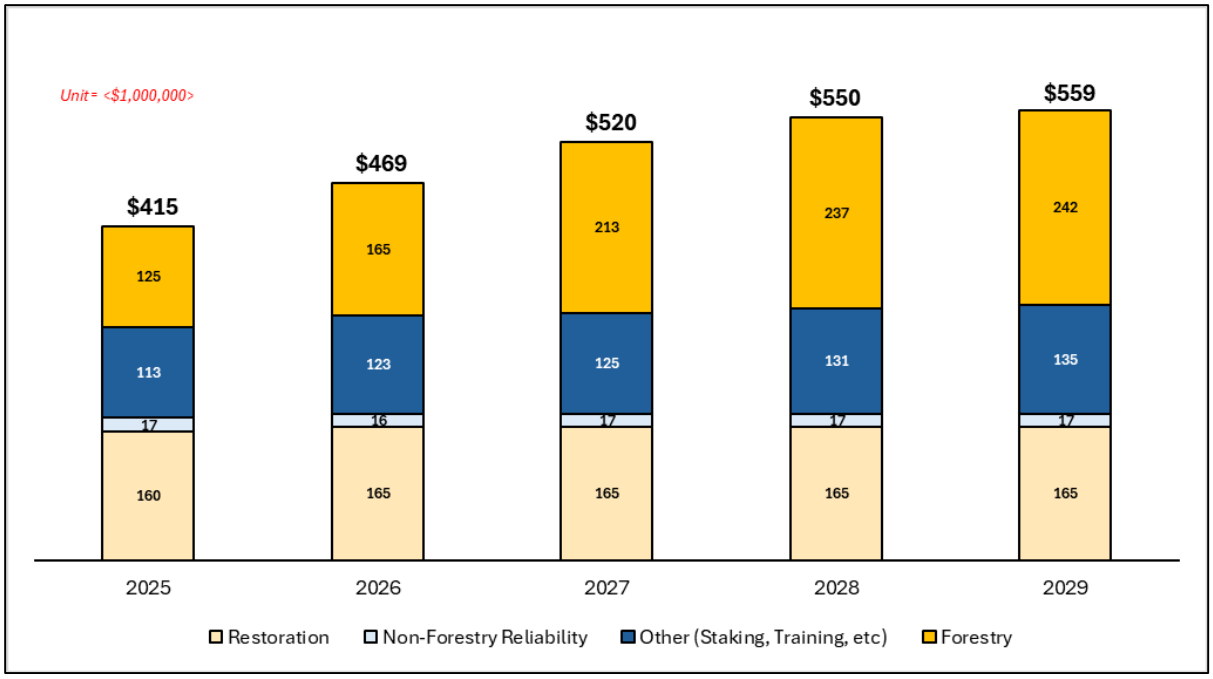


FIGURE 139
O&M PLAN (2025-2029)

This plan also incorporates Environmental Justice into its planning for capital projects and maintenance to ensure disadvantaged communities receive reliable power.

- The Forestry Line Clearing work included in this plan is essential to **addressing the largest single risk to reliability on LVD system** and the Company has developed a prescriptive line clearing impact analysis, with a focus on reliability metrics and tree-caused incidents to inform this work.
- The Company is **expanding its use of data-driven strategies** to guide its LVD full circuit clearing and ramp up to a 5-year clearing cycle for all distribution lines.
- Technology, Analytics, and Grid Modernization will complement the asset investments through developing **new tools and systems to improve the way the Company monitors, controls, and optimizes assets.** Digital will serve as the accelerant to achieve our reliability aspirations by leveraging artificial intelligence, machine learning, and automation to optimize processes, identify trends, and improve customer experiences.

The work described in this Plan relies on adequate field resources, both internal to the Company and externally contracted, to match the work demand.

Our unionized workforce is an essential component for the successful continued investment into the electric distribution system. The Company has seen continued field resource growth over the last 5 years, and has been deliberate in matching the forecasted work demand.

This plan will accelerate this growth into the future with a combination of new resiliency investment and increased maintenance of our system.

As described earlier in the Highlights of the Reliability Roadmap section, the Company fundamentally believes that the **investments outlined in this plan will deliver the safety, reliability, and resiliency benefits** that customers expect. The Company plans to seek recovery for these investments. Timely recovery of the costs of the investments described in this plan is essential to delivering the desired improvements in performance.

The Company looks forward to working with the MPSC, Staff, and the broader set of stakeholders as this plan is executed and further improved over time.

The Company plans to file updates to this plan, adding future years of investment and accounting for additional years of actual spending, with each subsequent rate case filing as an exhibit supporting test year investments.

Figure 1. Heatmap of Intraclass Correlation Coefficient ("ICC") values for each reliability metric and feeder-level reliability regression model. 35

Figure 2. Regression coefficients for Model 6 (including feeder characteristics, demographic characteristics, and year fixed effects) of SAIDI excluding MEDs. 37

Figure 3. Regression coefficients for Model 6 (including feeder characteristics, demographic characteristics, and year fixed effects) of SAIDI including MEDs. 40

Figure 4. Regression coefficients for Model 6 (including feeder characteristics, demographic characteristics, and year fixed effects) of SAIFI excluding MEDs. 43

Figure 5. Regression coefficients for Model 6 (including feeder characteristics, demographic characteristics, and year fixed effects) of SAIFI including MEDs. 45

Figure 6. Average annual disconnection rate (in units of disconnections per 1000 households) for each year from 2020 through 2024 for 2020 Census tracts in Consumers' service territory. 50

Figure 7. Histogram of 2020 Census-tract-level disconnection rates (in units of disconnections per 1000 households) for 2020. 50

Figure 8. Histogram of 2020 Census-tract-level disconnection rates (in units of disconnections per 1000 households) for 2021. 51

Figure 9. Histogram of 2020 Census-tract-level disconnection rates (in units of disconnections per 1000 households) for 2022. 51

Figure 10. Histogram of 2020 Census-tract-level disconnection rates (in units of disconnections per 1000 households) for 2023. 52

Figure 11. Histogram of 2020 Census-tract-level disconnection rates (in units of disconnections per 1000 households) for 2023. 52

Figure 12. Map showing the boundaries of Census Tract 26073000703, labeled 0007.03, and annotated with a teal star. 53

Figure 13. Map of 2020 Census tracts shaded according to the base-10 logarithm of their disconnection rate in 2024, with darker purples corresponding to higher disconnection rates. 54

Figure 14. Map of 2020 Census tracts shaded according to their Energy Burden (% Income), Electricity from the LEAD Tool. 60

Figure 15. Map of 2020 Census tracts shaded according to the total Michigan Energy Assistance Program ("MEAP") funds spent (in dollars) at the county level. 61

Figure 16. Map of 2020 Census tracts shaded according to the average Michigan Energy Assistance Program ("MEAP") funds spent per household served (in dollars) at the county level. 62

Figure 17. Disconnection rate (disconnections per 1000 households) versus SAIDI including MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data. 64

Figure 18. Disconnection rate (disconnections per 1000 households) versus SAIDI excluding MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data. 64

Figure 19. Disconnection rate (disconnections per 1000 households) versus SAIFI including MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data. 65

Figure 20. Disconnection rate (disconnections per 1000 households) versus SAIFI excluding MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data. 65

List of Tables

Page

Table 1. American Community Survey variables used in the study with table codes and descriptions. 4

Table 2. Additional calculated predictor variables and associated American Community Survey reference codes. 6

Table 3. The average value (over all 1084 of the 2010 Census tracts in Consumers' service territory for which reliability data was provided) of each 2010 Census-tract-level reliability metric in each year from 2020 through 2025. 10

Table 4. The average value (over all feeders in Consumers' distribution system) of each of four feeder-level reliability metrics in each year from 2020 through 2025. 11

Table 5. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for EJ census tracts and for non-EJ census tracts. The difference is calculated by subtracting the EJ Mean from the Non-EJ Mean. Statistical significance is assessed at $\alpha = 0.05$, and the group that experiences better reliability is assessed only for statistically significant differences in mean reliability. 12

Table 6. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for Rural census tracts and for Urban census tracts. Significance is assessed at $\alpha = 0.05$. 15

Table 7. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for High-Income census tracts and for Low-Income census tracts. Significance is assessed at $\alpha = 0.05$. 18

Table 8. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for High-Percent-Minority-Percentile ("High PM") census tracts and for Low-Percent-Minority-Percentile ("Low PM") census tracts. Significance is assessed at $\alpha = 0.05$. 22

Table 9. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIDI excluding MEDs (with county-level and year fixed effects). All models include MiEJScreen Overall Score as a predictor. Significance codes: *** denotes $p < 0.001$, ** denotes $p < 0.01$, and * denotes $p < 0.05$. 28

Table 10. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIFI excluding MEDs (with county-level and year fixed effects). All models include MiEJScreen Overall Score as a predictor. Significance codes: *** denotes $p < 0.001$, ** denotes $p < 0.01$, and * denotes $p < 0.05$. 28

Table 11. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIDI excluding MEDs (with county-level and year fixed effects). All models include

Percent Minority Percentile as a predictor. Significance codes: *** denotes p < 0.001, ** denotes p < 0.01, and * denotes p < 0.05. 30

Table 12. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIFI excluding MEDs (with county-level and year fixed effects). All models include Percent Minority Percentile as a predictor. Significance codes: *** denotes p < 0.001, ** denotes p < 0.01, and * denotes p < 0.05. 31

Table 13. The percentage of feeders in Consumer's electric distribution system at each voltage level and configuration. 33

Table 14. Mixed-effects linear regression models for SAIDI excluding MEDs. Coefficients are given with standard errors in parentheses. *indicates significance at the p < 0.05 level. 38

Table 15. Mixed-effects linear regression models for SAIDI including MEDs. Coefficients are given with standard errors in parentheses. * indicates significance at the p < 0.05 level. 40

Table 16. Mixed-effects linear regression models for SAIFI excluding MEDs. Coefficients are given with standard errors in parentheses. *indicates significance at the p < 0.05 level. 43

Table 17. Mixed-effects linear regression models for SAIFI including MEDs. Coefficients are given with standard errors in parentheses. *indicates significance at the p < 0.05 level. 46

Table 18. Descriptive statistics (i.e., mean, standard deviation, minimum, and maximum) of disconnection rates (in units of disconnections per 1000 households) among 2020 Census tracts in Consumers' service territory from 2020 through 2024. 49

Table 19. Comparison of 2020 census-tract-level disconnection rates for each year from 2020 through 2024 averaged for Low-Income and High-Income census tracts. The difference is calculated by subtracting the Low-Income Mean from the High-Income Mean. Statistical significance is assessed at $\alpha = 0.05$, and the group that experiences a worse average disconnection rate is assessed only for statistically significant differences in mean disconnection rate. 55

Table 20. Comparison of 2020 census-tract-level disconnection rates for each year from 2020 through 2024 averaged for Low-Percentage-Minority-Population and High-Percentage-Minority-Population census tracts. The difference is calculated by subtracting the High- Percentage-Minority-Population Mean from the Low-Percentage-Minority-Population. Statistical significance is assessed at $\alpha = 0.05$, and the group that experiences a worse average disconnection rate is assessed only for statistically significant differences in mean disconnection rate. 56

Table 21. Panel regression model for disconnection rate (in units of disconnections per 1000 households) considering year- and county-level fixed effects: coefficients for each independent variable, standard errors, and p-values. *indicates p < 0.05. 59

Table 22. Comparison of census-tract-level disconnection rates for each year from 2020 through 2024 averaged for the 10% of census tracts with the worst reliability per

each metric (the Vulnerable group) and all other census tracts within Consumers service territory (the Non-Vulnerable group). Significance is assessed at $\alpha = 0.05$. 66

Limitations

The study presented in this report is intended for use by Consumers Energy Company ("Consumers") to inform their decisions related to distributional equity of electric reliability among the various communities that they serve. While this study is informative, it is understood and agreed that responsibility for these decisions remain fully with Consumers. Proper application of this report requires recognition and understanding of the limitations of both the scope and methodology of the study. The scope of the study was limited to performing regression analysis to assess correlations between electric reliability and: (1) demographic characteristics of communities served by Consumers; and (2) physical characteristics of distribution circuits. The scope of the study also included regression analysis of correlations between residential involuntary disconnections for non-payment and demographic characteristics of communities within Consumers' service territory.

In the analysis, Exponent has relied on data and various other information provided by Consumers. We cannot verify the correctness of this input data and rely on Consumers for their accuracy.

Exponent has exercised professional skill and care ordinarily provided by professionals practicing in the same or similar locality under the same or similar circumstances in the preparation of this report, and the findings presented herein are made based on information available to Exponent as of the date of this report. This report may be supplemented to expand or modify our findings based on additional analysis or review of additional information.

It is noted that the Executive Summary cannot summarize all of Exponent's technical evaluation, analysis, conclusions, and recommendations. Hence, the main part of this report is at all times the controlling document.

Executive Summary

The primary objective of this study was to update the set of analyses previously conducted (i.e., the "2025 Analysis") to quantify differences in the reliability experienced by Environmental Justice ("EJ") and Non-EJ communities within Consumers Energy Company's ("Consumers") service territory from 2020-2024[1] with an additional year's worth of data from 2025. A further objective of this study was to update the regression analysis of rates of residential involuntary disconnection for nonpayment ("disconnection rates") among Consumers' customers that was previously conducted using data from 2020-2023 with data for 2024. We also aimed to refine the disconnection regression analysis by including additional independent variables in the model and providing additional context for the results.

To quantify differences in the reliability experienced by EJ and Non-EJ communities in Consumers' service territory, we used statistical techniques including the binary difference-in-means *t*-test and regression analysis. The results of this analysis suggest that EJ communities tend to experience better average reliability than non-EJ communities, consistent with our findings in the 2025 Analysis. The results of the updated regression analysis also indicate that MiEJScreen Overall Score is statistically significant and correlated with improving reliability as quantified by the following metrics (when all other variables, as well as county and year factors, are held constant): SAIDI including and excluding MEDs; SAIFI including and excluding MEDs; CAIDI including and excluding MEDs; CELID-5 and -24; CEMI-4, -5, and -7; Total Customer Interruptions; and Unique Customers with an Interruption. These findings are consistent with those of the 2025 Analysis.

We also examined differences in the reliability experienced by groups of customers that may be disadvantaged, or reasonably expected to be more vulnerable to disruptions in electric service, and other customers in Consumers' service territory. Consistent with our findings in the 2025 Analysis, we found that Urban census tracts tend to have better average reliability than Rural census tracts; that Low-Income census tracts tend to have better average reliability than High-Income census tracts; and that High-Percent-Minority-Percentile census tracts tend to have better average reliability than Low-Percent-Minority-Percentile census tracts. In 2025, we observed notable exceptions to this general pattern: Non-EJ, Rural, High-Income, and Low-Percent-Minority-Percentile census tracts had better average reliability in terms of the percentage of catastrophic-weather restorations made within 48 hours than EJ, Urban, Low-Income, and High-Percent-Minority-Percentile census tracts. On average, High-Income and Low-Percent-Minority-Percentile census tracts also had better reliability in terms of CAIDI including MEDs and the percentage of all-weather restorations made within 36 hours, than Low-Income and High-Percent-Minority-Percentile census tracts, respectively.

[1] Consumers Energy Company. Rate Case No. U-21870. "Reliability Regression Analysis for Environmental Justice Communities." Exhibit A-135. June 2, 2025.

We also assessed how different physical characteristics of distribution circuits (also called feeders) and the demographic characteristics of the communities they serve relate to their reliability. We found that feeders' physical characteristics, rather than demographic characteristics of the populations they serve, drive differences in reliability across feeders. None of the demographic characteristics – including whether a feeder serves an EJ census tract – had statistically significant correlations with any of the four feeder reliability metrics. Relative to the reference voltage (4.8/8.32 kV Wye Grounded), having an alternative voltage configuration is often statistically significant and has a large effect on reliability. We also found that, consistent with expectations, increasing Primary Miles and Mean Canopy Cover are statistically significant and associated with increases in both SAIDI and SAIFI (both including and excluding MEDs), indicating that increases in these characteristics are associated with worse reliability. Primary Underground Percentage and Customers Per Primary Line Mile had statistically significant negative correlations with all metrics, indicating that increases in these characteristics are associated with improved reliability.

The results of the regression analysis of disconnection rates were enhanced by the addition of electric energy burden (i.e., the percentage of household income that is spent on electric energy costs[2]) to the set of independent variables. As expected, electric energy burden has the greatest correlation with disconnection rate of all the independent variables included in the model. Notably, the statistically significant positive correlation previously observed in the 2025 Analysis between Percentage Minority Population and disconnection rate persists even when electric energy burden (along with the same variables previously included in the model) is controlled for.

Data

In addition to the annual reliability and disconnection data provided for the 2025 Analysis,[3] Consumers also provided reliability and disconnection data for 2025. The updated reliability and disconnection data were used in the regression analyses detailed in subsequent sections. Demographic data was obtained in a similar fashion to the 2025 Analysis, using the MiEJScreen tool and data from the United States Bureau of the Census ("Census Bureau"). These demographic data were used as independent variables in the regression analyses, along with feeder characteristics provided by Consumers. The following subsections detail the different datasets used, highlighting variables and data that are new or different relative to the 2025 Analysis.

2010 Census Tract-Level Data

Reliability Data

Consumers provided annual values of 18 reliability metrics at the 2010 Census-tract level for 2020 through 2025. The reliability data provided was the same as in the 2025 Analysis, but with an additional year of data for 2025. Values of three reliability indices were calculated both with and without Major Event Days ("MEDs"), i.e., days during which "the daily system SAIDI [System Average Interruption Duration Index] exceeds a threshold value."[4]

- Total number of customers interrupted;
- Unique number of customers with an interruption;
- SAIDI excluding MEDs: the total duration of interruption for the average customer during a year,[5] excluding MEDs; expressed in minutes.
- SAIDI including MEDs: the total duration of interruption for the average customer during a year, including MEDs; expressed in minutes.
- System Average Interruption Frequency Index ("SAIFI") excluding MEDs: how often the average customer experiences a sustained interruption during a year, excluding MEDs,[6] expressed in interruptions per customer.
- SAIFI including MEDs: how often the average customer experiences a sustained interruption during a year, including MEDs; expressed in interruptions per customer.

[5] IEEE 1366-2022, p15.

[6] *Ibid*.

- Customer Average Interruption Duration Index ("CAIDI") excluding MEDs: the average time to restore service,[7] excluding MEDs; expressed in minutes.
- CAIDI including MEDs: the average time to restore service, including MEDs; expressed in minutes.
- The Customers Experiencing Multiple Interruptions Index ("CEMI-n"), which indicates the percentage of individual customers experiencing n or more sustained interruptions in a year;[8] values were provided for the following metrics:
  - CEMI-4
  - CEMI-5
  - CEMI-7
  - CEMI-10
- The Customers Experiencing Long Interruption Durations Index ("CELID-t"), which indicates the percentage of individual customers that experience a single interruption of at least a given duration, t, in hours;[9] values were provided for the following metrics:
  - CELID-5
  - CELID-24
- The percentage of normal-weather restorations made within 8 hours: Consumers defines normal-weather conditions as those that leave less than 1% of their customers without power.[10]
- The percentage of gray-sky weather restorations made within 24 hours: Consumers defines gray-sky events as those that leave less than 10% of their customers without power.[11]
- The percentage of all-weather restorations made within 36 hours: this category considers restorations made under normal, gray-sky, and catastrophic-weather conditions.
- The percentage of catastrophic-weather restorations made within 48 hours: Consumers defines catastrophic events as those that leave at least 10% of their customers without power.[12]

Demographic Data

The demographic variables and MiEJScreen Overall Score[13] used in the report are identical to those used in the 2025 Analysis.[14] As before, the following demographic variables were extracted from the MiEJScreen Tool:

[11] *Ibid*.

[12] *Ibid*.

[13] The MiEJScreen Overall Score is called "MiEJ Score Percentile" in the data available to download through the MiEJScreen: Environmental Justice Screening Tool (Version 1.0) at the following link: https://egle.maps.arcgis.com/apps/webappviewer/index.html?id=b100011f137945138a52a35ec6d8676f

[14] Consumers Energy Company. Rate Case No. U-21870. " Reliability Regression Analysis for Environmental Justice Communities." Exhibit A-135. June 2, 2025. p7.

- Percent Minority Percentile, which is based on "the sum of all race/ethnicity categories except White/Non-Hispanic. It includes Black, American Indian/Alaskan native, Asian, Native Hawaiian-Other Pacific Islander and two or more races." The value of this variable is not the actual percentage of the aforementioned racial/ethnic groups within a census tract's population but rather the census tract's percentile, based on the census tract's rank among the other census tracts in terms of the percentage of its population comprised by Black, Indigenous, and People of Color ("BIPOC");[15]
- Poverty, which is the "percent of population living below two times the federal poverty level";[16]
- Median Household Income in the past 12 months;
- Population Density, in units of 100 people per square mile;
- Percent Unemployed, which is the "percent of the population over the age of 16 that is unemployed and eligible for the labor force."[17] This excludes "retirees, students, homemakers, [and] institutionalized persons."; and
- Housing Burden, which is "the percent of households paying more than 30% of their income on shelter costs."[18]

Urbanized Area and Urban Cluster Data

For details on Urbanized Area ("UA") and Urban Cluster ("UC") data, refer to the 2025 Analysis.[19]

2020 Census Tract-Level Data

Reliability Data

For 2020 through 2025, Consumers provided annual values of the same 18 reliability metrics at the 2020 Census-tract level that they provided at the 2010 Census-tract level.

Residential Involuntary Disconnection Data

Consumers provided annual disconnection counts for 2020 through 2025 for 2020 Census tracts within their service territory. Consumers provided updated disconnection counts for each year from 2020 through 2024, i.e., the disconnection counts in the current study are not the same as

those used in the 2025 Analysis.[20] Disconnection rates, in units of disconnections per 1000 households, were calculated at the census-tract level as specified in the following section.

Demographic Data

The Census Bureau provides annual American Community Survey ("ACS") 5-year estimates for demographic variables. The annual ACS 5-year estimates that were used in the 2025 Analysis[21] were also used in this analysis and are shown in Table 1. When the present analysis was carried out, ACS 5-year estimates were available for each year from 2020 through 2024. Because ACS data for 2025 was not available when the present analysis was carried out, disconnection rates were not calculated for 2025 and are therefore not included in this report.

The U.S. Department of Energy's Low-income Energy Affordability Data ("LEAD") Tool tabulates data on average annual energy cost and energy burden. These data have been used in studies assessing correlations between disconnections and demographic characteristics of communities.[22] We used data on Energy Burden (% Income), Electric from the LEAD Tool, which represents the percentage of gross household income spent on the cost of electric energy.[23] This data was tabulated once, i.e., does not vary by year, for 2020 Census tracts.[24]

Table 1. American Community Survey variables used in the study with table codes and descriptions.

ACS Code	Estimate	Table description

Witness: EMDuke
Date: June 2026

Circuit-Level Data

The following sections summarize data provided by Consumers for individual circuits, also called "feeders."

Reliability Data

Consumers provided annual values of the following four reliability metrics for 1943[25] feeders from 2020 through 2025:

- SAIDI excluding MEDs;
- SAIDI including MEDs;
- SAIFI including MEDs; and
- SAIFI excluding MEDs.

Circuit-2010 Census Tract Overlap Data

For each feeder, Consumers provided the percentage of its length that falls within a 2010 Census tract.

Circuit Characteristics Data

Consumers provided data on the following characteristics (the same as specified in the 2025 Analysis[26]) for each feeder:

- Customers per Primary Line Mile;
- Mean Canopy Cover Percentage: the percentage of the land surface covered by trees along the length of a circuit;
- Open Wire Secondary Miles;
- Primary Miles;
- Primary Underground Percentage: the percentage of a feeder's primary line mileage that is underground;
- Voltage: the voltage (kV) and configuration of phases (Delta or Wye Grounded);
- Primary Miles; and
- Year of Last Trim: the year that vegetation proximal to the feeder was most recently trimmed.

[25] In the 2025 Analysis, we stated erroneously on p11 that we used data for 2400 feeders when in fact we used data for 1934 feeders.

[26] Consumers Energy Company. Rate Case No. U-21870. "Reliability Regression Analysis for Environmental Justice Communities". Exhibit A-135. June 2, 2025. p11.

Methods

As discussed in the 2025 Analysis,[27] we used two types of statistical methods to assess whether statistically significant differences are observed in the reliability of different groups of customers within Consumers' service territory. First, the binary difference-in-means *t*-test was applied to assess whether differences in the average reliability of two groups of census tracts were statistically significant. Second, regression models were fitted to assess the magnitude and direction of correlation between the demographic characteristics of a census tract and its reliability, or between the characteristics of a circuit (including both its physical characteristics and the types of communities it serves) and its reliability. The following sections summarize how groups of census tracts were defined, how feeders were classified, and how linear regression models were specified.

Classifying 2010 Census Tracts

2010 Census tracts were classified into the following groups as specified in the 2025 Analysis:[28]

- EJ or Non-EJ;
- Urban or Rural;
- Low Income or High Income; and
- Low Percent Minority Percentile or High Percent Minority Percentile.

Except for the Urban or Rural category, classification was carried out based on MiEJScreen data. Since MiEJScreen data is time-invariant, 2010 Census tracts' classifications do not vary by year.

Classifying 2020 Census Tracts

2020 Census tracts were classified into the following groups as specified in the 2025 Analysis:[29]

- Low Income and High Income; and
- Low Percentage Minority Population and High Percentage Minority Population.

The classification of 2020 Census tracts was carried out based on ACS data, which are provided annually. Therefore, 2020 Census tracts' classifications are assessed annually.

[27] *Ibid*, p12.

[28] *Ibid*, p12-13.

[29] *Ibid*, p13.

Classifying Feeders as Serving a Group of Census Tracts

Feeders were classified as serving groups of 2010 Census tracts as specified in the 2025 Analysis.[30]

Binary Difference-in-Means *t*-test

The binary difference-in-means *t*-test was carried out as specified in the 2025 Analysis.[31]

Linear Regression

We used mixed-effects linear regression to assess how 2010 Census tract-level reliability varies as a function of characteristics of the communities within those census tracts. Our census-tract-level reliability regression models include both time and county-level fixed effects as well as census tract-level random effects and are specified as described in the 2025 Analysis.[32] We also used mixed-effects linear regression to analyze how feeder reliability varies with both physical characteristics of feeders and demographic characteristics of the census tracts served by a feeder. Our feeder-level reliability regression models include both time fixed effects and feeder-level random effects and are specified as in the 2025 Analysis.[33] We used panel linear regression with both time and county-level fixed effects to evaluate relationships between 2020 Census tract-level disconnection rates and characteristics of the communities within those census tracts, as detailed in the 2025 Analysis.[34]

[30] *Ibid*, p13-14.

[31] *Ibid*, p14.

[32] *Ibid*, p16.

[33] *Ibid*, p16-17.

[34] *Ibid*, p15-16.

Descriptive Analysis Results: Reliability

Descriptive Analysis: Average Reliability

The average value of each reliability metric in each year from 2020 through 2025 is shown in Table 3, considering all 1084 census tracts (per the 2010 Census) in Consumers' service territory for which reliability data was available. Tract-level average reliability values for 2020 through 2024 are identical to those reported in the 2025 Analysis.[35] The total number of census tracts in the present analysis differs from the 1050 census tracts included in the 2025 Analysis due to reliability data for additional tracts available in 2025. The values in this table are provided as a reference for the regression coefficients reported and discussed in subsequent sections. For the same reason, the average value of each feeder-level reliability metric in each year from 2020 through 2025 is shown in . Note that feeder-level reliability data are not identical to those reported in the 2025 Analysis as a result of updated data provided by Consumers.

Table 3. The average value (over all 1084 of the 2010 Census tracts in Consumers' service territory for which reliability data was provided) of each 2010 Census-tract-level reliability metric in each year from 2020 through 2025.

Reliability Metric	2020	2021	2022	2023	2024	2025
Unique Customers with an Interruption	1113.87	1211.56	1102.35	1142.70	1088.09	1111.59
Total Customer Interruptions	2363.38	2827.99	2281.05	2452.29	2382.12	2458.24
SAIDI including MEDs	511.22	930.59	447.32	911.41	478.95	968.66

SAIFI excluding MEDs	1.01	1.07	0.96	0.97	0.89	0.92
CAIDI including MEDs	363.92	518.43	345.51	529.50	346.91	567.70
CAIDI excluding MEDs	191.92	211.60	188.66	188.96	182.07	196.66
CEMI-4	0.09	0.13	0.09	0.11	0.11	0.14
CEMI-5	0.05	0.07	0.05	0.05	0.06	0.08
CEMI-7	0.01	0.02	0.01	0.02	0.02	0.02
CEMI-10	0.00	0.00	0.00	0.00	0.00	0.00
CELID-5	0.27	0.39	0.27	0.35	0.29	0.38
CELID-24	0.08	0.16	0.06	0.16	0.07	0.17
Percentage of all-weather restorations made within 36 hours	96.97	94.49	97.88	93.16	97.77	92.34
Percentage of catastrophic-weather restorations made within 48 hours	89.17	79.68	94.05	85.60	95.34	83.89
Percentage of normal-weather restorations made within 8 hours	95.18	93.42	94.45	93.95	94.34	94.08
Percentage of gray-sky-weather restorations made within 24 hours	93.33	89.58	89.37	97.15	94.42	94.71

[35] *Ibid*, p18.

Table 4. The average value (over all feeders in Consumers' distribution system for which reliability data was provided) of each of four feeder-level reliability metrics in each year from 2020 through 2025.

Reliability Metric	2020	2021	2022	2023	2024	2025
SAIDI excluding MEDs	193.65	235.95	184.18	195.9	183.69	196.32
SAIDI including MEDs	535.83	970.7	467.62	1074.43	589.62	957.13
SAIFI excluding MEDs	1.01	1.08	0.94	1.02	1.01	1.05
SAIFI including MEDs	1.33	1.62	1.23	1.47	1.5	1.65

Comparing the Average Reliability of Groups of Census Tracts

To assess whether there were statistically significant differences in the reliability of groups of 2010 Census tracts in Consumers' service territory from 2020 through 2025, we carried out the binary difference-in-means *t*-test. As in the 2025 Analysis,[36] the test was performed for each of the following paired groups of 2010 Census tracts in each year for each reliability metric:

- EJ and Non-EJ;
- Urban and Rural;
- Low Income and High Income; and
- High Percent Minority Percentile and Low Percent Minority Percentile.

The following subsections detail the findings of each set of comparisons.

EJ and Non-EJ Census Tracts

For EJ and Non-EJ census tracts, the results of the binary difference-in-means *t*-test for each reliability metric and each year from 2020 through 2025 are shown in Table 5. The results for 2020 through 2024 are identical to the previously reported results in the 2025 Analysis[37] and are included to facilitate comparison with the results for 2025.

In 2025, statistically significant differences in the mean reliability experienced by EJ and Non-EJ census tracts are observed for Unique Customers with an Interruption and Total Customer Interruptions; SAIDI including MEDs; SAIFI including and excluding MEDs; CEMI-4, -5, and -7; CELID-5; and the percentage of catastrophic-weather restorations made within 48 hours. The percentage of catastrophic-weather restorations made within 48 hours is the only metric by which Non-EJ tracts experienced statistically significant better average reliability, as shown for

[36] *Ibid*, p19.

[37] *Ibid*, p19.

2025 in Table 5. For all other reliability metrics by which a statistically significant difference in average reliability exists, EJ tracts experienced better average reliability.

2025 is the only year in which the difference in the mean SAIDI excluding MEDs of EJ and Non-EJ census tracts is not statistically significant. 2025 is also the only year in which the difference in the mean percentage of catastrophic-weather restorations made within 48 hours between EJ and Non-EJ census tracts is significant. The 2025 Analysis found that for all statistically significant differences, EJ tracts experience better average reliability, but in 2025 Non-EJ tracts experienced better average reliability in terms of the percentage of catastrophic-weather restorations made within 48 hours.

Table 5. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for EJ census tracts and for non-EJ census tracts. The difference is calculated by subtracting the EJ Mean from the Non-EJ Mean. Statistical significance is assessed at $\alpha = 0.05$, and the group that experiences better reliability is assessed only for statistically significant differences in mean reliability.

Reliability Metric	Year	Non-EJ Mean	EJ Mean	Difference	*p*-value	Significant?	Better?
Unique Customers with an Interruption	2020	1.13E+03	8.90E+02	2.37E+02	6.62E-03	TRUE	EJ

Urban and Rural Census Tracts

For Urban and Rural census tracts, the results of the binary difference-in-means *t*-test for each reliability metric and each year from 2020 through 2025 are shown in Table 6. The results for 2020 through 2024 are identical to the results of the 2025 Analysis and are included to facilitate comparison with results for 2025.[38]

For 2025, statistically significant differences in the mean reliability experienced by Urban and Rural census tracts are observed for Unique Customers with an Interruption; Total Customer Interruptions; SAIDI and SAIFI (each excluding and including MEDs); CAIDI excluding MEDs; CEMI-4, -5, -7, and -10; CELID-5 and -24; the percentage of catastrophic-weather restorations made within 48 hours; and the percentage of normal-weather restorations made within 8 hours. The percentage of catastrophic-weather restorations made within 48 hours in 2025 is the only metric by which Rural tracts experienced better average reliability. By all other metrics, Urban tracts consistently experienced better average reliability.

Table 6. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for Rural census tracts and for Urban census tracts. Significance is assessed at α = 0.05.

Reliability Metric	Year	Rural Mean	Urban Mean	Difference	*p*-value	Significant?	Better?

Low-Income and High-Income Census Tracts

For Low-Income and High-Income census tracts, the results of the binary difference-in-means *t*-test for each reliability metric and each year from 2020 through 2025 are shown in Table 7. The results for 2020 through 2024 are identical to the results of the 2025 Analysis.[39] In 2025, statistically significant differences in the mean reliability experienced by Low-Income and High-Income census tracts were observed in terms of Unique Customers with an Interruption and Total Customer Interruptions; SAIDI and SAIFI, each including and excluding MEDs; CAIDI including MEDs; CEMI-4, -5, -7, and -10; CELID-5; the percentage of all-weather restorations made within 36 hours and the percentage of catastrophic-weather restorations made within 48 hours. For CAIDI including MEDs, the percentage of all-weather restorations made within 36 hours, and the percentage of catastrophic-weather restorations made within 48 hours, High-Income tracts experienced better average reliability in 2025. By all other metrics, Low-Income tracts experienced better average reliability in 2025. There are no statistically significant differences between the average reliability of High-Income and Low-Income tracts for any year in terms of CAIDI excluding MEDs, the percentage of normal-weather restorations made within 8 hours, or the percentage of gray-sky-weather restorations made within 24 hours.

With respect to the results of the 2025 Analysis, a similar trend is observed in the present analysis: for all but three reliability metrics, Low-Income tracts experienced better average reliability in 2025. Two of the three metrics by which High-Income tracts were previously found to have experienced better average reliability are the same in the current analysis: the percentage of all-weather restorations made within 36 hours (in 2020), and the percentage of catastrophic-weather restorations made within 48 hours (in 2020 and 2024).

Table 7. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for High-Income census tracts and for Low-Income census tracts. Significance is assessed at α = 0.05.

Reliability Metric	Year	High-Income Mean	Low-Income Mean	Difference	*p*-value	Significant?	Better?
Unique Customers with an Interruption	2020	1.16E+03	6.83E+02	4.79E+02	5.98E-13	TRUE	Low
	2021	1.26E+03	7.75E+02	4.85E+02	8.84E-13	TRUE	Low

High-Percent-Minority-Percentile and Low Percent-Minority-Percentile Census Tracts

For Low-Percent-Minority-Percentile and High-Percent-Minority-Percentile census tracts, the results of the binary difference-in-means *t*-test for each reliability metric and each year from 2020 through 2025 are shown in Table 8. In 2025, statistically significant differences in the mean reliability experienced by Low-Percent-Minority-Percentile and High-Percent-Minority-Percentile census tracts are observed for Unique Customers with an Interruption and Total Customer Interruptions; SAIDI and SAIFI (each excluding and including MEDs); CAIDI including MEDs; CEMI-4, -5, -7, and -10; CELID-5; the percentage of all-weather restorations made within 36 hours; and the percentage of catastrophic-weather restorations made within 48 hours. In 2025, Low-Percent-Minority-Percentile tracts experienced better average reliability than High-Percent-Minority-Percentile tracts in terms of CAIDI including MEDs, the percentage of all-weather restorations made within 36 hours, and the percentage of catastrophic-weather restorations made within 48 hours. By all other reliability metrics, High-Percent-Minority-Percentile tracts experienced better average reliability in 2025. In general, when statistically significant differences in the average reliability of the two groups exist, High-Percent-Minority-Percentile tracts experience better average reliability. Except for the three metrics previously

noted in 2025, the only other instance where Low-Percent-Minority-Percentile tracts had better average reliability is in terms of the percentage of catastrophic-weather restorations made within 48 hours in 2020. There are no statistically significant differences among High-Percent-Minority-Percentile and Low-Percent-Minority-Percentile tracts for any year for the percentage of normal-weather restorations made within 8 hours or the percentage of gray-sky-weather restorations made within 24 hours.

Table 8. Comparison of census-tract-level reliability metrics for each year from 2020 through 2025 averaged for High-Percent-Minority-Percentile ("High PM") census tracts and for Low-Percent-Minority-Percentile ("Low PM") census tracts. Significance is assessed at α = 0.05.

Reliability Metric	Year	Low PM Mean	High PM Mean	Difference	*p*-value	Significant?	Better?
Unique Customers with an Interruption	2020	1.15E+03	7.69E+02	3.83E+02	6.02E-10	TRUE	High PM

Summary of Comparisons of Average Reliability Among Groups of Census Tracts

Comparisons of average reliability in each year from 2020 through 2025 among EJ and Non-EJ; Urban and Rural; Low-Income and High-Income; and High-Percent-Minority-Percentile and Low-Percent-Minority-Percentile census tracts show that when statistically significant differences in the average reliability of each pair of groups exist, it is generally the EJ, Urban, Low-Income, and High-Percent-Minority-Percentile census tracts that have better average reliability than their counterparts. The metrics by which EJ, Urban, Low-Income, and High-Percent-Minority-Percentile census tracts experienced better average reliability include SAIDI and SAIFI (both including and excluding MEDs), indicating that customers in these census tracts had shorter and less frequent interruptions on average than customers in Non-EJ, Rural, High-Income, and Low-Percent-Minority-Percentile census tracts, respectively.

EJ, Urban, Low-Income, and High-Percent-Minority-Percentile census tracts also experienced better average reliability in terms of CEMI-4, -5, -7, and -10 and CELID-5 than Non-EJ, Rural, High-Income, and Low-Percent-Minority Percentile census tracts, respectively. This indicates that smaller proportions of customers in EJ, Urban, Low-Income, and High-Percent-Minority-Percentile tracts experienced multiple sustained interruptions and long interruption durations than in Non-EJ, Rural, High-Income, and Low-Percent-Minority Percentile tracts, respectively.

Notable changes were observed in 2025 compared to the 2020 through 2024 period. For the first time, statistically significant differences were observed in the average percentage of normal-weather restorations made within 8 hours between Urban and Rural census tracts, with Urban tracts experiencing better average reliability in 2025. High-Income census tracts experienced better average reliability in 2025 than Low-Income census tracts in terms of CAIDI including MEDs and the percentage of all-weather restorations made within 36 hours. Low-Percent-Minority-Percentile census tracts also experienced better average reliability in 2025 than High-Percent-Minority-Percentile census tracts in terms of CAIDI including MEDs and the percentage of all-weather restorations made within 36 hours. Additionally, in 2025, statistically significant differences in the average percentage of catastrophic-weather restorations made within 48 hours were observed for all four pairs of census tract groups:

- Non-EJ tracts and Rural tracts experienced better average reliability in terms of the percentage of catastrophic-weather restorations made within 48 hours in 2025 than EJ tracts and Urban tracts, respectively, marking a reversal from the previous consistent pattern where EJ and Urban tracts experienced better reliability across all metrics;
- High-Income tracts experienced better average reliability than Low-Income tracts in terms of the percentage of catastrophic-weather restorations made within 48 hours in 2025, continuing a pattern previously observed in 2020 and 2024;[40] and

[40] *Ibid*, p25-27.

- Low-Percent-Minority-Percentile tracts experienced better average reliability than High-Percent-Minority-Percentile tracts in terms of the percentage of catastrophic-weather restorations made within 48 hours in 2020 and 2025.

Reliability Regression Results: Census Tracts

To assess the relationships between the demographic characteristics of different census tracts and the electric reliability experienced by customers within those census tracts, we fit mixed-effects linear regression models considering both county-level and year fixed effects to each of the 18 reliability metrics tabulated for 2010 Census tracts from 2020 through 2025. The procedure is identical to that performed in the 2025 Analysis,[41] but with an additional year of data for 2025. As before, two sets of models are implemented: (1) using MiEJScreen Overall Score as an independent variable; and (2) using Percent Minority Percentile as an independent variable.

Census-Tract-Level Reliability Regression Results Considering MiEJScreen Overall Score

For each of the 18 reliability metrics, we fit five different models with the following independent variables, for a total of 90 regression models:

1. MiEJScreen Overall Score;
2. MiEJScreen Overall Score and Poverty;
3. MiEJScreen Overall Score and Median Household Income past 12 months (in $10,000 increments)
4. MiEJScreen Overall Score and Population Density (in increments of 100 people per square mile); and
5. MiEJScreen Overall Score, Poverty, Median Household Income past 12 months, Population Density, Percent Unemployed, and Housing Burden.

Table 9 shows the values of the regression coefficients for each independent variable in each of the five models for SAIDI excluding MEDs. The MiEJScreen Overall Score has a statistically significant negative correlation with SAIDI excluding MEDs in each of the five models fitted. That is, as the MiEJScreen Overall Score of a census tract increases, its reliability as measured by SAIDI excluding MEDs tends to improve when all other variables are held constant. In Model 1, in which the MiEJScreen Overall Score is the only independent variable, a one percentage point increase in the MiEJScreen Overall Score is associated with a 1.49 minute decrease in SAIDI excluding MEDs when county and year factors are held constant. In Model 5 – which includes controls for Poverty, Median Household Income, Past 12 Months, Population Density, Percent Unemployed, and Housing Burden – an increase of one percentage point in the MiEJScreen Overall Score is associated with a 1.40 minute decrease in SAIDI excluding MEDs when all other independent variables, as well as county and year factors, are held constant.

[41] *Ibid*, p31.

The coefficients of the other predictors in Model 5 that are statistically significant can be interpreted as follows when all other independent variables, county, and year factors are held constant:

- An increase in Population Density of 100 people per square mile is associated with a 0.79 minute decrease in SAIDI excluding MEDs; and
- A one percentage point increase in Percent Unemployed is associated with an approximately 3 minute increase in SAIDI excluding MEDs.

For SAIDI excluding MEDs, the updated results for Model 5 (based on reliability data from 2020 through 2025) are generally consistent with those of the 2025 Analysis (based on reliability data from 2020 through 2024):[42]

- The MiEJScreen Overall Score coefficient in Model 5 remained relatively stable at -1.40 minutes, compared to -1.36 minutes in the prior report.[43]
- The coefficient of Population Density also remained relatively stable at -0.79 minutes, compared to a previous value of -0.9 minutes.[44]
- The coefficient of Percent Unemployed increased slightly, from 2.91 minutes in the previous analysis results to 3.03 minutes currently.[45]

As shown in Table 10, MiEJScreen Overall Score has a statistically significant negative correlation with SAIFI excluding MEDs in each of the five models fitted. When all else is held constant, increasing MiEJScreen Overall Score is associated with decreasing SAIFI excluding MEDs, indicating improving reliability at the census-tract level. These results are consistent with those of the 2025 Analysis.[46]

As shown in Appendix A, MiEJScreen Overall Score has a statistically significant ($p < 0.05$) negative correlation with the following reliability metrics in Model 5: SAIDI including MEDs; SAIFI including MEDs; CAIDI excluding and including MEDs; CELID-5 and -24; CEMI-4, -5, and -7; Total Customer Interruptions; and Unique Customers with an Interruption. When all else is held constant, as the MiEJScreen Overall Score of a census tract increases, its reliability (as measured by the aforementioned metrics) tends to improve. The correlation between MiEJScreen Overall Score and the remaining reliability metrics (namely, CEMI-10 as well as the restoration percentages) is not statistically significant at the $p < 0.05$ level. This is largely consistent with the results of the 2025 Analysis.[47] Considered as a whole, these results show no evidence that census

tracts with higher MiEJScreen Overall Scores tend to have worse reliability than other census tracts.

Census-Tract-Level Reliability Regression Results Considering Percent Minority Percentile

For each of the 18 reliability metrics, we fit five different models with the following independent variables, for a total of 90 regression models:

1. Percent Minority Percentile;
2. Percent Minority Percentile and Poverty;
3. Percent Minority Percentile and Median Household Income past 12 months (in $10,000 increments)
4. Percent Minority Percentile and Population Density (in increments of 100 people per square mile); and
5. Percent Minority Percentile, Poverty, Median Household Income past 12 months, Population Density, Percent Unemployed, and Housing Burden.

Table 11 shows that Percent Minority Percentile has a statistically significant negative correlation with SAIDI excluding MEDs in each of the five models that were fitted. As the Percent Minority Percentile of a census tract increases, the reliability of that census tract (as measured by SAIDI excluding MEDs) also tends to increase, when all other independent variables, as well as county and year factors, are held constant. In Model 5, a one percentage point increase in the Percent Minority Percentile of a census tract is associated with a decrease of approximately 1 minute in the census tract's SAIDI excluding MEDs when all other variables are held constant. This is consistent with previously reported findings based on reliability data from 2020 through 2024.[48] The coefficients of the other independent variables in Model 5 can be interpreted as follows when all other independent variables, as well as county and year factors, are held constant:

- A one percentage point increase in Poverty is associated with a 0.6 minute increase in SAIDI excluding MEDs;
- A $10,000 increase in Median Household Income, Past 12 Months is associated with a 9 minute increase[49] in SAIDI excluding MEDs;
- An increase in Population Density of 100 people per square mile is associated with a decrease of 0.9 minutes in SAIDI excluding MEDs;

[48] *Ibid*, p35.

[49] In the 2025 Analysis, we stated erroneously on p35 that a $10,000 increase in Median Household Income, Past 12 Months is associated with a 0.9 minute increase in SAIDI excluding MEDs. Per Table 11 on p36 of the 2025 Analysis, that increase is in fact associated with a 9 minute increase in SAIDI excluding MEDs. The result of our current analysis is therefore consistent with the result of the 2025 Analysis.

- A one percentage point increase in Percent Unemployed is associated with a 3.2 minute increase in SAIDI excluding MEDs; and
- The correlation between Housing Burden and SAIDI excluding MEDs is not statistically significant at the $p < 0.05$ level.

With the exception of Housing Burden, which did have a statistically significant correlation with SAIDI excluding MEDs in the previous model, the present magnitude, direction, and statistical significance of the correlations between the independent variables in Model 5 and SAIDI excluding MEDs are consistent with those of the previous model that was fitted using reliability data from 2020 through 2024.[50]

A statistically significant negative correlation is also observed between Percent Minority Percentile and SAIFI excluding MEDs, as shown in Table 12. When all else is held constant, increasing Percent Minority Percentile is associated with improving reliability at the census tract level. These results are consistent with those of the 2025 Analysis.[51]

As shown in Appendix A, Percent Minority Percentile has a statistically significant ($p < 0.05$) negative correlation with the following reliability metrics: SAIDI including MEDs; SAIFI including MEDs; CELID-5 and -24; CEMI-4, -5, -7, and -10; Total Customer Interruptions; and Unique Customers with an Interruption. When all else is held constant, as the Percent Minority Percentile of a census tract increases, its reliability (as measured by the aforementioned metrics) tends to improve. The correlation between Percent Minority Percentile and the remaining reliability metrics (namely, CAIDI excluding and including MEDs as well as the restoration percentages) is not statistically significant at the $p < 0.05$ level. This is largely consistent with the results of the previous model fitted using reliability data from 2020 through 2024.[52]

Considered as a whole, these results show no evidence that census tracts with higher Percent Minority Percentile values tend to have worse reliability than other census tracts.

Table 11. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIDI excluding MEDs (with county-level and year fixed effects). Reliability Regression Results: Feeders

The feeder-level regression analysis in the 2025 Analysis[53] was repeated with updated feeder characteristics[54] and annual reliability data for 2020 through 2025. Feeder reliability was measured in terms of SAIDI and SAIFI, each excluding and including MEDs. For each feeder reliability metric, we fit six different mixed-effects linear regression models to feeder and demographic characteristics in order to determine: (1) how much of the variation in reliability can be attributed to differences between feeders; and (2) to which feeder characteristics or demographic characteristics of the communities served by a feeder the variation in reliability could be correlated. A total of twenty-four mixed-effects linear regression models (six models for each of four feeder reliability metrics) were therefore fitted.

Each of the six mixed-effects linear regression models included different independent variables and fixed effects. Two categories of independent variables were considered: (1) feeder characteristics; and (2) demographic characteristics of the census tracts served by a feeder. The feeder characteristics included in some of the six mixed-effects linear regression models were:

- Customers per Primary Line Mile;
- Mean Canopy Cover Percentage;
- Open Wire Secondary Miles;
- Primary Miles;
- Primary Underground Percentage;
- Voltage,[55] as a categorical variable with the most common (4.8/8.32 kV Wye Grounded) as the reference value; and
- Years Since Last Trim < 7, which was a binary variable with a value of 1 if the vegetation near the feeder had been trimmed in the past seven years and 0 otherwise.

Table 13 lists the different voltage levels and configurations represented in Consumers' electric distribution system, as well as the percentage of feeders that fall into each voltage category. Because it accounts for approximately 55% of feeders, the 4.8/8.3 kV Wye Grounded voltage category is defined as the reference voltage, i.e., the category to which other voltage categories are compared.

[53] *Ibid*, p38.

[54] Time-varying feeder characteristic data were not available for the 2025 Analysis or the present analysis. Both the 2025 Analysis and current analysis assume that feeder characteristics do not vary with time. However, the feeder characteristic data used in the present analysis differ from the data used in the 2025 Analysis. Some changes reflect work undertaken by Consumers, such as circuit fractionalization. It is important to consider that the circuit characteristics used in the current analysis may be different than those used previously for the same circuits, so comparison of overall trends between the two analyses are more meaningful than direct comparisons of regression coefficient values.

[55] Voltage categories in the updated data exclude some categories that existed in the data from the 2025 Analysis and have been replaced with a new "MULTIPLE" category.

Demographic characteristics were included as binary variables in some of the six regression models. A feeder was considered to serve a particular type of census tract – as defined by a particular demographic characteristic – if any part of its length overlapped with any census tract of that type, as previously discussed. The demographic characteristics included in some of the regression models are listed below; all take a value of 1 if the feeder serves the type of census tract described and take a value of 0 otherwise:

- Serves an EJ census tract;
- Serves an Urban census tract;
- Serves a Low-Income census tract; and
- Serves a High-Percent-Minority-Percentile census tract.

The six types of mixed-effects linear regression models that we fit are:

1. Intercept-only: This model provides an overall mean reliability across all feeders across all years when not controlling for any other variables;
2. Feeder characteristic fixed effects: This model quantifies the correlation between each feeder characteristic and feeder reliability;
3. Year fixed effects: This model quantifies potential time-dependent effects on feeder reliability;
4. Feeder characteristic and year fixed effects: This model quantifies the correlation of each feeder characteristic with feeder reliability, considering any potential time-based fixed effects;
5. Demographic fixed effects: This model includes only demographic characteristics and quantifies their correlation with feeder reliability; and
6. Combined effects: This model includes both feeder and demographic characteristics and accounts for any potential time-based fixed effects.

Table 13. The percentage of feeders in Consumer's electric distribution system at each voltage level and configuration.

Voltage	Percentage of Feeders
4.8/8.32 kV Wye Grounded	55.5
7.2/12.47 kV Wye Grounded	22.7
MULTIPLE	18.4
14.4/24.9 kV Wye Grounded	2.5
7.2 kV Delta	0.8
4.8 kV Delta	0.1

Between-Feeder and Within-Feeder Variability

Figure 1 shows the Intraclass Coefficient (“ICC”) for each regression model and demonstrates how explained variance changes with the introduction of different predictors. The ICC is

calculated as previously described[56] and is the ratio of the amount of variance in the model that is explained by between-group variance to the total amount of variance in the model (i.e., the sum of between-group and within-group variance). The ICC can range from 0 to 1, with values closer to 0 indicating greater within-feeder variability and values closer to 1 indicating greater between-feeder variability.

The intercept-only model suggests there is a certain level of baseline variability that is attributed to within-feeder variance and not differences between feeders. The ICC values for the intercept-only models of SAIDI excluding MEDs, SAIDI including MEDs, SAIFI excluding MEDs, and SAIFI including MEDs are 0.59, 0.22, 0.43, and 0.49, respectively. These ICC values indicate that 41%, 78%, 57%, and 51%, respectively, of the variability in these reliability metrics stems from within-feeder variance rather than from differences between feeders. The remaining variability, indicated by the ICC value, results from differences between feeders that additional predictors may help explain.

For all four reliability metrics, Model 2, which includes only feeder characteristic effects, has a lower ICC than Model 5, which includes only demographic characteristic effects. Model 2 having a lower ICC than Model 5 indicates that feeder characteristics explain more of the between-feeder variability than demographic characteristics. For example, for SAIDI excluding MEDs, the ICC decreasing from 0.59 with Model 1 (the intercept-only model) to 0.50 with Model 2 (in which only feeder characteristics are included) means that the feeder characteristics included in Model 2 explain some of the between-feeder variance that is unexplained in Model 1. Model 5 (in which only demographic characteristics are included) has an ICC of 0.58, indicating that the addition of demographic characteristics explains little of the between-feeder variability that is unexplained in Model 1. Similarly, the ICC of Model 6 (which includes both feeder and demographic characteristics) is the same or very similar to that of Model 2 (which includes only feeder characteristics). This further supports the notion that the demographic characteristics included in some of the models do not explain differences in between-feeder reliability but that the feeder characteristics do explain some of these differences.

Also notable is the difference in reliability (as reflected by Model 1, the intercept-only model) for each metric depending on whether MEDs are considered. For SAIDI, approximately 59% of the variability can be attributed to between-feeder differences in the intercept-only model when MEDs are excluded. When MEDs are included, the variability due to between-feeder differences decreases to 22%. For SAIFI, approximately 43% of the variability can be attributed to between-feeder differences in Model 1 when MEDs are excluded. When MEDs are included, the variability due to between-feeder differences increases to 49%. This indicates that when MEDs are included in the reliability metric, SAIFI is more sensitive to differences between feeders than SAIDI.

[56] Consumers Energy Company. Rate Case No. U-21870. "Reliability Regression Analysis for Environmental Justice Communities". Exhibit A-135. June 2, 2025. p17.

For all four reliability metrics, the inclusion of the year fixed effect (Model 3) did not help explain additional between-feeder variability based on the ICC value relative to the intercept-only model (Model 1), as the ICC value of Model 3 is the same as (or, for SAIDI including MEDs, slightly larger than) that of Model 1. Similarly, there was no change in ICC when comparing feeder characteristics-only (Model 2) and feeder characteristics and year fixed effects (Model 4). These observations indicate that there is not a time-based effect that helps explain differences in reliability between feeders.

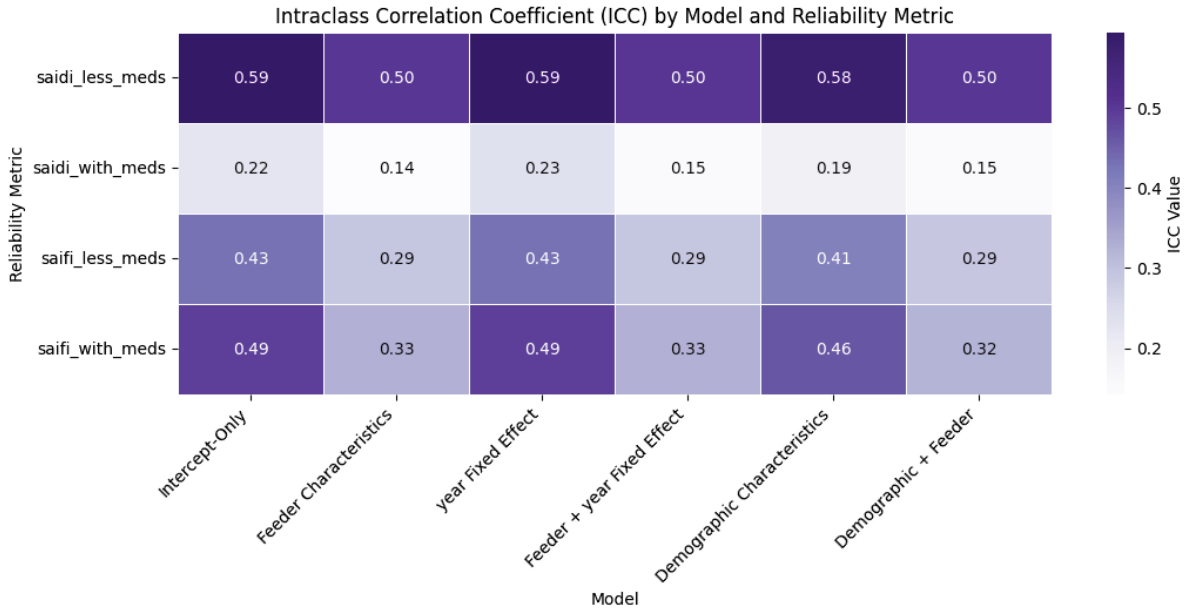

Figure 1. Heatmap of Intraclass Correlation Coefficient ("ICC") values for each reliability metric and feeder-level reliability regression model.

Feeder-Level Reliability Regression Results

The procedure from the 2025 Analysis[57] is repeated for each feeder reliability metric. The coefficients, standard errors, and p-values for each independent variable in each of the six models are estimated and shown in Table 13 (for SAIDI excluding MEDs) through Table 16 (for SAIFI including MEDs). Figure 2 through Figure 5 plot the coefficients from Model 6, which includes feeder characteristics, demographic characteristics, and year fixed effects. Because the Serves Urban, Serves Low Income, Serves High Percent Minority Percentile, Serves EJ, and Years Since Last Trim < 7 predictors are binary variables, their coefficients are the difference in mean reliability between the two groups they represent after controlling for other variables. The coefficients associated with the different voltage categories represent the difference in mean

[57] *Ibid*, p38.

reliability between the voltage of interest and the reference voltage after controlling for other variables.

SAIDI excluding MEDs

For SAIDI excluding MEDs, the regression coefficients of the independent variables in Model 6 are plotted in Figure 2. Table 13 reports the coefficients, standard errors, and p-values for all models for SAIDI excluding MEDs. For Model 6, the coefficients of the feeder characteristics that are statistically significant can be interpreted as follows when all other variables and factors are held constant:

- Voltage: 14.4/24.9 kV Wye Grounded: Feeders in this voltage category have a 274.9-minute longer mean SAIDI excluding MEDs than feeders at the reference voltage (4.8/8.32 kV Wye Grounded). This indicates that, on average, 14.4/24.9 kV Wye Grounded feeders have longer outage durations than 4.8/8.32 kV Wye Grounded feeders when all other variables and factors are held constant.
- Voltage: 7.2/12.47 kV Wye Grounded: Feeders in this voltage category have a 30.8-minute longer mean SAIDI excluding MEDs than feeders at the reference voltage.
- Voltage: MULTIPLE: Feeders in this voltage category have a 31.0-minute longer mean SAIDI excluding MEDs than feeders at the reference voltage.
- Primary Underground Percentage: A one percentage-point increase in Primary Underground Percentage is associated with a 0.86 minute decrease in SAIDI excluding MEDs.
- Customers per Primary Line Mile: An increase of 1 customer per primary line mile is associated with a 0.53 minute decrease in SAIDI excluding MEDs.
- Mean Canopy Cover Percentage: A one percentage-point increase in Mean Canopy Cover Percentage is associated with a 3.9 minute increase in SAIDI excluding MEDs.
- Primary Miles: Every one-mile increase in Primary Miles is associated with a 1.7 minute increase in SAIDI excluding MEDs.

None of the demographic characteristics has a statistically significant correlation with SAIDI excluding MEDs.

The signs of the coefficients in this model broadly agree with our physical understanding of the distribution system. For example, 14.4/24.9 kV Wye Grounded feeders (Figure B3) and 7.2/12.47 kV Wye Grounded feeders (Figure B2) tend to serve census tracts in more remote parts of Consumers' service territory than feeders at the reference voltage (Figure B1). When outages occur, it may therefore take longer for crews to access those feeders, resulting in longer outage durations. When all other variables and factors are held constant, increasing feeder length (in terms of Primary Miles) is also associated with longer outage durations, which may reflect the

difficulty of precisely locating faults on longer circuits and repairing them. Similarly, increasing Mean Canopy Cover Percentage is associated with longer outage durations, which may reflect that locations with greater vegetation are also more remote and require more time to reach when outages occur. In contrast, increasing customer density is associated with shorter outage durations when all other variables and factors are held constant, which may reflect that faults on lines that serve more customers are easier to locate, to access, and may also be of higher priority to remedy. Increasing undergrounding is also associated with shorter outage durations, which is somewhat unexpected, though consistent with the results of the 2025 Analysis.

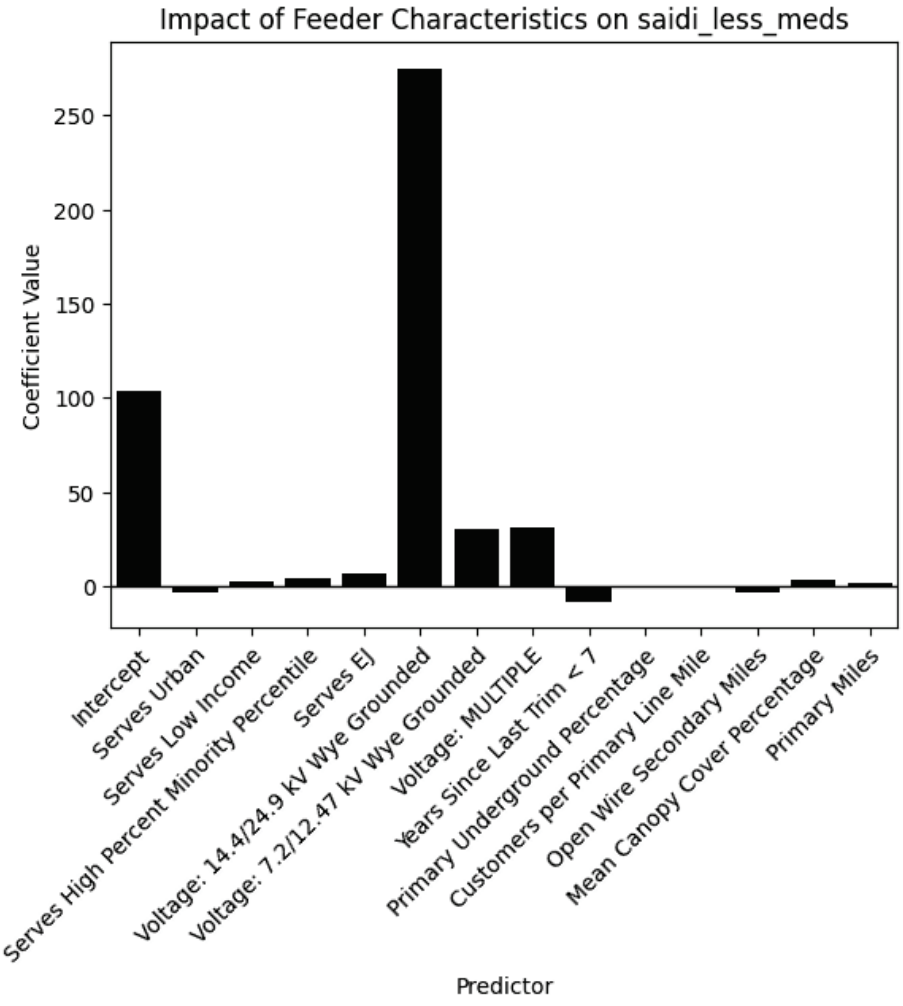

Figure 2. Regression coefficients for Model 6 (including feeder characteristics, demographic characteristics, and year fixed effects) of SAIDI excluding MEDs.

SAIDI including MEDs

For SAIDI including MEDs, the regression coefficients of the independent variables in Model 6 are plotted in Figure 3. The coefficients, standard errors, and p-values for all models are tabulated in Table 14. For Model 6, the coefficients of the feeder characteristics that are statistically significant can be interpreted as follows when all other variables and factors are held constant:

- Voltage: 14.4/24.9 kV Wye Grounded: Feeders in this voltage category have a 290-minute longer mean SAIDI including MEDs than feeders at the reference voltage (4.8/8.32 kV Wye Grounded).

- Voltage: 7.2/12.47 kV Wye Grounded: Feeders in this voltage category have a 117-minute shorter mean SAIDI including MEDs than feeders at the reference voltage.
- Primary Underground Percentage: A one percentage-point increase in Primary Underground Percentage is associated with a 6.0 minute decrease in SAIDI including MEDs.
- Customers per Primary Line Mile: An increase of 1 customer per primary line mile is associated with a 2.2 minute decrease in SAIDI including MEDs.
- Open Wire Secondary Miles: A one-mile increase in Open Wire Secondary Miles is associated with a 24.2 minute decrease in SAIDI including MEDs.
- Mean Canopy Cover Percentage: A one percentage-point increase in mean canopy cover is associated with a 12.6 minute increase in SAIDI including MEDs.
- Primary Miles: Every one-mile increase in Primary Miles is associated with a 5.8 minute increase in SAIDI including MEDs.

None of the demographic characteristics included in the model has a statistically significant correlation with SAIDI including MEDs.

Though the signs of the coefficients in this model broadly agree with our physical understanding of the distribution system, it is somewhat surprising that 7.2/12.47 kV Wye Grounded feeders (which primarily serve areas in the northern and western parts of Consumers' service territory, as shown in Figure B2) have shorter average outage durations when MEDs are included than feeders at the reference voltage (when all other variables and factors are held constant). This observation is consistent with our 2025 Analysis[58] and may reflect preparations made in advance of forecasted Major Event Days that reduce outage durations in more remote parts of Consumers' service territory.

SAIFI excluding MEDs

For SAIFI excluding MEDs, the regression coefficients of the independent variables in Model 6 are plotted in Figure 4. The coefficients, standard errors, and p-values for all models are tabulated in Table 15. For Model 6, the coefficients of the feeder characteristics that are statistically significant can be interpreted as follows:

- Voltage: 14.4/24.9 kV Wye Grounded: Feeders in this voltage category have 0.8 more interruptions per customer, on average, than feeders at the reference voltage.
- Voltage: 7.2/12.47 kV Wye Grounded: Feeders in this voltage category have 0.2 more interruptions per customer, on average, than feeders at the reference voltage.
- Voltage: MULTIPLE: Feeders in this voltage category have 0.2 more interruptions per customer, on average, than feeders at the reference voltage.
- Primary Underground Percentage: A one percentage-point increase in Primary Underground Percentage is associated with a decrease of 0.004 interruptions per customer.
- Customers per Primary Line Mile: An increase of 1 customer per primary line mile is associated with a decrease of 0.002 interruptions per customer.
- Mean Canopy Cover Percentage: A one percentage-point increase in mean canopy cover is associated with an increase of 0.02 interruptions per customer.
- Primary Miles: Every one-mile increase in Primary Miles is associated with an increase of 0.009 interruptions per customer.

None of the demographic characteristics has a statistically significant correlation with SAIFI excluding MEDs.

The signs of the coefficients in this model broadly agree with our physical understanding of the distribution system and are generally consistent with the results of the 2025 Analysis. When all other variables and factors are held constant, increasing Primary Underground Percentage is associated with fewer interruptions. This is consistent with our understanding that undergrounding reduces outages caused by vegetation contact and other environmental factors to which overhead wires are susceptible. Increases in Mean Canopy Cover Percentage and Primary Miles are associated with increased interruption frequency. Higher vegetation density increases chances of vegetation contact and longer lines have more exposure to potential hazards, increasing the likelihood of interruptions.

Feeders with 14.4/24.9 kV Wye Grounded and 7.2/12.47 kV Wye Grounded voltages are higher voltage than the reference of 4.8/8.32 kV Wye Grounded. It is unsurprising that circuits with higher electrical demand experience more frequent interruptions, and this is consistent with our 2025 findings. Similarly, increasing customer density is associated with less frequent interruptions. This characteristic was not significant in the 2025 Analysis and is a somewhat surprising result. This may be explained in part by feeder age, which was not included as a variable in the model.

SAIFI including MEDs

For SAIFI including MEDs, the regression coefficients of the independent variables in Model 6 are plotted in Figure 5. The coefficients, standard errors, and p-values for all models are tabulated in Table 16.

For Model 6, the coefficients of the feeder characteristics that are statistically significant can be interpreted as follows:

- Voltage: 14.4/24.9 kV Wye Grounded: Feeders in this voltage category have 0.9 more interruptions per customers, on average, than feeders at the reference voltage.
- Voltage: 7.2/12.47 kV Wye Grounded: Feeders in this voltage category have 0.2 more interruptions per customer, on average, than feeders at the reference voltage.
- Voltage: MULTIPLE: Feeders in this voltage category have 0.3 more interruptions per customer, on average, than feeders at the reference voltage.
- Primary Underground Percentage: A one percentage-point increase in primary underground percentage is associated with a decrease of 0.006 interruptions per customer.
- Customers per Primary Line Mile: An increase of 1 customer per primary line mile is associated with a decrease of 0.003 interruptions per customer.

- Mean Canopy Cover Percentage: A one percentage-point increase in mean canopy cover is associated with an increase of 0.03 interruptions per customer.
- Primary Miles: Every one-mile increase in primary miles is associated with an increase of 0.013 interruptions per customer.

None of the demographic characteristics included in the model has a statistically significant correlation with SAIFI including MEDs.

The signs of the coefficients in this model for SAIFI including MEDs are the same as those of the coefficients for SAIFI excluding MEDs and broadly agree with our physical understanding of the distribution system.

Summary of Feeder-Level Reliability Regression Analysis Results

Of the physical characteristics included in the regression models, Voltage often has a statistically significant and relatively large effect on SAIDI and SAIFI, both including and excluding MEDs, indicating that feeder voltages and configurations other than the reference voltage often have quite different average reliability than the reference voltage (4.8/8.32 kV Wye Grounded, the most common circuit configuration in the distribution system).

Primary Miles and Mean Canopy Cover Percentage had statistically significant, positive correlations with SAIDI and SAIFI, both excluding and including MEDs in Model 6. These correlations indicate that as Primary Miles and Mean Canopy Cover Percentage increase, feeder

reliability tends to worsen. As the length of primary miles on a circuit increases, so does its exposure to different hazards, such as vegetation, that could cause interruptions. Similarly, as the amount of vegetation proximal to a feeder increases, so too does the likelihood of it coming into contact with a conductor and causing an outage. This also explains why Primary Underground Percentage had statistically significant, negative correlations with both SAIDI and SAIFI, both excluding and including MEDs, indicating that as the proportion of a feeder that is underground increases, reliability tends to improve. Additionally, Customers per Primary Line Mile had statistically significant, negative correlations with both SAIDI and SAIFI, both excluding and including MEDs, indicating that feeders serving more customers per mile of primary line tend to have better average reliability. Open-Wire Secondary Miles had a statistically significant, negative correlation with SAIDI including MEDs, indicating that feeders with more open-wire secondary miles tend to have shorter average outage durations when Major Event Days are included; however, this relationship was not statistically significant for the other three reliability metrics studied.

None of the demographic characteristics included in the regression models – namely, whether a feeder serves Urban, EJ, Low-Income, or High-Percent-Minority-Percentile census tracts – was found to have a statistically significant correlation with feeder reliability.

Descriptive Analysis Results: Residential Involuntary Disconnection Rates

Descriptive Analysis: Average Disconnection Rates

Table 13 shows yearly statistics (namely, mean, standard deviation, minimum, median, 95th percentile, and maximum values) for disconnection rates across all census tracts in Consumers' service territory from 2020 through 2024. The statistics for 2020 through 2023 do not match those reported in the 2025 Analysis[59] because Consumers issued revised disconnection counts for 2020 through 2024 for use in this report. The disconnection rates reported here for 2020 through 2023 are greater than those in the 2025 Analysis.

Figure 6 plots the average disconnection rate among all census tracts by year and shows that the average disconnection rate among census tracts in Consumers' service territory decreased from 2021 to 2022 before increasing each year from 2022 through 2024. Both the mean and the 95th percentile disconnection rates are 11% higher in 2024 than in 2023. Figure 7 through Figure 11 show the distribution of the disconnection rate among census tracts in Consumers' service territory in each year from 2020 through 2024. All five distributions are right-skewed, with more than half of census tracts experiencing disconnection rates below 50 disconnections per 1000 households. These results are consistent with observations in the 2025 Analysis.

Of note, the maximum disconnection rate in 2024 is 92% greater than the maximum disconnection rate in 2023. The maximum disconnection rate in 2024 occurs in Census Tract 26073000703, located in Isabella County. As shown in Figure 7, this census tract is comprised predominantly by the campus of Central Michigan University and in 2024 includes 18 households and has a Percentage Renters value of 100%; this count of households likely does not reflect the 2270 people living in the census tract because the on-campus student dormitories are not counted as households. This census tract had 15 disconnections in 2024, resulting in the disconnection rate of 833.33 disconnections per 1000 households. One possible explanation for this high disconnection rate is that it reflects in part the transience of students living in apartments off campus, at the eastern edge of the census tract. Census Tract 26073000703 also had the maximum disconnection rate among census tracts in Consumers' service territory in 2022, when it had 4 disconnections and 10 households, resulting in a disconnection rate of 400 disconnections per 1000 households.

Figure 8 maps the logarithm (base 10) of the disconnection rate in each census tract in 2024 and shows that the highest disconnection rates tend to occur in the most densely populated areas.

[59] *Ibid*, p56-61.

Table 18. Descriptive statistics (i.e., mean, standard deviation, minimum, and maximum) of disconnection rates (in units of disconnections per 1000 households) among 2020 Census tracts in Consumers' service territory from 2020 through 2024.

Year	Mean	Standard Deviation	Minimum	Median	95th Percentile	Maximum	No. of Census Tracts
2020	14.90	11.56	0.40	12.15	36.88	80.62	1133
2021	53.67	52.24	0.43	39.45	175.54	363.64	1152
2022	51.56	50.16	0.37	37.31	168.46	400.00	1151
2023	58.08	54.76	0.43	43.82	176.50	435.09	1147
2024	64.68	60.65	0.41	48.46	195.76	833.33	1150

Comparing the Average Disconnection Rates of Groups of Census Tracts

To assess whether statistically significant differences exist in the average disconnection rates of groups of census tracts in Consumers' service territory from 2020 through 2024, we carried out the binary difference-in-means *t*-test. As in the 2025 Analysis,[61] the test was performed for each of the following paired groups of census tracts in each year from 2020 through 2024:

- Low Income and High Income; and
- High Percentage Minority Population and Low Percentage Minority Population.

[61] *Ibid*, p62.

The following subsections detail the findings of each set of comparisons.

Low-Income and High-Income Census Tracts

For Low-Income and High-Income census tracts, the results of the binary difference-in-means *t*-test for each year from 2020 through 2024[62] are shown in Table 18. Consistent with the findings of the 2025 Analysis,[63] statistically significant differences in the mean disconnection rate between High-Income and Low-Income census tracts are observed in each year. Low-Income Census tracts experience higher (worse) disconnection rates on average.

Table 19. Comparison of 2020 Census-tract-level disconnection rates for each year from 2020 through 2024 averaged for Low-Income and High-Income census tracts. The difference is calculated by subtracting the Low-Income Mean from the High-Income Mean. Statistical significance is assessed at α = 0.05, and the group that experiences a worse average disconnection rate is assessed only for statistically significant differences in mean disconnection rate.

Year	High-Income Mean	Low-Income Mean	Difference	*p*-value	Significant?	Worse?
2020	13.08	31.24	-18.15	5.84E-23	TRUE	Low-Income
2021	43.23	145.42	-102.19	1.07E-26	TRUE	Low-Income
2022	41.84	135.68	-93.85	1.48E-25	TRUE	Low-Income
2023	47.35	151.01	-103.66	1.80E-24	TRUE	Low-Income
2024	53.29	164.61	-111.32	2.81E-28	TRUE	Low-Income

High-Percentage-Minority-Population and Low-Percentage-Minority-Population Census Tracts

For High-Percentage-Minority-Population and Low-Percentage-Minority-Population census tracts, the results of the binary difference-in-means *t*-test for each year from 2020 through 2024 are shown in Table 15. Consistent with the findings of the 2025 Analysis,[64] statistically significant differences in the mean disconnection rate between High-Minority and Low-Minority census tracts are observed in each year. High-Minority census tracts experience higher (worse) disconnection rates on average. The results using the updated data are generally consistent with the results reported in the 2025 Analysis.[65]

[62] Table 19 on p. 62 of the 2025 Analysis erroneously included disconnection rates for 2024 but should only have included disconnection rates for 2020 through 2023, as ACS 5-Year Estimates of the number of households in a Census tract (used with disconnect count to calculate disconnection rate) had not yet been published for 2024.

[63] Consumers Energy Company. Rate Case No. U-21870. "Reliability Regression Analysis for Environmental Justice Communities". Exhibit A-135. June 2, 2025. p62.

[64] *Ibid*.

[65] Table 20 on p. 63 of the 2025 Analysis erroneously included disconnection rates for 2024 but should only have included disconnection rates for 2020 through 2023, as ACS 5-Year Estimates of the number of households in a Census tract (used with disconnect count to calculate disconnection rate) had not yet been published for 2024.

Table 20. Comparison of 2020 Census-tract-level disconnection rates for each year from 2020 through 2024 averaged for Low-Percentage-Minority-Population and High-Percentage-Minority-Population census tracts. The difference is calculated by subtracting the High-Percentage-Minority-Population Mean from the Low-Percentage-Minority-Population. Statistical significance is assessed at $\alpha = 0.05$, and the group that experiences a worse average disconnection rate is assessed only for statistically significant differences in mean disconnection rate.

Year	Low-Minority Mean	High-Minority Mean	Difference	*p*-value	Significant?	Worse?
2020	12.81	33.89	-21.09	8.65E-26	TRUE	High-Minority
2021	42.71	152.72	-110.02	5.37E-29	TRUE	High-Minority
2022	41.25	144.26	-103.01	6.60E-31	TRUE	High-Minority
2023	46.80	161.91	-115.11	7.73E-33	TRUE	High-Minority
2024	52.77	176.34	-123.57	1.24E-37	TRUE	High-Minority

Regression Analysis Results: Residential Involuntary Disconnection Rates

We used panel linear regression models to assess correlations between rates of residential disconnections in Consumers' service territory from 2021 through 2024 to demographic characteristics from the ACS, using the annual ACS 5-Year estimates over the same time frame and data from the LEAD Tool, as described above. Consistent with the 2025 Analysis, disconnection data for 2020 were excluded given the COVID-19-related moratorium on disconnections in place for most of that year.[66] We used the following independent variables in the disconnection regression models:

- Median Home Value (in $10,000 increments);
- Percentage Minority Population;
- Percentage Below Poverty;
- Unemployment Rate;
- Percentage Renters;
- Percentage of Homes Built after 1990;
- Population Density, in units of households per square mile (in 1000 household increments); and
- Energy Burden (% Income), Electricity.

This set of independent variables is the same as was used in the 2025 Analysis, with the addition of electric energy burden. The panel linear regression takes into consideration potential fixed effects for census tracts in a particular county and year.

Table 16 shows the coefficients for each independent variable as well as their standard errors and p-values. We observe that Unemployment Rate is not statistically significant at the $p < 0.05$ level, consistent with the results of the 2025 Analysis based on disconnection rates from 2021 through 2023.[67] The remaining variables are statistically significant at the $p < 0.05$ level and have the following correlations with disconnection rates when all other independent variables, as well as county and year factors, are held constant:

- Percentage Minority Population: A one percentage-point increase in the Percentage Minority Population of a census tract is associated with an increase of 1.14 disconnections per 1000 households. This is slightly larger than the coefficient in the 2025 Analysis (1.00).[68]

[66] Consumers Energy Company. Rate Case No. U-21870. "Reliability Regression Analysis for Environmental Justice Communities". Exhibit A-135. June 2, 2025. p76.

[67] *Ibid*.

[68] *Ibid*, p76-77.

- Percentage Below Poverty Population: A one percentage-point increase in below-poverty population is associated with an increase of 0.52 disconnections per 1000 households. This is similar to the coefficient in the 2025 Analysis (0.63).[69]
- Percentage Renters: A one percentage-point increase in the percentage of renters in a census tract is associated with an increase of 0.18 disconnections per 1000 households. This is similar to the coefficient in the 2025 Analysis (0.24).[70]
- Percentage of Homes Built after 1990: A one percentage-point increase in the percentage of homes in a census tract that were built after 1990 is associated with a decrease of 0.22 disconnections per 1000 households. This is similar to the coefficient in the 2025 Analysis (-0.21).
- Population Density: An increase of 1000 households per square mile is associated with a decrease of 5.94 disconnections per 1000 households. This is similar to but smaller in magnitude than the coefficient in the 2025 Analysis (-6.97).
- Median Home Value: A $10,000 increase in a census tract's Median Home Value is associated with a decrease of 1.16 disconnections per 1000 households. This is nearly the same as in the 2025 Analysis (-1.18).
- Energy Burden (% Income), Electricity: A one percentage-point increase in the average electric energy burden of a census tract is associated with an increase of 6.86 disconnections per 1000 households. This variable was not included in the 2025 Analysis.

The regression results from the current analysis are thus largely consistent with those reported for the 2025 Analysis. The addition of Energy Burden (% Income), Electricity increases the explanatory power of the model, as indicated by the reduction in the value of the intercept in the current model (39.55) relative to the model in the 2025 Analysis (46.94).[71] The magnitude of the coefficient of Energy Burden (% Income), Electricity is the largest of all independent variables in the model. This suggests that of the variables included, the average percentage of household income that goes toward electric energy costs in a census tract has the greatest impact on the average disconnection rate of a census tract. This result is consistent with our understanding of Consumers' disconnection policies, which are, to our knowledge, based on the amount a customer is in arrears on their electric bill, the amount of time they have been in arrears, and their responsiveness to Consumers' Customer Experience Team's attempts to engage with them.

Figure 14 shows 2020 Census tracts in Consumers' service territory shaded according to the Energy Burden (% Income), Electricity data provided by the LEAD Tool. Census tracts with the highest electric energy burden tend to be in more densely populated areas – notably, Saginaw, Flint, and Ann Arbor – though not all densely populated areas have high electric energy burden (e.g., Grand Rapids, Lansing). Figure 15 shows 2020 Census tracts in Consumers' service

territory shaded by the total dollar value of Michigan Energy Assistance Program ("MEAP") funds spent in the county of which they are part.[72] Figure 16 shows 2020 Census tracts in Consumers' service territory shaded by the average MEAP funds spent per household served in the county of which they are part. A comparison of Figure 13 with Figure 15 suggests that Census tracts with the highest disconnection rates tend to be in counties with higher total MEAP funds spent but, as shown in Figure 16, lower average MEAP funds spent per household served. These maps suggest that MEAP funds may not alleviate households' electric energy burden to the extent that they can avoid disconnections, or that the MEAP funds allocated to an area may be sufficient for some but not all households in areas with the highest disconnection rates.

Table 21. Panel regression model for disconnection rate (in units of disconnections per 1000 households) considering year- and county-level fixed effects: coefficients for each independent variable, standard errors, and p-values. * indicates p < 0.05.

Variable	Coefficient	Standard Error	p-value
Intercept	39.55*	12.48	1.54E-03
Percentage Minority Population	1.14*	0.15	3.60E-14
Percentage Below Poverty	0.52*	0.20	1.08E-02
Percentage Renters	0.18*	0.06	4.17E-03
Unemployment Rate	0.28	0.43	5.12E-01
Percentage of Homes Built after 1990	-0.22*	0.07	3.13E-03
Population Density	-5.94*	2.28	9.37E-03
Median Home Value (per $10,000)	-1.16*	0.34	7.48E-04
Energy Burden (% Income), Electricity	6.86*	3.36	4.13E-02

[72] MEAP data are tabulated for counties, not census tracts.

Assessing the Relationship Between Disconnection Rates and Reliability

As in the 2025 Analysis,[73] we sought to assess the relationship between demographic characteristics, disconnection rates, and reliability. The following section implements the same analysis as in the 2025 Analysis, but with updated disconnection data provided by Consumers for 2020 through 2024. Simple linear regression models are fit to each reliability metric for disconnection rates at the 2020 Census-tract-level, and a binary difference-in-means *t*-test is performed to compare the average disconnection rates of census tracts with the worst reliability to all other tracts.

[73] Consumers Energy Company. Rate Case No. U-21870. "Reliability Regression Analysis for Environmental Justice Communities". Exhibit A-135. June 2, 2025. p78.

Figure 17 through Figure 20 show scatter plots with best-fit lines from simple linear regressions for SAIDI and SAIFI (each including and excluding MEDs) data for each year from 2020 through 2024. The R^2 values for each simple linear regression model are also shown. The updated data does not change the prior observation that these measures of reliability seem to be poor predictors of disconnection rate. The largest R^2 value across all regressions remains 0.04. This is observed across all other reliability metrics regressed against disconnection rates as well, for which figures are not shown.

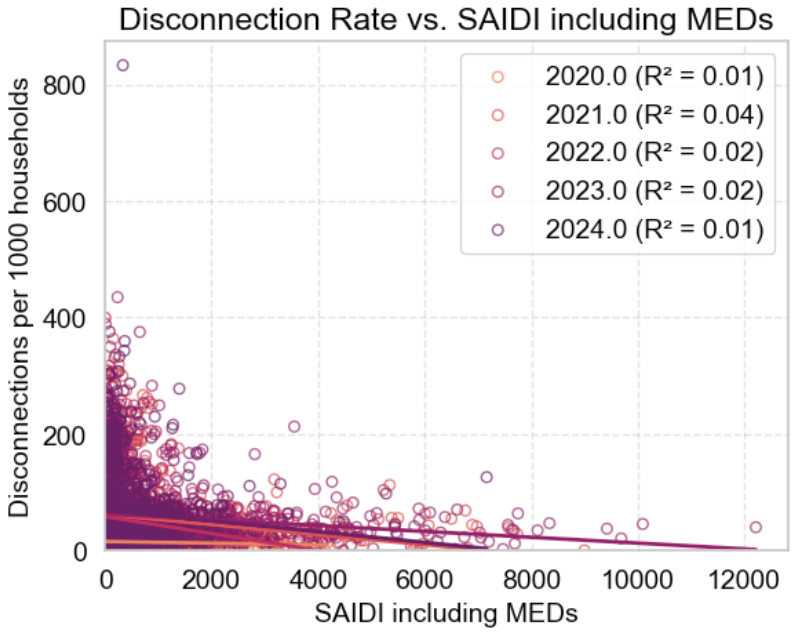

Figure 17. Disconnection rate (disconnections per 1000 households) versus SAIDI including MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data.

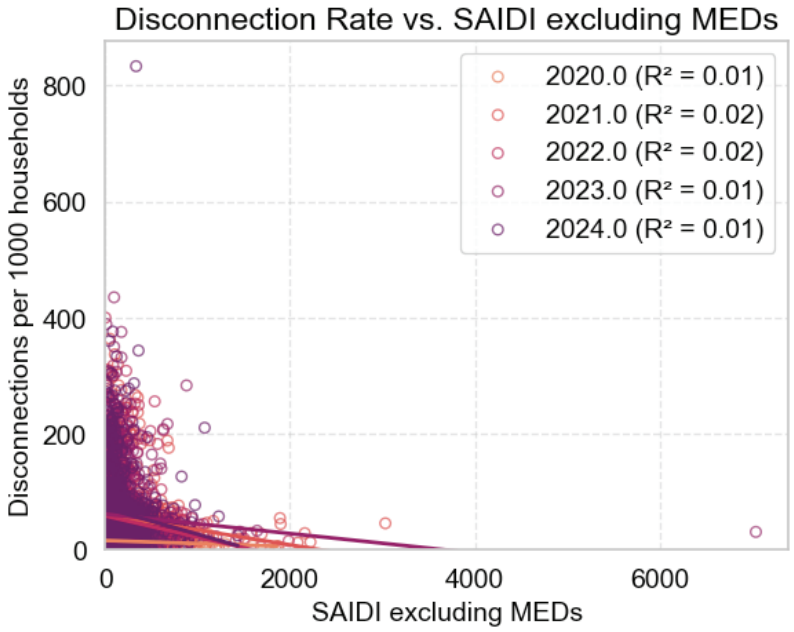

Figure 18. Disconnection rate (disconnections per 1000 households) versus SAIDI excluding MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data.

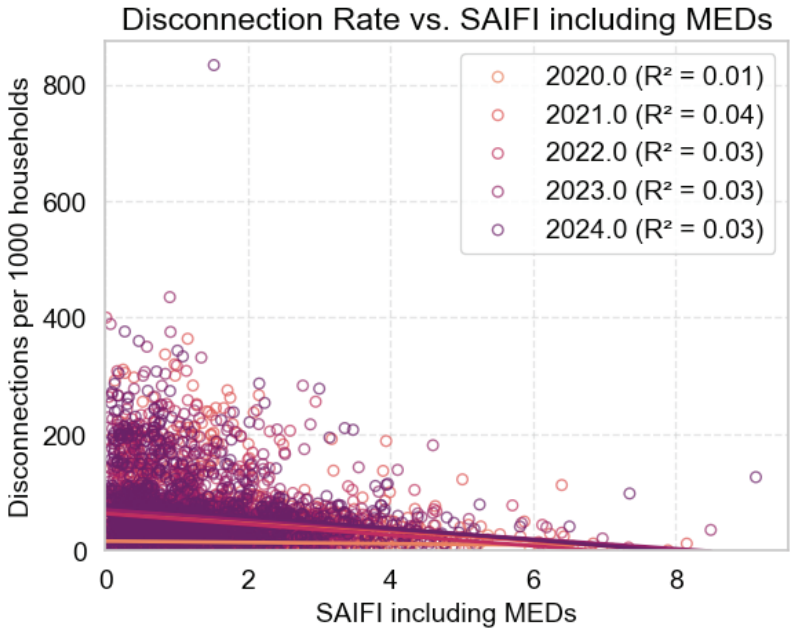

Figure 19. Disconnection rate (disconnections per 1000 households) versus SAIFI including MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data.

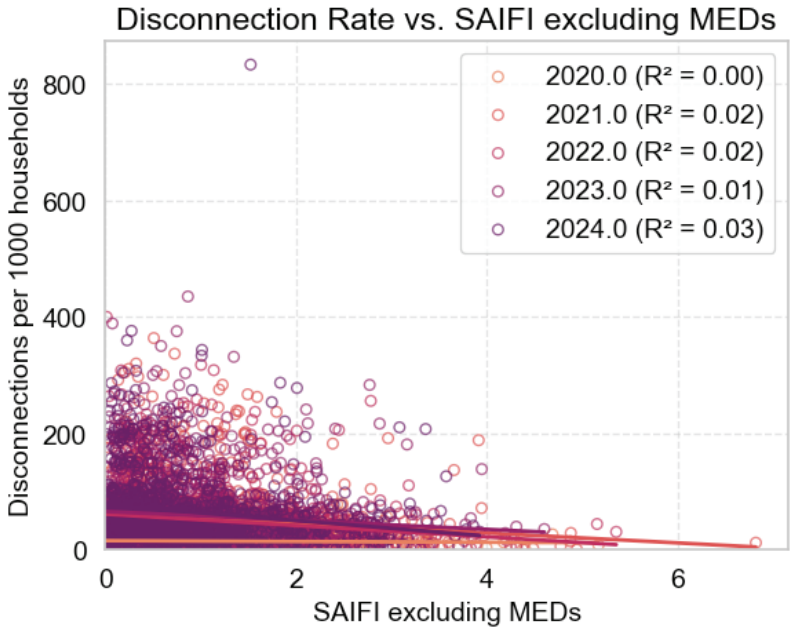

Figure 20. Disconnection rate (disconnections per 1000 households) versus SAIFI excluding MEDs for each year from 2020 through 2024, as well as separate best-fit lines for each year's worth of data.

We also compared the average disconnection rates for the census tracts with the worst reliability (according to each reliability metric) and all other census tracts to understand any potential differences in disconnections among the groups using the same method detailed in the 2025 Analysis.[74] The 10% of census tracts with the worst reliability (as measured by a particular reliability metric) were classified as Vulnerable, while all other census tracts were considered Non-Vulnerable. The average disconnection rate for each group was calculated, as well as the difference in the averages between the two groups. A binary difference-in-means *t*-test was performed to assess the statistical significance of the difference. The results are shown in Table 17. This comparison was not performed for CEMI-10 in 2020 and 2021 due to the sample size within a group being too small to determine the statistical significance of the difference.

When statistically significant differences in the average disconnection rate of census tracts with the worst reliability and all other census tracts exist, the census tracts with the worst reliability consistently have lower disconnection rates on average than all other census tracts. Census tracts classified as Vulnerable have, on average, statistically significant lower disconnection rates than their counterparts when reliability is measured with SAIDI (excluding and including MEDs), SAIFI (excluding and including MEDs); CELID-5; CEMI-4, -5, and -7; Unique Customers with an Interruption; and Total Customer Interruptions. In most years, differences in the mean disconnection rate were not statistically significant among groups of census tracts classified according to CAIDI excluding MEDs, the percentage of catastrophic-weather restorations made within 48 hours, the percentage of gray-sky-weather restorations made within 24 hours, and the percentage of normal-weather restorations made within 8 hours. This analysis therefore shows no evidence that census tracts with the worst reliability consistently experience statistically significant, higher disconnection rates than other census tracts. These results are consistent with the findings of the 2025 Analysis.

Table 22. Comparison of census-tract-level disconnection rates for each year from 2020 through 2024 averaged for the 10% of census tracts with the worst reliability per each metric (the Vulnerable group) and all other census tracts within Consumers service territory (the Non-Vulnerable group). Significance is assessed at α = 0.05.

Reliability Metric	Year	Non-Vulnerable Mean	Vulnerable Mean	Difference	p-value	Significant?	Worse?
Unique Customers with an Interruption	2020	1.52E+01	1.23E+01	2.89E+00	6.35E-05	TRUE	Non-Vulnerable

Discussion and Conclusions

The aim of this analysis was to assess whether evidence of disparities exists in the reliability experienced by EJ and Non-EJ communities in Consumers' service territory, as well as other potentially vulnerable communities of interest. We conducted three analyses of reliability data from 2020 through 2025:

1. Comparisons of the average reliability of EJ and Non-EJ census tracts; Urban and Rural census tracts; Low-Income and High-Income census tracts; and High-Percent-Minority-Percentile and Low-Percent-Minority-Percentile census tracts;
2. Census tract-level reliability regression analyses with MiEJScreen Overall Score as an independent variable; and
3. Feeder-level reliability regression analyses.

As in our 2025 Analysis, which included reliability data from 2020 through 2024, the results of the first two analyses suggest that EJ communities tend to experience better reliability than Non-EJ communities, and that more vulnerable communities tend to have better reliability than less vulnerable ones.[75]

Comparisons of the average reliability in 2025 among EJ and Non-EJ; Urban and Rural; Low-Income and High-Income; and High-Percent-Minority-Percentile and Low-Percent-Minority-Percentile Census tracts show that when statistically significant differences exist in the average reliability of each pair of groups, the EJ, Urban, Low-Income, and High-Percent-Minority-Percentile Census tracts generally have better average reliability than their counterparts. The metrics by which EJ census tracts experienced better average reliability in 2025 than Non-EJ census tracts are: Unique Customers with an Interruption; Total Customer Interruptions; SAIDI including MEDs; SAIFI including and excluding MEDs; CEMI-4, -5, -7, and -10; and CELID-5.

Exceptions to the general observation that vulnerable groups of census tracts have better average reliability than non-vulnerable groups of Census tracts in 2025 are that:

- Non-EJ census tracts have better average reliability than EJ census tracts in terms of the percentage of catastrophic-weather restorations made within 48 hours.
- Rural census tracts have better average reliability than Urban census tracts in terms of the percentage of catastrophic-weather restorations made within 48 hours.
- High-Income census tracts have better average reliability than Low-Income census tracts in terms of:
    - CAIDI including MEDs;
    - The percentage of all-weather restorations made within 36 hours; and

[75] *Ibid*, p85.

    - The percentage of catastrophic-weather restorations made within 48 hours.
- Low-Percent-Minority-Percentile Census tracts have better average reliability than High-Percent-Minority-Percentile Census tracts in terms of:
    - CAIDI including MEDs;
    - The percentage of all-weather restorations made within 36 hours; and
    - The percentage of catastrophic-weather restorations made within 48 hours.

These exceptions suggest that restoration activities in the wake of severe weather disruptions in 2025 may, on average, have restored service to census tracts that would be considered less vulnerable by the metrics considered in this analysis.

The census-tract-level reliability regression analyses indicate that increasing MiEJScreen Overall Score tends to be associated with improving reliability, when a statistically significant correlation between the two exists, and all other variables and factors are held constant. In a model that includes controls for Poverty, Median Household Income, Past 12 Months, Population Density, Percent Unemployed, and Housing Burden, this observation holds true for SAIDI excluding and including MEDs; SAIFI excluding and including MEDs; CAIDI excluding and including MEDs; CELID-5 and -24; CEMI-4, -5, and -7; Total Customer Interruptions; and Unique Customers with an Interruption. These results are consistent with the findings of the 2025 Analysis.[76]

The census-tract-level reliability regression analyses also indicate that increasing Percent Minority Percentile tends to be associated with improving reliability, when a statistically significant correlation between the two exists and all other variables and factors are held constant. In a model that includes controls for Poverty, Median Household Income, Past 12 Months, Population Density, Percent Unemployed, and Housing Burden, this observation holds true for SAIDI excluding and including MEDs; SAIFI excluding and including MEDs; CELID-5 and -24; CEMI-4, -5, -7, and -10; Total Customer Interruptions; and Unique Customers with an Interruption. These results are similar to those of the 2025 Analysis.[77]

The feeder-level reliability regression analyses indicate that physical characteristics of feeders often have statistically significant correlations with feeder reliability while demographic characteristics of the communities served by feeders do not. Primary Miles and Mean Canopy Cover Percentage have statistically significant positive correlations with reliability, indicating that increased feeder length and canopy cover are associated with increases in outage duration and frequency. Customers per Primary Line Mile has a statistically significant negative correlation with all four feeder-level reliability metrics, indicating that increasing customer density is associated with decreased outage duration and frequency. Open Wire Secondary Miles has a statistically significant correlation with only SAIDI including MEDs: an increase in Open Wire Secondary Miles is associated with reduced outage duration. Relative to the reference

[76] *Ibid*.

[77] *Ibid*, p38.

voltage (4.8/8.32 kV Wye Grounded), having an alternative voltage configuration is often statistically significant and has a large effect on reliability. For all four reliability metrics considered in the feeder-level regression analysis, no statistically significant correlations were observed with any of the demographic characteristics included in each model – namely, whether a feeder serves EJ, Urban, Low-Income, or High-Percent-Minority-Percentile census tracts.

We also used regression analysis to assess whether evidence exists of differences in the residential involuntary disconnection rates of different communities in Consumers' service territory. In addition to the independent variables previously included in the 2025 Analysis, we also included electric energy burden as a predictor in the regression model for disconnection rates. As expected, of all the variables that have a statistically significant correlation with disconnection rate, electric energy burden has the greatest correlation: a one percentage-point increase in Energy Burden (% Income), Electricity is associated with an increase of 6.86 disconnections per 1000 households when all other variables and factors are held constant. Previously the variable with the greatest statistically significant correlation with disconnection rate, Population Density now has the second largest-magnitude correlation: an increase of 1000 households per square mile is associated with a decrease of 5.94 disconnections per 1000 households when all other variables and factors are held constant.

The statistically significant correlation between Percentage Minority Population observed in the 2025 Analysis[78] persists in the current results: now, a one percentage-point increase in Percentage Minority Population is associated with an increase of 1.14 disconnections per 1000 households when all other variables and factors are held constant. It is notable that this correlation persists even when electric energy burden – as well as Median Home Value, Percentage Below Poverty, Unemployment Rate, Percentage of Homes Built after 1990, and Population Density – are controlled for. The magnitude of this correlation is greater than that of the correlations between disconnection rate and Percentage Below Poverty, Percentage Renters, Percentage of Homes Built after 1990, and nearly the same as that of Median Home Value (per $10,000). The magnitude of the correlation between Percentage Minority Population and disconnection rate is also practically significant given that the mean annual disconnection rate in Consumers' service territory in 2024 was 64.68 disconnections per 1000 households.

The correlation between minority population and disconnection rate has also been observed in recent regression analyses in the literature. In a census-block-level regression analysis of disconnection rates in Minnesota, Pradhan and Chan (2024) find that a one percentage-point increase in the minority population of a census block group is associated with an increase of 0.22 disconnections per 1000 households when all other variables and factors are held constant.[79] In a study of disconnections in California, Memmott et al. (2024) find that the percentages of a zip-code's population comprised by Black and Hispanic residents have statistically significant

[78] *Ibid*.

[79] Pradhan, B. and Chan, G. (2024). Minnesota's energy paradox: Household energy insecurity in the face of racial and economic disparities. The Electricity Journal: Vol. 37, Issue 6. p8.

positive correlations with disconnection rate, even when income, energy costs, and housing conditions (including age and number of rooms/apartments), are controlled for.[80] They report that a one percentage-point increase of the Black share of a zip code's population is associated with a 0.59% increase in disconnections per 1000 households, while a one percentage-point increase in the Hispanic share of a zip code's population is associated with a 0.26% increase in disconnections per 1000 households.[81] Interestingly, the correlation between disconnection rate and the percentage of a zip-code's population comprised of children under 5 is also statistically significant and greater than the correlations between disconnection rate and the percentages of a zip-code's population comprised by Black and Hispanic residents.[82] That is, a one percentage-point increase in the population of children under 5 in an area is associated with a greater increase in disconnection rate than one percentage-point increases in the Black or Hispanic share of the population. Cicala (2021) conducts a study using zip-code-level data on electricity disconnections in Illinois as well as socioeconomic data and detailed information on the percentage of customers levied late fees, served disconnection notices, and disconnected for non-payment as well as with past-due balances, on deferred payment plans, and in low-income assistance programs.[83] He finds that customers in Black and Hispanic zip codes were more likely to be disconnected for non-payment[84] and suggests that disconnections may be "an indicator of severe economic distress."[85] Cicala (2021) notes that his findings do not "reveal bias in utilities' treatment of poor and minority customers: individual usage, payments and balances are unobserved."[86] Instead, his results show "the disproportionate economic stress experienced in these communities."[87] The pairwise correlation coefficient between Percentage Minority Population and Energy Burden (% Income), Electricity in our data is 0.49, indicating that census tracts with greater shares of their population comprised by racial and ethnic minorities also tend to experience higher electric energy burdens.

Appendix A

Census-Tract-Level Reliability Regression Results: Supplementary Material

A. Census-Tract-Level Reliability Regression: Supplementary Material

This appendix contains the full regression results for two sets of census-tract-level reliability regression models: (1) regression models including MiEJScreen Overall Score as an independent variable; and (2) regression models including Percent Minority Percentile as an independent variable. Each regression model was fitted for the 18 reliability metrics for which data was provided by Consumers. Each reliability metric was considered separately as a dependent variable. Therefore, a total of 180 unique regression models were fitted.

The five regression models in the first set of models are:

1. MiEJScreen Overall Score;
2. MiEJScreen Overall Score and Poverty;
3. MiEJScreen Overall Score and Median Household Income, Past 12 Months (per $10,000);
4. MiEJScreen Overall Score and Population Density (in increments of 100 people per square mile); and
5. MiEJScreen Overall Score, Poverty, Median Household Income, Past 12 Months (per $10,000), Population Density (in increments of 100 people per square mile), Percent Unemployed, and Housing Burden.

The five regression models in the second set of models are:

1. Percent Minority Percentile;
2. Percent Minority Percentile and Poverty;
3. Percent Minority Percentile and Median Household Income, Past 12 Months (per $10,000);
4. Percent Minority Percentile and Population Density (in increments of 100 people per square mile); and
5. Percent Minority Percentile, Poverty, Median Household Income, Past 12 Months (per $10,000), Population Density (in increments of 100 people per square mile), Percent Unemployed, and Housing Burden.

Because results for SAIDI excluding MEDs and SAIFI excluding MEDs are included in the main body of the report, they are not reproduced here.

Census Tract-Level Reliability Regression Results Considering MiEJScreen Overall Score

SAIDI including MEDs

Table A - 1. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIDI including MEDs (with county-level and year fixed effects). All models include MiEJScreen Overall Score as a predictor. Significance codes: *** denotes p < 0.001, ** denotes p < 0.01, and * denotes p < 0.05.

	Model Number				
SAIDI including MEDs	**1**	**2**	**3**	**4**	**5**
MiEJScreen Overall Score	-7.51e+00*** (6.29e-01)	-7.90e+00*** (8.30e-01)	-7.92e+00*** (9.41e-01)	-5.58e+00*** (7.79e-01)	-6.71e+00*** (1.04e+00)
Poverty	-	4.76e-01 (6.73e-01)	-	-	9.21e-01 (9.64e-01)
Median Household Income, Past 12 Months (per $10,000)	-	-	-6.04e+00 (1.03e+01)	-	5.87e+00 (1.23e+01)
Population Density (People per Sq. Mile)	-	-	-	-3.99e+00*** (9.54e-01)	-4.25e+00*** (9.87e-01)
Percent Unemployed	-	-	-	-	1.11e+01*** (3.15e+00)
Housing Burden	-	-	-	-	-4.95e-01 (8.07e-01)

SAIFI including MEDs

Table A - 2. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIFI including MEDs (with county-level and year fixed effects). All models include MiEJScreen Overall Score as a predictor. Significance codes: *** denotes p < 0.001, ** denotes p < 0.01, and * denotes p < 0.05.

	Model Number				
SAIFI including MEDs	**1**	**2**	**3**	**4**	**5**

Appendix B

Feeder-Level Reliability Regression Results: Supplementary Material

Feeder-Level Reliability Regression Results: Supplementary Material

This appendix contains supplementary information on the feeders in Consumers' electric distribution systems. Figure B1 through Figure B6 map the 2010 Census tracts within Consumers' service territory served by feeders of each voltage level and configuration.

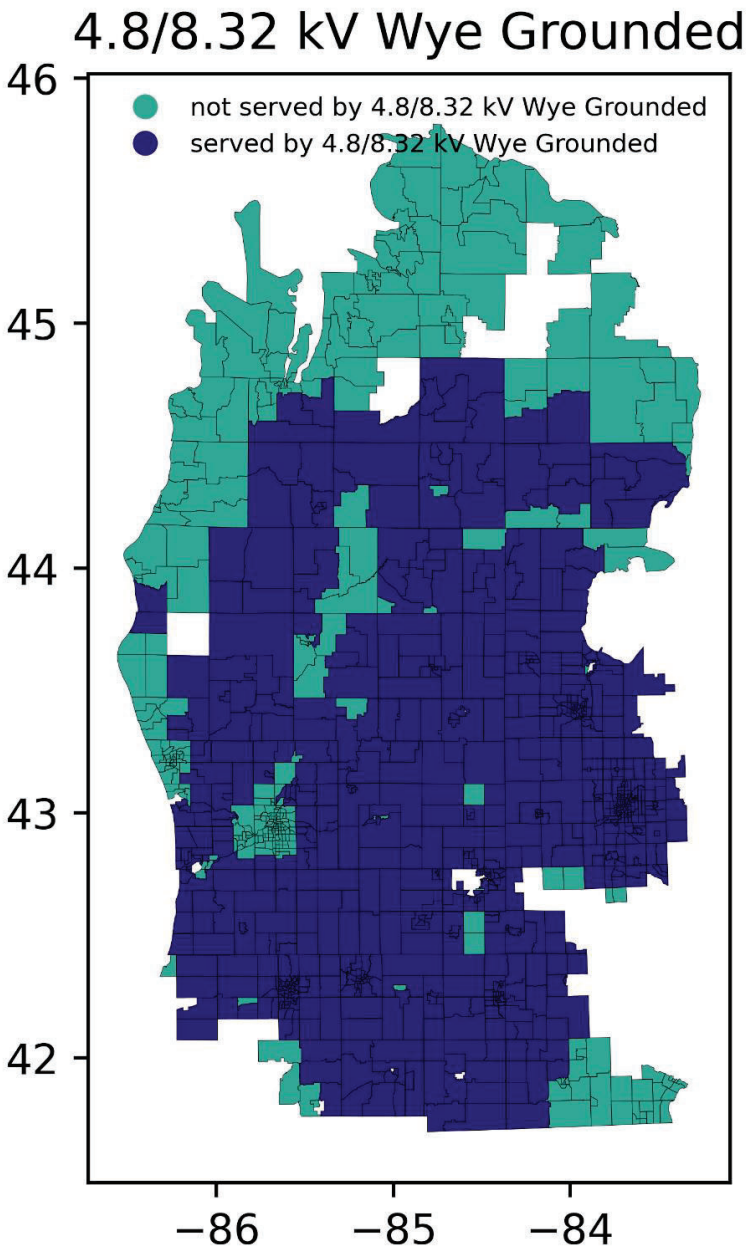

Figure B1. Map of 2010 census tracts in Consumers' service territory served by 4.8/8.32 kV Wye Grounded feeders.

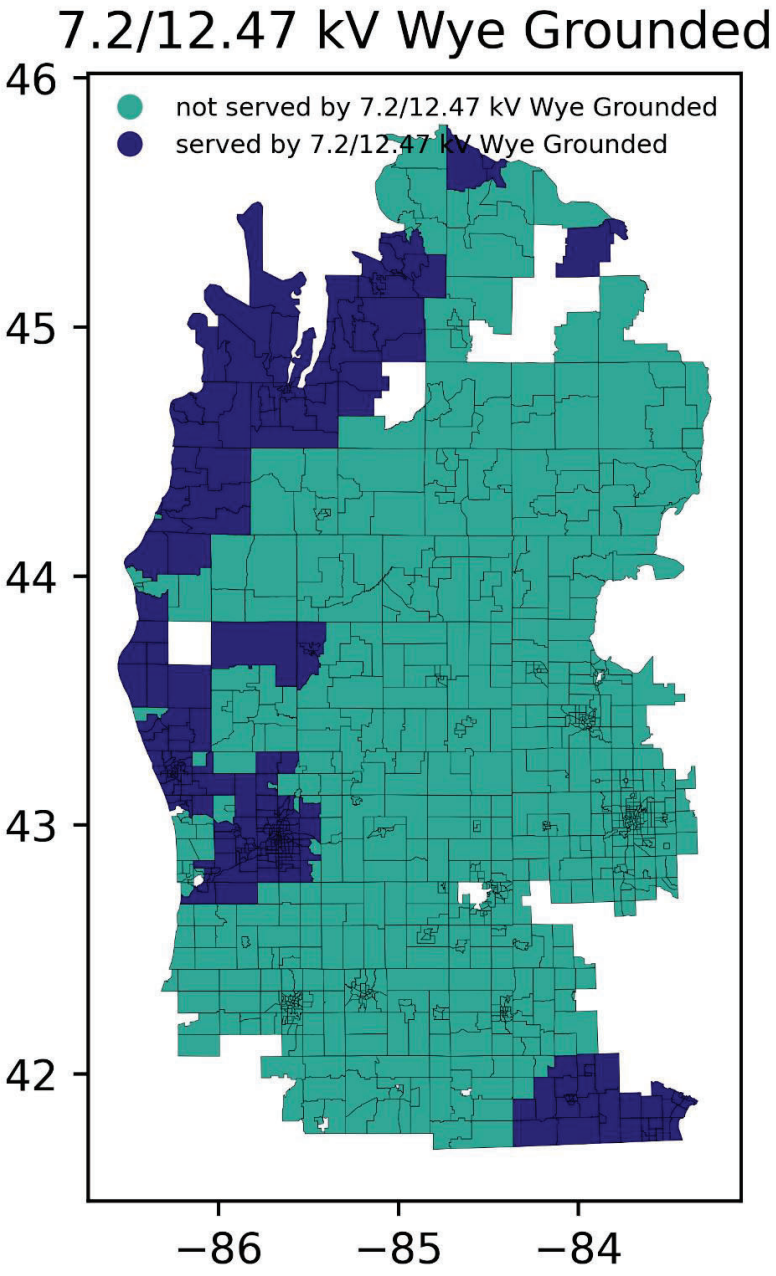

Figure B2. Map of 2010 census tracts in Consumers' service territory served by 7.2/12.47 kV Wye Grounded feeders.

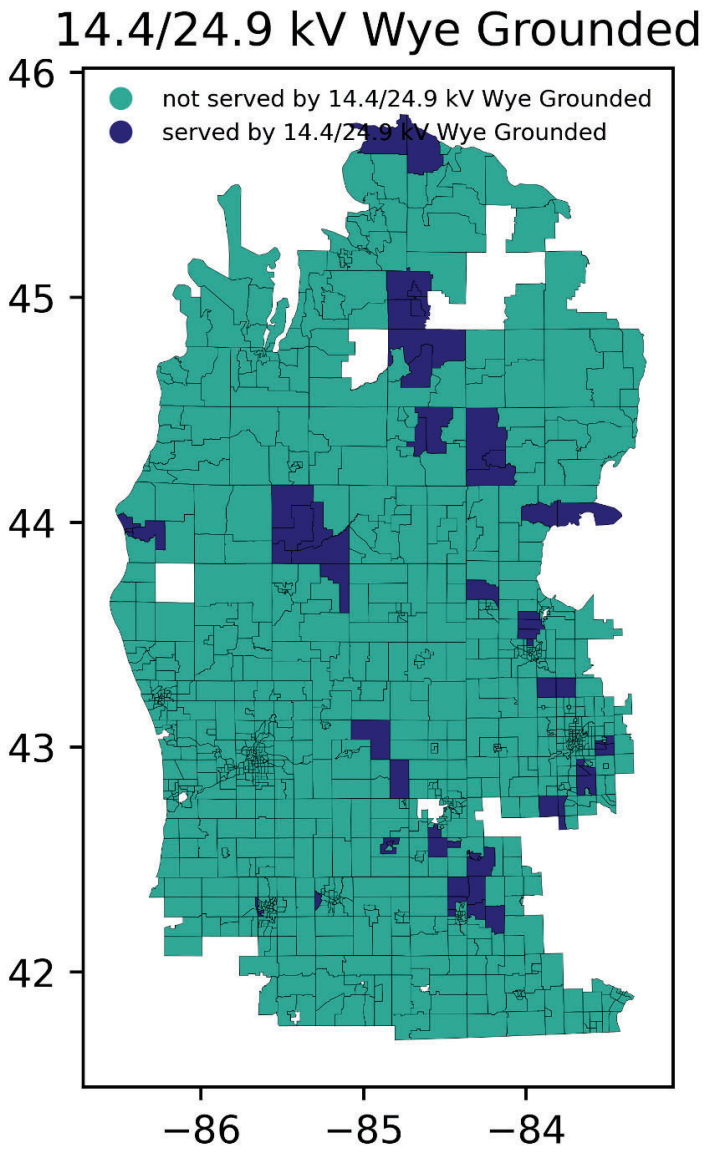

Figure B3. Map of 2010 census tracts in Consumers' service territory served by 14.4/24.9 kV Wye Grounded feeders.

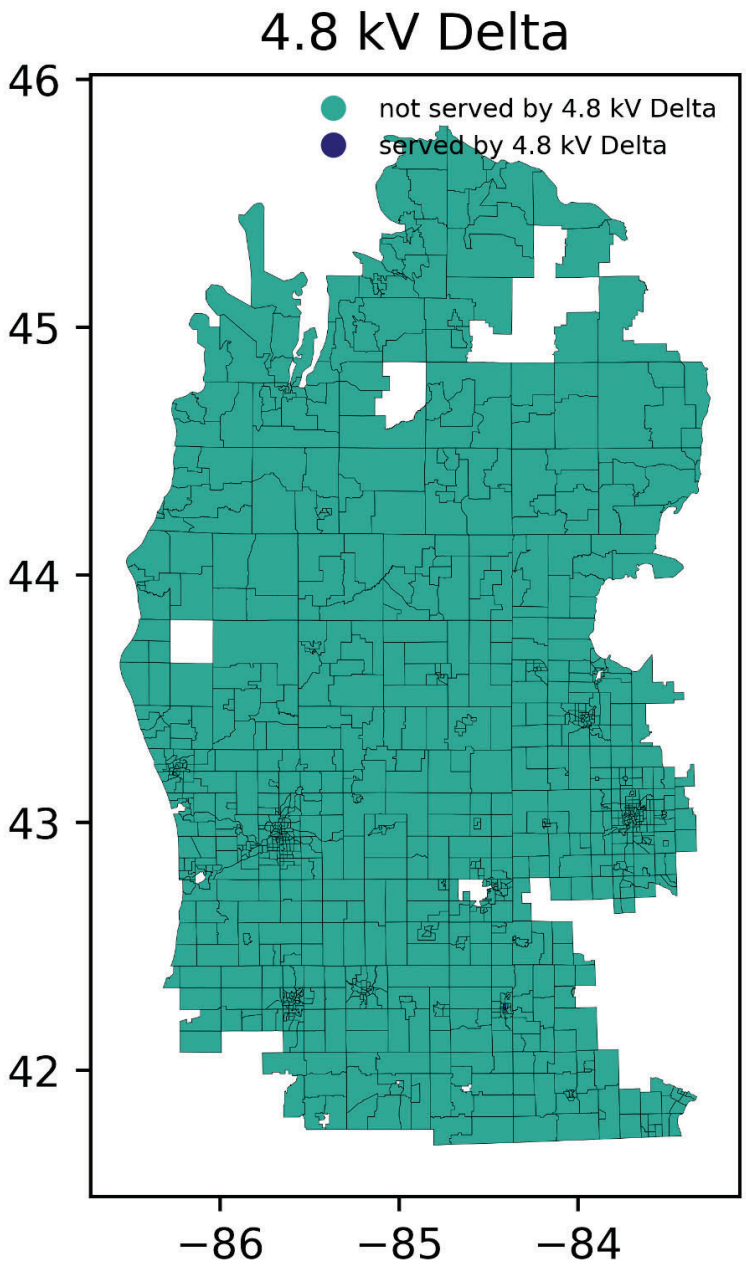

Figure B4. Map of 2010 census tracts in Consumers' service territory served by 4.8kV Delta feeders.

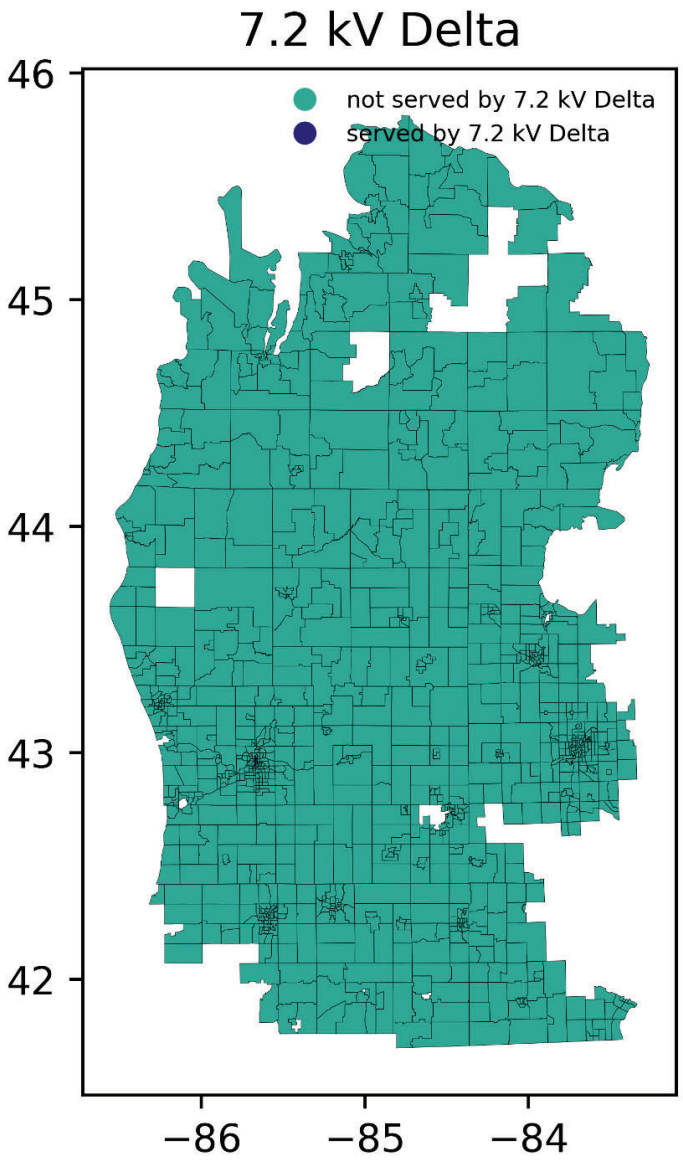

Figure B5. Map of 2010 census tracts in Consumers' service territory served by 7.2 kV Delta feeders.

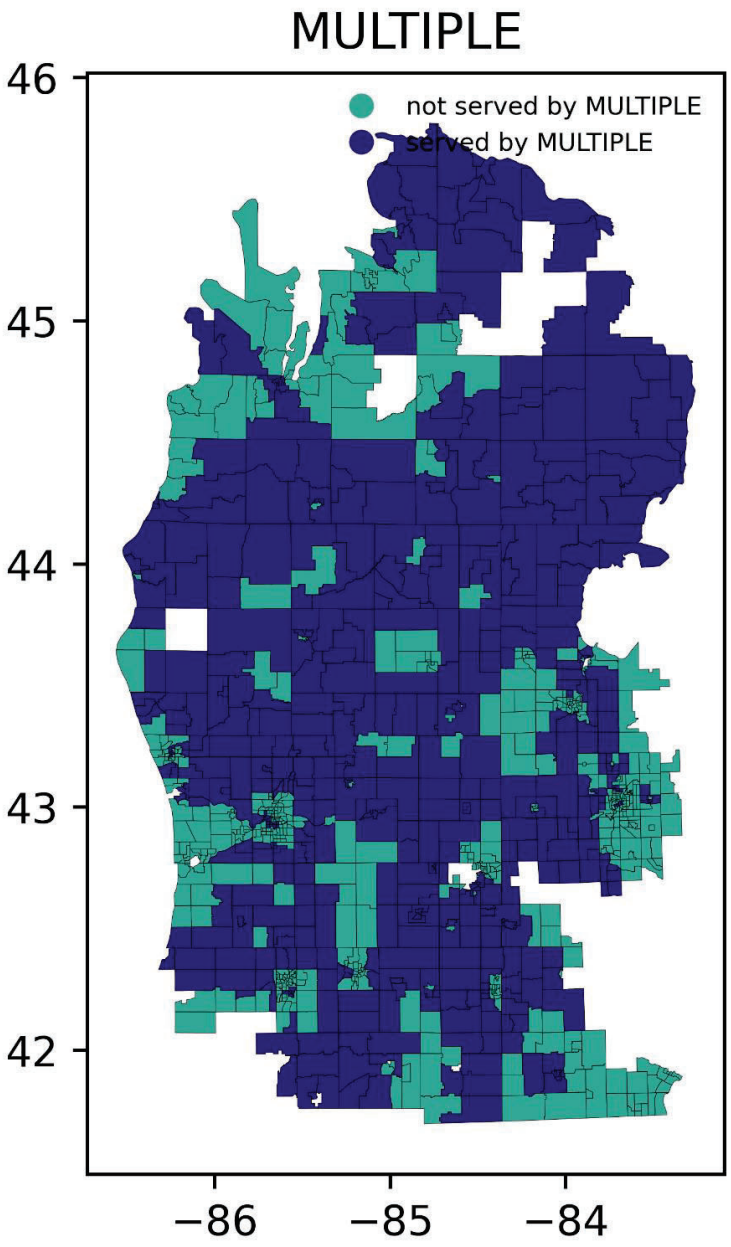

Figure B6. Map of 2010 census tracts in Consumers' service territory served by MULTIPLE feeders.

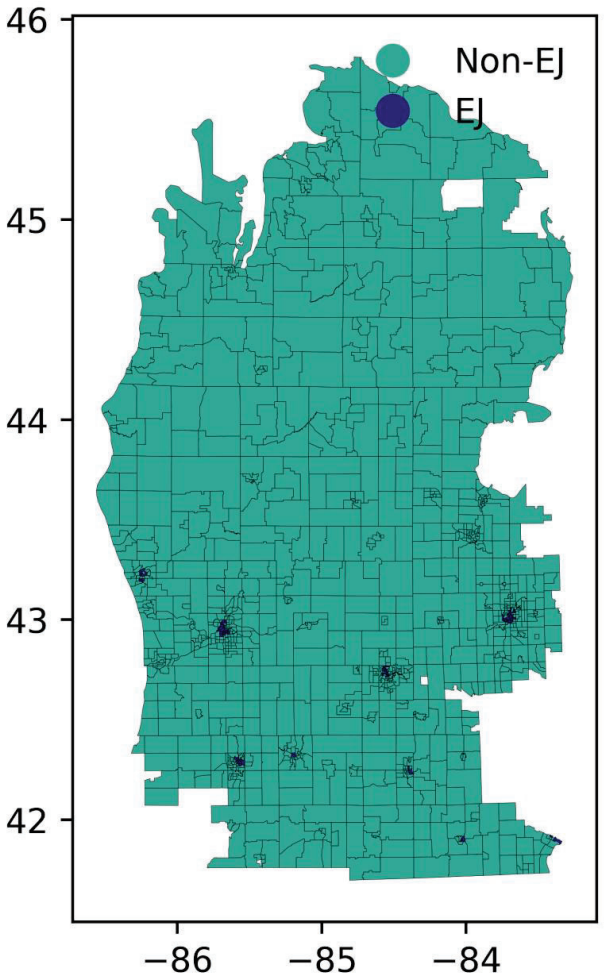
Executive Summary

Reliability and Disconnections Regression Analysis

© 2024 Exponent, Inc.



Background

- March 2024 MPSC Order: use regression analysis to assess whether customers in Environmental Justice (EJ) communities experience lower levels of distribution reliability than customers in other communities.
- March 2025 MPSC Order: include residential involuntary disconnections for non-payment in the regression analysis.
- The aim of the current analysis is to update the reliability and disconnections analyses that were previously run (the “2025 Analysis”) with an additional year of data.

© 2024 Exponent, Inc.

Groups of Customers

- EJ and Non-EJ census tracts
  - EJ if MiEJScreen Overall Score > 80; and
  - Non-EJ otherwise.
- Urban and Rural census tracts
- Low-Income and High-Income census tracts
- High-Percent-Minority-Percentile and Low-Percent-Minority-Percentile census tracts

EJ and non-EJ communities within Consumers' service territory.

© 2024 Exponent, Inc.

Summary of Observations: Reliability

Reliability

- Are there statistically significant differences in the average reliability of different groups of customers?
- What correlations exist between communities' demographic characteristics and their reliability?
- What correlations exist between circuit characteristics and their reliability?

When there are statistically significant differences in average reliability, EJ census tracts tend to have better average reliability than Non-EJ census tracts.

Increasing MiEJScreen Overall Score and increasing Percent Minority Percentile are often associated with improving reliability, when all other variables and factors are held constant.

Whether a feeder serves an EJ census tract does not have a statistically significant correlation with its reliability.

© 2024 Exponent, Inc.

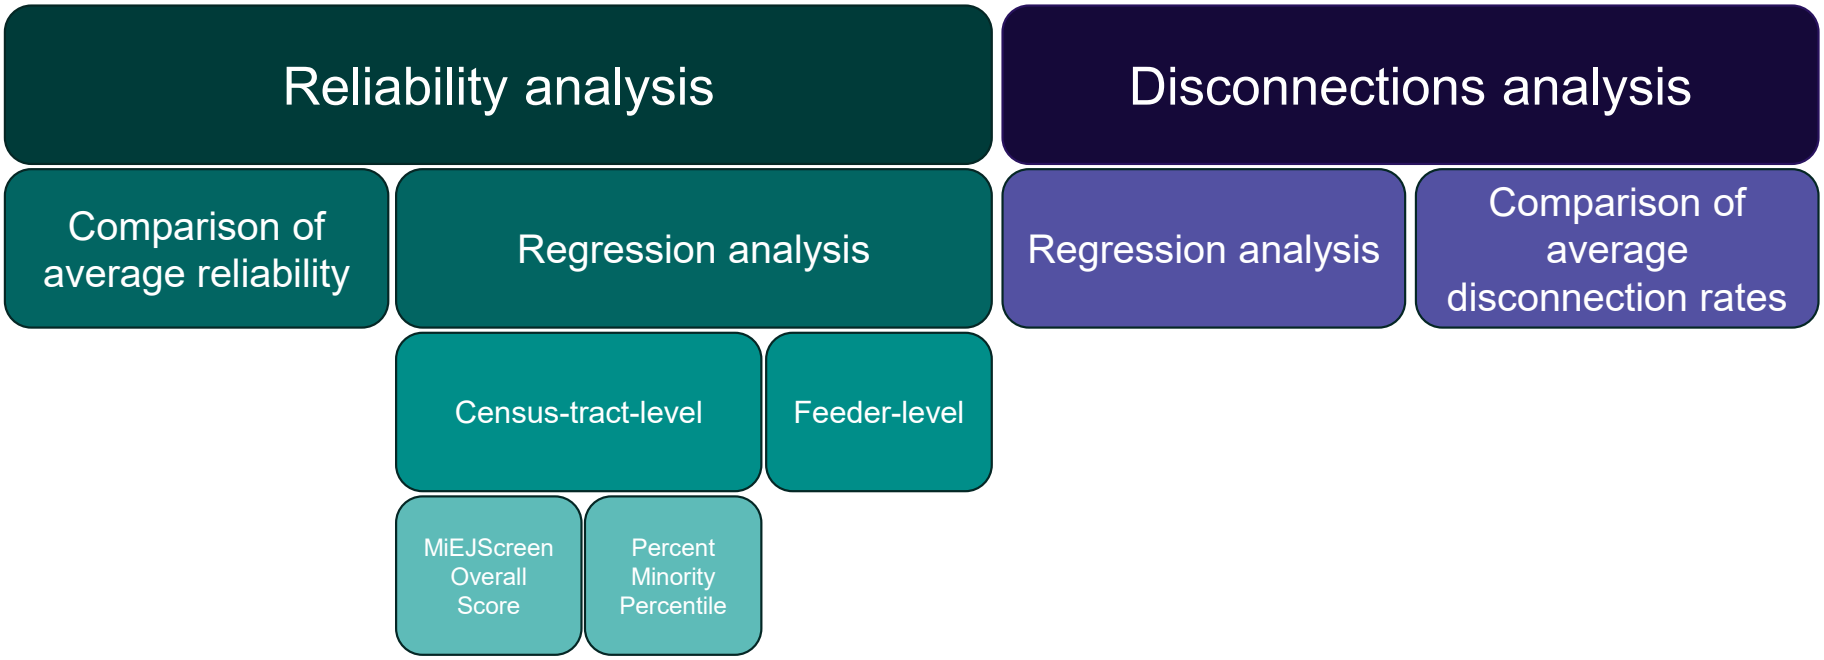
Summary of Observations: Disconnections

Disconnections

- What correlations exist between communities' demographic characteristics and rates of residential involuntary disconnections for non-payment?

Energy Burden (% Income), Electricity has a statistically significant correlation with disconnection rate that is greater than those of the other independent variables in the model.

When all other variables and factors are held constant, increasing Percentage Minority Population in a census tract is statistically significant and associated with increasing disconnection rate.



Percentage Below Poverty; Population Density; Median Home Value; Percentage of Homes Built After 1990; and Percentage Renters also have statistically significant correlations with disconnection rate.

- Do customers with the worst reliability also experience higher rates of disconnections than other customers?

No; the census tracts with the worst reliability tend to have lower average disconnection rates than the rest of the census tracts.

Comparison of Average Reliability

Are there statistically significant differences in the average reliability of different groups of customers?

- **Method**: Used binary difference-in-means t-test to compare average reliability (by 18 different metrics).

© 2024 Exponent, Inc.

Comparison of Average Reliability: EJ and Non-EJ

- When there are statistically significant differences in the mean reliability of EJ and non-EJ census tracts, EJ census tracts consistently experience better average reliability.
  - **Exception**: In 2025, the percentage of catastrophic-weather restorations made within 48 hours is the only metric by which Non-EJ tracts experience statistically significant better average reliability.

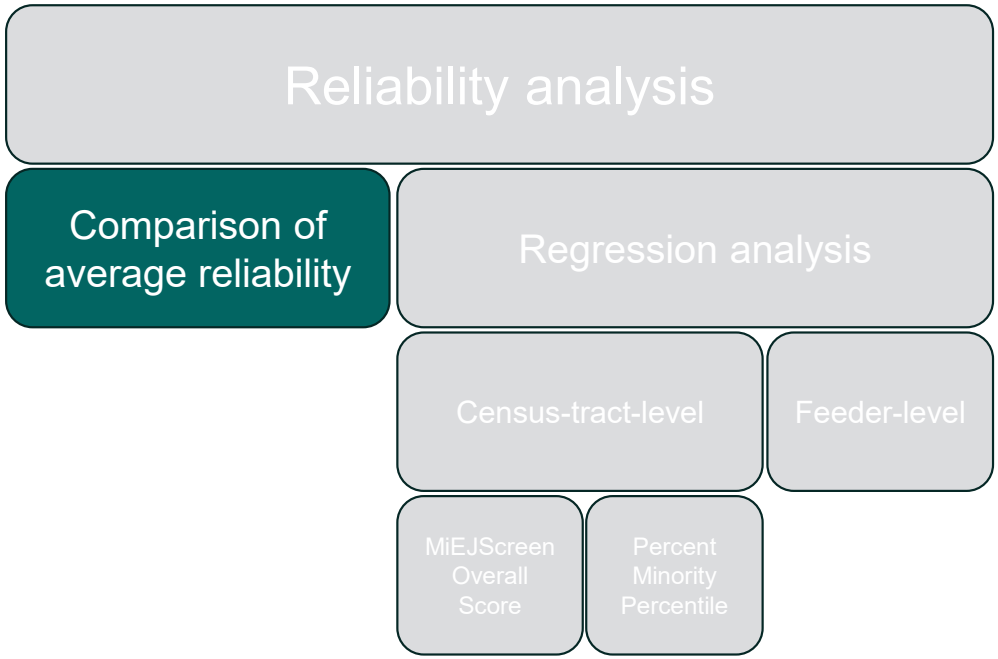
Comparison of Average Reliability: Low Income and High Income

- When there are statistically significant differences in the mean reliability of Low-Income and High-Income census tracts, Low-Income census tracts generally experience better average reliability.
- **Exceptions**: In 2025, High-Income census tracts experienced better average reliability in terms of:
  - CAIDI including MEDs;
  - The percentage of all-weather restorations made within 36 hours (also in 2020); and
  - The percentage of catastrophic-weather restorations made within 48 hours (also in 2020, 2024).

© 2024 Exponent, Inc.



Comparison of Average Reliability: High Percent Minority Percentile and Low Percent Minority Percentile

- When there are statistically significant differences in the mean reliability of High Percent Minority Percentile and Low Percent Minority Percentile census tracts, High Percent Minority Percentile census tracts generally experience better average reliability.
- **Exceptions**: In 2025, Low-Percent-Minority-Percentile census tracts experienced better average reliability in terms of:
  - CAIDI including MEDs;
  - The percentage of all-weather restorations made within 36 hours; and
  - The percentage of catastrophic-weather restorations made within 48 hours (also in 2020).

© 2024 Exponent, Inc.

Comparison of Average Reliability

- Are there statistically significant differences in the average reliability of different groups of customers?
  - When there are statistically significant differences in the mean reliability of EJ and Non-EJ census tracts, EJ census tracts consistently experience better average reliability.
  - Urban, Low-Income, and High-Percent-Minority-Percentile census tracts consistently experience better average reliability than their counterparts, with a few exceptions in 2025:
    - CAIDI including MEDs;
    - The percentage of all-weather restorations made within 36 hours; and
    - The percentage of catastrophic-weather restorations made within 48 hours.

3. Regression Analysis Results: Census Tract-Level Reliability

© 2025 Exponent, Inc.

Census-tract-level Reliability Regression: Overview

What correlations exist between demographic characteristics of census tracts and their reliability?

- Built regression models to relate reliability to census-tract-level demographic characteristics.
  - **Method**: Mixed-effects linear regression with county-level and year fixed effects.
  - **Data**: For each census tract
    - 18 reliability metrics (2020-2025)
    - Demographic variables based on data from MiEJScreen

© 2024 Exponent, Inc.

Regression Results with MiEJScreen Overall Score: SAIDI excluding MEDs

Table 9. The coefficient values (with standard errors in parentheses) of independent variables in different 2010-census-tract-level mixed-effects regression models of SAIDI excluding MEDs (with county-level and year fixed effects). All models include MiEJScreen Overall Score as a predictor. Significance codes: *** denotes p < 0.001, ** denotes p < 0.01, and * denotes p < 0.05.

Dependent variable

Predictors

	Model Number				
SAIDI excluding MEDs	1	2	3	4	5
MiEJScreen Overall Score	-1.49e+00*** (1.20e-01)	-1.60e+00*** (1.59e-01)	-1.62e+00*** (1.81e-01)	-1.12e+00*** (1.48e-01)	-1.40e+00*** (1.99e-01)
Poverty	-	1.36e-01 (1.29e-01)	-	-	2.66e-01 (1.83e-01)
Median Household Income, Past 12 Months (per $10,000)	-	-	-1.84e+00 (1.97e+00)	-	1.05e+00 (2.35e+00)
Population Density (People per Sq. Mile)	-	-	-	-7.51e-01*** (1.81e-01)	-7.88e-01*** (1.87e-01)
Percent Unemployed	-	-	-	-	3.03e+00*** (5.97e-01)
Housing Burden	-	-	-	-	-2.57e-01 (1.53e-01)

Model with most controls, and what we consider the final model. We interpret the coefficients of the predictors in this model.

Regression Results with MiEJScreen Overall Score: SAIDI excluding MEDs

- When all other variables and factors are held constant:
  - A one percentage point increase in the **MiEJScreen Overall Score** is associated with a 1.40 minute decrease in SAIDI excluding MEDs (improving reliability);
    - 2025 Analysis: 1.36 minute decrease.
  - An increase in **Population Density** of 100 people per square mile is associated with a 0.79 minute decrease in SAIDI excluding MEDs (improving reliability);
    - 2025 Analysis: 0.9 minute decrease.
  - A one percentage point increase in **Percent Unemployed** is associated with an 3.0 minute increase in SAIDI excluding MEDs (worsening reliability);
    - 2025 Analysis: 2.91 minute increase.
- **Poverty** and **Housing Burden** are not statistically significant, though they were in the 2025 Analysis.
- **Median Household Income, Past 12 Months** is not statistically significant and wasn't in the 2025 Analysis.

© 2024 Exponent, Inc.

Regression Results with MiEJScreen Overall Score: SAIFI excluding MEDs

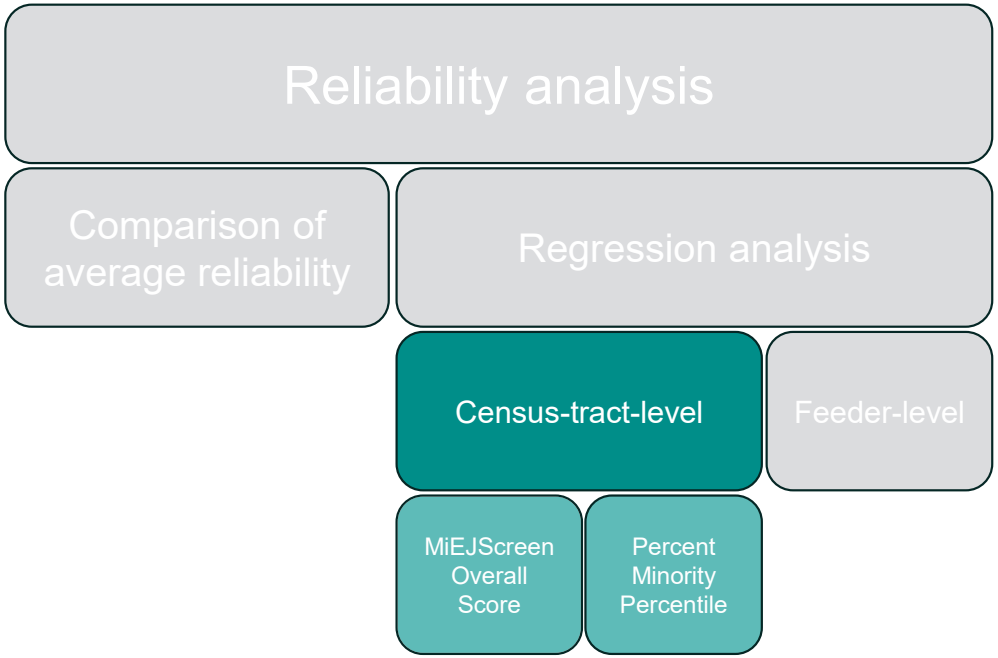
- When all other variables and factors are held constant:
  - A one percentage point increase in the **MiEJScreen Overall Score** is associated with a decrease of 0.006 interruptions per customer (improving reliability);
    - 2025 Analysis: decrease of 0.005 interruptions per customer.
  - An increase in **Population Density** of 100 people per square mile is associated with a decrease of 0.004 interruptions per customer (improving reliability);
    - 2025 Analysis: decrease of 0.004 interruptions per customer.
  - A one percentage point increase in **Percent Unemployed** is associated with an increase of 0.01 interruptions per customer (worsening reliability); and
    - 2025 Analysis: increase of 0.01 interruptions per customer.
- **Poverty** is not statistically significant, though it was in the 2025 Analysis.
- **Housing Burden** and **Median Household Income, Past 12 Months** are not statistically significant and were not in the 2025 Analysis.

© 2024 Exponent, Inc.

Census-tract-level Reliability Regression: Summary for MiEJScreen Overall Score

- MiEJScreen Overall Score is statistically significant and correlated with improving reliability in terms of:
  - Unique Customers with an Interruption;
  - Total Customer Interruptions;
  - SAIDI (excluding and including MEDs);
  - SAIFI (excluding and including MEDs);
  - CAIDI (excluding and including MEDs);
  - CELID-5 and -24; and
  - CEMI-4, -5, and -7.
- The correlation between MiEJScreen Overall score and reliability is not statistically significant for:
  - CEMI-10;
  - The percentage of normal-weather restorations made within 8 hours;
  - The percentage of gray-sky-weather restorations made within 24 hours;
  - The percentage of all-weather restorations made within 36 hours*; or
  - The percentage of catastrophic-weather restorations made within 48 hours.
- * In 2025 Analysis, MiEJScreen Overall score was statistically significant and correlated with improving reliability in terms of the percentage of all-weather restorations made within 36 hours.
- **These results show no evidence that census tracts with higher MiEJScreen Overall Scores tend to have worse reliability than other census tracts.**

© 2024 Exponent, Inc.



Census-tract-level Reliability Regression: Summary for Percent Minority Percentile

- Percent Minority Percentile is statistically significant and correlated with improving reliability in terms of:
  - Unique Customers with an Interruption;
  - Total Customer Interruptions;
  - SAIDI (excluding and including MEDs);
  - SAIFI (excluding and including MEDs);
  - CELID-5 and -24; and
  - CEMI-4, -5, -7, and -10.
- Percent Minority Percentile is not statistically significant for:
  - CAIDI (excluding or including MEDs);
  - The percentage of normal-weather restorations made within 8 hours;
  - The percentage of gray-sky-weather restorations made within 24 hours;
  - The percentage of all-weather restorations made within 36 hours*; or
  - The percentage of catastrophic-weather restorations made within 48 hours.
- **These results show no evidence that census tracts with higher Percent Minority Percentile values tend to have worse reliability than other census tracts.**

© 2024 Exponent, Inc.

Census-tract-level Reliability Regression: Summary

- What correlations exist between demographic characteristics of census tracts and their reliability?
  - Increasing MiEJScreen Overall Score tends to be associated with improving reliability, when a statistically significant correlation between the two exists.
  - Increasing Percent Minority Percentile also tends to be associated with improving reliability.
  - Census tracts with higher poverty and unemployment rates tend to have longer and more frequent outages when all other variables and factors are held constant.

© 2024 Exponent, Inc.

4. Regression Analysis Results: Feeder-Level Reliability

© 2025 Exponent, Inc.

Feeder-level Reliability Regression: Overview

What correlations exist between feeder characteristics and their reliability?

- Built regression models to relate reliability to feeder characteristics.
  - **Method**: Mixed-effects linear regression with year fixed effects.
  - **Data**: For each feeder:
    - 4 reliability metrics (2020-2025):
      - SAIDI (excluding and including MEDs)
      - SAIFI (excluding and including MEDs)
    - Physical attributes
    - Percent of its length within a 2010 census tract
    - Demographic variables based on data from MiEJScreen

© 2024 Exponent, Inc.

Feeder-level Reliability Regression: Feeder Characteristics

Physical characteristics of feeders that were included in the models are:

- Customers per Primary Line Mile;
- Mean Canopy Cover Percentage;
- Open Wire Secondary Miles;
- Primary Miles;
- Primary Underground Percentage;
- Voltage (categorical);
  - Reference value is 4.8/8.32 kV Wye Grounded, since it's the most common of all feeder voltages.
- Years Since Last Trim < 7 (binary).

© 2024 Exponent, Inc.

Feeder-level Reliability Regression: Demographic Characteristics

- We also included demographic characteristics of the areas served by each feeder as binary variables:
  - Serves an EJ census tract;
  - Serves an Urban census tract;
  - Serves a Low-Income census tract; and
  - Serves a High-Percent-Minority-Percentile census tract.
- A feeder was considered as serving a type of census tract if any part of its length overlapped with that type of census tract.

© 2024 Exponent, Inc.

Feeder-Level Average Reliability

- Average feeder reliability provides context for interpreting regression results.
- Consumers provided updated feeder data for 2020 through 2025.
- Feeder reliability in 2025 was worse, on average, than in 2024.

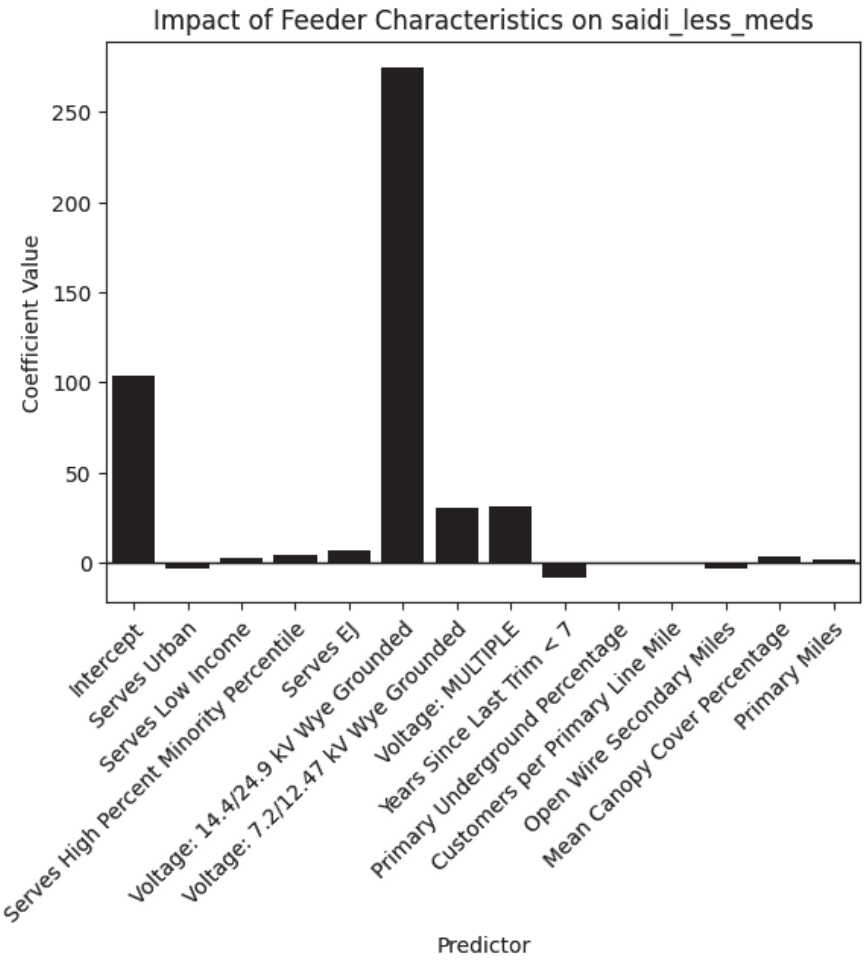


Table 4. The average value (over all feeders in Consumers' distribution system) of each of four feeder-level reliability metrics in each year from 2020 through 2025.

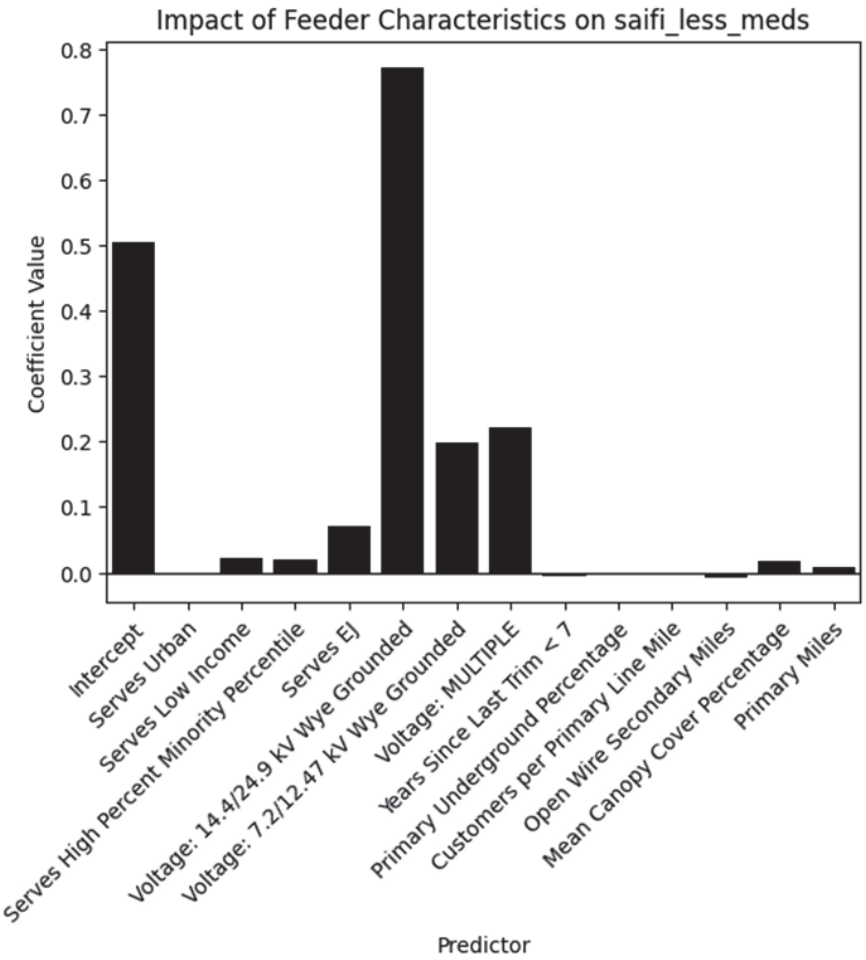
Reliability Metric	2020	2021	2022	2023	2024	2025
SAIDI excluding MEDs	193.65	235.95	184.18	195.9	183.69	196.32
SAIDI including MEDs	535.83	970.7	467.62	1074.43	589.62	957.13
SAIFI excluding MEDs	1.01	1.08	0.94	1.02	1.01	1.05
SAIFI including MEDs	1.33	1.62	1.23	1.47	1.5	1.65

© 2024 Exponent, Inc.

Feeder-level Regression Results: SAIDI excluding MEDs

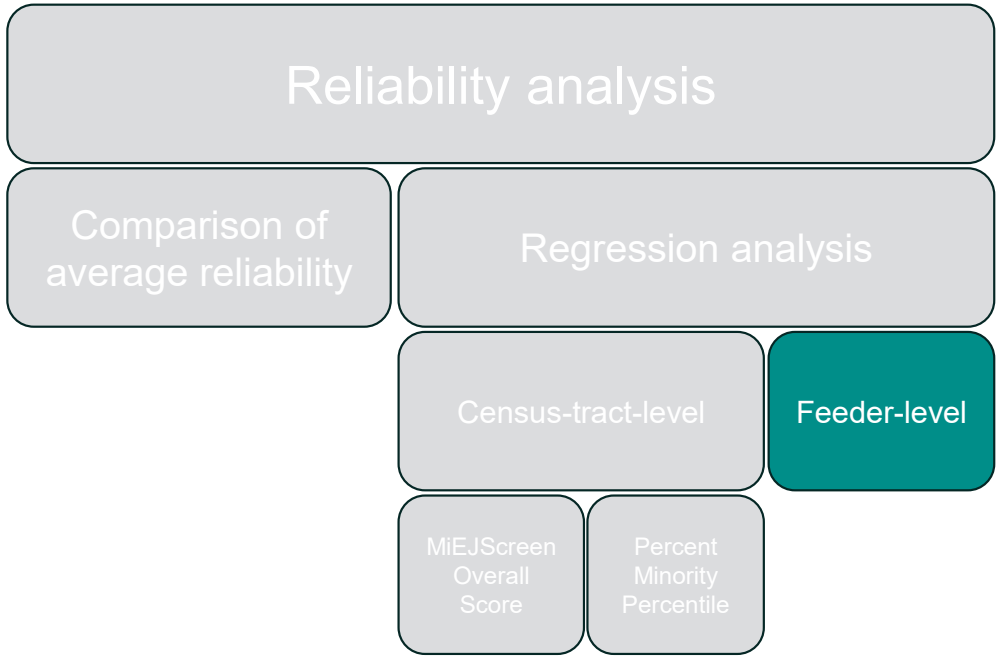


- Voltage can have a large and statistically significant correlation with SAIDI excluding MEDs. When all other variables are held constant and relative to the reference voltage:
  - 14.4/24.9 kV Wye Grounded (+275 minutes)
  - 7.2/12.47 kV Wye Grounded (+31 minutes)
  - MULTIPLE (+31 minutes)
- Feeder characteristics with statistically significant correlations with SAIDI excluding MEDs are:
  - **Primary Underground Percentage**: A one percentage-point increase is associated with a 0.9 minute decrease (improving reliability).
  - **Customers per Primary Line Mile**: An increase of 1 customer per primary line mile is associated with a 0.5 minute decrease (improving reliability).
  - **Mean Canopy Cover Percentage**: A one percentage-point increase is associated with 3.9 minute increase (worsening reliability).
  - **Primary Miles**: Every one-mile increase is associated with a 1.7 minute increase (worsening reliability).
- Open-Wire Secondary Miles is not statistically significant but was in 2025 Analysis.
- None of the demographic characteristics has a statistically significant correlation with SAIDI excluding MEDs.

© 2024 Exponent, Inc.

Feeder-level Regression Results: SAIFI excluding MEDs

- Voltage can have a large and statistically significant correlation with SAIFI excluding MEDs. When all other variables are held constant and relative to the reference voltage:
  - 7.2/12.48 kV Wye Grounded (+0.2 interruptions/customer/year)
  - 14.4/24.9 kV Wye Grounded (+0.8 interruptions/customer/year)
  - MULTIPLE (+0.2 interruptions/customer/year)
- All other feeder characteristics (except Open Wire Secondary Miles) have statistically significant correlations with SAIFI excluding MEDs.
  - **Primary Underground Percentage**: A one percentage-point increase is associated with a decrease of 0.004 interruptions/customer/year (improving reliability).
  - **Customers per Primary Line Mile**: An increase of 1 customer per primary line mile is associated with a decrease of 0.002 interruptions/customer/year (improving reliability).
  - **Mean Canopy Cover Percentage**: A one percentage-point increase is associated with an increase of 0.02 interruptions/customer/year (worsening reliability).
  - **Primary Miles**: Every one-mile increase is associated with an increase of 0.009 interruptions/customer/year (worsening reliability).
- None of the demographic characteristics included has a statistically significant correlation with SAIFI excluding MEDs.



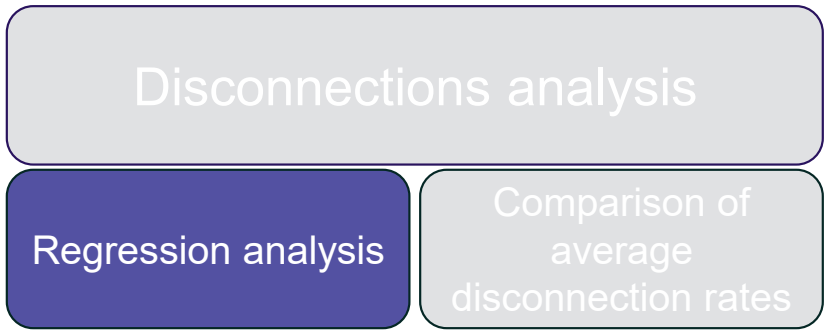
© 2024 Exponent, Inc.

Feeder-level Reliability Regression: Summary

What correlations exist between feeder characteristics and their reliability?

- None of the demographic characteristics (Serves Urban, EJ, Low-Income, or High-Percent-Minority-Percentile) included in the feeder regression analysis had statistically significant correlations with feeder reliability.
  - In 2025 Analysis, feeders that serve Urban census tracts tended to have shorter outage durations than feeders that don't serve Urban census tracts.
  - In 2025 Analysis, feeders that serve EJ census tracts tended to have more frequent outages than feeders that don't serve EJ census tracts.
- Physical characteristics of feeders have statistically significant correlations with their reliability.

© 2024 Exponent, Inc.



5. Regression Analysis Results: Disconnection Rates

© 2025 Exponent, Inc.

Disconnections Regression Analysis: Overview

What correlations exist between demographic characteristics and disconnection rates?

- Built regression models to relate reliability to census-tract-level demographic characteristics.
  - **Data**: For each 2020 Census tract in Consumers' service territory:
    - Count of disconnections in each year (2021*-2024)
    - Demographic variables based on data from the American Community Survey (ACS) – 5-year estimates (2021-2024**)
    - New ➡ Energy burden data from DoE LEAD Tool (do not vary with time)

* Disconnection data for 2020 were excluded given the voluntary moratorium instituted by Consumers in response to the COVID-19 pandemic for the better part of that year.

** ACS 5-year estimates for 2025 were not available at the time of this analysis.

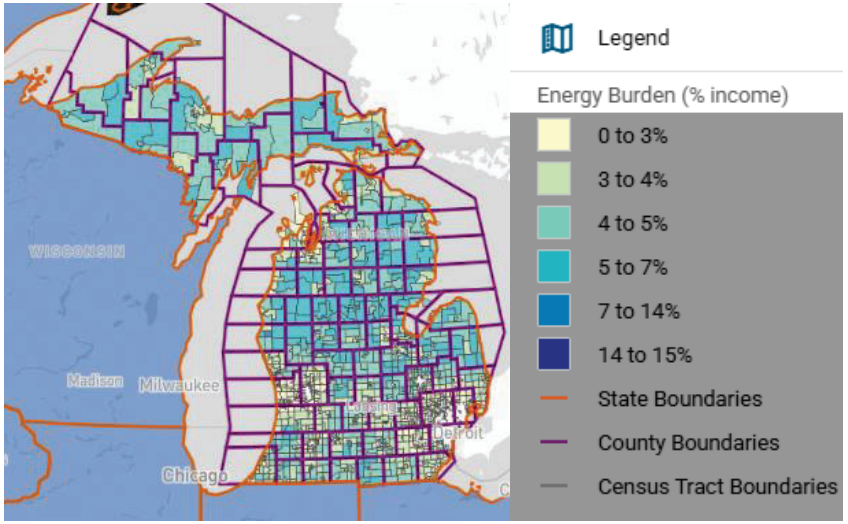
© 2024 Exponent, Inc.

Disconnections: Descriptive Statistics

Table 17. Descriptive statistics (i.e., mean, standard deviation, minimum, and maximum) of disconnection rates (in units of disconnections per 1000 households) among 2020 Census tracts in Consumers' service territory from 2020 through 2024.

Year	Mean	Standard Deviation	Minimum	Median	95th Percentile	Maximum	No. of Census Tracts
2020	14.90	11.56	0.40	12.15	36.88	80.62	1133
2021	53.67	52.24	0.43	39.45	175.54	363.64	1152
2022	51.56	50.16	0.37	37.31	168.46	400.00	1151
2023	58.08	54.76	0.43	43.82	176.50	435.09	1147
2024	64.68	60.65	0.41	48.46	195.76	833.33	1150

- In 2024, the maximum disconnection rate occurred in a census tract in Isabella County that is comprised mostly of Central Michigan University's campus.
  - It had 15 disconnections and 18 households in 2024, resulting in a disconnection rate of 833.33 per 1000 households.



On-campus housing – **not included** in household count

© 2024 Exponent, Inc.

Disconnections Regression: Including Energy Burden

- The Department of Energy's LEAD tool provides census tract-level data on Electric Energy Burden (% income).
- LEAD data are provided once, i.e., do not vary by year.
- Memmott et al. (2024) find that energy cost is significant (at the p < 0.01 level) in their their zip-code-level regression model for disconnection rate in California.

Source: US Department of Energy Low-income Energy Affordability Data Tool.

Memmott, T., Konisky, D.M., and Carley, S. (2024). *Assessing demographic vulnerability and weather impacts on utility disconnections in California*. Nature Communications, Vol. 15:9458. https://doi.org/10.1038/s41467-024-53913-y

Disconnections Regression Analysis: Results

Disconnection Rates (2021-2024)
4553 observations

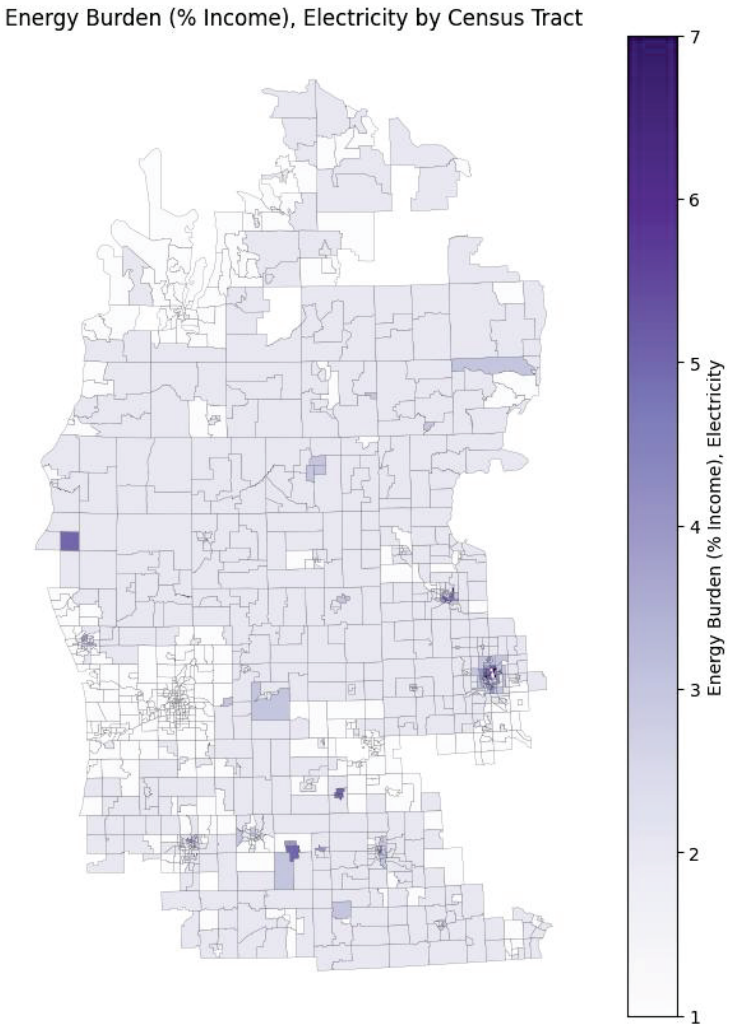
Table 20. Panel regression model for disconnection rate (in units of disconnections per 1000 households) considering year- and county-level fixed effects: coefficients for each independent variable, standard errors, and p-values. * indicates $p < 0.05$.

Variable	Coefficient	Standard Error	p-value
Intercept	39.55*	12.48	1.54E-03
Percentage Minority Population	1.14*	0.15	3.60E-14
Percentage Below Poverty	0.52*	0.20	1.08E-02
Percentage Renters	0.18*	0.06	4.17E-03
Unemployment Rate	0.28	0.43	5.12E-01
Percentage of Homes Built after 1990	-0.22*	0.07	3.13E-03
Population Density	-5.94*	2.28	9.37E-03
Median Home Value (per $10,000)	-1.16*	0.34	7.48E-04
Energy Burden (% Income), Electricity	6.86*	3.36	4.13E-02

© 2025 Exponent, Inc.

Disconnections Regression Analysis: Results

When all other variables, as well as county-level and year factors, are held constant:



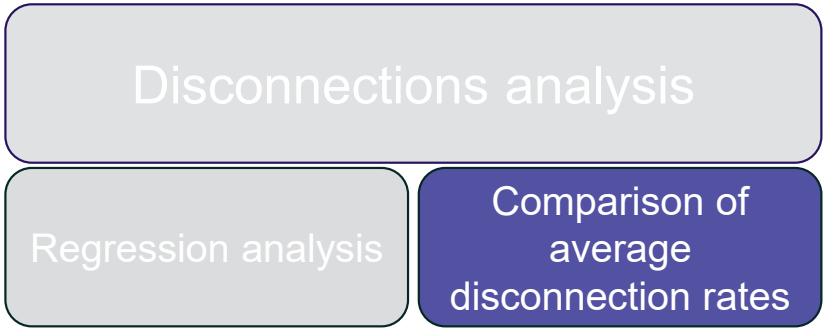
- **Percentage Minority Population**: A one percentage-point increase in minority population is associated with an increase of 1.14 disconnections per 1000 households.
- **Percentage Below Poverty Population**: A one percentage-point increase in below poverty population is associated with an increase of 0.52 disconnections per 1000 households.
- **Percentage Renters**: A one percentage-point increase in the percentage of renters is associated with an increase of 0.18 per 1000 households.
- **Percentage of Homes Built after 1990**: A one percentage-point increase in percentage of homes built after 1990 is associated with a decrease of 0.22 disconnections per 1000 households.
- **Population Density**: An increase of 1000 households per square mile is associated with a decrease of 5.94 disconnections per 1000 households.
- **Median Home Value**: A $10,000 increase in a census tract's Median Home Value is associated with a decrease of 1.16 disconnections per 1000 households.

New ➡
- **Energy Burden (% Income), Electricity**: A one percentage-point increase in energy burden is associated with an increase of 6.86 disconnections per 1000 households.

© 2025 Exponent, Inc.

Disconnections Regression Analysis: Discussion

- Energy burden has the largest correlation with disconnection rate, as expected.
- The statistically significant positive correlation between Percentage Minority Population and disconnection rate that was observed in 2025 Analysis persists even when energy burden is controlled for.
  - The magnitude of the correlation between Percentage Minority Population and disconnection rate is smaller than that between Energy Burden and disconnection rate.
- The results of the current analysis are consistent with those of the 2025 Analysis.



© 2024 Exponent, Inc.

Disconnections & Reliability Analysis: Overview

Do communities with the worst reliability also have higher disconnection rates than other communities?

- Assessed whether statistically significant differences exist in the average disconnection rates of (1) the 10% of census tracts with the worst reliability (as measured by 18 different metrics); and (2) all other census tracts.
  - **Methods**: Binary difference-in-means t-test.
  - **Data**: For each 2020 census tract in Consumers' service territory:
    - Count of disconnections in each year (2020-2024) → disconnection rate
    - 18 reliability metrics in each year (2020-2024)

© 2024 Exponent, Inc.

Comparison of Average Reliability: Census Tracts with Highest Disconnection Rates and Other Census Tracts

- This analysis shows no evidence that census tracts with the worst reliability consistently experience statistically significant, higher disconnection rates than other census tracts.
- Current results are consistent with observations in 2025 Analysis.

Excerpt of Table 21.

Reliability Metric	Year	Non-Vulnerable Mean	Vulnerable Mean	Difference	p-value	Significant?	Worse?
Unique Customers with an Interruption	2020	1.52E+01	1.23E+01	2.89E+00	6.35E-05	TRUE	Non-vulnerable

6. Key Takeaways & Next Steps

© 2025 Exponent, Inc.

Key Takeaways

- Census-tract-level Reliability
  - Increasing MiEJScreen Overall Score and increasing Percent Minority Percentile are often associated with improving reliability when all other variables and factors are held constant.
- Feeder-level Reliability
  - Whether a feeder serves an EJ census tract does not have a statistically significant correlation with its reliability.
  - Whether a feeder serves different demographic groups (Urban, Low-Income, High-Percent-Minority-Percentile) does not have a statistically significant correlation with its reliability.
- Disconnections
  - When all other variables and factors are held constant, increasing Energy Burden (% Income), Electricity in a census tract is statistically significant and associated with increasing disconnection rate.
  - Energy burden has the greatest correlation with disconnection rate among all predictors included in the model.
  - The statistically significant positive correlation between Percentage Minority Population and disconnection rate that was observed in the 2025 Analysis persists even when energy burden is controlled for but is smaller than the correlation between energy burden and disconnection rate.

Limitations

The study presented in the report and summarized in these slides is intended for use by Consumers Energy Company ("Consumers") to inform their decisions related to distributional equity of electric reliability among the various communities that they serve. While this study is informative, it is understood and agreed that responsibility for these decisions remain fully with Consumers. Proper application of this report requires recognition and understanding of the limitations of both the scope and methodology of the study. The scope of the study was limited to performing regression analysis to assess correlations between electric reliability and: (1) demographic characteristics of communities served by Consumers; and (2) physical characteristics of distribution circuits. The scope of the study also included regression analysis of correlations between residential involuntary disconnections for non-payment and demographic characteristics of communities within Consumers' service territory.

In the analysis, Exponent has relied on data and various other information provided by Consumers. We cannot verify the correctness of this input data and rely on Consumers for their accuracy.

Exponent has exercised professional skill and care ordinarily provided by professionals practicing in the same or similar locality under the same or similar circumstances in the preparation of this report, and the findings presented herein are made based on information available to Exponent as of the date of this report. This report may be supplemented to expand or modify our findings based on additional analysis or review of additional information.

It is noted that the Executive Summary cannot summarize all of Exponent's technical evaluation, analysis, conclusions, and recommendations. Hence, the main part of the report is at all times the controlling document.

Executive Summary

Consumers Energy has proudly served Michigan families and businesses since 1886, with more than 1.9 million electric customers across the state today. The Company is committed to providing an electric distribution system that delivers safe, reliable, clean, and affordable electricity to customers today and in the future. To do that, Consumers Energy must address the wildfire risk brought on by changing climate in Michigan[1].

Over the last decade, wildfires have grown in number and severity throughout the United States and become a significant public health and safety concern. In the last 10 years, Michigan's lower peninsula has averaged approximately 200 wildfires per year, burning an average of nearly 2,000 acres each year.[2] Given these trends, the Company developed this plan to mitigate destructive wildfire risk in Consumers Energy's electric territory.

Consumers Energy is guided by its ambition to deliver world class performance delivering hometown service, measured by our triple bottom line of people, planet, and Michigan's prosperity. Our triple bottom line considers the interests of customers and other stakeholders and captures the broader societal impacts of the Company's activities.

Purpose

This plan describes the Company's approach to mitigating the risk of wildfires caused by or impacting electrical infrastructure and surrounding communities throughout Consumers Energy's service territory, with safety as the top priority. The Company first identified the growing risk of wildfires as a result of changing weather patterns in the Reliability Roadmap published in September 2023[3] and subsequently created this plan to mitigate that risk.

This document outlines the plans and actions Consumers Energy is taking to develop competencies, invest in system hardening, and expand existing programs such as line clearing to alleviate the pressure from increased wildfire risk.

The goal is the overall safety of the customers and communities we serve, and the Consumers Energy employees who serve them. This plan will continue to evolve as the Company learns more about wildfire risk in Michigan, new wildfire risk reduction strategies and technologies, and how changing weather patterns impact the region.

Objectives

Consumers Energy is driven to be an excellent corporate citizen for the state of Michigan and that means not only providing safe, reliable electricity to our 1.9 million customers but also actively making the communities we serve safer.

Our objective is to improve our distribution system to provide reliable energy delivery to our customers while hardening and protecting it against wildfire ignition risks. This will be accomplished by expanding current and investing in new programs and competencies to mitigate

[2] Michigan Department of Natural Resources - Fire Report Dashboard
[3] MPSC Case No.: U-20147

risk. To do this Consumers Energy is:

- Furthering the Company's understanding of the current and probable wildfire risk areas in our service territory through development and maturity of assessment tools.
- Implementing mitigation solutions that balance the risk of wildfires with safe and reliable energy delivery.
- Leveraging existing programs, such as line clearing, to deliver benefits beyond reliability and resiliency.
- Implementing procedures to inform customers and communities of wildfire preparedness measures and communication protocols in the event of a wildfire risk event, i.e., *Red Flag Warnings*.
- Engaging customers and communities in the ongoing development of the wildfire risk mitigation plan, particularly as it relates to ensuring customer safety and electric reliability.
- Continuously improving this plan by leveraging industry experts and peers and learning about and deploying best practices.

Wildfire Risk Mitigation Activities

To meet Consumers Energy's wildfire risk mitigation plan objectives, the Company is focused on the following:

- **Situational Awareness:** Monitor weather, any heightened wildfire risk warnings (including *Red Flag Warnings*), and conditions on the Low Voltage Distribution ("LVD") system to respond to wildfire risks.
- **Operational Procedures:**
    - *Field Operations:* Use modified field operating procedures to reduce the risk of ignition from utility infrastructure or operations, and to ensure the safety of our employees.
    - *Recloser Settings:* Employ procedures to mitigate spark risk on the distribution system during elevated wildfire risk periods.
    - *Public Safety Power Shutoff:* Maintain a plan to de-energize specific areas of the distribution network during extreme wildfire risk periods to pre-emptively eliminate potential spark risk from Consumers Energy's distribution system.
    - *Emergency Preparedness:* Maintain a wildfire-specific emergency action plan to enable Emergency Management to act quickly in case of wildfire danger.
- **System Hardening:**
    - *Protective Line Devices:* Install non-expulsion fuses to limit spark when a fuse opens as well as remotely controlled line reclosers or other devices to increase sectionalization and control of LVD lines in the elevated wildfire risk areas.
    - *Covered Conductor:* Install covered conductor and other LVD construction methods in elevated risk areas to reduce chance of spark or arcing, which would result in a potential

ignition due to contact with another conductor, animal, vegetation or any other material.

- *Undergrounding:* Convert portions of the overhead distribution system to underground using specific criteria designed to identify line segments with the highest potential to eliminate wildfire risk associated with overhead conductor.

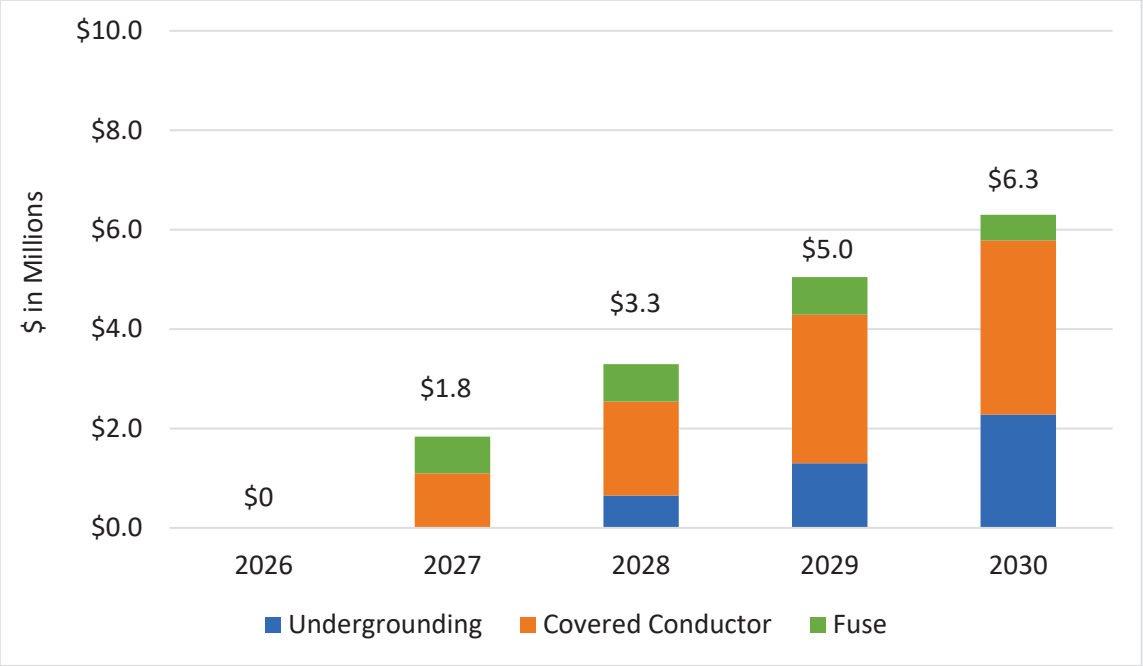
- **Line Clearing:** Leverage the newly implemented 5-year clearing cycle for the LVD system with a more aggressive timeline to achieve this cycle in elevated wildfire risk areas better to manage growth and limit potential vegetation-to-conductor contact. Capture Light Detection and Ranging ("LiDAR") imagery to inform and support line clearing tactics.

Figures 1 and 2 summarize the estimated costs for Consumers Energy's proposed wildfire risk mitigation activities over the next five years. This plan grows to over $6 million in capital and $600 thousand in O&M as the Company builds its capabilities to mitigate wildfire risk.

Given the Commission order in Case No. U-21585 requiring a more detailed benefit-cost analysis to substantiate capital investment in mitigating wildfire risk, the Company worked with a third party to provide greater detail as to the value of Wildfire Risk Mitigation investments. The third-party wildfire risk assessment including the benefit-cost analysis is explained further in the Wildfire Risk Assessment section below. The capital plan resulting from this analysis is summarized in Figure 1 below.

Figure 1

Consumers Energy's Wildfire Risk Mitigation Capital Investment Plan



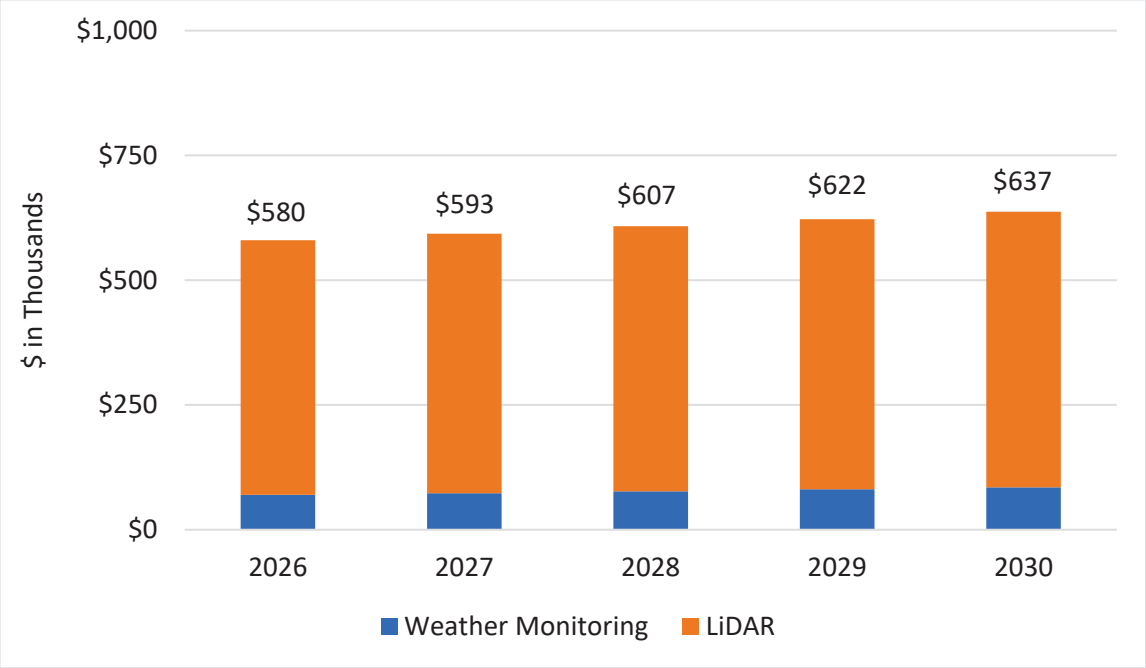


Figure 2

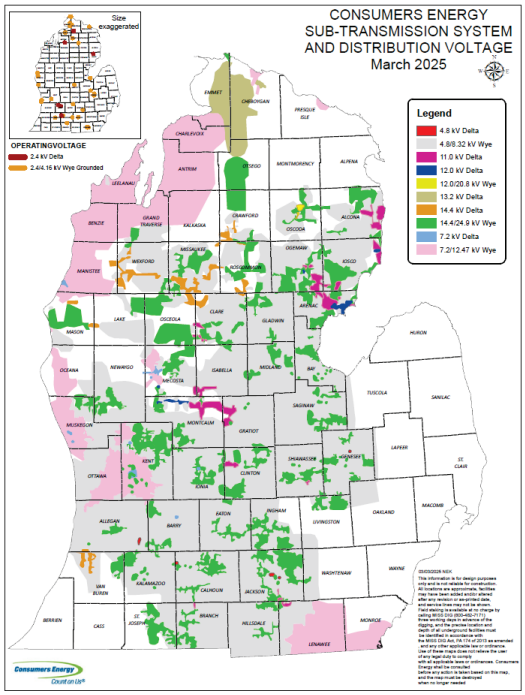
Consumers Energy's Wildfire Risk Mitigation O&M Plan



Risk Assessment and Mapping

Consumers Energy Service Territory Overview

The Company's electric distribution system is an essential part of Michigan's infrastructure, serving 1.9 million customers across more than 114,000 miles of distribution lines and approximately 1,140 substations in the Lower Peninsula of Michigan, from Monroe County to Mackinaw City, as shown in Figure 3.

Figure 3

Consumers Energy's Electric Service Territory

The distribution system is functionally separated by operating voltage into High Voltage Distribution ("HVD") and LVD.

- HVD operates at the highest voltages, taking electricity from regional transmission companies, and transporting it across miles of lines, where it connects into the LVD system at substations throughout the Company's service territory.
- At LVD substations, high voltage is 'stepped down' (or reduced to lower voltages) onto the LVD system. LVD voltage is then further stepped down at secondary distribution transformers to secondary voltages (120 to 480 Volts), serving businesses and residences.

The LVD system is comprised of more than 114,000 total miles of lines, made up of approximately 64,000 miles of primary overhead and underground (carries electricity from substations to transformers), and 50,0000 miles of secondary (carries electricity from distribution transformers to customers).

The HVD system is comprised of approximately 4,900 total miles, consisting almost entirely of 46 kV lines and including radial 138 kV and 69 kV lines.

Wildfire History within Consumers Energy's Service Territory

Consumers Energy has used historical wildfire information from 2016 through 2025 from the Michigan Department of Natural Resources ("DNR") combined with the Federal Emergency Management Agency ("FEMA") *National Risk Index* map, and risk analysis performed by a third-party to continue growing our knowledge and understanding of wildfire risk in Consumers Energy's service territory.

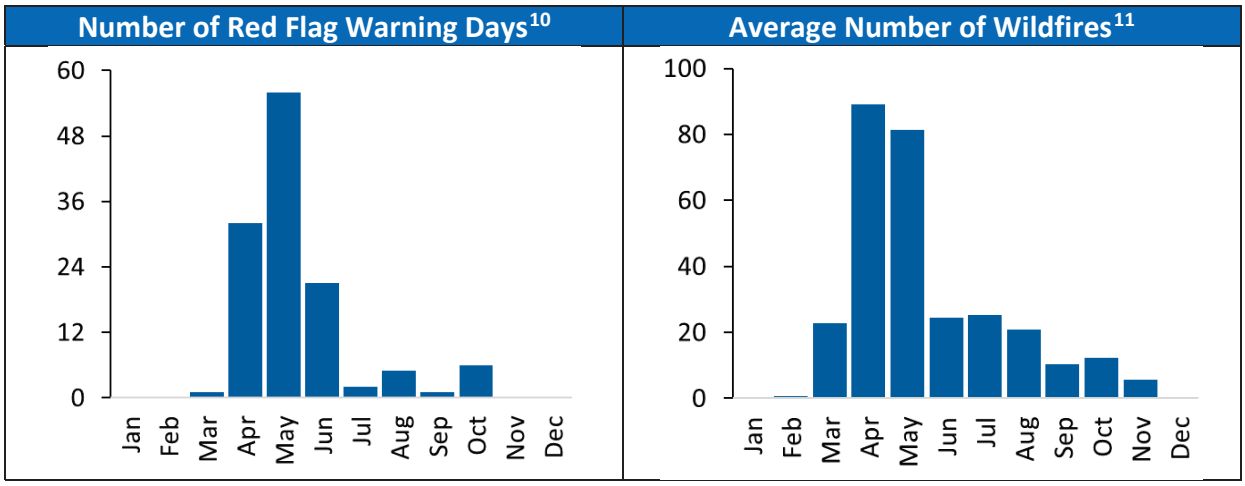
Historically, wildfires have occurred throughout the lower peninsula. For instance, the Thumb Fire, also known as The Great Fire of 1881, burned more than 1 million acres in less than a day, with nearly 300 people[4] losing their lives. It also destroyed more than 1,500 dwellings and stranded over 14,000 people[5].

Over the last 10 years, nearly 2,000 wildfires in the lower peninsula burned almost 20,000 acres. Five of the last ten years have seen more than 2,000 acres burned each year.[6]

Several wildfires in recent history have burned multiple thousands of acres, and significantly impacted the northern lower peninsula:

- 2023 Wilderness Trail Fire – Burned approximately 2,400 acres, closed I-75, necessitated flight restrictions below 5,000 feet; was caused by a campfire, and required Consumers Energy to de-energize a 46kV line, interrupting service to almost 3,000 customers.
- 2022 Blue Lakes Fire – Burned 2,500 acres, closed multiple roads in the area, and was caused by a lightning strike.
- 2010 Meridian Boundary Fire – Burned more than 8,800 acres and 51 structures, closed multiple roads in the area, and was caused by burning debris.

To understand the timing of historical wildfires in the lower peninsula of Michigan, Consumers Energy evaluated the average number of wildfires by month and number of days *Red Flag Warnings* were issued by the National Weather Service. The National Weather Service declares *Red Flag Warnings* when there are "warm temperatures, very low humidities, and stronger winds which are expected to combine to produce an increased risk of fire danger"[7]. Contributing Red Flag Factors include:



- First significant lightning occurrence after a hot and dry period.
- Significant cold frontal passage, expected to cause strong sustained and gusty winds, and an abrupt wind shift.
- Any combination of weather and fuel conditions that would create a critical fire control situation or extensive wildfire outbreak.[8]

As shown in Figure 4, the number of days with *Red Flag Warnings* issued is highest April through June and corresponds with the average number of wildfires by month being highest in March through August. Based on historic wildfire data, a wildfire is more likely to occur in the spring when underbrush and trees are dry and not yet green, and in the late summer when it becomes drier throughout the state. Given continued climate change, the drying trend will continue to worsen.[9]

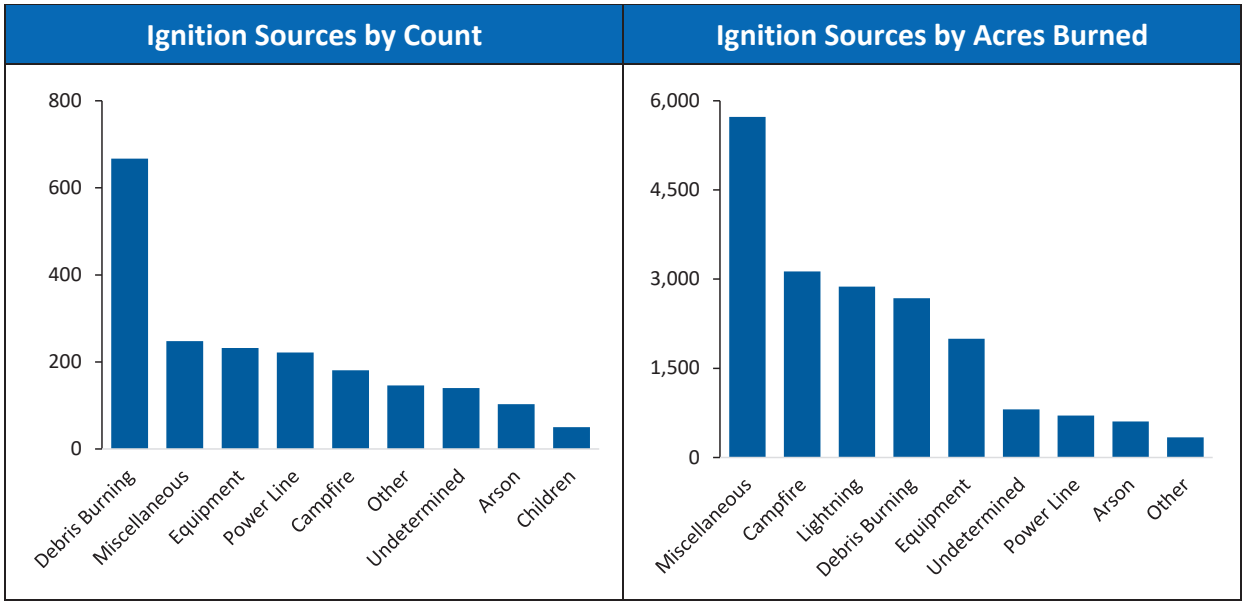
Figure 4



Red Flag Warnings and Wildfires in Michigan (2006-2025)

Over the last 10 years, debris burning has been the number one cause of wildfires in the lower peninsula of Michigan with miscellaneous, equipment, power lines and campfires rounding out the top five causes as shown in Figure 5. Based on the data from the Michigan DNR, power lines have caused approximately 11% of all wildfires over the last 10 years.

Figure 5

Wildfire Ignition Sources in Michigan's Lower Peninsula (2016-2025) [12]

The map in Figure 6 below shows where wildfires occurred throughout Michigan's lower peninsula in 2024. The majority of these wildfires took place in the northern part of the LP.

[11] Michigan Department of Natural Resources Fire Report Dashboard

[12] Michigan Department of Natural Resources Fire Report Dashboard

Figure 6

Wildfires in Michigan's Lower Peninsula (2024)[13]

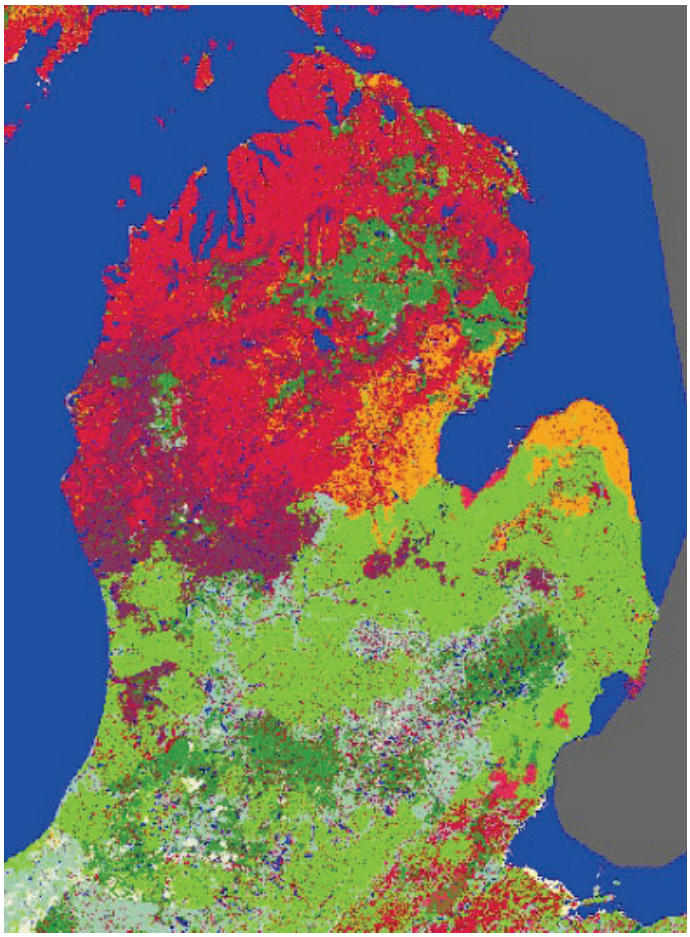
It is also important to understand Michigan's fire regime and what it means for Michigan's wildfire risk profile.

A *fire regime* refers to the pattern, frequency, and intensity of wildfires in a specific area over long periods of time. In the Lower Peninsula of Michigan, fire regime group V is most common with significant portions of the area classified as fire regime groups I or III as shown in Figure 7 below. The fire regime group considers the fire return interval and the percentage of different severity fires. This classification is based on the history of fires in a particular area, as well as the fuel load and type. Less frequent fires, as seen in fire regime group V areas, increase the risk of more intense, damaging fires.

In areas of Michigan that are largely unforested or consist mainly of hardwoods, such as oak and maple with minimal shrubbery, the frequency and intensity of fires tend to remain low. Conversely, in regions dominated by softwoods, such as the Jack Pine forests of north-central Michigan, the frequency and intensity of fires are higher.

Understanding the history of fires allows for better fire management. Not all fires are bad. For instance, in Northern Michigan, Jack Pine forests rely on the heat from a fire to open and release seeds. This is one reason why the Michigan DNR and the United States Forest Service ("USFS")

[13] Department of Natural Resources (DNR Wildland Fire map)



will conduct prescribed burns.

Looking at the map below in Figure 7, we can understand the different regime boundaries throughout the state based on the history of fires and can focus more resources on prevention in the higher regime areas that are more likely to be impacted by large, intense fires.

In the last 25 years, fires have impacted northern Lower Michigan including the 4 Mile Road fire (2008, 1,000 acres), Meridian Boundary Fire (2010, 8,586 acres), The Wilderness Trail Fire (2023, 2,442 acres), and Blue Lakes Fire (2022, 2,516 acres).

Figure 7

Fire Regime Groups for Michigan's Lower Peninsula[14]

Fire regime group label	Definition
I–A	Percentage of replacement fire less than 66.7%, fire return interval 0–5 years
I–B	Percentage of replacement fire less than 66.7%, fire return interval 6–15 years
I–C	Percentage of replacement fire less than 66.7%, fire return interval 16–35 years
II–A	Percentage of replacement fire greater than 66.7%, fire return interval 0–5 years
II–B	Percentage of replacement fire greater than 66.7%, fire return interval 6–15 years
II–C	Percentage of replacement fire greater than 66.7%, fire return interval 16–35 years
III–A	Percentage of replacement fire less than 80%, fire return interval 36–100 years
III–B	Percentage of replacement fire less than 66.7%, fire return interval 101–200 years
IV–A	Percentage of replacement fire greater than 80%, fire return interval 36–100 years
IV–B	Percentage of replacement fire greater than 66.7%, fire return interval 101–200 years
V–A	Any severity, fire return interval 201–500 years
V–B	Any severity, fire return interval 501 or more years

[14] www.landfire.gov

Wildfire Risk Assessment

Generally, risk encompasses the likelihood of an event together with the impact of that event.

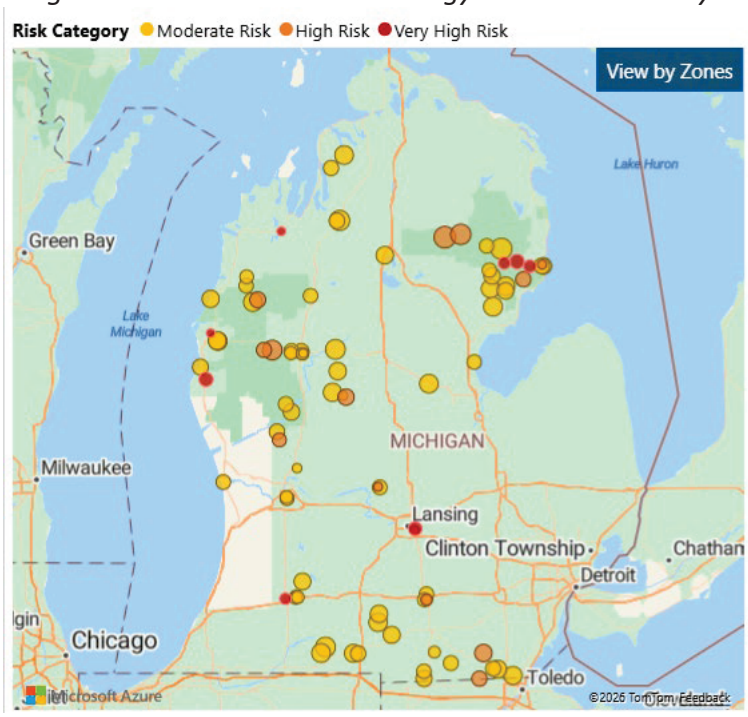
The likelihood of a wildfire event depends on factors such as ignition risk, fuel source availability, and weather conditions. The impact of a wildfire event includes public safety, physical structures, and environmental consequences.

To enhance the Company's wildfire risk analysis, an independent third party was engaged to perform a wildfire risk assessment across Consumers Energy's service territory. The assessment evaluated both ignition risk and consequence across over 159,000 protective zones, approximately 50 times more granular than FEMA-based assessments. This allows for targeted investments where risk and impact are most significant.

Ignition risk was calculated as the probability of failure times the conditional probability of ignition. A machine learning model was created to estimate the risk of outage failure based on numerous data sets including asset data, operational data, weather data, and vegetation data. To convert the failure probability estimated by the model into an ignition probability, a conditional probability driven by local data observations about historical outages and ignitions within the area of the zone was estimated. Areas of elevated wildfire risk within Consumers Energy's service territory are shown in Figure 8 and classified as very high, high, and moderate.

Figure 8

Ignition Risk in Consumers Energy's Service Territory



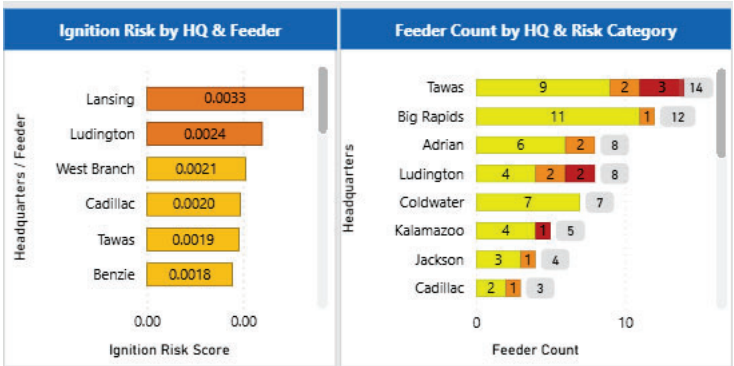


Figure 9 identifies the Lansing, Ludington, West Branch, Cadillac, Tawas, and Benzie headquarters as having the highest ignition risk.

Figure 9

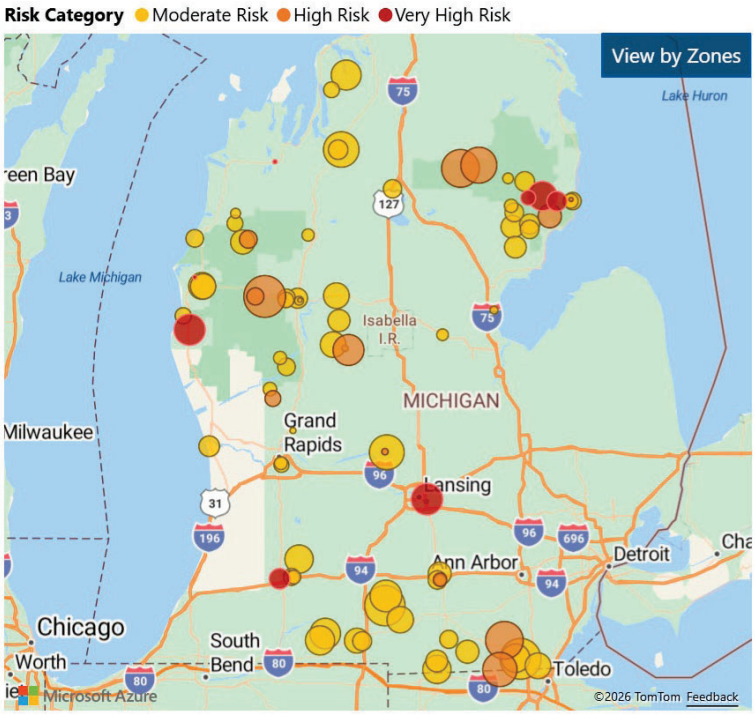
Ignition Risk by Headquarter

Consequence was based on the *National Risk Index* data available from FEMA which includes population consequence, as estimated by a statistical value of life; building consequence; and agricultural consequence.

Total consequence across the territory is estimated at approximately $25.2 billion. Estimated Annual Loss (EAL), defined as consequence multiplied by ignition risk, for Consumers Energy's service territory is approximately $22.0 million. Zones classified as having "Very High" and "High" consequence account for approximately $10.1 billion of total consequence and $12.5 million of EAL. While the highest ignition likelihood is clustered in Lansing, Ludington, and West Branch headquarters, the highest concentrations of EAL are observed in Jackson, Kalamazoo, and Lansing (as shown in Figures 10 and 11 below).

Figure 10

EAL in Consumers Energy's Service Territory



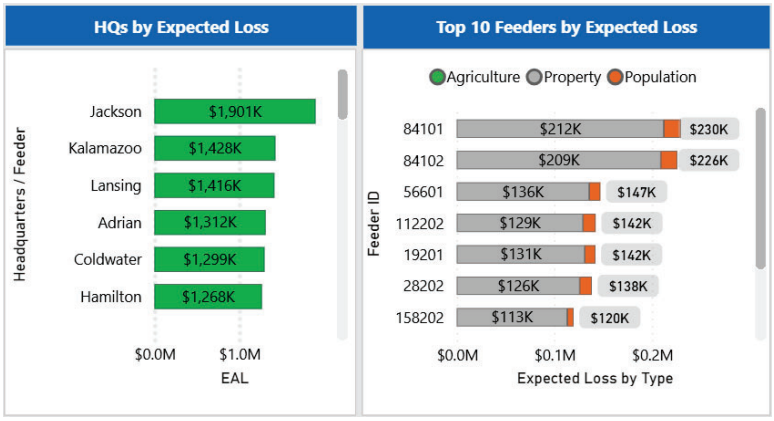


Figure 11

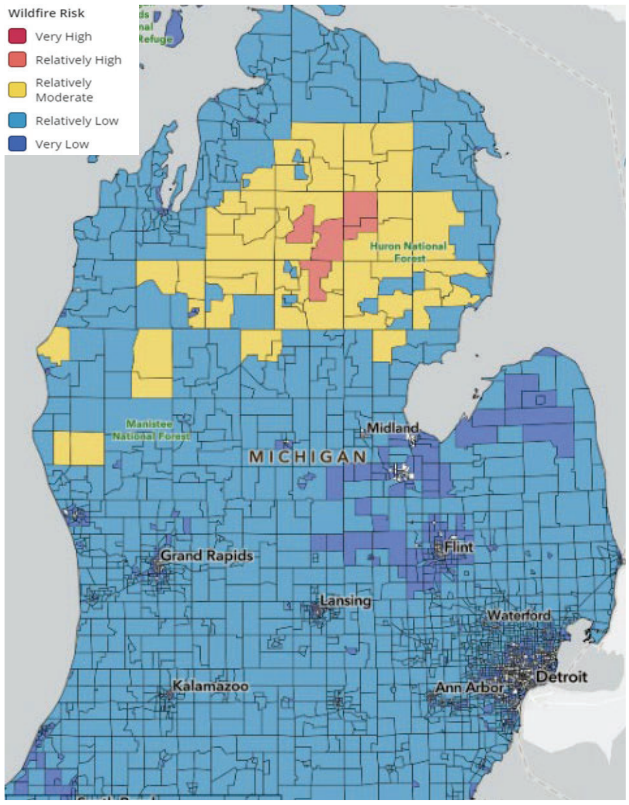
EAL by Headquarter and Type

Once ignition risk, consequence, and EAL were calculated, a benefit-cost analysis was performed by considering the costs of mitigation options within a zone and comparing them to the expected reduction in EAL to derive a prioritization of mitigations by zone to maximize the reduction in wildfire risk.

Based on this benefit-cost analysis, a five-year, approximately $23 million mitigation portfolio is expected to reduce EAL by approximately $0.5 million annually and mitigate approximately $23 million in lifetime losses, delivering a portfolio benefit-cost ratio of approximately 1.0.



Prior to the third-party, Consumers Energy Territory specific wildfire risk assessment described above, the Company referenced the FEMA *National Risk Index* to assess wildfire risk in Michigan. FEMA publishes a *National Risk Index* map that includes a Wildfire Risk Index score and rating for the United States, representing a community's relative risk for wildfires when compared to the rest of the United States[15]. FEMA updated its *National Risk Index* in December 2025 as shown in Figure 12 below. FEMA wildfire risk now indicates predominantly low to moderate wildfire risk across Consumers Energy's service territory. While FEMA mapping was previously used to inform wildfire risk and investment decisions, the aforementioned assessment is now being used to inform and support the hardening investments outlined in this plan.

[15] Wildfire | National Risk Index (fema.gov)

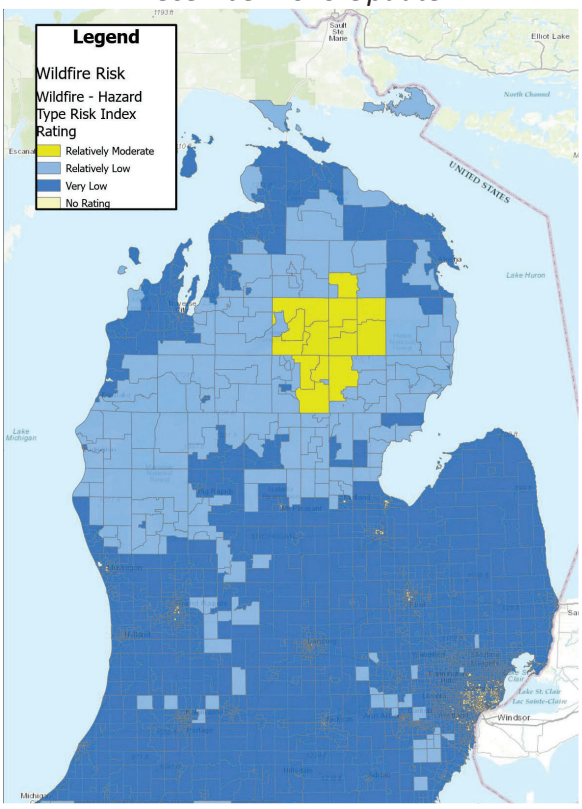


Figure 12

FEMA National Risk Index – Wildfire Hazard

Prior to December 2025

December 2025 Update

Additionally, the Company is collaborating with agencies such as the Michigan DNR, local fire departments, and county emergency managers, to ensure alignment regarding the elevated wildfire risk areas in Michigan and a cohesive effort to reduce wildfire risk in Michigan.

Opportunities to Evaluate

Previously, the FEMA *National Risk Index* map was used in identifying elevated wildfire risk areas to focus on mitigation. In 2026, Consumers Energy used a third-party to identify assets vulnerable to wildfire within elevated wildfire risk areas by using Company-specific data in addition to external data sources mentioned earlier in this section. While the third-party wildfire risk assessment utilized more Consumers Energy-specific data than the FEMA *National Risk Index*, there are still opportunities to incorporate additional data to improve the risk assessment further. For example:

- To build increasingly sophisticated wildfire risk assessment models, the Company will capture and track asset health data using its Asset Repository (“AR”) and Asset Investment Planning (“AIP”). To support all or part of their risk assessment modeling, many utilities in the Western United States use third-party vendors analyzing hundreds of thousands of asset health data inputs and employing machine learning and other advanced techniques. Consumers Energy will continue to evaluate these options as it matures its AR and AIP.
- Localized weather patterns such as wind gust intensities (that can contribute to wire-to-wire

contact) and hot/dry day frequencies can be analyzed to further characterize the ignition risk in these areas. To increase the granularity of weather data, the Company is installing Company-owned weather stations which is discussed in more detail in the Situational Awareness section below. While external weather data was utilized in the third-party wildfire risk assessment, incorporating data from Company-owned weather stations in the future will allow for more localized analysis.

As the Company continues to enhance the wildfire risk assessment with more Consumers Energy-specific information, mitigation activities and investments can be increasingly targeted, and emergency agencies can be made aware of potential risks to public safety, physical structures, the environment, and the electric distribution system—all of which will serve to mitigate wildfire ignition and spread.

Situational Awareness

Situational awareness is the action the Company takes to monitor weather conditions and asset health in elevated wildfire risk areas to support both real-time and longer term operational and investment decisions.

There are a number of situational awareness tools specifically used to mitigate wildfire risk that the Company has identified through benchmarking efforts with other utilities. These include:

- Wildfire-specific weather monitoring
- Weather stations
- Staff meteorologists
- Enhanced inspections
- Fire detection cameras
- Fire spread modeling
- Enhanced wildfire risk modeling

Consumers Energy is currently focused on leveraging weather monitoring, a staff meteorologist, line sensors, and enhanced inspections to mitigate wildfire risk. The Company will continue to evaluate additional situational awareness tools such as expanded use of drones, fire detection cameras, and downed conductor detection technology.

Weather Monitoring

Weather monitoring is critical for wildfire risk mitigation as it helps identify areas and levels of concern that may be used to respond quickly and effectively to real-time changing weather conditions and prioritize mitigation activities.

Consumers Energy has expanded its weather monitoring program to include reviewing *Red Flag Warnings,* using a wildfire-specific weather forecast from DTN, and has an on-staff Company meteorologist with an additional on-staff meteorologist starting in the Summer of 2026. Wildfire-specific weather forecast data is emailed by DTN to the Company twice per day and used to

facilitate real-time adjustments to operational procedures as well as allowing the Company to begin collecting territory-specific wildfire weather data to incorporate into ongoing wildfire risk monitoring. The meteorologist continuously monitors and assesses weather and fire risk conditions. Continuous assessment and weather monitoring, along with situational awareness, may involve, but is not limited to, reviewing information from sources such as DTN, NWS, Meso West, DNR, SPC Maps and Spot Forecast Monitor as well as Resilience Analysis and Planning Tool – Production.

The Company is advancing its weather and wildfire monitoring capabilities through the installation of five weather stations in designated elevated wildfire risk areas. This effort represents the initial phase of a broader deployment strategy, which targets the installation of 100 stations by 2027. These actions align with the initiatives outlined in the Company's Reliability Roadmap.

Company-owned weather stations allow a utility more control and access to more granular weather information. Historically, weather and hazard forecast information is provided by DTN by regions that consist of several counties as shown in Figure 13. This broad view limits the Company's ability to understand in detail. Peer assessments have shown that more granular weather information is beneficial when tracking wildfire risk because both the risk assessment and mitigations can be more specific.

Company-owned weather stations will allow the Company to measure wildfire risk and take mitigation actions in a more targeted way, reducing the negative reliability impacts of some mitigation activities to customers. Consumers Energy Company-owned weather stations were approved in the electric rate case, Case No. U-21870, to support storm response as well as the Company's overall reliability efforts as described in the Company's Reliability Roadmap. The Company will be able to leverage these weather stations for wildfire risk mitigation.

Figure 13

Company-owned weather stations may be positioned in a way to extract territory-specific real-time weather data that can be recorded to allow staff meteorologists to specialize in real-time weather patterns as well as analyze historical data trends in Consumers Energy's territory.

Additional localized detail would create more insight into weather conditions that lead to wildfire risk, and would allow the Company to refine operational procedures and better target system hardening to enhance wildfire risk mitigation.

The costs for the wildfire-specific weather forecast from DTN are shown in Figure 14 below. The cost to install Company-owned weather stations is not included in this wildfire risk mitigation plan.

Figure 14

Weather Monitoring O&M Plan

Line Sensors

Line sensors are inductively charged devices installed on the overhead primary conductor of the LVD distribution system. They are used to remotely monitor electrical current and detect sustained, momentary, and potential faults, improving the capability to respond quickly and reduce customer outages. Line sensors also capture data points such as amperage, conductor temperature, phase imbalance mis-phasing, and load flow direction.

Adding line sensors to LVD distribution lines in the elevated wildfire risk area allows the Company to reduce ignition risk by remotely monitoring the current conditions of the distribution primary conductor, as well as monitoring for potential faults, which will allow the Company to quickly respond before a failure occurs.

Consumers Energy has prioritized the elevated wildfire risk areas for the installation of line sensors on circuits. The Company will continue to evaluate opportunities to install additional line sensors on these circuits to provide additional insight and remote monitoring capabilities.

Enhanced Inspections

'Enhanced inspections' refer to increasing the frequency of LVD line inspections and correcting identified failures to reduce wildfire risk. Line inspections are currently conducted on a two-year cycle and include visually observing LVD distribution lines and supporting infrastructure to identify potential issues with equipment.

Consumers Energy is inspecting highest risk miles annually as a part of our LVD lines inspections program. By increasing the frequency of these inspections, the Company will reduce risk by identifying and mitigating the potential for ignition risk as well as fuel sources such as dead trees and overgrown vegetation.

As stated in the Company's Reliability Roadmap, Consumers Energy will improve the inspection process, using drones in a much more widespread manner, while investing in automation and machine learning to increase the efficiency with which defects are identified. The enhanced inspections in elevated wildfire risk areas will benefit from these advancements.

Opportunities to Evaluate

The Company will continue to evaluate other situational awareness tools such as expanded use of drones, fire detection cameras, and downed conductor detection technology as well as continue to benchmark and collaborate with Edison Electric Institute ("EEI") and Electric Power Research Institute ("EPRI") to identify new technologies and best practices for wildfire risk mitigation.

Drones can be used in a variety of ways to expedite or enhance inspections and investigations as described in the Company's Reliability Roadmap. One way the Company may consider using drones to reduce wildfire risk is to use a thermal camera drone to detect hotspots or failing equipment invisible to the naked eye. This technology may be particularly useful during outage or disturbance investigations. The Company will continue to evaluate the benefits of using thermal camera drones in elevated wildfire risk areas.

Fire detection cameras are automated cameras connected to an artificial intelligence engine that detects smoke within a specific mileage radius. These cameras support wildfire risk mitigation by sending fire location information to any stakeholders identified to receive the information. This early warning and detection technology is used by many utilities in the western part of the United States who have distribution and transmission systems in less densely populated areas to find and respond to wildfires quickly and effectively. The Company would need approximately 135 cameras to adequately cover the elevated wildfire risk areas at a cost of approximately $7 million. Consumers Energy will continue to evaluate the benefits of fire detection cameras in elevated wildfire risk areas.

Downed conductor detection technology is an important tool to reduce ignition risk for wildfire risk mitigation. High-impedance fault situations, such as downed live conductors, are challenging to detect because they do not result in large enough fault current for traditional protection devices to sense. The potential for detecting and isolating high-impedance faults is improved with downed conductor technology. Installation of this technology can improve public safety and reduce the risk of fire from a downed live conductor. The implementation and method of this technology depend on the controller hardware and vendor. Consumers Energy will continue to evaluate the implementation of downed conductor detection technology in elevated wildfire risk areas.

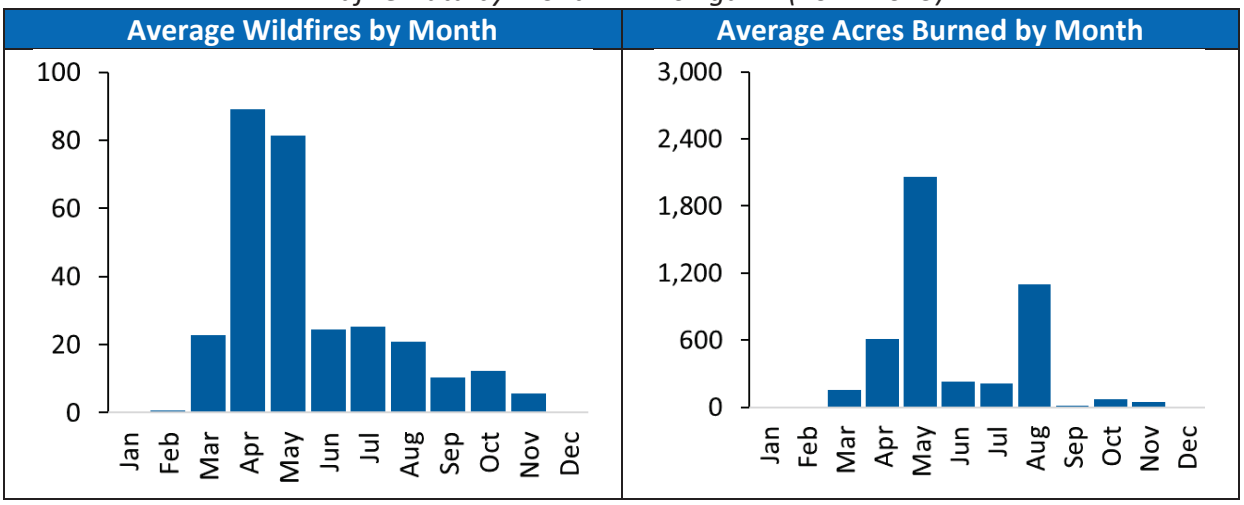
Operational Procedures

Consumers Energy has put operational procedures in place to both mitigate ignition risk depending on the magnitude of wildfire risk at a specific time, and to respond to a wildfire event quickly and effectively to minimize harm to the public, physical structures including the electric distribution system, and the environment.

The Company has also established various thresholds to monitor increasing wildfire risk in real-time, and operational procedures at those thresholds to mitigate an increased risk of wildfire. The Company has implemented a *Red Flag Warning* response, wildfire-specific emergency response plan as part of the Company's *Electric Emergency Response Plan,* and a *Public Safety Power Shutoff* policy.

Elevated Wildfire Risk Thresholds

The situational awareness tools outlined previously will identify increasing wildfire risk in real-time. To effectively respond to any risk level appropriately, it is important to define levels or thresholds of risk.



Thresholds of wildfire risk used by other utilities include:

- Wildfire risk area: Designated by a third-party such as FEMA or proprietary analysis
- Wildfire season: Designated by third-party state agency or proprietary historical analysis
- Red Flag Warnings: Issued by the National Weather Service
- Unique thresholds: Based on a combination of weather conditions such as temperature, wind speed, and humidity as well as ignition risk measures like level of fuel moisture

As described in the Risk Assessment and Mapping section above, wildfires are most likely to occur in March through August based on historical Red Flag Warnings and wildfire frequency. This is further supported by the cumulative acres burned per month historically as shown in Figure 15.

Figure 15

Wildfire Data by Month in Michigan[16] (2012-2025)

Operational Procedures to Mitigate Wildfire Risk

There are several increasingly impactful operational procedures the utility industry is using to mitigate wildfire risk, including responding to Red Flag Warnings, modifying field operations,

[16] Michigan Department of Natural Resources Fire Report Dashboard

adjusting recloser settings, and implementing public safety power shutoff ("PSPS") events.

The Company has developed procedures for these mitigation activities to ensure when they are employed, they will maximize wildfire risk mitigation and minimize impact to customer experience and reliability.

Red Flag Warning Response. The Company has established a Red Flag Warning response plan that incorporates monitoring potential and actual weather conditions and initiates wildfire mitigation actions on circuits identified to have higher wildfire risk. Red Flag Warning conditions are monitored by senior Control Center staff who are on-shift 24 hours a day, 7 days a week. Upon notification of a Red Flag Warning in areas of the state where higher wildfire risk circuits exist, the response plan is initiated with the target to put mitigation actions in place for the duration of the Red Flag Warning event. Mitigating actions include:

- Applying the Hot Line Tag function to substation reclosers to make fault condition device tripping schemes more sensitive and to clear faults more quickly;
- Blocking Automatic Transfer Recloser loop schemes from operating automatically and transferring power from adjacent circuits;
- Stopping hot work on energized lines on the identified circuits;
- Staging field personnel at substations and LVD line sections to respond to outages and hazards; and
- Initiating Public Safety Power Shutoff (PSPS) in only the most extreme wildfire conditions.

Field Operations. As the wildfire risk increases, many utilities modify their field operating procedures to reduce the risk of ignition from utility infrastructure or operations. Modifications include changes to requirements for:

- Open fire/burning
- Presence and use of firefighting tools
- Smoking
- Fire extinguishing
- Off-road vehicle travel
- Off-road equipment use
- Scheduled customer work or construction
- Timing of work
- Worksite preparation
- Hot work
- Line testing
- Blasting, grinding, and welding
- Line clearing activities

The Company has field operations standards during Red Flag Warnings in elevated wildfire risk areas including:

- Operations personnel will be placed and assigned to areas identified as elevated risk;
- Any risk identified will be discussed with Electric Operations Supervisor to determine urgency of repair;
- Types of field operations work permitted during elevated risk; and
- Primary outages may be restored after all primary has been inspected via stepped restoration.

If Operations responds to an emergent job that is involved in a fire, there are steps to follow, including:

1. Make the scene safe.
2. Request fire department response to ensure risk of re-ignition is mitigated.
3. Contact Electric Operations Supervisor and escalate to Senior Manager or On-Call Incident Commander.

Some aspects of the Company's standard operating procedures inherently take wildfire risk into account, like line clearing activities. The *Forestry Line Clearing Program* at Consumers Energy uses experienced line clearing vendors that have their own tactics for wildfire risk mitigation. Some of these tactics include:

- Employees must be aware of the *Fire Danger Index* at the beginning of each workday.
- Employees complete standard fire prevention awareness and training, including the proper use of fire extinguishing equipment.
- Employees inspect fire extinguishing equipment regularly and repair or replace the equipment as needed.
- A designated individual is required to be assigned to fire watch duty when the fire danger level is high, very high, or extreme, and shall observe and monitor the work site for smoldering.
- Employees are informed of the proper actions to take in the event of a fire. This includes, but is not limited to, notification and evacuation procedures. It is stressed that at no time does the task of fighting fire supersede an employee's primary duties of ensuring their own personal safety and the safety of others. It is required to report the incident to the proper authority and ensure personal accountability for self and others at the jobsite, in accordance with company policy.

Standard operating procedures may change as Consumers Energy evaluates and implements wildfire risk mitigation standards for field work being done by internal and contracted employees.

Recloser Settings. *Recloser settings* refer to the operational sequence and sensitivity of reclosers on the distribution system.

Reclosers open when a fault occurs and then will reclose, based on the operation sequence settings. Once a recloser opens, the line is de-energized until it closes again. Recloser operation

sequence settings can be adjusted to change the response time characteristics for a fault and the number of reclose attempts.

Since most distribution faults are temporary, reclosers generally improve customer reliability by clearing faults without a sustained outage. However, upon the initial fault or if the fault is still present when the device recloses, there is a possibility sparks or arcing may occur, presenting ignition risk. To limit this ignition risk, reclosers can be set to "lock out" (remain open) upon a single trip event, until the line can be visually inspected.

Fast trip settings can also have a wildfire risk mitigation benefit. Enabling fast curve settings will cause the device to trip faster when a fault occurs, reducing the amount of energy released into a fault. Fast trip settings can reduce ignition risk, but such settings will be detrimental to reliability due to manual circuit inspections before manually reclosing when in use.

Setting automatic reclosing to lock out upon a single trip event or enabling fast trip settings will reduce wildfire risk during elevated wildfire risk conditions by reducing ignition risk. However, it is important to note that increasing the sensitivity of recloser settings in this way results in more interruptions for customers who will require service restoration. Line sensor deployment and subsequent utilization are important in helping to identify fault locations when fast trip settings are enabled.

As part of the Company's Red Flag Warning response, substation reclosers are set to Hot Line Tag ("HLT") mode during qualifying wildfire conditions. HLT operates in a one-shot mode, tripping all phases extremely quickly when a fault is detected, and prevents the recloser from being reclosed.

Experience with HLT settings revealed that substation reclosers have limited reach and may not be able to detect faults at the end of some circuits, leaving those portions of the line without the extremely fast tripping provided by HLT. Consumers Energy is working to enhance the protection plan under the *Red Flag Warning* response to address this limitation.

Consumers Energy is also evaluating different wildfire protection strategies recommended by EPRI, such as *relatively fast* clearing times compared to *extremely fast* clearing times. Relatively fast clearing times will still clear as fast as possible while maintaining some level of coordination with other protective devices on the circuit. Having this level of coordination will allow for faster fault locating and dispatching.

Utilities in the Western United States have employed modified recloser settings to mitigate increasing wildfire risk, as well as reduce the need to implement PSPS events. They continue to test and analyze the best settings for different combinations of weather conditions, fuel availability, and electric distribution system considerations to optimize for both wildfire risk mitigation and customer reliability.

Consumers Energy will continue to incorporate new information and industry learnings into its ongoing efforts to refine its protection strategy to ensure both safety and reliability.

Consumers Energy Control Centers use Supervisory Control and Data Acquisition (SCADA) to communicate with and control devices on the electric distribution system. Many substations in Consumers Energy's electric service territory have electronic automatic reclosers with SCADA capability. This capability allows remote de-energization of a substation and all distribution lines

connected to the substation. Reclosers are also installed on distribution lines, but they are not all electronic reclosers. Only electronic reclosers have SCADA capability. The Company is evaluating adding SCADA functionality to existing LVD line reclosers and ensuring future line reclosers are SCADA ready.

Adding SCADA capability to LVD distribution lines allows remote sectionalization of distribution lines, minimizing the impact of an outage and decreasing the need for crews to manually adjust reclosers. SCADA capability will be crucial to allow remote changes of line recloser settings during high-risk wildfire conditions in a practical amount of time. Changing line recloser settings to fast trip settings will result in an increase in outages and the Company will adjust service restoration procedures accordingly to combat any reliability impact.

Public Safety Power Shutoff. PSPS refers to the total de-energization of sections of the distribution system during extreme wildfire conditions. This de-energization has the potential to remove power from thousands of customers as a pre-emptive wildfire risk mitigation effort. It is an extreme action that should only be undertaken after very careful consideration of the threat and impact of a wildfire on life and property.

While many of the utilities in the Western United States have deployed this tactic in recent years, their current focus is on reducing the need for this tool by mitigating wildfire risk in other ways, including refining their approach to adjusting system settings (e.g., recloser settings) to maximize wildfire risk mitigation and reliability.

The Company has established a *Public Safety Power Shutoff (PSPS)* policy that allows for the targeted de-energization of power in specific areas during periods of elevated wildfire risk to reduce the potential for electrical ignition. While PSPS can be very effective at mitigating wildfire risk, it can also negatively impact customers who depend on the Company to deliver reliable power. This procedure will be a last resort and only used in extreme wildfire weather conditions.

Emergency Response

Emergency response refers to actions the Company takes to respond to a wildfire event. In any incident, response activities are prioritized based on:

1. Life safety
2. Incident stabilization
3. Property/Environmental preservation

Outlined in the *Wildfire Hazard Specific Annex* is a recommended structure of command, staffing, suggested incident objectives, and actions that must be taken to return the Company to normal operations. This includes internal and external notifications, information assistance, and collaboration with relevant local agencies.

This annex is housed within the Company's overarching *Electric Emergency Response Plan*. The annex was developed by the Emergency Management Program in coordination with Electric Operations to align with the FEMA's National Incident Management System ("NIMS") and the Company' Incident Command System ("ICS").

NIMS guides all levels of governmental and non-governmental organizations and the private sector to work together to prevent, protect against, mitigate, respond to, and recover from

incidents. The structure of the ICS activation is similar to the storm response operations that the Company described in the Reliability Roadmap.

System Hardening for Wildfires

System hardening for wildfires is improving, modernizing, and hardening the distribution system with wildfire risk mitigation as a prioritized concern.

Based on industry research and benchmarking, system hardening best practices for wildfire risk mitigation include:

- Further sectionalizing the distribution system
- Fractionalization of substations and circuits
- Enhancing pole inspections and remediations
- Undergrounding overhead lines
- Replacing traditional expulsion fuses
- Installing covered conductor
- Constructing microgrids

Consumers Energy is investing in a layered approach to strengthen overhead lines and harden the distribution system by undergrounding overhead lines, installing covered conductor, and adding or replacing protective line devices within the elevated wildfire risk area. The goal of this layered approach is to help mitigate contact with tree limbs and other foreign objects that may lead to wildfire ignition, and to minimize the impact this contact may have on the distribution system and the customers we serve.

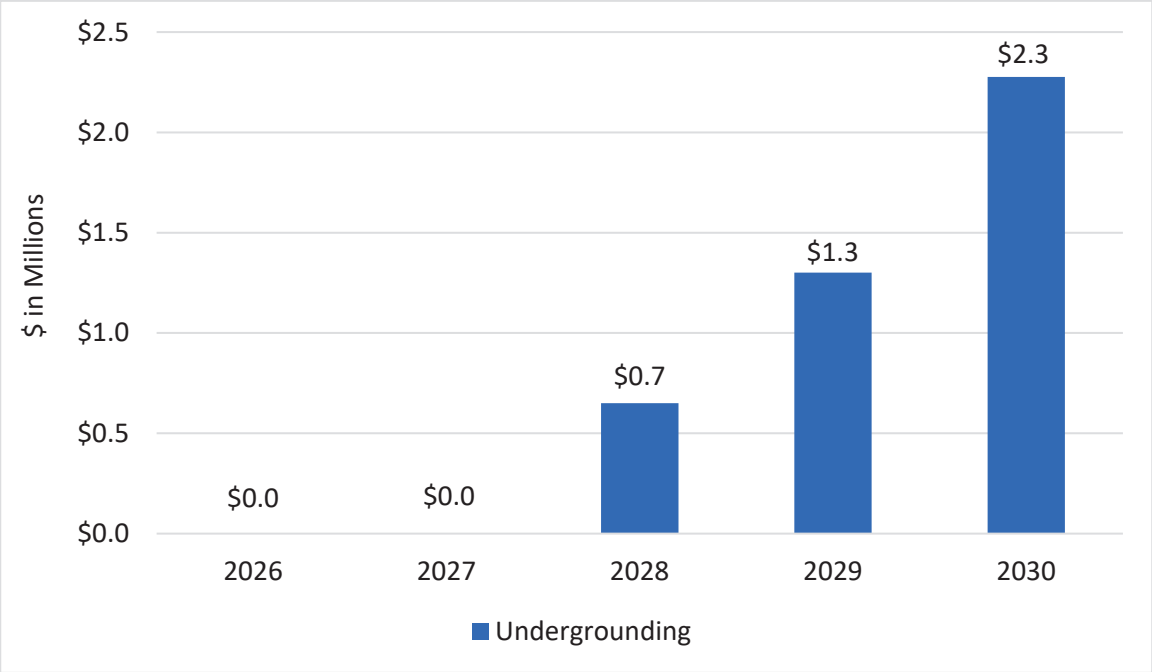
Consumers Energy will prioritize investment according to ignition risk and consequence.

The Company will continue to evaluate additional system hardening best practices such as enhancing pole inspections, replacements, and constructing microgrids.

Undergrounding

Undergrounding overhead conductor has been identified by multiple utilities as the best practice for wildfire risk mitigation. By undergrounding overhead conductor, the largest contributor to wildfire ignition from a powerline, foreign objects touching overhead conductor, is eliminated and Consumers Energy expects to see fewer faults and ignitions in those areas.

The third-party wildfire risk assessment currently identified 20 zones consisting of 11.2 miles to underground for wildfire risk mitigation.



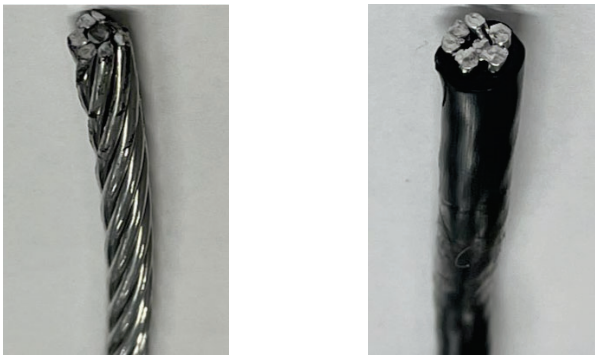
Consumers Energy will begin undergrounding these zones in 2028. Line miles will be prioritized by ignition risk and consequence as well as operational considerations given undergrounding overhead conductor requires specific resources and permits to construct.

Additional miles may also be undergrounded each year in wildfire risk areas through the resiliency efforts outlined in the Company's Electric Rate Case. These projects would be specifically chosen for resiliency, but provide benefits to both resiliency and wildfire risk

mitigation endeavors. The 5-year investment plan for undergrounding is shown in Figure 16.

Figure 16

Undergrounding Capital Investment Plan



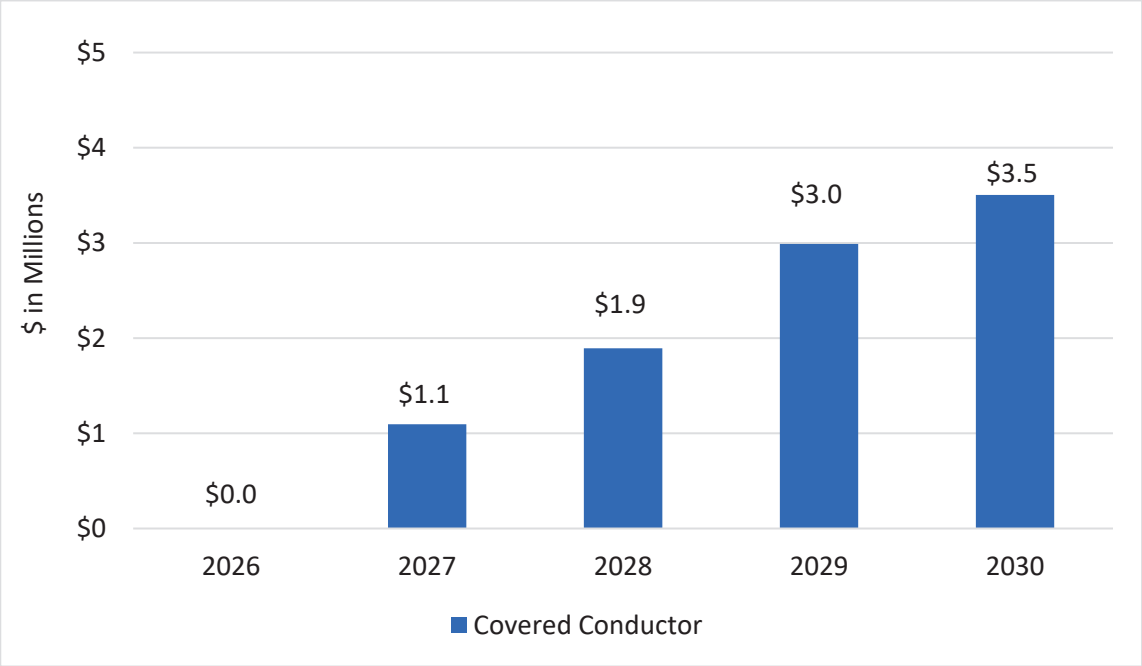
Covered Conductor

Covered conductor is a conductor cable design that includes a polymer sheath on the external portion of the wire to protect against incidental contact with trees and other vegetation.

Figure 17 is an example of covered conductor next to bare or traditional conductor. Covered conductor has multiple advantages over traditional conductor, and is typically used to increase system reliability and mitigate the probability of ignition from vegetation caused arcing.

Figure 17

Bare versus Covered Conductor



The third-party wildfire risk assessment identified 33 zones consisting of 55.6 miles to install covered conductor for wildfire risk mitigation.

Consumers Energy will begin installing covered conductor in these zones in 2027. Line miles will

be prioritized by ignition risk and consequence as well as operational considerations. The 5-year investment plan for covered conductor is shown in Figure 18.

Figure 18

Covered Conductor Capital Investment Plan

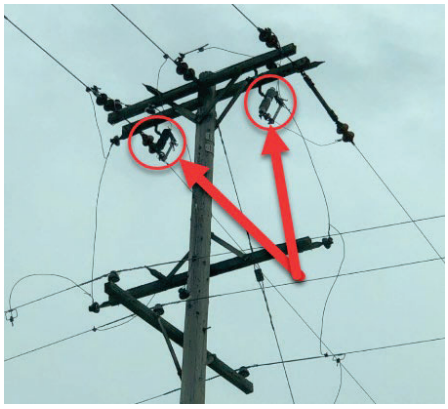
Protective Line Devices

Consumers Energy has a large distribution network providing service to the majority of Michigan's lower peninsula. This large network can experience faults on the system caused by a wide range of factors. When faults on the distribution system occur, the distribution system primarily relies on sectionalizing devices to protect the system. Automatic sectionalizing devices, including fuses, sectionalizers, and reclosers maintain electric service reliability by isolating faulted sections of the system. Manual sectionalizing devices, including disconnect and load-break switches, provide a convenient means of changing system connections.

Fuses. The majority of the fuses currently on the distribution system are *expulsion fuses* that are designed to operate by creating an expulsion within the fuse, resulting in the fuse isolating the fault, see Figure 19.

When an expulsion occurs, the molten material within the fuse is discharged out of the fuse casing through a venting system in the bottom of the fuse cylinder and could ignite nearby fuel sources. Due to this ignition risk, CAL FIRE and other wildfire protection organizations in the western United States have safety requirements for the use of expulsion fuses, and utilities in the western United States are actively replacing expulsion fuses with non-expulsion fuses.[17]

To best mitigate the possibility of ignition resulting from these devices, Consumers Energy is evaluating their replacement within elevated wildfire risk areas. This includes benchmarking other utilities and fuse options to identify the most effective non-expulsion alternatives. Among



[17] California Power Line Fire Prevention Field Guide

these options, Consumers Energy is exploring full-range current-limiting fuses, such as the ELF Fuse by Eaton Cooper, which fits into a standard cutout. These devices provide a safer alternative for wildfire-prone areas and align with best practices highlighted by EPRI for reducing risks associated with expulsion events and potential ignition hazards.

Industry benchmarking has shown that a peer utility has implemented a complementary, application-based fusing strategy in elevated wildfire risk areas that uses the non-expulsion full-range current-limiting Eaton ELF fuses for lower-load locations (such as pole-top transformers and lightly loaded laterals) while applying non-expulsion SMU power fuses at higher-load locations where current-limiting fuse ratings are exceeded. This combined approach allows ignition risk to be reduced across a greater portion of distribution circuits while preserving protection coordination, device reach, and system reliability. Informed by this collaboration and benchmarking, Consumers Energy is investigating a similar non-expulsion fusing strategy for application in elevated wildfire risk areas.

Figure 19

Lateral Expulsion Fuse Installation (2-phase)

Reclosers. Reclosers are single-phase or three-phase interruptive devices installed in substations or on primary lines for circuit sectionalizing. As discussed in the Operational Procedures section, electronic recloser settings can be adjusted to mitigate ignition risk in elevated wildfire risk conditions.

Installing three-phase electronic reclosers, as shown in Figure 20 below, to LVD distribution lines in elevated wildfire risk area allows the Company to adjust protection settings for only a portion of a circuit, rather than the entire circuit using a substation recloser.

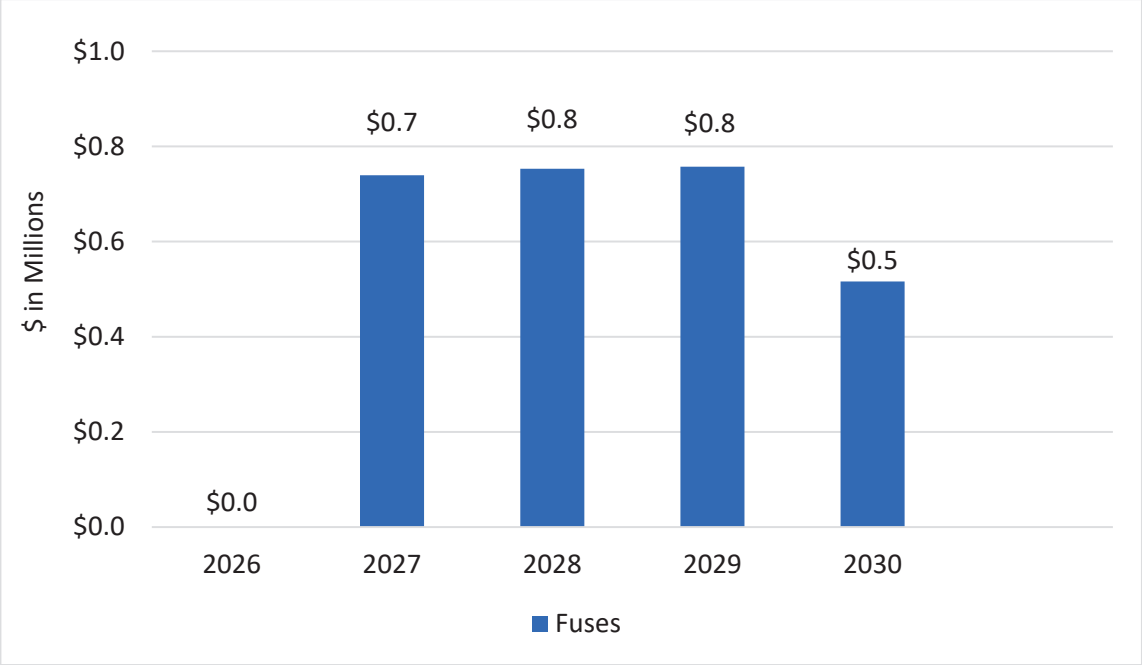
Figure 20

Recloser Installation

Consumers Energy is considering insights from EPRI to ensure reclosers are applied and configured to avoid the risks they highlight, particularly those related to energized downed conductors[18].

- Compact single-phase reclosers can unintentionally re-energize downed conductors under certain conditions, increasing public safety risks.
- Furthermore, smaller or aging conductors are more vulnerable to failure during fault events, which can result in energized downed lines.

To address these insights while preserving the operational and wildfire mitigation benefits of compact reclosers, Consumers Energy is evaluating controls such as disabling automatic reclosing functionality in elevated wildfire risk areas and configuring selected devices for single-shot or non-reclosing operation. By refining recloser settings, evaluating line conditions, and carefully assessing deployment locations, Consumers Energy is ensuring these devices are strategically implemented to enhance safety and reliability while mitigating potential risks.



The third-party wildfire risk assessment identified over 1,800 fuses to replace for wildfire risk mitigation. While the Company will continue to evaluate deploying reclosers for wildfire risk mitigation, it is not currently proposing recloser investment because the third-party wildfire risk assessment benefit-cost analysis was based on reducing ignition risk, and the Company currently believes the most value for deploying reclosers for wildfire risk mitigation is reducing customer outage minutes.

The 5-year investment plan for protective line devices is shown below in Figure 21.

[18] EPRI - Wildfire Protection Strategies for Overhead Bare Wire Power Systems, August 2024

Figure 21

Protective Line Devices Capital Investment Plan

Voltage Conversions

The Company's three standard voltages, 4.8/8.32 kV, 7.2/12.47 kV, and 14.4/24.9 kV, comprise the majority of LVD overhead primary line miles in the elevated wildfire risk area. However, there are some line miles configured as Delta systems that are less safe to operate compared to a grounded wye system.

As described more fully in the Reliability Roadmap, by converting non-standard components to one of the three standard voltages, the Company will mitigate the safety risk from ungrounded wires and increase operational flexibility by expanding the ability to transfer loads to reduce outage times. This will support wildfire risk mitigation by preparing the circuits for more controllability to execute wildfire risk mitigation operational procedures, and reduce ignition risk from ungrounded wires. Consumers Energy is evaluating the use of voltage conversions as a part of our reliability plan.

Opportunities to Evaluate

The Company continues to evaluate additional ways to use system hardening to mitigate wildfire risk by benchmarking with other utilities, researching technology, and collaborating with EEI and EPRI to identify new technologies and best practices. While Consumers Energy will refine plans for undergrounding, covered conductor, and protective line devices based on learnings from initial investments, the Company is also evaluating increasing pole inspections and replacements and microgrids in elevated wildfire risk areas.

Wooden utility poles have been in consistent use within Michigan for decades, and it is estimated that there are more than 2 million throughout the state. These poles support the distribution network of electric utilities as well as telephone companies and Internet providers.

Inspecting and replacing poles as needed is a priority for Consumers Energy. The Reliability Roadmap includes a plan to inspect LVD poles on a 12-year cycle to identify and replace all rejected poles that do not meet *National Electric Safety Code* ("NESC") standards.

With the current inspection and replacement program in place, Consumers Energy will continue to evaluate whether an enhanced wildfire specific pole inspection and replacement plan should be implemented in elevated wildfire risk areas.

Ductile iron poles could be a replacement for the standard wooden poles currently used, and are being evaluated as a potential option for mitigating wildfires. The benefit of iron poles is the durability, life span, and reduction in potential fuel for a wildfire.

Fractionalization is the practice of segmenting circuits into smaller sections with fewer customers to reduce the number of customers impacted by single contingency outages and customer exposure to outages.

As the distribution system has been expanded over many years to meet the requirements of connecting new customers, there is a subset of circuits with disproportionately high customer counts and overhead line exposure, resulting in challenges due to the underlying system configuration. Limiting the number of customers impacted by any single outage is growing in importance as increasing recloser sensitivities to mitigate wildfire risk will likely result in more outages.

Microgrids provide power to critical facilities and infrastructure when a line is de-energized or there is some other emergency that causes electricity not to be available. Microgrids are self-contained grids which can connect or disconnect from the larger grid and still provide power usually from a battery or renewable power source. Other utilities are using microgrids to reduce wildfire ignition risk as well as provide back-up power to strategic locations during times of emergency or outage.

A microgrid would enable power to continue to be used in areas that may have been isolated by surrounding wildfires, diminishing the effects of power outages, and allowing emergency responders to continue to use facilities that might be unavailable during a power outage.

Microgrid solutions to mitigate wildfire risk include remote microgrids, grid-connected microgrids, and microgrid incentives.

- *Remote microgrids* are not connected to the utility electric distribution system and operate in isolation.
- *Grid-connected microgrids* are connected to the utility electric distribution system, but they may be separated from the distribution system as needed.
- *Microgrid incentives* are to fund third-party owned microgrids.

Line Clearing

Line Clearing Program for Wildfire Risk Mitigation

Trees are one of the greatest causes of interruptions to electric service for customers on the LVD system, contributing 42.1% of all-weather outages and 35.8% of all non-Major Event Day

("MED") outages[19].

The Company clears vegetation within a 30-foot-wide right-of-way ("ROW") for primary voltages to attain a minimum of 10 feet of separation between conductors and vegetation at the time of clearing, and to maintain accessibility along the ROW for maintenance and repair of the line.

The Company has been defining plans in its electric rate cases starting in 2020, and in the Electric Distribution Infrastructure and Investment Plans/Reliability Roadmap starting in 2021, to achieve and maintain a 7-year effective clearing cycle for its LVD system. In Case No. U-21585, the Company proposed moving LVD circuits that intersect with elevated wildfire risk areas to a 5-year clearing cycle.

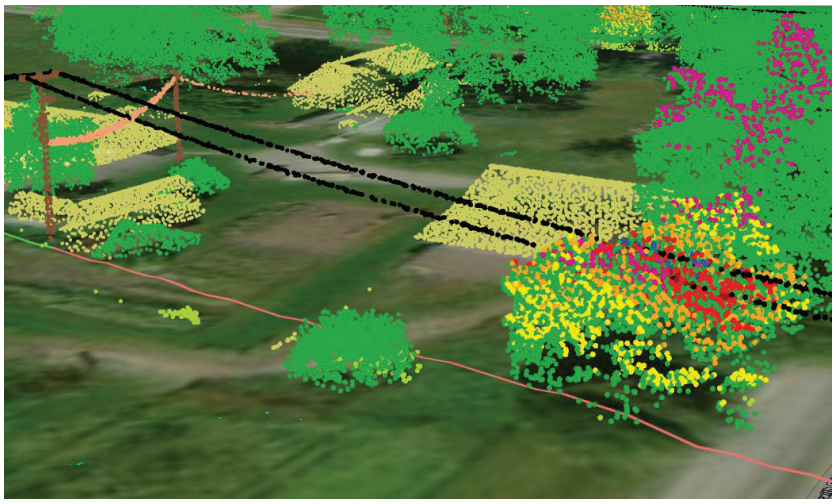
Referring to the Order in MPSC Case No. U-21870, the Company is beginning to execute on an enhanced line clearing strategy for the entirety of its LVD system: ramping-up to achieve a 5-year clearing cycle and performing more aggressive line clearing on targeted 3-phase primary lines. The projected timeline to achieve the shortened line clearing cycle and scope of more aggressive line clearing targets the end of the 2030-2031 test period. This strategy encompasses the LVD system and therefore includes circuits intersecting with elevated wildfire risk. While the Company is projecting to achieve the reduced cycle strategy by the end of the 2030-2031 test period for all LVD circuits, the Company is prioritizing elevated wildfire risk areas through a more aggressive timeline. Leveraging available analyses, the Company plans to achieve the five-year cycle in elevated wildfire risk areas earlier (i.e., by year-end 2028).

A reduced clearing cycle for circuits intersecting the elevated wildfire risk areas decreases the chance of tree-conductor contact, thereby reducing the potential of a spark igniting a wildfire. The expense projected to achieve the shortened line clearing cycle is outlined in the Reliability Roadmap.

The Company is proposing to continue capturing LiDAR imagery on LVD primary miles on circuits that intersect with areas of elevated wildfire risk. The purpose of capturing LiDAR is to inform and support the execution strategy of the line clearing tactics described above. Figure 2 above includes the estimated annual O&M cost for LiDAR collection and processing. In Case No. U-21870, the Company outlined $0.50 million for LiDAR in this area, and it is updating this projected annual expense to $0.51 million to reflect inflation.

In 2025, the Company worked with a vendor that performed LiDAR collection via fixed-wing aircraft during the leaf-on season. The data processing of raw LiDAR point cloud data included three-dimensional ("3D") modeling and classification of poles and wires relative to nearby vegetation. Classified points were then transformed into actionable insights, including volumetric encroachment measurements and span-level risk scores. As this is the first LiDAR data captured on the LVD system for this purpose, the Company is conducting pilot exercises to test and evaluate intervention methods utilizing this data, which may include, but not be limited to:

- Sequencing line clearing by prioritizing pockets of high span-level risk scores first when conducting full circuit clearing on workplan circuits where possible, given environmental



[19] Percent of customers interrupted by unplanned outages in 2025 with cause code of Trees or Trees - Outside ROW.

considerations; and

- Evaluating spans with high-risk scores on circuits that are mid-cycle for mid-cycle clearing.

Figure 22

3D LiDAR Map Example

For example, Figure 22 shows a span on an LVD circuit at the end of its five-year cycle. LiDAR points are classified utilizing a color key: brown points represent a pole, black points represent the primary conductors, red/yellow/green points represent identified vegetation grow-in present on this span by distance, pink points represent vegetation with fall-in potential, and blue points represent vegetation overhanging the conductors.

The Company is proposing to continue capturing LiDAR in this targeted area to enable opportunities to evaluate change detection and measure the impacts of line clearing intervention in elevated risk areas on an annual basis. LiDAR creates the opportunity for the Company to utilize a new type of data in its Line Clearing Program on a small scale first while it strengthens its abilities and evaluates expansion opportunities in the future.

Opportunities to Evaluate

The Company will continue to evaluate additional ways to adjust line clearing practices to mitigate wildfire risk by benchmarking with peer utilities and collaborating with organizations such as EPRI to identify new technologies and best practices for wildfire risk mitigation. One opportunity for further evaluation is an expanded scope of hazard tree removal in the elevated risk areas.

Hazard trees (dead, dying, or mechanically stressed trees) within 20 feet of the edge of the ROW are removed when the property owner does not object. Currently, hazard trees are identified and removed as part of the standard clearing cycle process in the Line Clearing Program.

In elevated wildfire risk areas, wildfire risk could be further mitigated by expanding the scope of hazard tree removal through either increased frequency or increased distance from pole centerline:

- Mid-cycle hazard tree removal mitigation would identify hazard trees mid-cycle and remove

them; this will help mitigate the risk of hazard trees falling on lines in-between cycle clearing.

- Expanding the distance from centerline hazard trees are identified and removed would help mitigate the risk of hazard trees further away falling on lines.

Figure 23 below illustrates the risk of trees outside of the standard 30' ROW corridor.

Figure 23

Out of ROW Tree Failure on LVD Three Phase

The Company is proposing a focus on achieving its enhanced line clearing program strategy by the end of the 2030-2031 test period, as outlined in the Reliability Roadmap, which includes reduced cycles across the electric service territory and a scope of more aggressive line clearing, before adding additional line clearing tactics such as mid-cycle hazard tree removal.

Stakeholder Engagement

Industry. Through benchmarking with utilities located in the Eastern, Southeastern, Midwest, Mountain West and Pacific West, Consumers Energy identified best practices for wildfire risk mitigation. These relationships will be leveraged as the Company continues to build out and mature this wildfire risk mitigation plan. Consumers Energy is also engaged with industry groups including EEI and EPRI, which provide knowledge sharing opportunities through working groups and summits.

Agencies. Communication and coordination with local and state emergency agencies and first responders is essential to the success of wildfire risk mitigation. Consumers Energy coordinates with these agencies as part of the Company's standard emergency response activities and will broaden that engagement as wildfire risk-specific mitigation activities are operationalized.

In November 2025, the Company met with the USFS and the Michigan DNR to conduct a

downed-wire awareness training session and to review the USFS incident command structure and coordinated response protocols.

In April 2026, the Company participated in a wildfire preparedness meeting in Mio, MI with the USFS for the Huron Zone, which is identified as one of the most at-risk areas of the Company's electric grid system. Participants included representatives from the USFS, Michigan DNR, local fire departments, the Michigan State Police, and the local Road Commission.

Feedback from these engagements indicated strong appreciation for the Company's proactive participation and focus on wildfire preparedness. These collaborative efforts strengthen interagency coordination and enhance wildfire response readiness across Michigan, supporting the effectiveness of the Company's wildfire risk mitigation plan.

There may be additional opportunities in the future to engage with local and state agencies on public education and awareness, wildfire risk mitigation planning, wildfire risk mitigation activities, wildfire emergency preparedness, and wildfire emergency response.

Public. The Company will use existing corporate communications and community affairs channels to engage the public on the wildfire risk mitigation activities and investments in this plan. As the plan matures, additional engagement will be considered to increase education and awareness around times of elevated wildfire risk.

Conclusion

This wildfire risk mitigation plan is designed to protect public safety, physical structures, the environment, and the electric distribution system. By proactively identifying risks, implementing mitigation measures, maintaining readiness, and collaborating with relevant state and local agencies, Consumers Energy can reduce the impact of wildfires on our operations and maintain a resilient electrical grid for the state of Michigan.

As part of this approach, the Company will determine best practices and gain additional knowledge around the cost and effectiveness of the wildfire risk mitigation tactics implemented which are outlined in this plan. Consumers Energy will continue to evaluate investment plans based on skills and efficiencies learned during the test year and may propose a more aggressive future workplan to mitigate wildfire risk.

Regular reviews and updates to this plan will be made to ensure it remains consistent with industry and government recommendations and standards which are still evolving.

Corporate Membership Dues
for the Year Ended December 31, 2025

Case No.: U-22070
Exhibit No.: A-109 (MJF-6)
Page: 1 of 1
Witness: MJFoster
Date: June 2026

Line No.	(a) Organization	(b) Description	(c) Customer Benefits	(d) Membership Costs	(e) Membership Costs included for recovery
1	Detroit Regional Chamber of Commerce (DRC)	The DRC serves as the primary voice for business across the 11-county Southeast Michigan region. The DRC core function is to foster a "business-friendly climate" and drive regional economic growth through four strategic pillars: Economic Development, Regional Collaboration, Education Reform, and Member Value.	Chamber of Commerce memberships enable the Company to connect with business customers, strengthen community relationships, and support economic growth across Michigan.	$ 5,653	$ 3,543
2	Jackson County Chamber of Commerce	The Jackson County Chamber is the leading driver and advocate for dynamic business and economic development in Jackson County. Creating a vibrant, inclusive community, through meaningful partnerships, intentional connections and engagement.	Chamber of Commerce memberships enable the Company to connect with business customers, strengthen community relationships, and support economic growth across Jackson County.	3,150	2,100
3	Keystone Policy Center	Keystone Policy Center is a trusted non-profit organization founded in 1975 to drive actionable, shared solutions to contentious policy challenges. Keystone is recognized by public, private, and civic-sector leaders throughout the United States for independent, collaborative problem-solving approaches that offer a proven blueprint for progress and collective impact. The Keystone Energy Board is a longstanding forum for energy sector leaders to learn about and discuss timely issues, examining the linkages among energy, environmental and economic policies. The Energy Board is comprised of about 50 individuals representing different perspectives on energy policy; our members bring expertise from industry, technology, environmental and consumer advocacy, and state and federal government.	The Keystone Policy Center values to Consumers Energy customers include networking, utility benchmarking, best practices, and research with a focus on environmental issues, renewable energy standards, load growth from data centers, and grid reliability.	12,600	8,400
4	Michigan Electric and Gas Association (MEGA)	MEGA works with the Michigan legislature, federal and state regulatory agencies, and the entire Michigan energy industry to ensure safe, reliable, and affordable electric utility service.	MEGA delivers value to Consumers Energy customers by engaging with the Michigan Legislature, federal and state regulatory agencies, and the broader Michigan energy industry to support safe, reliable, and affordable electric service and support for low-income programs.	15,750	10,501
5	Edison Electric Institute (EEI)	EEI provides strategic business intelligence, and essential conferences and forums. The EEI facilitates collaboration regarding emerging issues facing the industry. The EEI also provides a forum to ask industry related questions to other utilities and provides invaluable resource information about the utility industry and other issues.	EEI provides value to Consumers Energy customers through Mutual Assistance coordination to quickly secure resources for storm restoration. The electric utility industry has no other mutual assistance structure. Other benefits from the EEI membership include utility benchmarking and best practices on subjects such IT & Security, grid modernization, economic development, suppply chain, renewable generation, and other utility functions that helps the Company understand its performance to utility peers. EEI facilitates sharing of best practices and is an invaluable resource of information that can help the Company better serve our customers.	1,301,133	721,696
6	Association of Edison Illuminating Companies (AEIC)	AEIC is the electric utility industry's longest-serving and preeminent association, where leaders from 185 member companies work together to share knowledge that is essential to achieving operational excellence and grid modernization. AEIC brings together the electric utility industry's leading operations experts to rise to challenges, accelerate opportunities, and achieve excellence in all aspects of generation, transmission, distribution, and storage of electric power for the benefit of its members, the industry at large, and consumers.	AEIC provides value to Consumers Energy customers by providing an affordable option to access information on best practice, research, and the exchange of technical resources on topics such as grid modernization, grid reliability, clean energy, safety, energy efficiency, generation, and storage of electric power.	27,228	18,153

STATE OF MICHIGAN

BEFORE THE MICHIGAN PUBLIC SERVICE COMMISSION

In the matter of the application of **CONSUMERS ENERGY COMPANY** for authority to increase its rates for the generation and distribution of electricity and for other relief.	))))))	Case No. U-22070

EXHIBITS

OF

BRITTANI A. GRAY

ON BEHALF OF

CONSUMERS ENERGY COMPANY

June 2026

1. Tariff Sheet Nos. A-5.00, C-12.00, C-26.00, C-64.30, D-9.00, D-10.00, and D-19.00 through D-24.00 – **Residential Electric Heating Rate REH** – Added a new electric heating rate for residential customers and reformatted tariff sheets.

2. Tariff Sheet No. C-4.00 – Rule C1 – **Characteristics of Service** – Updated Contribution in Aid of Construction Allowance.

3. Tariff Sheet No. C-15.00 – Rule C4.4 – **Resale** – Revised all inclusive resale rate per kWh.

4. Tariff Sheet No. C-18.00 – Rule C4.5 – **Mobile Home Park** – Updated New Service Connection fee for underground service (Mobile Home Park).

5. Tariff Sheet No. C-26.20 and C-27.00 – Rule C6.1 – **Overhead Extension Policy** – Updated Overhead New Service Connection fees, Line Extension charges over 600 feet and Residential direct connect refund.

6. Tariff Sheet Nos. C-31.00 and C-32.00 – Rule C6.2 – **Underground Policy** – Updated New Service Connection fee for underground service.

7. Tariff Sheet No. C-36.00 – Rule C8 – **Power Supply Cost Recovery** – Updated the Power Supply Cost Recovery (PSCR) adjustment factor.

8. Tariff Sheet No. C-49.00 – Rule C10.3 – **Experimental Advanced Renewable Program (AR Program)** – Revised AR Program tariffs to define process upon contract expiration.

9. Tariff Sheet Nos. C-64.30 through C-64.50 – Rule C11.3 – **Distributed Generation Program** – Updated Distributed Generation Program tariffs to reflect revised outflow credits and reformatted tariff sheets.

10. Tariff Sheet Nos. C-77.00, D-66.00, D-78.20, D-82.00, E-22.00, E-24.00 and E-26.00 – **Line Loss Factors** – Updated line loss factors.

11. Tariff Sheet Nos. C-79.00 through C-82.00 – Rule C19 – **Transportation Electrification Programs (TEPs)** – Updated tariffs to remove On-Bill Installment Payment Plan, pre-approved EV installer requirement, modified AMI Monitoring credit, broadened eligibility, and revised separate metering requirements.

12. Tariff Sheet Nos. D-2.20, D-2.40, and D-5.00 – **Surcharges** – Updated Investment Recovery Mechanism Surcharge, Electric Rate Case Deferral Surcharge, and Electric Rate Case Demand Response Surcharge.

13. Tariff Sheet Nos. D-14.00, D-15.00, D-17.00, D-36.00, D-36.10, D-38.00, D-40.00, D-40.50, D-42.00, D-43.00, D-44.10, D-44.20, D-45.00, D-46.00, D-48.00 through D-50.00, D-51.00, D-53.00, D-55.00 through D-57.00, D-59.00 through D-63.00, D-66.00, D-67.10 through D-67.30, D-71.00, D-72.00, D-75.00 through D-77.00, D-78.20, D-78.30, D-82.00 through D-83.10, D-85.00, D-86.00, D-90.10, D-90.20, D-94.00, D-94.20, D-94.30 and D-96.00 – **Rate Schedules** – Revised prices for electric rate schedules.

14. Tariff Sheet Nos. D-17.00, D-38.00, and D-42.00 – **Residential Peak Reward Program** – Removed the control group participation credit.

15. Tariff Sheet No. D-36.00 – **Residential Smart Hours Rate RSH** – Clarified eligibility of Rate RSH.

16. Tariff Sheet Nos. D-78.30 through D-78.50 – **Large Economic Development Rate LED** – Added Adjustment for Power Factor and reformatted tariff sheets.

17. Tariff Sheet Nos. D-88.00 and D-89.00 – **General Unmetered Lighting Rate GUL** – Revised eligibility and clarified rate transition following LED Conversion.

The Company reserves the right to make special contractual arrangements as to the provision of necessary Service Facilities, duration of contract, minimum bills, require upfront deposit and other service conditions, including, but not limited to, when the customer's load requirements are of a short-term duration, temporary or a transient nature, or if in the opinion of the Company, the customer does not have acceptable credit history or represents an unacceptable credit risk or other reasons within the sound discretion of the Company.

Contributions in Aid of Construction otherwise required by the Company may be suspended for charging sites participating in the PowerMIDrive Public or PowerMIFleet programs.

C1.5 Invalidity of Oral Agreements or Representations

When a written contract is required, no employee or agent of the Company is authorized to modify or supplement the Rules and Regulations and Rate Schedules of the Electric Rate Book by oral agreement or representation, and no such oral agreement or representation shall be binding upon the Company.

(Continued on Sheet No. C-5.00)

(Continued From Sheet No. C-11.00)

C4. APPLICATION OF RATES (Contd)

C4.3 Application of Residential Usage and Non-Residential Usage (Contd)

A. Residential Usage and Rate Application (Contd)

(3) Homes or Dormitories for Groups Other Than Private Family Dwellings
Tourist homes, rooming houses, dormitories, nursing homes and other similarly occupied buildings containing sleeping accommodations for up to six persons where residential usage is metered and consumed shall be classified as residential and billed on a Residential Service Rate. The landlord and his/her immediate family are not included in the six-person limitation.

(4) Multifamily Dwellings

(a) General

A "multifamily dwelling" shall be considered any duplex, apartment building, mobile home park, condominium, cooperative or other grouping of households. All newly constructed multifamily dwellings shall have separately metered households. The requirement for separately metered households may be waived at the request of the developer in cases where newly constructed or rehabilitated duplexes, apartment buildings and other multifamily dwellings are owned by a nonprofit corporation or "flow-through entity," which have a long-term regulatory agreement with the Michigan State Housing Development Authority, the United States Department of Housing and Urban Development or the United States Department of Agriculture to provide affordable housing for qualifying low-income residents. Separately metered households shall be required in the event the property is no longer subject to such regulatory agreement; the owner must notify Consumers Energy and all costs associated with conversion from a single metered facility to separately metered multifamily dwellings shall be the responsibility of the property owner. Any spaces within the development used for commercial purposes shall be separately metered by Consumers Energy.

(b) Common Area Usage in Multifamily Dwellings Containing Separately Metered Households

Common area usage, excluding mobile home parks, shall be metered and billed as follows:

(i) Dwellings containing less than five households shall be separately metered and billed on a Residential Service Rate. When the landlord lives in one of the units, the common area usage may be metered and billed through the landlord's meter.rent
(ii) Dwellings containing five or more households shall be separately metered and billed on the appropriate General Service Rate.

Common area usage in mobile home parks shall be separately metered and billed on the appropriate General Service Rate.

(c) Multifamily Dwellings Served Through a Single Meter

A multifamily dwelling served through a single meter shall be billed as follows:

(i) Dwellings containing two households, including common area, shall be billed on Residential On-Peak Summer Basic Rate RSP. Residential Electric Vehicle Program participants may take service on *Residential Electric Heating Rate REH,* Residential Smart Hours Rate RSH or Residential Nighttime Savers Rate RPM.
(ii) Dwellings containing three or four households, including common area, shall be billed on Residential On-Peak Summer Basic Rate RSP or the appropriate General Service Rate. Residential Electric Vehicle Program participants may take service on *Residential Electric Heating Rate REH,* Residential Smart Hours Rate RSH or Residential Nighttime Savers Rate RPM.
(iii) Dwellings containing five or more households, including common area, shall be billed on the appropriate General Service Rate.

(Continued on Sheet No. C-13.00)

(Continued From Sheet No. C-14.00)

C4. APPLICATION OF RATES (Contd)

C4.3 Application of Residential Usage and Non-Residential Usage (Contd)

D. Rate Application for Seasonal Condominium Campgrounds (Contd)

(6) The customer must notify individuals and co-owners utilizing the customer's property that requests and concerns regarding electric service will be addressed between the single legal entity and ownership and primary operating authority, not with individuals.

(7) The customer shall be responsible for ensuring that the electrical facilities are adequate to meet the needs of the units placed within the Seasonal Condominium Campground in their entirety and shall pay the Company for any charges incurred for modifications necessary to accommodate load according to other portions of this Electric Rate Book.

C4.4 Resale

This provision is closed to resale for general unmetered service, unmetered or metered lighting service and new or expanded service for resale for residential use.

No customer shall resell electric service to others except when the customer is served under a Company rate expressly made available for resale purposes, and then only as permitted under such rate and under this rule.

Where, in the Company's opinion, the temporary or transient nature of the proposed ultimate use, physical limitation upon extensions, or other circumstances, make it impractical for the Company to extend or render service directly to the ultimate user, the Company may allow a customer to resell electric service to others.

For the purposes of this tariff, the provision of electric vehicle charging service for which there is no direct per kWh charge shall not be considered resale of service.

A resale customer is required to take service under the resale provision of one of the following rates for which they qualify: General Service Secondary Rate GS, General Service Secondary Time-of-Use Rate GSTU, General Service Secondary Demand Rate GSD, General Service Primary Rate GP, Large General Service Primary Demand Rate GPD, or General Service Primary Time-of-Use Rate GPTU. Resale Service is provided pursuant to a service contract providing for such resale privilege. Service to each ultimate user shall be separately metered.

A. If the resale customer elects to take service under a Company Full Service resale rate, the ultimate user shall be served and charged for such service under standard Rate RSM for residential use or under the appropriate standard General Service Rate applicable in the Company's Electric Rate Book available for similar service under like conditions. Reselling customers are not required to offer or administer any additional service provisions or nonstandard rates contained in the Electric Rate Book, such as the Income Assistance Service Provision or the Educational Institution Service Provision.

B. If the resale customer elects to take service under a Company Retail Open Access Service rate, the ultimate user shall be served and charged for such service under Rate ROA-R for residential use or under Rate ROA-S or ROA-P applicable in the Company's Electric Rate Book available for similar service under like conditions.

C. If the ultimate user is a campground lot or boat harbor slip, the resale customer has the option to charge a maximum of the following all inclusive rate per kWh in place of billing the ultimate customer on the appropriate standard Company tariff rate:

$~~0.207286~~ *0.228707* per kWh for all kWh during the months of June - September

$~~0.178963~~ *0.199454* per kWh for all kWh during the months of October - May

The Company shall be under no obligation to furnish or maintain meters or other facilities for the resale of service by the reselling customer to the ultimate user.

The service contract shall provide that the reselling customer's billings to the ultimate user shall be audited each year by February's month end, for the previous calendar year. The audit shall be conducted either by the Company, if the Company elects to conduct such audit, or by an independent auditing firm approved by the Company. The reselling customer shall be assessed a reasonable fee for an audit conducted by the Company. If the audit is conducted by an independent auditing firm, the customer shall submit a copy of the results of such audit to the Company in a form approved by the Company.

(Continued on Sheet No. C-16.00)

(Continued From Sheet No. C-17.00)

C4. APPLICATION OF RATES (Contd)

C4.5 Mobile Home Park - Individually Served (Contd)

B. Original Installations of Underground Service Connections From Underground Distribution Systems

The mobile home park owner or an authorized representative shall be required to make a nonrefundable contribution in aid of construction to the Company, to cover the cost resulting from the installation of the underground service connections. For the route specified by the Company, the contribution shall be ~~a flat fee of $1,300~~ *$10.20 per lineal foot, measured from the termination point of the Company's facilities to the customer's service termination point*. For an alternate route requested by the customer and is mutually agreed upon by the Company and the customer, the contribution shall be ~~a flat fee of $1,300 plus~~ *increased by* any additional costs in excess of those associated with the route specified by the Company.

The Company shall furnish, install, own and maintain the entire underground electric distribution system including the pre-meter portion of the service lateral cables for new mobile home parks. The trenches for Primary or Secondary main cables will be occupied jointly by facilities of the Company and other utilities where satisfactory agreement for reimbursement of applicable joint facility costs exist between the Company and the other utilities.

Certain related equipment, such as pad-mounted transformers, switching equipment, and service pedestals may be above grade. The area must be suitable for the direct burial installation of cable.

The mobile home park owner or an authorized representative shall provide, own, install and maintain suitable meter supports of a design satisfactory to the Company.

C. If temporary overhead service is installed for the convenience of the mobile home park owner or an authorized representative for construction purposes, such owner or representative shall be required to pay the in-and-out costs of such overhead facilities in the underground area.

D. Where, in the Company's judgment, practical difficulties exist, such as frost or water conditions, rock near the surface, or where there are requirements for deviation from the Company's filed construction standards, the per foot charges included in this rule shall not apply and the contribution in aid of construction shall be equal to the estimated difference in cost between overhead and underground facilities but not less than the contribution calculated under the appropriate per foot charge.

E. The Company may, upon request of the owner and subject to the provisions of this rule, assume ownership of, and incorporate into its electric distribution system, all of an owner's existing electric distribution system and service connection, including distribution lines, transformers, services, meter set assemblies, meters and associated equipment. The Company, on assuming ownership, shall provide individual service and meters for each ultimate consumer. The purchase price to be paid by the Company for such distribution system shall be computed at a rate of $200 per lot for each lot with an installed service connection to the distribution system where the average age of the mobile home park is five years or less. Such rate shall be reduced by $40 per lot for each additional five-year increment in average age.

In cases where the assumption of ownership would require the Company to install new distribution facilities and service connections or modify the existing distribution system, the mobile home park owner or authorized representative may be required to make a deposit or nonrefundable contribution in aid of construction to the Company to cover the cost of such facilities.

(Continued on Sheet No. C-19.00)

See Partlan Testimony, Page 15, Line 13-15 through Page 16, Lines 1-13; Exhibit A-120 (BAG-1), Item Nos. 5-6

(Continued From Sheet No. C-25.00)

C5. CUSTOMER RESPONSIBILITIES (Contd)

C5.6 Customer-Selected Due Date Program

Notwithstanding other provisions in this tariff book, the Company, at its discretion, may provide its electric service customers and combination electric and gas service customers the option to select the day of the month on which their bill is due, regardless of the meter read date. Participating customers must have an electric AMI transmitting technology meter.

Participation in the Customer-Selected Due Date Program is available to customers, as determined by the Company, when technically feasible based on the customer's selected rate and billing options. Customers not eligible to participate include, but not limited to, customers billed on a calendar-month basis, customers participating in Retail Open Access and customers participating in the Net Metering Program.

The Customer-Selected Due Date Program is only available for the following rate categories: Residential Summer On-Peak Basic (RSP), *Residential Electric Heating Rate (REH),* Residential Smart Hours (RSH), Residential Nighttime Savers (RPM), General Service Secondary (GS), General Service Secondary Demand (GSD), General Service Primary (GP) and General Service Metered Lighting (GML).

(Continued on Sheet No. C-26.10)

(Continued From Sheet No. C-26.10)

C6. DISTRIBUTION SYSTEMS, LINE EXTENSIONS AND SERVICE CONNECTIONS

C6.1 Overhead Extension Policy

Applications for electric service which require the construction of an overhead distribution system shall be granted under the following conditions:

A. Residential Customers

The Company shall construct single-phase distribution line extensions at its own cost a distance of 600 feet, for each residential dwelling.

The length of the distribution line extension shall be measured from the nearest point of connection to the Company's facilities from which the extension can be made to the point from which the service line to the customer shall be run.

Distribution line extensions in excess of the above 600 feet shall require a deposit for the estimated cost of such excess footage. The required deposit for such excess footage shall be $~~3.50~~ *9.15* per lineal foot less 25%.

The Company shall make a one-time refund, five years from the completion date of the extension or upon completion of the customer's construction, whichever the customer chooses, of $~~1,~~000 *1,500* for each additional residential customer and/or three times the estimated annual revenue for each additional General Service customer who connects directly to the line for which a deposit was required. Refund allowances shall first be credited against the 25% reduction before a refund is made to the customer based on the customer's cash deposit. Directly connected customers are those who do not require the construction of more than 300 feet of Primary and/or Secondary distribution line. Refunds shall not include any amount of contribution in aid of construction for underground service made under the provisions of Rule C6.2, Underground Policy. Total refund shall not exceed the amount of the original deposit.

B. Installations of Overhead Service Connection - Residential

The developer or customer shall be required to make a nonrefundable contribution in aid of construction to the Company, to cover the cost resulting from the installation of an overhead service connection. For the route specified by the Company, the contribution shall be ~~a flat fee of $1,300~~ *$10.20 per lineal foot, measured from the termination point of the Company's facilities to the customer's service termination point*. For an alternate route requested by the customer and is mutually agreed upon by the Company and the customer, the contribution shall be ~~a flat fee of $1,300 plus~~ *increased by* any additional costs in excess of those associated with the route specified by the Company.

(Continued on Sheet No. C-27.00)

(Continued From Sheet No. C-26.20)

C6. DISTRIBUTION SYSTEMS, LINE EXTENSIONS AND SERVICE CONNECTIONS (Contd)

C6.1 Overhead Extension Policy (Contd)

C. General Service Customers

The Company shall construct single-phase and three-phase distribution line extensions, at its own cost when the cost of such extension does not exceed three times the estimated annual revenue from the customer(s) to be immediately served.

Extensions with costs in excess of three times the estimated annual revenue shall require a deposit from the customer.

(1) Original Customers

At the end of the first complete 12-month period beginning three months following the date the line extension is completed, the Company shall refund to the depositor three times the amount that actual revenue exceeds the original revenue estimate. If the actual revenue exceeds the estimated revenue, the actual revenue then becomes the base upon which future refund calculations are to be made during the remainder of the five year refund period.

(2) Additional Connected Customers

The Company shall refund $~~1,000~~ *1,500* for each residential customer and/or three times the estimated annual revenue for each General Service customer who connects directly to the line for which a deposit was required. Directly connected customers are those who do not require the construction of more than 300 feet of Primary and/or Secondary distribution line. Refunds shall not be made until the original customer(s) or equivalent is actually connected to the extension. Refunds shall not include any amount of contribution in aid of construction for underground service made under the provisions of Rule C6.2, Underground Policy.

D. Installations of Overhead Service Connection - General Service

The developer or customer shall be required to make a refundable contribution in aid of construction to the Company, to cover the cost resulting from the installation of an overhead service connection. For the route specified by the Company, the contribution shall be ~~a flat fee of $2,200~~ *$17.20 per lineal foot, measured from the termination point of the Company's facilities to the customer's service termination point*. For an alternate route requested by the customer and is mutually agreed upon by the Company and the customer, the contribution shall be ~~a flat fee of $2,200 plus~~ *increased by* any additional costs in excess of those associated with the route specified by the Company.

E. General

(1) Refundable deposits made with the Company under this rule shall be subject to refund without interest, for a five-year period which begins three months after the line extension is completed. The Company shall have no further obligation to refund any remaining portion of line extension deposits.

(2) Each extension shall be a separate, distinct unit and any further extension therefrom shall have no effect upon the agreements under which existing extensions were constructed.

(3) Refunds cannot exceed the refundable portion of the deposit.

(4) Estimated construction costs shall exclude services and meters.

(5) The applicant shall furnish, without cost to the Company, all necessary rights-of-way and tree trimming permits, in a form satisfactory to the Company. If the applicant is unable to secure rights-of-way and permits, in a form satisfactory to the Company, the Company may extend its distribution system along an alternate route selected by the Company, and may require the applicant to pay all additional costs incurred.

(Continued on Sheet No. C-28.00)

See Partlan Testimony, Page 15, Line 13-15 through Page 16, Lines 1-13; Exhibit A-120 (BAG-1), Item Nos. 5-6

(Continued From Sheet No. C-30.00)

C6. DISTRIBUTION SYSTEMS, LINE EXTENSIONS AND SERVICE CONNECTIONS (Contd)

C6.2 Underground Policy (Contd)

B. Installations of Underground Distribution Facilities - Residential (Contd)

(2) Original Installations of Underground Distribution Systems (Contd)

(a) In subdivisions (Contd)

Where a residential underground distribution system serves lots on one side of a street, the later connection of lots on the other side of the street to that existing system shall be considered as an original installation of a residential underground distribution system for such later-connected lots.

Streetlighting, if any, shall be served underground in areas served directly by residential underground distribution systems. The character and location of the streetlighting cables, if any, and all equipment constituting the residential underground distribution system, shall conform to specifications prepared by the Company.

Where the underground cable for a residential underground distribution system extends through areas within the subdivision which are undeveloped or consist of lots platted for future use and which are not to be served initially by the system, the front-foot measurement of both sides of the street or easement along which the cable extends through such areas shall be included in determining the contribution of the owner(s) or developer(s) for the residential underground distribution system.

Where the Company and the owner(s) or developer(s) agree that it is desirable to extend the underground cable to the boundary of a subdivision property from a point outside the subdivision a contribution of $7.00 per trench foot shall be required.

(b) Outside of subdivisions

The Company shall extend its Primary or Secondary distribution system from existing overhead or underground facilities. When any such extension is made from an existing overhead system the property owner may be required to provide an easement(s) for extension of the overhead system to a pole on his/her property where transition from overhead to underground can be made.

The customer shall be required to make a nonrefundable contribution in aid of construction to the Company, to cover the estimated total difference in cost between overhead and direct burial underground facilities for all underground facilities required to serve the customer.

(3) Installation of Underground Service Connections

The developer or customer shall be required to make a nonrefundable contribution in aid of construction to the Company, to cover the cost resulting from the installation of an underground service connection. For the route specified by the Company, the contribution shall be ~~a flat fee of $1,300~~ *$10.20 per lineal foot, measured from the termination point of the Company's facilities to the customer's service termination point*. For an alternate route requested by the customer and is mutually agreed upon by the Company and the customer, the contribution shall be ~~a flat fee of $1,300 plus~~ *increased by* any additional costs in excess of those associated with the route specified by the Company.

Where the electric service connection is installed jointly with the gas service line, the per foot charge for all footage, as measured, shall be reduced by 25 cents per foot.

(Continued on Sheet No. C-32.00)

See Partlan Testimony, Page 15, Line 13-15 through Page 16, Lines 1-13; Exhibit A-120 (BAG-1), Item Nos. 5-6

(Continued From Sheet No. C-31.00)

C6. DISTRIBUTION SYSTEMS, LINE EXTENSIONS AND SERVICE CONNECTIONS (Contd)

C6.2 Underground Policy (Contd)

C. Installations of Underground Distribution Facilities - General Service

(1) Installation of Underground Distribution Systems

The Company shall construct single-phase and three-phase distribution line extensions at its own cost, when the cost of such extension, less contributions made under other sections of this rule, does not exceed three times the estimated annual revenue from the customer(s) to be immediately served. Extensions with costs in excess of three times the estimated annual revenue shall require a deposit from the customer.

(2) Installation of Underground Service Connections

The developer or customer shall be required to make a refundable contribution in aid of construction, to cover the cost resulting from the installation of an underground service connection. For the route specified by the Company, the contribution shall be ~~a flat fee of $2,200~~ *$17.20 per lineal foot, measured from the termination point of the Company's facilities to the customer's service termination point.* For an alternate route requested by the customer and is mutually agreed upon by the Company and the customer, the contribution shall be ~~a flat fee of $2,200 plus~~ *increased by* any additional costs in excess of those associated with the route specified by the Company.

(Continued on Sheet No. C-33.00)

(Continued From Sheet No. C-35.00)

C8. POWER SUPPLY COST RECOVERY (PSCR) CLAUSE (Contd)

A. Applicability of Clause (Contd)

"Power Supply Costs" means those elements of the costs of fuel and purchased and net interchanged power as determined by the Commission to be included in the calculation of the Power Supply Cost Recovery Factor. The Commission determined in its Order in Case No. U-10335 dated May 10, 1994 that the fossil plant emissions permit fees over or under the amount included in base rates charged the Company are an element of fuel costs for the purpose of the clause.

B. Billing

(1) The Power Supply Cost Recovery Factor shall consist of an adjustment factor of ~~1.07273~~ *1.08378* applied to projected average booked cost of fuel burned for electric generation and purchased and net interchange power incurred above or below a cost base of $0.05570 per kWh (excluding line losses). Average booked costs of fuel burned and purchased and net interchange power shall be equal to the booked costs in that period divided by that period's net system kWh requirements. The average booked costs so determined shall be truncated to the full $0.00001 cost per Kilowatt-hour. Net system kWh requirements shall be the sum of the net kWh generation and net kWh purchased and interchange power.

(2) Each month the Company shall include in its rates a Power Supply Cost Recovery Factor up to the maximum authorized by the Commission as shown on Sheet No. D-6.00.

Should the Company apply lesser factors than those shown on Sheet No. D-6.00, or if the factors are later revised pursuant to Commission Orders or Michigan Compiled Laws, Annotated, 460.6 et seq., the Company shall notify the Commission if necessary and file a revised Sheet No. D-6.00.

C. General Conditions

(1) The power supply and cost review shall be conducted not less than once a year for the purpose of evaluating the Power Supply Cost Recovery Plan filed by the Company and to authorize appropriate Power Supply Cost Recovery Factors. Contemporaneously with its Power Supply Cost Recovery Plan, the Company shall file a 5-year forecast of the power supply requirements of its customers, its anticipated sources of supply and projections of Power Supply Costs.

(2) Not more than 45 days following the last day of each billing month in which a Power Supply Cost Recovery Factor has been applied to customers' bills, the Company shall file with the Commission a detailed statement for that month of the revenues recorded pursuant to the Power Supply Cost Recovery Factor and the allowance for cost of power included in the base rates established in the latest Commission order for the Company, and the cost of power supply.

(3) All revenues collected pursuant to the Power Supply Cost Recovery Factors and the allowance for power included in the base rates are subject to annual reconciliation proceedings.

(Continued on Sheet No. C-37.00)

(Continued from Sheet No. C-48.00)

C10. RENEWABLE ENERGY PLAN (REP) (Contd)

C10.3 Experimental Advanced Renewable Program (AR Program) (Contd)

D. Contractual Price (Contd)

In subsequent allocation cycles, the price may be adjusted by the Company at its sole discretion based on the amount of capacity included in valid applications for the prior allocation cycle. For each five percent increment that the amount of capacity exceeded the amount of capacity solicited in the prior allocation cycle and the current allocation cycle, the price shall be reduced by $0.001 per kWh except that the price reduction shall be no more than $0.010 per kWh from one allocation cycle to the next allocation cycle. For each ten percent increment that the amount of capacity was less than the amount of capacity offered in that allocation, the price shall be increased by $0.001 per kWh. The price shall not be less than $0.20 per kWh or exceed $0.26 per kWh. For contracts awarded after June 30, 2013, the minimum price of $0.20 per kWh shall not apply.

For participants in the AR Program with contracts awarded after January 1, 2015, the price shall be $0.199 per kWh for Non-Residential applications and $0.24 per kWh for Residential applications. Participants providing service with a generating system constructed after October 1, 2011 that qualify for both the Michigan Labor and Michigan Material requirements shall be awarded an incentive price of $0.001 per kWh for all energy delivered.

E. Termination of Agreements

In the event that the customer ceases to operate the equipment or ownership of the equipment changes, then the customer should notify the Company of the circumstances and provide notice of the need to terminate the agreement. The premises and/or the customer referenced within a contractual agreement for service under this program may be restricted from participating in the program until after the original date set for expiration of the agreement.

Upon expiration of a customer's contractual participation in the AR Program, the customer will be enrolled in the Simple Renewable Program (SRP), unless the Company determines that enrollment is not appropriate based on the customer's generation and applicable charges. The Company shall provide notice of enrollment or alternative options to the customer. A customer may elect to discontinue participation or participate in another Company-offered program for which the customer is eligible.

C18. STANDARD OFFER - PURCHASED POWER (Contd)

D. Monthly Rate (Contd)

Rate Options (Contd)

Capacity

The monthly capacity payment will be equal to the number of Zonal Resource Credits ("ZRCs") that MISO determines the seller's QF can supply to the Company for the applicable MISO resource planning period multiplied by the applicable capacity rate expressed in such units of capacity. The current resource planning period is the planning year which runs from June 1st of each year through May 31st of the following year. If no historical generation data is available for the first year of generation a QF shall be assigned the MISO class average capacity credits by technology.

Capacity value paid to QFs does not depend on whether the Company actually obtains ZRCs for such capacity, only that the Company could obtain ZRCs for the QF capacity. Capacity value paid to a QF is in units of $ per ZRC-Month. MISO ZRCs are equal to the project's nameplate capacity (in MW_{AC}) modified by the MISO effective load carrying capacity (ELCC) calculation.

Capacity will be paid based on the average of the methodologies utilized by MISO at the time the QF contract is executed and at the time of capacity delivery from the QF, according to the MISO Business Practices Manual (BPM) calculation method effective at the respective times.

Eligible QFs that meet the requirements of Section C18A (1) or C18A (2) of this Rule can select one of the Energy Rate Options listed below:

Rate Option	**Energy Rate $/kWh**			
1. As Available Rate	Actual MISO Day Ahead Locational Marginal Price (LMP) at the Company's CONS.CETR load node under a 15-year term then multiplied by 1 plus the line loss adjustment factor of ~~2.24~~ *2.22*% for interconnection voltages less than 46 kV or ~~1.36~~ *1.32*% for interconnection voltage at 46 kV and less the Administrative Fee of $0.001/kWh			
2. LMP Energy Rate Forecast (Year 1-5)	A 10-year term based on a forecast of LMPs for the first five years and year six through year 10 of the term will be based on actual LMPs as described below. Rates include the line loss adjustment and Administrative Fee.			
	On-Peak Energy Rate Interconnection Voltage <46 kV	**Off-Peak Energy Rate Interconnection Voltage <46 kV**	**On-Peak Energy Rate Interconnection Voltage =46 kV**	**Off-Peak Energy Rate Interconnection Voltage =46 kV**
Year	**$/kWh**	**$/kWh**	**$/kWh**	**$/kWh**
2025	$0.03148	$0.02648	$0.03117	$0.02621
2026	$0.03296	$0.02757	$0.03263	$0.02729
2027	$0.03458	$0.02865	$0.03423	$0.02836
2028	$0.03530	$0.02876	$0.03495	$0.02847
2029	$0.03624	$0.02975	$0.03588	$0.02945
2030	$0.03727	$0.03052	$0.03690	$0.03021
2031	$0.03765	$0.03131	$0.03728	$0.03100
2032	$0.03836	$0.03209	$0.03798	$0.03177
2033	$0.04007	$0.03306	$0.03968	$0.03273
Actual LMP (Year 6-10)	Actual MISO Day Ahead Locational Marginal Price (LMP) at the Company's CONS.CETR load node under the remaining contract term then multiplied by 1 plus the line loss adjustment factor of ~~2.24~~ *2.22*% for interconnection voltages less than 46 kV or ~~1.36~~ *1.32*% for interconnection voltage at 46 kV and less the Administrative Fee of $0.001/kWh.

C19. TRANSPORTATION ELECTRIFICATION PROGRAMS (TEPS)

The Company's Transportation Electrification Programs (TEPs) have been created to support the development of infrastructure within the Company's service territory needed to accommodate widespread adoption of electric vehicles (EVs) and help optimize use of the grid. TEPs will also increase battery and plug-in hybrid electric vehicle (EV) charging capabilities and charging infrastructure across the state, while improving off-peak utilization of the electric grid to benefit all electric customers. Eligible customers who participate in these programs may receive a rebate incentive for optimizing use of their electric vehicle supply equipment (EVSE) to help reduce the cost of make-ready infrastructure and EVSE ~~but the EVSE must be separately metered from all other electrical load and used for the exclusive purpose of charging electric vehicle batteries~~.

Customers not participating in TEPs that still want to install EVSE at their premises may select a Rate Schedule commensurate with their Non-Residential or Residential usage as applicable but may incur additional costs due to co-incident peak usage of their EVSE, exceeding design standards, or both.

C19.1 Residential Electric Vehicle Programs

A. Definitions

(1) "AMI Monitoring" means advanced metering infrastructure monitoring which stores, tracks, and communicates usage data with the Company.

(2) "Electric Vehicle" means a motorized vehicle that has a battery instead of a gasoline tank, and an electric motor instead of an internal combustion engine. For purposes of the Residential Electric Vehicle Program, the term shall also include Plug-in hybrid electric vehicles (PHEVs), which are a combination of gasoline and electric vehicles. In addition to a plug-in battery, such vehicles have an electric motor, a gasoline tank and an internal combustion engine.

(3) "Electric Vehicle Charging Outlet" means a NEMA 14-50 outlet, or other similar technology subject to the sole discretion and approval of the Company.

B. ~~On-Bill Installment Payment Plan and~~ *PowerMIDrive* Rebate ~~Qualifications~~ for Electric Vehicle Charging Outlet Installation

(1) Eligibility

Residential Customers ~~taking service on Residential Smart Hours Rate RSH or Residential Nighttime Savers Rate RPM may be eligible for the On-Bill Installment Payment Plan to pay for the cost of installation of an~~ *installing an* Electric Vehicle Charging Outlet~~and~~ may ~~also~~ be eligible for a one-time initial rebate of up to $500 to offset installation charges. Residential Customers ~~taking service on Residential Smart Hours Rate RSH or Residential Nighttime Savers Rate RPM~~ who meet the eligibility criteria of the Income Assistance Service Provision or the Low Income Assistance Credit may qualify for a one-time initial rebate of up to $1000 to offset installation charges in lieu of the standard initial rebate of $500.

Multifamily Dwellings containing four or fewer households served through a single meter ~~taking service on Residential Smart Hours Rate RSH or Residential Nighttime Savers Rate RPM may be eligible for the On-Bill Installment Payment Plan to pay for the cost of installation of an~~ *and are installing an* Electric Vehicle Charging Outlet~~and~~ may be eligible for a one-time initial rebate of up to $500 to offset installation charges. If the existing single meter of the Multifamily Dwelling cannot serve the parking area of the dwelling, the premises may be eligible for an enhanced rebate of up to $7500 for installation of at least two Electric Vehicle Charging Outlets or hard-wired chargers rated at 50 amps.

Residential Customers interested in the *PowerMIDrive rebate* ~~On-Bill Installment Payment Plan~~ shall submit an online application *on the Company's website* to determine eligibility. ~~Eligible customers shall select an installer from a list of Company pre-approved installers, using the Company's website, to install the Electric Vehicle Charging Outlet at the eligible address.~~ The Electric Vehicle Charging Outlet shall be installed at the address displayed on the registration of the Electric Vehicle, which must be the Principal Residence of the customer. ~~In the event the customer fails to utilize a pre-approved installer set forth on Company's website, eligibility to participate in the On-Bill Installment Payment Plan may be revoked, which may result in the customer paying the installer directly and forfeiting the benefits associated with the On-Bill Installment Payment Plan.~~ *Customers taking service on Residential Service Secondary Non-Transmitting Meter Rate RSM are not eligible for the PowerMIDrive rebate.*

(Continued on Sheet No. C-80.00)

(Continued From Sheet No. C-79.00)

C19. TRANSPORTATION ELECTRIFICATION PROGRAMS (TEPS) (Contd)

C19.1 Residential Electric Vehicle Programs (Contd)

B. ~~On-Bill Installment Payment Plan and~~ *PowerMIDrive* Rebate Qualifications for Electric Vehicle Charging Outlet Installation (Contd)

(1) Eligibility (Contd)

~~At the Company's sole discretion, eligible~~ Residential Customers may *apply for the PowerMIDrive rebate* ~~enroll in the On-Bill Installment Payment Plan~~ prior to receipt of a valid State-issued Electric Vehicle registration if the customer has proof of an existing reservation for an Electric Vehicle. ~~In the event that a customer is enrolled in the On-Bill Installment Payment Plan under the program and an Electric Vehicle Charging Outlet is installed pursuant to said approval, but the customer fails to ultimately obtain an Electric Vehicle or otherwise provide proof of a valid State-issued Electric Vehicle registration, the customer's eligibility to participate in the On-Bill Installment Payment Plan may be revoked, and the customer may be required to pay the full cost of the Electric Vehicle Charging Outlet and its installation without the benefit provided for under the On-Bill Installment Payment Plan.~~

~~(2) On-Bill Installment Payment Plan~~

~~The On-Bill Installment Payment Plan Monthly Amount is calculated as the total of installation fee of the selected pre-approved installer plus a $10 one-time administrative fee less an eligible rebate divided by 12. The On-Bill Installment Payment Plan will be billed on the customer invoices within 45 days following completion of the installation.~~

~~The On-Bill Installment Payment will appear as a separate line item on the customer invoice for 12 billing months. Customers may pay the entirety of the On-Bill Installment Plan in less than 12 months without penalty.~~

~~A participating customer shall agree to the On-Bill Installment Payment Plan Monthly Amount and repayment terms.~~

~~If a Customer enrolls in the On-Bill Installment Payment Plan prior to receipt of the Electric Vehicle, the Customer shall notify the Company upon arrival of the Electric Vehicle. Upon notification, the Customer will be enrolled in AMI Monitoring.~~

~~Participation in the On-Bill Installment Payment Plan is at the sole discretion of the Company. A customer who received a shutoff notice within the nine months preceding the Customer's request to be enrolled in the Residential Electric Vehicle Program is not eligible.~~

~~If during the duration of the approved On-Bill Installment Payment Plan, the customer, for any reason, no longer owns an Electric Vehicle, the customer shall remain responsible for the full payment due under the On-Bill Installment Payment Plan until the cost of the Electric Vehicle Charging Outlet and installation are paid in full.~~

~~If the customer sells the premises where the Electric Vehicle Charging Outlet was installed, and that customer also participates in the On-Bill Installment Payment Plan, the Customer shall notify the Company of the sale, and the full amount due and owing for the Electric Vehicle Charging Station and installation shall be accelerated and the full amount due and owing included on the Customer's final bill.~~

~~(3)~~*(2)* AMI Monitoring for ~~On-Bill Installment Payment Plan and~~ *PowerMIDrive* Rebate Participants

All Customers participating in the ~~On-Bill Installment Payment Plan,~~ *PowerMIDrive* rebate~~, or both~~ shall be enrolled in AMI Monitoring and may earn one AMI Monitoring Credit per billing month to encourage Electric Vehicle charging during Off-Peak Hours. The AMI Monitoring Credit for standard Residential ~~and Multifamily Dwelling~~ customers is $10 per billing month. ~~The AMI Monitoring Credit for enhanced Multifamily Dwelling customers is $20 per billing month.~~ The AMI Monitoring Credit shall be applied in billing months in which the customer has charged the Electric Vehicle on three or less days during On-Peak hours. The credit is available for a period of 12 consecutive months and will appear as a separate line item on the customer invoice.

Residential Customers ~~taking service on Residential Smart Hours Rate RSH or Residential Nighttime Savers Rate RPM~~ may enroll in AMI Monitoring without *applying for the PowerMIDrive rebate.* ~~enrolling in the On-Bill Installment Payment Plan.~~ Interested ~~Residential~~ Customers shall submit an online application on the Company's website to enroll in AMI Monitoring.

Customers taking service on Residential Service Secondary Non-Transmitting Meter Rate RSM are not eligible for AMI Monitoring.

(Continued on Sheet No. C-81.00)

(Continued From Sheet No. C-80.00)

C19. TRANSPORTATION ELECTRIFICATION PROGRAMS (TEPS) (Contd)

~~C19.1 Residential Electric Vehicle Programs (Contd)~~

~~B. On-Bill Installment Payment Plan and Rebate Qualifications for Electric Vehicle Charging Outlet Installation (Contd)~~

~~(3) AMI Monitoring for On-Bill Installment Payment Plan and Rebate Participants (Contd)~~

~~Customers participating in AMI Monitoring may earn one $10 AMI Monitoring Credit per participating Electric Vehicle per billing month to encourage Electric Vehicle charging during Off-Peak hours. The AMI Monitoring Credit shall be applied in billing months in which the customer has charged the Electric Vehicle on three or less days during On-Peak Hours. The AMI Monitoring Credit is available for a period of 12 consecutive months and will appear as a separate line item on the customer invoice.~~

C19.2. Non-Residential Electric Vehicle Programs

A. PowerMIDrive Public

(1) Eligibility

This program is available to any Non-Residential Customer, either Full Service or Retail Open Access (ROA), that installs a Company-qualified Level 2 or Level 1 electric vehicle supply equipment (EVSE) at ~~a~~ qualifying ~~overnight or long-term parking~~ locations available to the public. ~~These are, but not limited to, the following locations: hotels, motels, campgrounds, resorts, airports, train stations and other locations in which the general public can park their electric vehicle overnight or multiple days while charging.~~ Customers who participate in this program may be eligible for a rebate per the terms and conditions located on the Company's website.

Such EVSE must be UL or equivalent safety certified *and* Energy Star rated ~~and achieve at least a 97% up-time for five years after installation~~. *For parking lots with greater than 10 parking spaces, the EVSE must be separately metered from all other electrical load and used for the exclusive purpose of charging electric vehicle batteries*. The EVSE operator may determine the pricing structure and this is not considered Resale. The site must also include clear signage that parking is for EV charging only.

(2) Terms and Conditions

To participate in the program, the customer must comply with all terms and conditions as stated on the Company's website. Applications are not a guarantee of program acceptance or rebate payment. Completed applications will be reviewed in the order received. Rebate funds are reserved for an applicant's project when Consumers Energy sends notice of acceptance to the applicant.

Full-Service Customers *that are separately metered* must be served on either General Service Secondary Time-of-Use Rate GSTU or General Service Primary Time-of-Use Rate GPTU.

For ROA Secondary Customers who choose to participate in the PowerMIDrive Public program, the distribution charges assessed to these customers will be the same as Full-Service customers being served on General Service Secondary Rate GS. ROA Primary Customers will be assessed the same distribution charges as Full-Service customers being served on as Large General Service Primary Demand Rate GPD, but must encourage charging per off-peak hours listed in GSTU or GPTU.

~~For both Full-Service and ROA customers who own and operate a DC Fast Charging station and participate in the remaining PowerMIDrive DC Fast Charging rebates, they must be served on General Service Primary Rate GP.~~

(Continued on Sheet No. C-82.00)

(Continued From Sheet No. C-81.00)

C19. TRANSPORTATION ELECTRIFICATION PROGRAMS (TEPS) (Contd)

C19.2 Non-Residential Electric Vehicle Programs (Contd)

B. PowerMIFleet

(1) Eligibility

This program is available to any Non-Residential Customer, either Full Service or Retail Open Access, that offer separately metered EVSE for private businesses and their vehicle fleet. These are, but not limited to, the following locations: public transit, non-profit organizations, local governments, small to medium sized businesses and educational facilities. Customers who are selected by the Company to participate in this program may be eligible for a rebate per the terms and conditions located on the Company's website. Such EVSE must be UL or equivalent safety certified~~,~~ *and* Energy Star rated ~~and achieve at least a 97% up-time for five years after installation~~. The EVSE operator may determine the pricing structure and this is not considered Resale.

(2) Terms and Conditions

To participate in the program, the customer must comply with all terms and conditions as stated on the Company's website. Submitting an interest form is not a guarantee of program selection for participation in the program.

Full-Service Customers *that are separately metered* shall be served on General Service Secondary Time-of-Use Rate GSTU or General Service Primary Time-of-Use Rate GPTU.

For ROA Customers who choose to participate in the PowerMIFleet program, the distribution charges assessed to these customers will be the same as Full-Service customers being served on General Service Secondary Rate GS. ROA Primary Customers will be assessed the same distribution charges as Full-Service customers being served on Large General Service Primary Demand Rate GPD but must encourage charging per off-peak hours listed in GSTU or GPTU.

RESIDENTIAL SUMMER ON-PEAK BASIC RATE RSP

Availability

Subject to any restrictions, this rate is available to any Full Service Customer desiring electric service for any usual residential use in: (i) private family dwellings; (ii) tourist homes, rooming houses, dormitories, nursing homes and other similarly occupied buildings containing sleeping accommodations for up to six persons; or (iii) existing multifamily dwellings containing up to four households served through a single meter. Service for single-phase or three-phase equipment may be included under this rate, provided the individual capacity of such equipment does not exceed 3 hp or 3 kW, nor does the total connected load of the home exceed 10 kW, except as provided for below.

Service for charging Electric Vehicles is available on this rate and shall not exceed 9.6 kW, except as provided for below. Electric Vehicle charging equipment is not included in the total connected load of the home for purpose of this section.

Individual equipment exceeding 3 hp or 3 kW, Electric Vehicle charging equipment exceeding 9.6 kW or total household load exceeding 10 kW may be subject to additional charges in accordance with Rule C6., Distribution Systems, Line Extensions and Service Connections. Such charges shall only apply to the extent the cost exceeds that of ensuring the connecting equipment matches that provided as standard to new residential customers.

This rate is not available for: (i) resale purposes; (ii) multifamily dwellings containing more than four living units served through a single meter; (iii) tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons; (iv) any other Non-Residential usage; or (v) Rule C5.5 - Non-Transmitting Meter Provision participants.

Residences in conjunction with commercial or industrial enterprises and mobile home parks may take service on this rate only under the Rules and Regulations contained in the Company's Electric Rate Book.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service Customers.

Energy Charge:

Consumers Energy Company **Sheet No. D-15.00**

RESIDENTIAL SUMMER ON-PEAK BASIC RATE RSP

(Continued From Sheet No. D-14.00)

Monthly Rate: (Contd)

Income Assistance Service Provision (RIA):

When service is supplied to a Principal Residence Customer, where the total household income does not exceed 150% of the Federal Poverty level, a credit shall be applied during all billing months. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. A Home Heating Credit energy draft
2. State Emergency Relief
3. Assistance from a Michigan Energy Assistance Program (MEAP)
4. Medicaid

If a customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for the Income Assistance Service Provision (RIA) shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Income Assistance Credit: $~~(8.00)~~ *(12.00)* per customer per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges.

This credit shall not be taken in conjunction with a credit for the Senior Citizen Service Provision (RSC).

Low Income Assistance Credit (LIAC):

Company selected Residential customers may receive LIAC for up to 12 consecutive months. The number of customers enrolled may be adjusted, at the Company's discretion, in order to dispense Commission-approved LIAC funding on an annual basis. Any shortfall in the dispensing of annual LIAC funds to qualified customers shall be carried over into the subsequent LIAC program year. LIAC customer selection will be based on highest need and with total household income that does not exceed 150% of the Federal Poverty level. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. Customers whose total household income does not exceed 150% of the Federal Poverty level within the last 12 months
2. Customers who have received assistance from a Michigan Energy Assistance Program (MEAP)
3. Customers who have received a Home Heating Credit energy draft
4. A State Emergency Relief program
5. Medicaid
6. Customers that have participated in a Supplementary Nutrition Assistance Program where the total household income does not exceed 150% of the Federal Poverty level within the last 12 months.

If the customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for LIAC shall be applied as follows:

Low Income Assistance Credit: $(42.00) per meter per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges. Re-enrollment, if applicable, and confirmation of qualification is required for each annual period of participation.

Customers selected for LIAC will not be eligible for the RIA Provision while enrolled in LIAC.

Senior Citizen Service Provision (RSC):

When service is supplied to the Principal Residence Customer who is 65 years of age or older and head of household, a credit shall be applied during all billing months.

The monthly credit for the residential Senior Citizen Service Provision shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service and Retail Open Access customers.

Senior Citizen Credit: $(4.00) per customer per month

This credit shall not be taken in conjunction with a credit for the Income Assistance Service Provision (RIA) and shall not be applied to more than one account per Principal Residence Customer.

RESIDENTIAL SUMMER ON-PEAK BASIC RATE RSP

(Continued From Sheet No. D-16.00)

Monthly Rate (Contd)

Peak Reward

Participating customers are able to manage electric costs by reducing load during critical peak events. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31 and up to five critical peak events between September 1 and May 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer. In the circumstance that MISO declares a maximum Generation Emergency Event, participating customers may receive a critical peak event communication without a guarantee of advance notice. The maximum Generation Emergency Event will be in accordance with the currently effective MISO Emergency Electrical Effective Procedure or North American Electric Reliability Corporation Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared emergency status.

A control group will be established for each critical peak event. ~~Control group participants will not receive notice and shall receive a standard credit of $3.00 for participation in the control group for the critical peak event.~~ Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Peak Reward enrollment transferred to their new premises, unless a request for cancelation is submitted to the Company.

During a critical peak event, customers will be credited the Peak Reward per kWh of incremental energy reductions. Customers participating in the Peak Reward Program cannot participate in the Critical Peak Price Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Peak Reward:	$(0.50)	per kWh of incremental energy reduction during a critical peak event

Critical Peak Price

Participating customers are able to manage electric costs by shifting load during critical peak events to a lower cost pricing period. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer.

A control group will be established for each critical peak event. Control group participants will not receive notice and shall not be penalized for not participating in the critical peak event. Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Critical Peak Price enrollment transferred to their new premises, unless a request for cancellation is submitted to the Company.

During a critical peak event, customers will be charged the Critical Peak Price per kWh consumed during the critical peak event. Customers participating in the Critical Peak Price Program cannot participate in the Peak Reward Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Critical Peak Price:	$1.00	per kWh of energy consumed during a critical peak event between June 1 and August 31
Off-Peak Discount:	*$(0.006008)* ~~$(0.006373)~~	per kWh of Off-Peak kWh between June 1 and August 31

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

~~**(Continued on Sheet No. D-18.00)**~~

RESIDENTIAL ELECTRIC HEATING RATE REH

Availability

Subject to any restrictions, this rate is available to any Full Service Customer utilizing electric heating service for residential use, provided the required metering equipment and supporting infrastructure are installed, in the following areas: (i) private family dwellings; (ii) tourist homes, rooming houses, dormitories, nursing homes and other similarly occupied buildings containing sleeping accommodations for up to six persons; or (iii) existing multifamily dwellings containing up to four households served through a single meter. Service for single-phase or three-phase equipment may be included under this rate, provided the individual capacity of such equipment does not exceed 3 hp or 3 kW, nor does the total connected load of the home exceed 10 kW, except as provided for below.

Service for charging Electric Vehicles is available on this rate and shall not exceed 9.6 kW, except as provided for below. Electric Vehicle charging equipment is not included in the total connected load of the home for purpose of this section.

Individual equipment exceeding 3 hp or 3 kW, Electric Vehicle charging equipment exceeding 9.6 kW or total household load exceeding 10 kW may be subject to additional charges in accordance with Rule C6., Distribution Systems, Line Extensions and Service Connections. Such charges shall only apply to the extent the cost exceeds that of ensuring the connecting equipment matches that provided as standard to new residential customers.

This rate is not available for: (i) resale purposes; (ii) multifamily dwellings containing more than four living units served through a single meter; (iii) tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons; (iv) any other Non-Residential usage; or (v) Rule C5.5 - Non-Transmitting Meter Provision participants.

Residences in conjunction with commercial or industrial enterprises and mobile home parks may take service on this rate only under the Rules and Regulations contained in the Company's Electric Rate Book.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service Customers.

(Continued on Sheet No. D-20.00)

RESIDENTIAL ELECTRIC HEATING RATE REH

(Continued From Sheet No. D-19.00)

Monthly Rate: (Contd)

Income Assistance Service Provision (RIA):

When service is supplied to a Principal Residence Customer, where the total household income does not exceed 150% of the Federal Poverty level, a credit shall be applied during all billing months. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. *A Home Heating Credit energy draft*
2. *State Emergency Relief*
3. *Assistance from a Michigan Energy Assistance Program (MEAP)*
4. *Medicaid*

If a customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for the Income Assistance Service Provision (RIA) shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Income Assistance Credit: $(12.00) per customer per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges.

This credit shall not be taken in conjunction with a credit for the Senior Citizen Service Provision (RSC).

Low Income Assistance Credit (LIAC):

Company selected Residential customers may receive LIAC for up to 12 consecutive months. The number of customers enrolled may be adjusted, at the Company's discretion, in order to dispense Commission-approved LIAC funding on an annual basis. Any shortfall in the dispensing of annual LIAC funds to qualified customers shall be carried over into the subsequent LIAC program year. LIAC customer selection will be based on highest need and with total household income that does not exceed 150% of the Federal Poverty level. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. *Customers whose total household income does not exceed 150% of the Federal Poverty level within the last 12 months*
2. *Customers who have received assistance from a Michigan Energy Assistance Program (MEAP)*
3. *Customers who have received a Home Heating Credit energy draft*
4. *A State Emergency Relief program*
5. *Medicaid*
6. *Customers that have participated in a Supplementary Nutrition Assistance Program where the total household income does not exceed 150% of the Federal Poverty level within the last 12 months.*

If the customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for LIAC shall be applied as follows:

Low Income Assistance Credit: $(42.00) per meter per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges. Re-enrollment, if applicable, and confirmation of qualification is required for each annual period of participation.

Customers selected for LIAC will not be eligible for the RIA Provision while enrolled in LIAC.

Senior Citizen Service Provision (RSC):

When service is supplied to the Principal Residence Customer who is 65 years of age or older and head of household, a credit shall be applied during all billing months.

The monthly credit for the residential Senior Citizen Service Provision shall be applied as follows:

Delivery Charges: ***These charges are applicable to Full Service and Retail Open Access customers.***

Senior Citizen Credit: $(4.00) per customer per month

This credit shall not be taken in conjunction with a credit for the Income Assistance Service Provision (RIA) and shall not be applied to more than one account per Principal Residence Customer.

(Continued on Sheet No. D-21.00)

RESIDENTIAL ELECTRIC HEATING RATE REH

(Continued From Sheet No. D-20.00)

Monthly Rate (Contd)

Device Cycling Program

A customer who is taking service from the Company may be eligible to participate in the Company's voluntary Device Cycling Program for load management of eligible electric equipment, including air conditioning and water heaters. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. Customer eligibility to participate is determined solely by the Company and Device Cycling Program Credits may be taken in conjunction with one another. The Company will accept a customer's qualifying electric equipment under this program only if it has the capability to be controlled by the Company or with a contractual agreement with a landlord if the customer is not the property owner. The Company will install the required equipment at the premises which will allow load management upon signal from the Company. When load management equipment is installed at a premises, future customers will be auto-enrolled into the Device Cycling Program. Upon move in, the customer will be notified confirming participation in the Device Cycling Program and will have 30 days to opt out. Such equipment shall be furnished, installed, maintained and owned by the Company at the Company's expense. Equipment installations must conform to the Company's specifications.

Customers can elect to participate in the Device Cycling Program and the Peak Reward Program as described in this tariff. When a customer participates in both programs, the customer's credit earned from their incremental savings through Peak Reward is compared to the total credit earned under the Device Cycling Program. The greater of the two credits will be applied to the customer's invoice for that billing month. Both credits will not apply in a single billing month.

The Company reserves the right to specify the term or duration of the program. The customer's enrollment shall be terminated if the voluntary program ceases, if the customer tampers with the control switch or the Company's equipment or any reasons as provided for in Rule C1.3, Use of Service. The Company reserves the right to call test events between September 1 and May 31 for customers participating in the Device Cycling Program.

Load management may occur during the summer billing months of June through August only. Load management may be implemented for, but not limited to, maintaining system integrity, making an emergency purchase, economic reasons, or when there is insufficient system generation available to meet anticipated system load. Load management may occur on any day, during any hour, and for any length of time during a declared emergency event as directed by MISO.

The customer may contact the Company to request to override a load management event for one load management event during the June through August months in any one calendar year for the balance of the hours left in that load management event with no penalty. The request shall be granted at the discretion of the Company. If the override request was granted by the Company and the customer requests and is granted any additional overrides in the same calendar year, the Device Cycling Credit may be forfeited for that billing month.

Rule C1.1 Character of Service, Rule C3 Emergency Electrical Procedures and other rules and regulations contained in the Company's Electric Rate Book apply to customers taking service under this Device Cycling Program.

The monthly credit(s) for the Peak Power Savers Program shall be applied as follows:

Power Supply Charges: These charges are applicable to Full Service Customers.

Air Conditioner Peak Cycling Credit:	*$(5.00)*	*per customer per month during the billing months of June - August*

(Continued on Sheet No. D-22.00)

RESIDENTIAL ELECTRIC HEATING RATE REH

(Continued From Sheet No. D-22.00)

Monthly Rate (Contd)

Peak Reward

Participating customers are able to manage electric costs by reducing load during critical peak events. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31 and up to five critical peak events between September 1 and May 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer. In the circumstance that MISO declares a maximum Generation Emergency Event, participating customers may receive a critical peak event communication without a guarantee of advance notice. The maximum Generation Emergency Event will be in accordance with the currently effective MISO Emergency Electrical Effective Procedure or North American Electric Reliability Corporation Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared emergency status.

A control group will be established for each critical peak event. Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Peak Reward enrollment transferred to their new premises, unless a request for cancelation is submitted to the Company.

During a critical peak event, customers will be credited the Peak Reward per kWh of incremental energy reductions. Customers participating in the Peak Reward Program cannot participate in the Critical Peak Price Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Peak Reward:	$(0.50)	per kWh of incremental energy reduction during a critical peak event

Critical Peak Price

Participating customers are able to manage electric costs by shifting load during critical peak events to a lower cost pricing period. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer.

A control group will be established for each critical peak event. Control group participants will not receive notice and shall not be penalized for not participating in the critical peak event. Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Critical Peak Price enrollment transferred to their new premises, unless a request for cancellation is submitted to the Company.

During a critical peak event, customers will be charged the Critical Peak Price per kWh consumed during the critical peak event. Customers participating in the Critical Peak Price Program cannot participate in the Peak Reward Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Critical Peak Price:	$1.00	per kWh of energy consumed during a critical peak event between June 1 and August 31
Off-Peak Discount:	$(0.006008)	per kWh of Off-Peak kWh between June 1 and August 31

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

(Continued on Sheet No. D-23.00)

RESIDENTIAL ELECTRIC HEATING RATE REH

(Continued From Sheet No. D-22.00)

Monthly Rate: (Contd)

Net Metering Program:

The Net Metering Program is available to any eligible customer as described in Rule C 11.2., Net Metering Program, who desires to generate a portion or all of their own retail electricity requirements using a Renewable Energy Resource as defined in Rule C11.2.B, Net Metering Definitions.

A customer who participates in the Net Metering Program is subject to the provisions contained in Rule C 11.2., Net Metering Program.

Distributed Generation Program:

The Distributed Generation Program is available to any eligible customer as described in Rule C 11.3., Distributed Generation Program, who desires to generate a portion or all of their own retail electricity requirements using a Renewable Energy Resource as defined in Rule C 11.3.B., Distributed Generation Definitions.

A customer who participates in the Distributed Generation Program is subject to the provisions contained in Rule C 11.3., Distributed Generation Program.

Green Generation Program:

Customer contracts for participation in the Green Generation Program shall be available to any eligible customer as described in Rule C10.2, Green Generation Program.

A customer who participates in the Green Generation Program is subject to the provisions contained in Rule C10.2, Green Generation Program.

Renewable Energy Credit (REC) Programs:

These programs provide customers with the opportunity to subscribe to the environmental attribute of renewable energy by offering customers the ability to utilize renewable energy credits to match up to 100% of their total annual energy.

A customer that participates in one of the Renewable Energy Credit (REC) Programs is subject to the provisions contained in Rule C10.8., Renewable Energy Credits (REC) Programs.

General Terms:

This rate is subject to all general terms and conditions shown on Sheet No. D-1.00.

Schedule of On-Peak and Off-Peak Hours:

The following schedule shall apply Monday through Friday, June 1 through September 30, including weekday holidays when applicable:

(1) On-Peak Hours: 2:00 PM to 7:00 PM
(2) Off-Peak Hours: 7:00 PM to 2:00 PM

Saturday and Sunday are Off-Peak.

Minimum Charge:

The System Access Charge included in the rate, adjusted for qualified service provision credit and any applicable non-consumption based surcharges.

Due Date and Late Payment Charge:

The due date of the customer's bill shall be 21 days from the date of transmittal. A late payment charge of 2%, not compounded, of the portion of the bill, net of taxes, shall be assessed to any bill that is delinquent. A customer who participates in the Winter Protection Plan or who is 65 years of age or older and who has notified the Company the customer is 65 years of age or older, shall be exempt from a late payment charge as described in Rule B2., Consumer Standards and Billing Practices for Electric and Natural Gas Service, R 460.125, Late payment charges.

Term and Form of Contract:

Service under this rate shall not require a written contract except for the Green Generation Program participants.

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-36.00**

RESIDENTIAL SMART HOURS RATE RSH

Availability

Subject to any restrictions, this rate is available to any Full Service residential customers who have the required metering equipment and infrastructure installed. The Company will furnish, maintain and own the required equipment at the customers' premises at the Company's request. By selecting this rate schedule, the customer agrees to provide an email address. Electric consumption is billed using on-peak and off-peak periods year-round on the Residential Smart Hours Rate.

Service for single-phase or three-phase equipment may be included under this rate, provided the individual capacity of such equipment does not exceed 3 hp or 3 kW, nor does the total connected load of the home exceed 10 kW, except provided for below.

Service for charging Electric Vehicles is available on this rate and shall not exceed 9.6 kW, except as provided for below. Electric Vehicle charging equipment is not included in the total connected load of the home for purposes of this section.

Individual equipment exceeding 3 hp or 3 kW, Electric Vehicle charging equipment exceeding 9.6 kW, or total household load exceeding 10 kW may be subject to additional charges in accordance with Rule C6., Distribution Systems, Line Extensions and Service Connections. Such charges shall only apply to the extent the cost exceeds that of ensuring the connecting equipment matches that provided as standard to new residential customers.

This rate is not available for*: (i)* resale purposes ~~or for~~*; (ii) multifamily dwellings containing more than four living units served through a single meter; (iii) tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons; (iv)* any *other* Non-Residential usage *or (v) customers being served under Rule C5.5 Non-Transmitting Meter Provision*.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service Customers.

Energy Charge:

	Non-Capacity	Capacity	Total	
Off-Peak - Summer	*$0.077148* ~~$0.067348~~	*$0.031811* ~~$0.036622~~	*$0.108959* ~~$0.103970~~	per kWh for all Off-Peak kWh between June 1 and September 30
On-Peak - Summer	*$0.114377* ~~$0.098398~~	*$0.046477* ~~$0.053506~~	*$0.160854* ~~$0.151904~~	per kWh for all On-Peak kWh between June 1 and September 30
Off-Peak - Winter	*$0.059486* ~~$0.052104~~	*$0.024611* ~~$0.028333~~	*$0.084097* ~~$0.080437~~	per kWh for all Off-Peak kWh between October 1 and May 31
On-Peak - Winter	*$0.073858* ~~$0.062442~~	*$0.029494* ~~$0.033954~~	*$0.103352* ~~$0.096396~~	per kWh for all On-Peak kWh between October 1 and May 31

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Delivery Charges: These charges are applicable to Full Service Customers.

System Access Charge:	$8.00	per customer per month
Distribution Charge:	$~~0.093333~~ *0.110796*	per kWh for all kWh for a Full Service customer

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10

(Continued on Sheet No. D-36.10)

RESIDENTIAL SMART HOURS RATE RSH

(Continued From Sheet No. D-36.00)

Income Assistance Service Provision (RIA):

When service is supplied to a Principal Residence Customer, where the total household income does not exceed 150% of the Federal Poverty level, a credit shall be applied during all billing months. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. A Home Heating Credit energy draft
2. State Emergency Relief
3. Assistance from a Michigan Energy Assistance Program (MEAP)
4. Medicaid

If a customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for the Income Assistance Service Provision (RIA) shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Income Assistance Credit: $~~(8.00)~~ *(12.00)* per customer per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges.

This credit shall not be taken in conjunction with a credit for the Senior Citizen Service Provision (RSC).

Low Income Assistance Credit (LIAC):

Company selected Residential customers may receive LIAC for up to 12 consecutive months. The number of customers enrolled may be adjusted, at the Company's discretion, in order to dispense Commission-approved LIAC funding on an annual basis. Any shortfall in the dispensing of annual LIAC funds to qualified customers shall be carried over into the subsequent LIAC program year. LIAC customer selection will be based on highest need and with total household income that does not exceed 150% of the Federal Poverty level. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. Customers whose total household income does not exceed 150% of the Federal Poverty level within the last 12 months
2. Customers who have received assistance from a Michigan Energy Assistance Program (MEAP)
3. Customers who have received a Home Heating Credit energy draft
4. A State Emergency Relief program
5. Medicaid
6. Customers that have participated in a Supplementary Nutrition Assistance Program where the total household income does not exceed 150% of the Federal Poverty level within the last 12 months.

If the customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for LIAC shall be applied as follows:

Low Income Assistance Credit: $(42.00) per meter per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges. Re-enrollment, if applicable, and confirmation of qualification is required for each annual period of participation.

Customers selected for LIAC will not be eligible for the RIA Provision while enrolled in LIAC.

Senior Citizen Service Provision (RSC):

When service is supplied to the Principal Residence Customer who is 65 years of age or older and head of household, a credit shall be applied during all billing months.

The monthly credit for the residential Senior Citizen Service Provision shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service and Retail Open Access customers.

Senior Citizen Credit: $(4.00) per customer per month

This credit shall not be taken in conjunction with a credit for the Income Assistance Service Provision (RIA) and shall not be applied to more than one account per Principal Residence Customer.

RESIDENTIAL SMART HOURS RATE RSH

(Continued From Sheet No. D-37.00)

Monthly Rate: (Contd)

Peak Reward

Participating customers are able to manage electric costs by reducing load during critical peak events. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31 and up to five critical peak events between September 1 and May 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer. In the circumstance that MISO declares a maximum Generation Emergency Event, participating customers may receive a critical peak event communication without a guarantee of advance notice. The maximum Generation Emergency Event will be in accordance with the currently effective MISO Emergency Electrical Effective Procedure or North American Electric Reliability Corporation Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared emergency status.

A control group will be established for each critical peak event. ~~Control group participants will not receive notice and shall receive a standard credit of $3.00 for participation in the control group for the critical peak event.~~ Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Peak Reward enrollment transferred to their new premises, unless a request for cancelation is submitted to the Company.

During a critical peak event, customers will be credited the Peak Reward per kWh of incremental energy reductions. Customers participating in the Peak Reward Program cannot participate in the Critical Peak Price Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Peak Reward:	$(0.50)	per kWh of incremental energy reduction during a critical peak event

Critical Peak Price

Participating customers are able to manage electric costs by shifting load during critical peak events to a lower cost pricing period. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer.

A control group will be established for each critical peak event. Control group participants will not receive notice and shall not be penalized for not participating in the critical peak event. Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Critical Peak Price enrollment transferred to their new premises, unless a request for cancellation is submitted to the Company.

During a critical peak event, customers will be charged the Critical Peak Price per kWh consumed during the critical peak event. Customers participating in the Critical Peak Price Program cannot participate in the Peak Reward Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Critical Peak Price:	$1.00	per kWh of energy consumed during a critical peak event between June 1 and August 31
Off-Peak Discount:	*$(0.006008)* ~~$(0.006373)~~	per kWh of Off-Peak kWh between June 1 and August 31

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

(Continued on Sheet No. D-39.00)

RESIDENTIAL NIGHTTIME SAVERS RATE RPM

Availability

The Residential Nighttime Savers Rate is voluntary and available for service rendered on and after June 1, 2021 to Full Service residential customers who have the required metering equipment and infrastructure installed. The Company will furnish, install, maintain and own the required equipment at the customers' premises at the Company's expense.

Service for single-phase or three-phase equipment may be included under this rate, provided the individual capacity of such equipment does not exceed 3 hp or 3 kW, nor does the total connected load of the home exceed 10 kW, except as provided for below.

Service for charging Electric Vehicles is available on this rate and shall not exceed 9.6 kW, except as provided for below. Electric Vehicle charging equipment is not included in the total connected load of the home for purposes of this section.

Individual equipment exceeding 3 hp or 3 kW, Electric Vehicle charging equipment exceeding 9.6 kW, or total household load exceeding 10 kW may be subject to additional charges in accordance with Rule C6., Distribution Systems, Line Extensions and Service Connections. Such charges shall only apply to the extent cost exceeds that of ensuring the connecting equipment matches that provided as standard to new residential customers.

This rate is not available for: (i) resale purposes; (ii) multifamily dwellings containing more than four living units served through a single meter; (iii) tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons; (iv) any other Non-Residential usage or (v) customers being served under Rule C5.5 Non-Transmitting Meter Provision.

Residences in conjunction with commercial or industrial enterprises and mobile home parks may take service on this program only under the Rules and Regulations contained in the Company's Electric Rate Book.

Nature of Service

Service under this program shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service Customers.

Income Assistance Service Provision (RIA):

When service is supplied to a Principal Residence Customer, where the total household income does not exceed 150% of the Federal Poverty level, a credit shall be applied during all billing months. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. A Home Heating Credit energy draft
2. State Emergency Relief
3. Assistance from a Michigan Energy Assistance Program (MEAP)
4. Medicaid

If a customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for the Income Assistance Service Provision (RIA) shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Income Assistance Credit: $~~(8.00)~~ *(12.00)* per customer per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges.

This credit shall not be taken in conjunction with a credit for the Senior Citizen Service Provision (RSC).

Low Income Assistance Credit (LIAC):

Company selected Residential customers may receive LIAC for up to 12 consecutive months. The number of customers enrolled may be adjusted, at the Company's discretion, in order to dispense Commission-approved LIAC funding on an annual basis. Any shortfall in the dispensing of annual LIAC funds to qualified customers shall be carried over into the subsequent LIAC program year. LIAC customer selection will be based on highest need and with total household income that does not exceed 150% of the Federal Poverty level. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. Customers whose total household income does not exceed 150% of the Federal Poverty level within the last 12 months
2. Customers who have received assistance from a Michigan Energy Assistance Program (MEAP)
3. Customers who have received a Home Heating Credit energy draft
4. A State Emergency Relief program
5. Medicaid
6. Customers that have participated in a Supplementary Nutrition Assistance Program where the total household income does not exceed 150% of the Federal Poverty level within the last 12 months.

If the customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for LIAC shall be applied as follows:

Low Income Assistance Credit: $(42.00) per meter per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges. Re-enrollment, if applicable, and confirmation of qualification is required for each annual period of participation.

Customers selected for LIAC will not be eligible for the RIA Provision while enrolled in LIAC.

RESIDENTIAL NIGHTTIME SAVERS RATE RPM

(Continued From Sheet No. D-41.00)

Monthly Rate (Contd)

Device Cycling Program (Contd)

Load management may occur during the summer months of June through August only. Load management may be implemented for, but not limited to, maintaining system integrity, making an emergency purchase, economic reasons, or when there is insufficient system generation available to meet anticipated system load. Load management may occur on any day, during any hour, and for any length of time during a declared emergency event as directed by MISO.

The Customer may contact the Company to request to override a load management event for one load management event during the June through August months in any one calendar year for the balance of the hours left in that load management event with no penalty. The request shall be granted at the discretion of the Company. If the override request was granted by the Company and the customer requests and is granted any additional overrides in the same calendar year, the Device Cycling Credit may be forfeited for that billing month.

Rule C1.1 Character of Service, Rule C3 Emergency Electrical Procedures and other rules and regulations contained in the Company's Electric Rate Book apply to customers taking service under this Peak Power Savers - Device Cycling Program.

The monthly credit(s) for the Peak Power Savers Program shall be applied as follows:

Power Supply Charges: These charges are applicable to Full Service Customers.

Air Conditioner Peak Cycling Credit:	$(5.00)	per customer per month during the billing months of June - August

Peak Reward

Participating customers are able to manage electric costs by reducing load during critical peak events. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. The Company may call up to fourteen critical peak events between June 1 and August 31 and up to five critical peak events between September 1 and May 31. Customers will be notified by 11:59 PM the day before a critical peak event is expected to occur. Receipt of such notice is the responsibility of the participating customer. In the circumstance that MISO declares a maximum Generation Emergency Event, participating customers may receive a critical peak event communication without a guarantee of advance notice. The maximum Generation Emergency Event will be in accordance with the currently effective MISO Emergency Electrical Procedure or North American Electric Reliability Corporation Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared emergency status.

A control group will be established for each critical peak event. ~~Control group participants will not receive notice and shall receive a standard credit of $3.00 for participation in the control group for the critical peak event.~~ Customers may be assigned to a maximum of two control groups per event season.

Customers must have a transmitting meter to participate in Peak Power Savers. Customers who relocate within the Consumers Energy electric service territory will have their Peak Reward Enrollment transferred to their new premises, unless a request for cancelation is submitted to the Company.

During a critical peak event, customers on will be credited the Peak Reward per kWh of incremental energy reductions. Customers participating in the Peak Reward Program cannot participate in the Critical Peak Price Program.

Power Supply Charges: These charges are applicable to Full Service Customers.

Peak Reward	$(0.50)	per kWh of incremental energy reduction during a critical peak event

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

Net Metering Program

The Net Metering Program is available to any eligible customer as described in Rule C 11.2., Net Metering Program, who desires to generate a portion or all of their own retail electricity requirements using a Renewable Energy Resource as defined in Rule C 11.2.B., Net Metering Definitions.

A customer who participates in the Net Metering Program is subject to the provision contained in Rule C 11.2., Net Metering Program.

Distributed Generation Program

The Distributed Generation Program is available to any eligible customer as described in Rule C 11.3., Distributed Generation Program, who desires to generate a portion or all of their own retail electricity requirements using a Renewable Energy Resource as defined in Rule C 11.3.B., Distributed Generation Definitions.

A customer who participates in the Distributed Generation Program is subject to the provisions contained in Rule C 11.3., Distributed Generation Program.

Green Generation Program

Customer contracts for participation in the Green Generation Program shall be available to any eligible customer as described in Rule C10.2, Green Generation Program.

A customer who participates in the Green Generation Program is subject to the provisions contained in Rule C10.2, Green Generation Program.

(Continued on Sheet No. D-44.00)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-44.10**

RESIDENTIAL SERVICE SECONDARY NON-TRANSMITTING METER RATE RSM

Availability

Subject to any restrictions, this rate is available to any customer desiring electric service for any usual residential use in: (i) private family dwellings; (ii) tourist homes, rooming houses, dormitories, nursing homes and other similarly occupied buildings containing sleeping accommodations for up to six persons; or (iii) existing multifamily dwellings containing up to four households served through a single meter. Service for single-phase or three-phase equipment may be included under this rate, provided the individual capacity of such equipment does not exceed 3 hp or 3 kW, nor does the total connected load of the home exceed 10 kW, except as provided for below.

Service for charging Electric Vehicles is available on this rate and shall not exceed 9.6 kW, except as provided for below. Electric Vehicle charging equipment is not included in the total connected load of the home for purposes of this section.

Individual equipment exceeding 3 hp or 3 kW, Electric Vehicle charging equipment exceeding 9.6 kW, or total household load exceeding 10 kW may be subject to additional charges in accordance with Rule C6., Distribution Systems, Line Extensions and Service Connections. Such charges shall only apply to the extent the cost exceeds that of ensuring the connecting equipment matches that provided as standard to new residential customers.

This rate is only available to customers electing a Non-Transmitting Meter in accordance with Rule C5.5, Non-Transmitting Meter Provision, customers with a Non-Communicating Advanced Metering Infrastructure (AMI) Meter, or customers determined to be eligible at the Company's sole discretion.

A Non-Communicating AMI meter is unable to consistently transmit interval data to the Company's billing system. Non-Communicating Meters are determined at the Company's sole discretion and are subject to a minimum of one communication review per calendar year. When the meter has been determined to successfully communicate interval data, the customer may be transferred to Residential Service Secondary On-Peak Summer Basic Rate RSP. The transfer to Rate RSP shall not occur between June 1 and September 30.

This rate is not available for: (i) resale purposes; (ii) multifamily dwellings containing more than four living units served through a single meter; (iii) tourist homes, rooming houses, dormitories, nursing homes and similarly occupied buildings containing sleeping accommodations for more than six persons; or (iv) any other Non-Residential usage.

Residences in conjunction with commercial or industrial enterprises and mobile home parks may take service on this rate only under the Rules and Regulations contained in the Company's Electric Rate Book.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

The Company will schedule meter readings on a monthly basis and attempt to obtain an actual meter reading for all tourist and/or occasional residence customers at intervals of not more than six months.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service customers.

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

(Continued on Sheet No. D-44.20)

RESIDENTIAL SERVICE SECONDARY NON-TRANSMITTING METER RATE RSM

(Continued From Sheet No. D-44.10)

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access customers.**

System Access Charge:	$8.00	per customer per month
Distribution Charge:	$~~0.093333~~ *0.110796*	per kWh for all kWh

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Income Assistance Service Provision (RIA)

When service is supplied to a Principal Residence Customer, where the total household income does not exceed 150% of the Federal Poverty level, a credit shall be applied during all billing months. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following in the past 12 months:

1. A Home Heating Credit energy draft
2. State Emergency Relief
3. Assistance from a Michigan Energy Assistance Program (MEAP)
4. Medicaid

If a customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for the Income Assistance Service Provision (RIA) shall be applied as follows:

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access Customers.**

Income Assistance Credit:	$~~(8.00)~~ *(12.00)*	per customer per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges.
This credit shall not be taken in conjunction with a credit for the Senior Citizen Service Provision (RSC).

Low Income Assistance Credit (LIAC)

Company selected Residential customers may receive LIAC for up to 12 consecutive months. The number of customers enrolled may be adjusted, at the Company's discretion, in order to dispense Commission-approved LIAC funding on an annual basis. Any shortfall in the dispensing of annual LIAC funds to qualified customers shall be carried over into the subsequent LIAC program year. LIAC customer selection will be based on highest need and with total household income that does not exceed 150% of the Federal Poverty level. The total household income is verified when the customer has provided proof that they have received, or are currently participating in, one or more of the following within the past 12 months:

1. Customers whose total household income does not exceed 150% of the Federal Poverty level within the last 12 months
2. Customers who have received assistance from a Michigan Energy Assistance Program (MEAP)
3. Customers who have received a Home Heating Credit energy draft
4. A State Emergency Relief program
5. Medicaid
6. Customers that have participated in a Supplementary Nutrition Assistance Program where the total household income does not exceed 150% of the Federal Poverty level within the last 12 months.

If the customer does not meet any of the above requirements, a low-income verification form will be provided by the Company for the customer to complete and return.

The monthly credit for LIAC shall be applied as follows:

Low Income Assistance Credit:	$(42.00)	per meter per month

If a credit balance occurs, the credit shall apply to the customer's future electric utility charges. Re-enrollment, if applicable, and confirmation of qualification is required for each annual period of participation.

Customers selected for LIAC will not be eligible for the RIA Provision while enrolled in LIAC.

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-45.00**

GENERAL SERVICE SECONDARY RATE GS

Availability

Subject to any restrictions, this rate is available to any general use customer, political subdivision or agency of the State of Michigan, either acting separately or in combinations permitted under the laws of this state, desiring Secondary Voltage service for any of the following: (i) standard secondary service, (ii) public potable water pumping and/or waste water system(s), or (iii) resale purposes. This rate is also available for service to any Primary Rate Customer where the Company elects to provide one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer.

This rate is not available for: (i) private family dwellings, (ii) lighting service except for private streets, mobile home parks or service to temporary lighting installations, (iii) heating water for industrial processing, (iv) resale for lighting service, or (v) new or expanded service for resale to residential customers. Unmetered Billboard Service is not available to Retail Open Access service.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Three-phase, 3-wire service requires that the customer furnishes all transformation facilities required for single-phase load and so arranges the load as to avoid excessive unbalance of the three-phase load. When the service is single-phase, or 4-wire, three-phase, the single-phase individual motor capacity shall not exceed 3 hp, nor the total single-phase motor capacity of 10 hp, without the specific consent of the Company.

Where the Company elects to measure the service on the Primary side of the transformers, 3% shall be deducted for billing purposes from the energy measurements thus made. Where the Company elected to provide a Primary Rate Customer one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer, 3% shall not be deducted for billing purposes from the energy measurements thus made.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service customers.

Energy Charge:

Non-Capacity	Capacity	Total	
$0.082864 ~~$0.073051~~	*$0.028634* ~~$0.035056~~	*$0.111498* ~~$0.108107~~	per kWh for all kWh during the billing months of June - September
$0.061019 ~~$0.053797~~	*$0.021227* ~~$0.025987~~	*$0.082246* ~~$0.079784~~	per kWh for all kWh during the billing months of October - May

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Delivery Charges: These charges are applicable to Full Service and Retail Open Access customers.

System Access Charge:	$20.00	per customer per month
Distribution Charge:	$~~0.069433~~ *0.084400*	per kWh for all kWh

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Billboard Service Provision

Monthly kWh shall be determined by multiplying the total connected load in kW (including the lamps, ballasts, transformers, amplifiers, and control devices) times 730 hours. The kWh for cyclical devices shall be adjusted for the average number of hours used.

(Continued on Sheet No. D-46.00)

GENERAL SERVICE SECONDARY RATE GS

(Continued From Sheet No. D-45.00)

Monthly Rate: (Contd)

Resale Service Provision

Subject to any restrictions, this provision is available to customers desiring Secondary Voltage service for resale purposes in accordance with Rule C4.4, Resale.

Educational Institution Service Provision (GEI)

When service is supplied to a school, college or university, a credit shall be applied during all billing months. As used in this provision, "school" shall mean buildings, facilities, playing fields, or property directly or indirectly used for school purposes for children in grades kindergarten through twelve, when provided by a public or nonpublic school. School does not include instruction provided in a private residence or proprietary trade, vocational, training, or occupational school. "College" or "University" shall mean buildings located on the same campus and used to impart instruction, including all adjacent and appurtenant buildings owned by the same customer which are located on the same campus and which constitute an integral part of such college or university facilities.

The monthly credit for the Educational Institution Service Provision shall be applied as follows:

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access Customers.**

Education Institution Credit: $~~(0.001000)~~ *(0.001179)* per kWh for all kWh

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

Demand Response Program

Customers participating in the voluntary Demand Response Program help reduce peak demand when energy use is the highest. A customer specific agreement stating the customer's Contracted Capacity kW shall be completed prior to participation in the Demand Response Program. Customer eligibility to participate in this program is determined solely by the Company. The Company reserves the right to specify the term or duration of the program. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season.

Under this program, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this program must be supported by an updated energy reduction plan on an annual basis.

Demand Response Program customers shall receive an annual Program Payment on the customer bill or a check for the capacity amount delivered during events specified in the customer specific agreement within three billing cycles after the program season ends. Eligible customers may also receive Emergency Event Performance Payments on the customer bill under specific circumstances as outlined in the customer specific agreement. If a customer fails to deliver their total Contracted Capacity during an Emergency Event ordered by Consumers Energy, an Underperformance Penalty may be applicable. Any applicable penalties or program incentives shall be applied to the customer bill. As a condition of enrollment, Customers will be required to provide energy reduction plans that detail their load reduction procedure as specified in the agreement. Customers will be required to provide event notification contacts that support the program. The program agreement will specify the terms of the program that include program duration, number and length of events, performance calculations and program rules.

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system must meet the requirements described in Rule C 11.1., Self-Generation.

(Continued on Sheet No. D-47.00)

GENERAL SERVICE SECONDARY TIME-OF-USE RATE GSTU

Availability

Subject to any restrictions, General Service Secondary Time-of-Use Rate GSTU is available to any Full Service Customer taking service at the Company's Secondary Voltage level with advanced metering infrastructure and supporting critical systems. Standby service shall be provided on this rate for secondary customers with solar installations equal to or greater than 150 kW.

This rate is not available for: (i) private family dwellings, (ii) lighting service except for private streets, mobile home parks or service to temporary lighting installations, (iii) heating water for industrial processing, (iv) resale for lighting service, or (v) new or expanded service for resale to residential customers.

This rate shall not be taken in conjunction with Net Metering.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Three-phase, 3-wire service requires that the customer furnishes all transformation facilities required for single-phase load and so arranges the load as to avoid excessive unbalance of the three-phase load. When the service is single-phase, or 4-wire, three-phase, the single-phase individual motor capacity shall not exceed 3 hp, nor the total single-phase motor capacity of 10 hp, without the specific consent of the Company.

Where the Company elects to measure the service on the Primary side of the transformers, 3% shall be deducted for billing purposes from the energy measurements thus made. Where the Company elected to provide a Primary Rate Customer one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer, 3% shall not be deducted for billing purposes from the energy measurements thus made.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service Customers.

Energy Charge:

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Delivery Charges: **These charges are applicable to Full Service Customers.**

System Access Charge: $20.00 per customer per month

Distribution Charge: $~~0.069433~~ *0.084400* per kWh for all kWh for a Full Service Customer

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

(Continued on Sheet No. D-49.00)

GENERAL SERVICE SECONDARY TIME-OF-USE RATE GSTU

(Continued From Sheet No. D-48.00)

Monthly Rate (Contd)

Schedule of Hours

The following schedule shall apply Monday through Friday (except holidays designated by the Company). Weekends and holidays are off-peak. Holidays designated by the Company include: New Year's Day - January 1, Memorial Day - Last Monday in May, Independence Day - July 4, Labor Day - First Monday in September, Thanksgiving Day - Fourth Thursday in November and Christmas Day - December 25. Whenever January 1, July 4, or December 25 falls on Sunday, extended holiday periods such as Monday, January 2, Monday, July 5 and Monday, December 26 shall not be considered as holidays for application of off-peak hours.

Summer Billing Months of June through September:

(1)	Off-Peak Hours	12:00 AM to 7:00 AM and 11:00 PM to 12:00 AM
(2)	Mid-Peak Hours	7:00 AM to 2:00 PM and 6:00 PM to 11:00 PM
(3)	On-Peak Hours	2:00 PM to 6:00 PM

Winter Billing Months of January through May and October through December:

(1)	Off-Peak Hours	11:00 PM to 7:00 AM
(2)	On-Peak Hours	7:00 AM to 11:00 PM

Resale Service Provision

Subject to any restrictions, the provision is available to customers desiring Secondary Voltage service for resale purposes in accordance with Rule C4.4, Resale.

Educational Institution Service Provision (GEI)

When service is supplied to a school, college or university, a credit shall be applied during all billing months. As used in this provision, "school" shall mean buildings, facilities, playing fields, or property directly or indirectly used for school purposes for children in grades kindergarten through twelve, when provided by a public or nonpublic school. School does not include instruction provided in a private residence or proprietary trade, vocational, training, or occupational school. "College" or "University" shall mean buildings located on the same campus and used to impart instruction, including all adjacent and appurtenant buildings owned by the same customer which are located on the same campus and which constitute an integral part of such college or university facilities.

The monthly credit for the Educational Institution Service Provision shall be applied as follows:

Delivery Charges: **These charges are applicable to Full Service Customers.**

Education Institution Credit: $~~(0.001000)~~ *(0.001179)* per kWh for all kWh

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

General Service Secondary Interruptible (GSI) Provision

This provision is available to no more than 200 Full Service Customers desiring interruptible service in conjunction with service taken under General Service Secondary Demand Rate GSD or General Service Secondary Time-of-Use Rate GSTU. A customer participating in this provision is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. Service to interruptible load shall be taken through separately metered circuits and permanently wired. The design and method of installation for application of this rate shall be subject to the approval of the Company.

Any load designated as interruptible by the customer is subject to Midcontinent Independent System Operator's, Inc. (MISO) requirements for Load Modifying Resources and the Company shall inform the Customer of such MISO requirements. Interruption under this provision may occur if MISO declares a Maximum Generation Emergency Event that requires deployment of Load Modifying Resources in accordance with the currently effective MISO Emergency Electrical Procedures or NERC Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared Emergency Status.

(Continued on Sheet No. D-50.00)

GENERAL SERVICE SECONDARY TIME-OF-USE RATE GSTU

(Continued From Sheet No. D-49.00)

Monthly Rate (Contd)

General Service Secondary Interruptible (GSI) Provision (Contd)

Under this provision, the customer shall be interrupted at any time the Company deems it necessary to maintain system integrity. Service to interruptible load shall not be transferred to firm service circuits to avoid interruption. The Company shall provide the Customer at least 30 minutes notice in advance of a required interruption. Failure to acknowledge receipt of such notice shall not relieve the Customer of the obligation for interruption under the GSI provision. Failure by a customer to comply with a system integrity interruption order of the Company shall be considered unauthorized use and billed at (i) the higher of the actual damages incurred by the Company or (ii) the rate of $25.00 per kW for the highest 15-minute kW of demand created during the interruption period in addition to the prescribed monthly rate.

This rate is not available for loads that are primarily off-peak, for example parking lot lighting. Participation requires a minimum term of one year. All contracts under this provision shall be negotiated on an annual basis for the following capacity planning year (June 1 through May 31) and the Customer must notify the Company by December 10th of each year of their desire to renew the GSI Provision, unless the Customer chooses to lengthen the term of their commitment (up to five years). Annual changes to the amount of interruptible kW for long term contracts are open to adjustment through December 10th of each year.

The monthly credit for the Interruptible Service Provision shall be applied as follows:

Power Supply Charges: **These charges are applicable to Full Service Customers.**

Capacity Credit: These charges are applicable to Full Service Customers.

Interruptible Credit: $~~(0.021695)~~ *(0.021742)* per kWh for all kWh

Demand Response Program

Customers participating in the voluntary Demand Response Program help reduce peak demand when energy use is the highest. A customer specific agreement stating the customer's Contracted Capacity kW shall be completed prior to participation in the Demand Response Program. Customer eligibility to participate in this program is determined solely by the Company. The Company reserves the right to specify the term or duration of the program. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season.

Under this program, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this program must be supported by an updated energy reduction plan on an annual basis.

Demand Response Program customers shall receive an annual Program Payment on the customer bill or a check for the capacity amount delivered during events specified in the customer specific agreement within three billing cycles after the program season ends. Eligible customers may also receive Emergency Event Performance Payments on the customer bill under specific circumstances as outlined in the customer specific agreement. If a customer fails to deliver their total Contracted Capacity during an Emergency Event ordered by Consumers Energy, an Underperformance Penalty may be applicable. Any applicable penalties or program incentives shall be applied to the customer bill. As a condition of enrollment, Customers will be required to provide energy reduction plans that detail their load reduction procedure as specified in the agreement. Customers will be required to provide event notification contacts that support the program. The program agreement will specify the terms of the program that include program duration, number and length of events, performance calculations and program rules.

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

Distributed Generation Program

The Distributed Generation Program is available to any eligible customer as described in Rule C 11.3., Distributed Generation Program, who desires to generate a portion or all of their own retail electricity requirements using a Renewable Energy Resource as defined in Rule C 11.3.B., Distributed Generation Definitions.

A customer who participates in the Distributed Generation Program is subject to the provisions contained in Rule C 11.3., Distributed Generation Program.

(Continued on Sheet No. D-50.10)

GENERAL SERVICE SECONDARY DEMAND RATE GSD

Availability

Subject to any restrictions, this rate is available to any customer desiring Secondary Voltage service, either for general use or resale purposes, where the Peak Demand is 5 kW or more. This rate is also available for service to any Primary Rate Customer where the Company elects to provide one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer.

This rate is not available for: (i) private family dwellings, (ii) lighting service, (iii) resale for lighting service, or (iv) new or expanded service for resale to residential customers.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Secondary Voltage service. The Company will determine the particular nature of the voltage in each case.

Three-phase, 3-wire service requires that the customer furnishes all transformation facilities required for single-phase load and so arranges the load as to avoid excessive unbalance of the three-phase load. When the service is single-phase, or 4-wire, three-phase, the single-phase individual motor capacity shall not exceed 3 hp, nor the total single-phase motor capacity of 10 hp, without the specific consent of the Company.

Where the Company elects to measure the service on the Primary side of the transformers, 3% shall be deducted for billing purposes from the demand and energy measurements thus made. Where the Company elected to provide a Primary Rate Customer one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer, 3% shall not be deducted for billing purposes from the energy measurements thus made.

Monthly Rate

Power Supply Charges: These Charges are applicable to Full Service customers.

GENERAL SERVICE SECONDARY DEMAND RATE GSD

(Continued From Sheet No. D-52.00)

Monthly Rate (Contd)

Educational Institution Service Provision (GEI)

When service is supplied to a school, college or university, a credit shall be applied during all billing months. As used in this provision, "school" shall mean buildings, facilities, playing fields, or property directly or indirectly used for school purposes for children in grades kindergarten through twelve, when provided by a public or nonpublic school. School does not include instruction provided in a private residence or proprietary trade, vocational, training, or occupational school. "College" or "University" shall mean buildings located on the same campus and used to impart instruction, including all adjacent and appurtenant buildings owned by the same customer which are located on the same campus and which constitute an integral part of such college or university facilities.

The monthly credit for the Educational Institution Service Provision shall be applied as follows:

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access Customers.**

Education Institution Credit: $~~(0.000820)~~ *(0.000956)* per kWh for all kWh

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

General Service Secondary Interruptible (GSI) Provision

This provision is available to no more than 200 Full Service Customers desiring interruptible service in conjunction with service taken under General Service Secondary Demand Rate GSD or General Service Secondary Time-of-Use Rate GSTU. A customer participating in this provision is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season. Service to interruptible load shall be taken through separately metered circuits and permanently wired. The design and method of installation for application of this rate shall be subject to the approval of the Company.

Any load designated as interruptible by the customer is subject to Midcontinent Independent System Operator's, Inc. (MISO) requirements for Load Modifying Resources and the Company shall inform the Customer of such MISO requirements. Interruption under this provision may occur if MISO declares a Maximum Generation Emergency Event that requires deployment of Load Modifying Resources in accordance with the currently effective MISO Emergency Electric Procedure or NERC Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared Emergency Status.

Under this provision, the customer shall be interrupted at any time the Company deems it necessary to maintain system integrity. Service to interruptible load shall not be transferred to firm service circuits to avoid interruption. The Company shall provide the Customer at least 30 minutes notice in advance of a required interruption. Failure to acknowledge receipt of such notice shall not relieve the Customer of the obligation for interruption under the GSI provision. Failure by a customer to comply with a system integrity interruption order of the Company shall be considered unauthorized use and billed at (i) the higher of the actual damages incurred by the Company or (ii) the rate of $25.00 per kW for the highest 15-minute kW of demand created during the interruption period in addition to the prescribed monthly rate. This rate is not available for loads that are primarily off-peak, for example parking lot lighting. Participation requires a minimum term of one year. All contracts under this provision shall be negotiated on an annual basis for the following capacity planning year (June 1 through May 31) and the Customer must notify the Company by December 10th of each year of their desire to renew the GSI Provision, unless the Customer chooses to lengthen the term of their commitment (up to five years). Annual changes to the amount of interruptible kW for long term contracts are open to adjustment through December 10th of each year.

The monthly credit for the Interruptible Service Provision shall be applied as follows:

Power Supply Charges: **These charges are applicable to Full Service Customers.**

Capacity Credit: These charges are applicable to Full Service Customers.

Interruptible Credit:	$(8.50)	per kW for all kW of Peak Demand during the billing months of June - September
	$(7.50)	per kW for all kW of Peak Demand during the billing months of October - May

(Continued on Sheet No. D-53.50)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-55.00**

GENERAL SERVICE PRIMARY RATE GP

Availability

As of January 1, 2021, this rate is closed to new business other than for service to DCFC fast charging stations. Subject to any restrictions, this rate is available to any customer, political subdivision or agency of the State of Michigan, either acting separately or in combinations permitted under the laws of this state, desiring Primary Voltage service for general use or for public potable water pumping and/or waste water system(s).

This rate is available to existing Full Service Customers with an electric generating facility interconnected at a primary voltage level utilizing General Service Primary Rate GP for standby service on or before June 7, 2012. The amount of retail usage shall be determined on an hourly basis. Customers with a generating installation are required to have an Interval Data Meter.

This rate is not available to a Primary Rate Customer where the Company elects to provide one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer.

This rate is not available for lighting service, except for temporary service for lighting installations.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Primary Voltage service. The Company will determine the particular nature of the voltage in each case.

Where service is supplied at a nominal voltage of 25,000 Volts or less, the customer shall furnish, install and maintain all necessary transforming, controlling and protective equipment.

Where the Company elects to measure the service at a nominal voltage above 25,000 Volts and where the meter is located on the Company side of the substation transformer, 1% shall be deducted for billing purposes, from the energy measurements thus made.

Where the Company elects to measure the service at a nominal voltage of less than 2,400 Volts, 3% shall be added for billing purposes, to the energy measurements thus made.

Monthly Rate

Power Supply Charges: These charges are applicable to Full Service customers.

Charges for Customer Voltage Level 3 (CVL3)

Energy Charge:

Non-Capacity	Capacity	Total	
$0.076253	*$0.022039*	*$0.098292*	per kWh for all kWh during the billing months
~~$0.069019~~	~~$0.028442~~	~~$0.097461~~	of June - September
$0.056699	*$0.016811*	*$0.073510*	per kWh for all kWh during the billing months
~~$0.051337~~	~~$0.021696~~	~~$0.073033~~	of October - May

Charges for Customer Voltage Level 2 (CVL2)

Energy Charge:

Non-Capacity	Capacity	Total	
$0.075383	*$0.021722*	*$0.097105*	per kWh for all kWh during the billing months
~~$0.068194~~	~~$0.027998~~	~~$0.096192~~	of June - September

Monthly Rate (Contd)

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access (ROA) customers.**

System Access Charge: $100.00 per customer per month

Charges for Customer Voltage Level 3 (CVL3)
Distribution Charge: $~~0.024415~~ *0.030543* per kWh for all kWh

Charges for Customer Voltage Level 2 (CVL2)
Distribution Charge: $~~0.010996~~ *0.013754* per kWh for all kWh

Charges for Customer Voltage Level 1 (CVL1)
Distribution Charge: $~~0.006957~~ *0.009289* per kWh for all kWh

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Adjustment for Power Factor

This rate requires a determination of the average Power Factor maintained by the customer during the billing period. Such average Power Factor shall be determined through metering of lagging Kilovar-hours and Kilowatt-hours during the billing period. The calculated ratio of lagging Kilovar-hours to Kilowatt-hours shall then be converted to the average Power Factor for the billing period by using the appropriate conversion factor. Whenever the average Power Factor during the billing period is above or below .875, the customer bill shall be adjusted as follows:

(a) If the average Power Factor during the billing period is higher than .875, a $1.14 per Kilovar credit will be applied to the amount which the average lagging Kilovar demand during the billing period is below that for an average Power Factor of .875. This credit shall not in any case be used to reduce the prescribed Minimum Charge.

(b) If the average Power Factor during the billing period is less than .875, a per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of .875 in accordance with the following table:

Power Factor	**Penalty**
0.700 to 0.874	$1.14 per Kilovar
Below 0.700	$1.14 per Kilovar first 2 months

(c) A Power Factor less than 0.700 is not permitted and necessary corrective equipment must be installed by the customer. A $5.25 per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of 0.875, after two consecutive months below 0.700 Power Factor and will continue as long as the Power Factor remains below 0.700. Once the customer's Power Factor exceeds 0.700, it is necessary to complete two consecutive months below 0.700 before the $5.25 per Kilovar penalty applies again.

Resale Service Provision

Subject to any restrictions, this provision is available to customers desiring Primary Voltage service for resale purposes in accordance with Rule C4.4, Resale.

(Continued on Sheet No. D-57.00)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-57.00**

GENERAL SERVICE PRIMARY RATE GP

(Continued From Sheet No. D-56.00)

Monthly Rate (Contd)

Substation Ownership Credit

Where service is supplied at a nominal voltage of more than 25,000 volts, and the customer provides all of the necessary transforming, controlling and protective equipment for all of the service there shall be deducted from the bill a monthly credit.

The monthly credit for the substation ownership shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service and Retail Open Access customers.

Charges for Customer Voltage Level 2 (CVL 2)
Substation Ownership Credit: $~~(0.004513)~~ *(0.005083)* per kWh for all kWh

Charges for Customer Voltage Level 1 (CVL 1)
Substation Ownership Credit: $~~(0.004093)~~ *(0.005427)* per kWh for all kWh

For those customers served by more than one substation where one or more of the substations is owned by the customer, the credit will be applied to the customer's coincident Maximum Demand for those substations owned by the customer. This credit shall not operate to reduce the customer's billing below the prescribed minimum charges included in the rate. The credit shall be based on the kW after the 1% deduction or 3% addition has been applied to the metered kWh.

Educational Institution Service Provision (GEI)

When service is supplied to a school, college or university, a credit shall be applied during all billing months. As used in this provision, "school" shall mean buildings, facilities, playing fields, or property directly or indirectly used for school purposes for children in grades kindergarten through twelve, when provided by a public or nonpublic school. School does not include instruction provided in a private residence or proprietary trade, vocational, training, or occupational school. "College" or "University" shall mean buildings located on the same campus and used to impart instruction, including all adjacent and appurtenant buildings owned by the same customer which are located on the same campus and which constitute an integral part of such college or university facilities.

The monthly credit for the Educational Institution Service Provision shall be applied as follows:

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access Customers.**
Educational Institution Credit: $~~(0.000578)~~ *(0.000649)* per kWh for all kWh

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

Demand Response Program

Customers participating in the voluntary Demand Response Program help reduce peak demand when energy use is the highest. A customer specific agreement stating the customer's Contracted Capacity kW shall be completed prior to participation in the Demand Response Program. Customer eligibility to participate in this program is determined solely by the Company. The Company reserves the right to specify the term or duration of the program. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season.

Under this program, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this program must be supported by an updated energy reduction plan on an annual basis.

Demand Response Program customers shall receive an annual Program Payment on the customer bill or a check for the capacity amount delivered during events specified in the customer specific agreement within three billing cycles after the program season ends. Eligible customers may also receive Emergency Event Performance Payments on the customer bill under specific circumstances as outlined in the customer specific agreement. If a customer fails to deliver their total Contracted Capacity during an Emergency Event ordered by Consumers Energy, an Underperformance Penalty may be applicable. Any applicable penalties or program incentives shall be applied to the customer bill. As a condition of enrollment, Customers will be required to provide energy reduction plans that detail their load reduction procedure as specified in the agreement. Customers will be required to provide event notification contacts that support the program. The program agreement will specify the terms of the program that include program duration, number and length of events, performance calculations and program rules.

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

(Continued on Sheet No. D-58.00)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-59.00**

LARGE GENERAL SERVICE PRIMARY DEMAND RATE GPD

Availability

Subject to any restrictions, this rate is available to any customer desiring Primary Voltage service, either for general use or resale purposes, where the On-Peak Billing Demand is 25 kW or more. This rate is also available to any political subdivision or agency of the State of Michigan, either acting separately or in combinations permitted under the laws of this state, for Primary Voltage service for potable water pumping and/or waste water system(s).

This rate is not available to a Primary Rate Customer where the Company elects to provide one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer.

This rate is also not available for lighting service, for resale for lighting service, or for new or expanded service for resale to residential customers.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Primary Voltage service. The Company will determine the particular nature of the voltage in each case.

Where service is supplied at a nominal voltage of 25,000 Volts or less, the customer shall furnish, install and maintain all necessary transforming, controlling and protective equipment.

Where the Company elects to measure the service at a nominal voltage above 25,000 Volts and where the meter is located on the Company side of the substation transformer, 1% shall be deducted for billing purposes, from the demand and energy measurements thus made.

Where the Company elects to measure the service at a nominal voltage of less than 2,400 Volts, 3% shall be added for billing purposes, to the demand and energy measurements thus made.

Interval Data Meters are required for service under this rate. Meter reading will be accomplished electronically through telecommunication links or other electronic data methods able to provide the Company with the metering data / billing determinants necessary for billing purposes.

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access (ROA) customers.**

System Access Charge: $200.00 per customer per month

Charges for Customer Voltage Level 3 (CVL3)
Distribution Charge: ~~$6.68~~ *8.12* per kW of Maximum Demand

Charges for Customer Voltage Level 2 (CVL2)
Distribution Charge: ~~$3.61~~ *4.45* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL1)
Distribution Charge: ~~$2.37~~ *3.28* per kW of Maximum Demand

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Adjustment for Power Factor

This rate requires a determination of the average Power Factor maintained by the customer during the billing period. Such average Power Factor shall be determined through metering of lagging Kilovar-hours and Kilowatt-hours during the billing period. The calculated ratio of lagging Kilovar-hours to Kilowatt-hours shall then be converted to the average Power Factor for the billing period by using the appropriate conversion factor. Whenever the average Power Factor during the billing period is above or below .875, the customer bill shall be adjusted as follows:

(a) If the average Power Factor during the billing period is higher than .875, a $1.14 per Kilovar credit will be applied to the amount which the average lagging Kilovar demand during the billing period is below that for an average Power Factor of .875. This credit shall not in any case be used to reduce the prescribed Minimum Charge.

(b) If the average Power Factor during the billing period is less than .875, a per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of .875 in accordance with the following table:

Power Factor	**Penalty**
0.700 to 0.874	$1.14 per Kilovar
Below 0.700	$1.14 per Kilovar first 2 months

Adjustment for Power Factor shall not be applied when the On-Peak Billing Demand is based on 60% of the highest On-Peak Billing Demand created during the preceding bill months of June through September or on a Minimum On-Peak Billing Demand.

(c) A Power Factor less than 0.700 is not permitted and necessary corrective equipment must be installed by the customer. A $5.25 per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of 0.875, after two consecutive months below 0.700 Power Factor and will continue as long as the Power Factor remains below 0.700. Once the customer's Power Factor exceeds 0.700, it is necessary to complete two consecutive months below 0.700 before the $5.25 per Kilovar penalty applies again.

(Continued on Sheet No. D-62.00)

LARGE GENERAL SERVICE PRIMARY DEMAND RATE GPD

(Continued From Sheet No. D-61.00)

Monthly Rate (Contd)

Maximum Demand

The Maximum Demand shall be the highest 15-minute demand created during the current month or previous 11 months.

On-Peak Billing Demand

The On-Peak Billing Demand shall be based on the highest on-peak demand created during the billing month, but never less than 60% of the highest on-peak billing demand of the four preceding summer billing months (June through September), nor less than 25 kW.

The On-Peak Billing Demand shall be the Kilowatts (kW) supplied during the 15-minute period of maximum use during on-peak hours, as described in Rule C14., Provisions Governing the Application of On-Peak and Off-Peak Rates.

The Company reserves the right to make special determination of the On-Peak Billing Demand, and/or the Minimum Charge, should the equipment which creates momentary high demands be included in the customer's installation.

Transmission On-Peak Billing Demand

The Transmission On-Peak Billing Demand for each billing month shall be the Kilowatts (kW) supplied during the 15-minute period of maximum use during on-peak hours, as described in Rule C14., Provisions Governing the Application of On-Peak and Off-Peak Rates.

Resale Service Provision

Subject to any restrictions, this provision is available to customers desiring Primary Voltage service for resale purposes in accordance with Rule C4.4, Resale.

Substation Ownership Credit

Where service is supplied at a nominal voltage of more than 25,000 Volts, energy is measured through an Interval Data Meter, and the customer provides all of the necessary transforming, controlling and protective equipment for all of the service there shall be deducted from the bill a monthly credit. For those customers, part of whose load is served through customer-owned equipment, the credit shall be based on the Maximum Demand.

The monthly credit for the substation ownership shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service and Retail Open Access Customers

Charges for Customer Voltage Level 2 (CVL 2)
Substation Ownership Credit: $~~(1.93)~~ *(2.16)* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL 1)
Substation Ownership Credit: $~~(1.82)~~ *(2.51)* per kW of Maximum Demand

For those customers served by more than one substation where one or more of the substations is owned by the customer, the credit will be applied to the customer's coincident Maximum Demand for those substations owned by the customer. This credit shall not operate to reduce the customer's billing below the prescribed minimum charges included in the rate. The credit shall be based on the kW after the 1% deduction or 3% addition has been applied to the metered kW.

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-63.00**

LARGE GENERAL SERVICE PRIMARY DEMAND RATE GPD

(Continued From Sheet No. D-62.00)

Monthly Rate (Contd)

Aggregate Peak Demand Service Provision (GAP)

This provision is available to any customer with 7 accounts or more who desire to aggregate their On-Peak Billing Demands for power supply billing purposes. To be eligible, each account must have a minimum average On-Peak Billing Demand of 250 kW and be located within the same billing district. The customer's aggregated accounts shall be billed under the same rate schedule and service provisions. The aggregate maximum capacity of all customers served under this provision shall be limited to 200,000 kW. Not withstanding the specific requirements outlined in this provision, the Company may, at its sole discretion, allow participation by customers who do not fully meet one or more of the stated eligibility criteria, including but not limited to the number of accounts or demand thresholds.

This provision commences with service rendered on and after June 20, 2008 and remains in effect until terminated by a Commission Order.

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

Interval Data Meters are required for service under this provision.

The aggregated accounts shall be summarized for each interval time period registered and a comparison shall be performed to determine the on-peak time at which the summarized value of the aggregated accounts reached a maximum for the billing month. The individual aggregated accounts shall be billed for their corresponding On-Peak Billing Demand occurring at that point in time.

Educational Institution Service Provision (GEI)

When service is supplied to a school, college or university, a credit shall be applied during all billing months. As used in this provision, "school" shall mean buildings, facilities, playing fields, or property directly or indirectly used for school purposes for children in grades kindergarten through twelve, when provided by a public or nonpublic school. School does not include instruction provided in a private residence or proprietary trade, vocational, training, or occupational school. "College" or "University" shall mean buildings located on the same campus and used to impart instruction, including all adjacent and appurtenant buildings owned by the same customer which are located on the same campus and which constitute an integral part of such college or university facilities.

The monthly credit for the Educational Institution Service Provision shall be applied as follows:

Delivery Charges: **These charges are applicable to Full Service and Retail Open Access Customers.**

Educational Institution Credit: $~~(0.000205)~~ *(0.000226)* per kWh for all kWh

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

Demand Response Program

Customers participating in the voluntary Demand Response Program help reduce peak demand when energy use is the highest. A customer specific agreement stating the customer's Contracted Capacity kW shall be completed prior to participation in the Demand Response Program. Customer eligibility to participate in this program is determined solely by the Company. The Company reserves the right to specify the term or duration of the program. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season.

Under this program, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this program must be supported by an updated energy reduction plan on an annual basis.

Demand Response Program customers shall receive an annual Program Payment on the customer bill or a check for the capacity amount delivered during events specified in the customer specific agreement within three billing cycles after the program season ends. Eligible customers may also receive Emergency Event Performance Payments on the customer bill under specific circumstances as outlined in the customer specific agreement. If a customer fails to deliver their total Contracted Capacity during an Emergency Event ordered by Consumers Energy, an Underperformance Penalty may be applicable. Any applicable penalties or program incentives shall be applied to the customer bill. As a condition of enrollment, Customers will be required to provide energy reduction plans that detail their load reduction procedure as specified in the agreement. Customers will be required to provide event notification contacts that support the program. The program agreement will specify the terms of the program that include program duration, number and length of events, performance calculations and program rules.

LARGE GENERAL SERVICE PRIMARY DEMAND RATE GPD

(Continued From Sheet No. D-65.00)

Monthly Rate (Contd)

Interruptible Service Provision - Market-Price Option (GI2) (Contd)

Monthly Billing

For billing purposes, the Contracted Firm Capacity will be billed first on Rate GPD, with the load in excess of contracted firm being billed on the GI2 charges specified in this rate schedule.

Power Supply Charges: These charges are applicable to contracted interruptible capacity.

The customer shall be responsible for the MISO Real-Time Locational Market Price (LMP) for the Company's load node (designated as "CONS.CETR" as the date of this Rate Schedule), multiplied by the customer's consumption (kWh), plus the Market Settlement Fee of $0.002/kWh.

Charges for Customer Voltage Level 3 (CVL 3)

LMP Energy Charge:	MISO Real-Time LMP per kWh for all kWh	
Capacity & Transmission Charge:	*$0.038856* ~~$0.033010~~	per kWh for all kWh during the billing months of June - September
	$0.036967 ~~$0.031900~~	per kWh for all kWh during the billing months of October - May

Charges for Customer Voltage Level 2 (CVL 2)

LMP Energy Charge:	MISO Real-Time LMP per kWh for all kWh	
Capacity & Transmission Charge:	*$0.035859* ~~$0.031449~~	per kWh for all kWh during the billing months of June - September
	$0.032876 ~~$0.029198~~	per kWh for all kWh during the billing months of October - May

Charges for Customer Voltage Level 1 (CVL 1)

LMP Energy Charge:	MISO Real-Time LMP per kWh for all kWh	
Capacity & Transmission Charge:	*$0.034321* ~~$0.029081~~	per kWh for all kWh during the billing months of June - September
	$0.031388 ~~$0.026985~~	per kWh for all kWh during the billing months of October - May

The MISO Real-Time LMP per kWh shall be adjusted for losses based on the customer's point of metering as shown below:

	Meter Point	
	High Side	Low Side
Customer Voltage Level 1	0.000%	~~0.986~~ *0.917*%
Customer Voltage Level 2	~~1.359~~ *1.320*%	~~2.247~~ *2.220*%
Customer Voltage Level 3	~~3.268~~ *3.237*%	~~6.502~~ *7.963*%

Delivery Charges: These charges are applicable to contract capacity

Rate GPD Delivery Charges will apply to all Delivery service, including contracted capacity designated as GI2 interruptible service.

System Access Charge		
If contracted capacity is separately metered:	$100.00	per additional meter installation per month

This provision is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10 as well as the System Access Charge, Delivery Charges, General Terms, Adjustment for Power Factor, Substation Ownership Credit, Minimum Charge and the Due Date and Late Payment Charge applicable to Rate GPD.

Annual Power Test Requirement

Under this provision, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this provision must be supported by an updated energy reduction plan on an annual basis.

(Continued on Sheet No. D-67.00)

LARGE GENERAL SERVICE PRIMARY DEMAND RATE GPD

(Continued From Sheet No. D-67.00)

Coincident Peak Demand Provision (CPD)

This provision is available to any customer on Rate GPD but limited to the first three customers enrolled in the provision. Customers served under this provision will be charged capacity and transmission through a volumetric on peak energy charge as stated below. This will be charged on all energy consumed during the on peak window, from 11 AM to 7 PM. They will pay the On Peak Demand Charge on all demand during the coincident peak window of 4 PM to 6 PM. Customers served under this provision will be subject to Critical Peak Event Pricing.

Critical Peak Event Determination

A Critical Peak Event occurs when a System Integrity Event is enacted.

A System Integrity Event is enacted when MISO declares that a Maximum Generation Emergency Event has occurred and MISO has instructed the Company to implement Load Management Measures using Load Modifying Resources. A System Integrity Event shall occur at any time for any duration. A Critical Peak Event caused by a System Integrity Event shall be billed the full on peak demand charge plus $1.00/kWh during the duration of the event.

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Delivery Charges:

System Access Charge:	$200.00	per customer per month
Charges for Customer Voltage Level 3 (CVL3)		
Capacity Charge:	~~$6.68~~ *8.12*	per kW of Maximum Demand
Charges for Customer Voltage Level 2 (CVL2)		
Capacity Charge:	~~$3.61~~ *4.45*	per kW of Maximum Demand
Charges for Customer Voltage Level 1 (CVL1)		
Capacity Charge:	~~$2.37~~ *3.28*	per kW of Maximum Demand

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Adjustment for Power Factor

This rate requires a determination of the average Power Factor maintained by the customer during the billing period. Such average Power Factor shall be determined through metering of lagging Kilovar-hours and Kilowatt-hours during the billing period. The calculated ratio of lagging Kilovar-hours to Kilowatt-hours shall then be converted to the average Power Factor for the billing period by using the appropriate conversion factor. Whenever the average Power Factor during the billing period is above or below .875, the customer bill shall be adjusted as follows:

(Continued on Sheet No. D-72.00)

See Gray Testimony, Page 3, Lines 13-15; Exhibit A-120 (BAG-1), Item No. 13; Exhibit A-16 (MCG-3), Pages 1-24

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-72.00**

GENERAL SERVICE PRIMARY TIME-OF-USE RATE GPTU

(Continued From Sheet No. D-71.00)

Monthly Rate (Contd)

Adjustment for Power Factor (Contd)

(a) If the average Power Factor during the billing period is higher than .875, a $1.14 per Kilovar credit will be applied to the amount which the average lagging Kilovar demand during the billing period is below that for an average Power Factor of .875. This credit shall not in any case be used to reduce the prescribed Minimum Charge.

(b) If the average Power Factor during the billing period is less than .875, a per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of .875 in accordance with the following table:

Power Factor	Penalty
0.700 to 0.874	$1.14 per Kilovar
Below 0.700	$1.14 per Kilovar first 2 months

(c) A Power Factor less than 0.700 is not permitted and necessary corrective equipment must be installed by the customer. A $5.25 per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of 0.875, after two consecutive months below 0.700 Power Factor and will continue as long as the Power Factor remains below 0.700. Once the customer's Power Factor exceeds 0.700, it is necessary to complete two consecutive months below 0.700 before the $5.25 per Kilovar penalty applies again.

Maximum Demand

The Maximum Demand shall be the highest 15-minute demand created during the current month or previous 11 months.

Resale Service Provision

Subject to any restrictions, this provision is available to customers desiring Primary Voltage service for resale purposes in accordance with Rule C4.4, Resale.

Substation Ownership Credit

Where service is supplied at a nominal voltage of more than 25,000 volts, energy is measured through an Interval Data Meter, and the customer provides all the necessary transforming, controlling and protective equipment for all the service there shall be deducted from the bill a monthly credit. For those customers, part of whose load is served through customer-owned equipment, the credit shall be based on the Maximum Demand.

The monthly substation ownership credit shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Charges for Customer Voltage Level 2 (CVL 2)
Substation Ownership Credit: $~~(1.93)~~ *(2.16)* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL 1)
Substation Ownership Credit: $~~(1.82)~~ *(2.51)* per kW of Maximum Demand

For those customers served by more than one substation where one or more of the substations is owned by the customer, the credit will be applied to the customer's coincident Maximum Demand for those substations owned by the customer. This credit shall not operate to reduce the customer's billing below the prescribed minimum charges included in the rate. The credit shall be based on the kW after the 1% deduction or 3% addition has been applied to the metered kW.

Educational Institution Service Provision (GEI)

When service is supplied to a school, college or university, a credit shall be applied during all billing months. As used in this provision, “school” shall mean buildings, facilities, playing fields, or property directly or indirectly used for school purposes for children in grades kindergarten through twelve, when provided by a public or nonpublic school. School does not include instruction provided in a private residence or proprietary trade, vocational, training, or occupational school. “College” or “University” shall mean buildings located on the same campus and used to impart instruction, including all adjacent and appurtenant buildings owned by the same customer which are located on the same campus and which constitute an integral part of such college or university facilities.

The monthly credit for the Educational Institution Service Provision shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Educational Institution Credit: $~~(0.000205)~~ *(0.000226)* per kWh for all kWh

Customers on this provision shall require a written contract, with a minimum term of one year, and shall be evaluated annually to determine whether or not the accounts shall remain on the service provision.

High-Peak - Winter	*$0.069902* ~~$0.059261~~	*$0.014382* ~~$0.017272~~	*$0.084284* ~~$0.076533~~	per kWh during the calendar months of October - May
Interruptible Credit	$0.000000	*$(0.008502)* ~~$(0.008461)~~	*$(0.008502* ~~$(0.008461)~~	per kWh during the calendar months of October - May
Emergency Event	NA	$1.00	$1.00	per kWh for all kWh during a System Integrity Event during the calendar months of October - May
Critical Peak-Winter Economic Event				the greater of either 150% of the High-Peak - Winter Energy Charge or the average Market price per kWh for a Critical Peak Event during the calendar months of October - May

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Delivery Charges:

System Access Charge:	$200.00	per customer per month
Charges for Customer Voltage Level 3 (CVL 3)		
Capacity Charge:	$~~6.68~~ *8.12*	per kW of Maximum Demand
Charge for Customer Voltage Level 2 (CVL 2)		
Capacity Charge:	$~~3.61~~ *4.45*	per kW of Maximum Demand
Charge for Customer Voltage Level 1 (CVL 1)		
Capacity Charge:	$~~2.37~~ *3.28*	per kW of Maximum Demand

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

(Continued on Sheet No. D-77.00)

ENERGY INTENSIVE PRIMARY RATE EIP

(Continued From Sheet No. D-76.00)

Monthly Rate (Contd)

Adjustment for Power Factor

This rate requires a determination of the average Power Factor maintained by the customer during the billing period. Such average Power Factor shall be determined through metering of lagging Kilovar-hours and Kilowatt-hours during the billing period. The calculated ratio of lagging Kilovar-hours to Kilowatt-hours shall then be converted to the average Power Factor for the billing period by using the appropriate conversion factor. Whenever the average Power Factor during the billing period is above or below .875, the customer bill shall be adjusted as follows:

(a) If the average Power Factor during the billing period is higher than .875, a $1.14 per Kilovar credit will be applied to the amount which the lagging Kilovar demand during the billing period is below that for an average Power Factor of .875. This credit shall not in any case be used to reduce the prescribed Minimum Charge.

(b) If the average Power Factor during the billing period is less than .875, a per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of .875 in accordance with the following table:

Power Factor	**Penalty**
0.700 to 0.874	$1.14 per Kilovar
Below 0.700	$1.14 per Kilovar first 2 months

(c) A Power Factor less than 0.700 is not permitted and necessary corrective equipment must be installed by the customer. A $5.25 per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of 0.875, after two consecutive months below 0.700 Power Factor and will continue as long as the Power Factor remains below 0.700. Once the customer's Power Factor exceeds 0.700, it is necessary to complete two consecutive months below 0.700 before the $5.25 per Kilovar penalty applies again.

Maximum Demand

The Maximum Demand shall be the highest 15-minute demand created during the current month or previous 11 months.

Interruptible Credit

Due to the nature of this rate schedule, all customers on this rate schedule shall receive an Interruptible Credit per kWh for all consumption for each calendar month.

Substation Ownership Credit

Where service is supplied at a nominal voltage of more than 25,000 volts, energy is measured through an Interval Data Meter, and the customer provides all the necessary transforming, controlling and protective equipment for all the service there shall be deducted from the bill a monthly credit. For those customers, part of whose load is served through customer-owned equipment, the credit shall be based on the Maximum Demand.

The monthly substation ownership credit shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service and Retail Open Access Customers.

Charges for Customer Voltage Level 2 (CVL 2)
Substation Ownership Credit: $~~(1.93)~~ *(2.16)* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL 1)
Substation Ownership Credit: $~~(1.82)~~ *(2.51)* per kW of Maximum Demand

For those customers served by more than one substation where one or more of the substations is owned by the customer, the credit will be applied to the customer's coincident Maximum Demand for those substations owned by the customer. This credit shall not operate to reduce the customer's billing below the prescribed minimum charges included in the rate. The credit shall be based on the kW after the 1% deduction or 3% addition has been applied to the metered kW.

Self-Generation (SG)

To be eligible for Self-Generation, a Customer with a generating installation operating in parallel with the Company's system, must meet the requirements described in Rule C 11.1., Self-Generation.

(Continued on Sheet No. D-78.00)

LARGE ECONOMIC DEVELOPMENT RATE LED

(Continued From Sheet No. D-78.10)

Nature of Service

Service under the rate shall be alternating current, 60-Hertz, three-phase Primary Voltage service. The particular nature of the voltage service provided to the customer shall be specified in a written agreement.

Where voltage is supplied at a nominal voltage of 25,000 volts or less, the customer shall furnish, install and maintain all necessary transforming, controlling and protective equipment.

Where the Company elects to measure the service at a nominal voltage above 25,000 volts and where the meter is located on the Company side of the substation transformer, 1% shall be deducted for billing purposes, from the demand and energy measurements thus made.

Where the Company elects to measure the service at a nominal voltage of less than 2,400 volts, 3% shall be added for billing purposes, from the demand and energy measurements thus made.

Interval Data Meters are required for service under this rate. Meter reading will be accomplished electronically through telecommunication links or other electronic measuring equipment available to provide the Company with the metering data necessary for billing purposes.

Line losses shall be applied to the customer's monthly metered production capacity, transmission capacity and energy to reflect the energy consumed in moving electric power through the Transmission system and the Company's distribution system to the customer's point of delivery as determined by the Company and approved by the Commission as reflected in the Monthly Rate.

Monthly Rate

System Contribution Charge:	$0.000284	per kWh for all kWh

Power Supply Charges:

Production Charge:

Customer Voltage Level 1	$~~11.27~~ *11.82*	per kW of On-Peak Billing Demand for all calendar months
Customer Voltage Level 2	$~~11.43~~ *11.99*	per kW of On-Peak Billing Demand for all calendar months
Customer Voltage Level 3	$~~11.61~~ *12.16*	per kW of On-Peak Billing Demand for all calendar months

Effective for contracts dated on and after June 7, 2024, the monthly Production Charge is the Cost of New Entry for MISO's Local Resource Zone 7 ("CONE"), as of the time of contract execution. The monthly Production Charge is fixed for the contract term at the rate in effect at the time of contract execution, unless the customer fails to meet the minimum On-Peak Billing Demand required by the Company. Effective for contracts dated on or before June 7, 2024, customers shall pay the monthly Production Charge which was in effect at the time of contract execution.

Transmission Charge:

Customer Voltage Level 1	$1.59	per kW of On-Peak Billing Demand for all calendar months
Customer Voltage Level 2	$1.62	per kW of On-Peak Billing Demand for all calendar months
Customer Voltage Level 3	$1.64	per kW of On-Peak Billing Demand for all calendar months

The monthly Transmission Charge is based on the incremental transmission charges applicable with the load served under this tariff and shall be adjusted and reconciled on an annual basis in the Company's PSCR proceedings.

Energy Charge:

For all energy supplied by the Company, the customer shall be responsible for either the MISO Real-Time or Day Ahead Locational Marginal Price (LMP) for the Company's load node (designated as "CONS.CETR" as of the date of this Rate Schedule), multiplied by the customer's consumption (kWh). Customers also enrolled in the Voluntary Large Customer Renewable Program LC-REP (LC-REP) may choose, at the Company's discretion, to have the billing of energy under this Rate Schedule match with the crediting methodology of energy under the LC-REP Program for administrative purposes.

Line losses applied to Energy Charge	
Customer Voltage Level 1	~~3.08~~ *3.19*%
Customer Voltage Level 2	~~4.25~~ *4.63*%
Customer Voltage Level 3	~~5.27~~ *6.11*%

(Continued on Sheet No. D-78.30)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-78.30**

LARGE ECONOMIC DEVELOPMENT RATE LED

(Continued From Sheet No. D-78.20)

Monthly Rate (Contd)

Delivery Charges:

Distribution Charges:

Customer Voltage Level 1:	$2.37	per kW of Maximum Demand
Customer Voltage Level 2:	$3.61	per kW of Maximum Demand
Customer Voltage Level 3:	$6.68	per kW of Maximum Demand

The Distribution Charges for the Large Economic Development Rate are equivalent to the Distribution Charges for Large General Service Primary Demand Rate GPD. The monthly charge per kW of Maximum Demand per calendar month may be adjusted to contribute to the recovery of the annual revenue requirement associated with investments made by the Company for incremental distribution facilities required to serve the customer and a facilities allowance specified in the contract for electric service.

Substation Ownership Credit

Where service is supplied at a nominal voltage of more than 25,000 volts, energy is measured through an Interval Data Meter, and the customer provides all the necessary transforming, controlling and protective equipment for all the service there shall be deducted from the bill a monthly credit. For those customers, part of whose load is served through customer-owned equipment, the credit shall be based on the Maximum Demand.

The monthly substation ownership credit shall be applied as follows:

Delivery Charges: These charges are applicable to Full Service Customers.

Charges for Customer Voltage Level 2 (CVL 2)

Substation Ownership Credit: $~~(1.93)~~ *(2.16)* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL 1)

Substation Ownership Credit: $~~(1.82)~~ *(2.51)* per kW of Maximum Demand

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10. This rate is not subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Adjustment for Power Factor

This rate requires a determination of the average Power Factor maintained by the customer during the billing period. Such average Power Factor shall be determined through metering of lagging Kilovar-hours and Kilowatt-hours during the billing period. The calculated ratio of lagging Kilovar-hours to Kilowatt-hours shall then be converted to the average Power Factor for the billing period by using the appropriate conversion factor. Whenever the average Power Factor during the billing period is above or below .875, the customer bill shall be adjusted as follows:

(a) If the average Power Factor during the billing period is higher than .875, a $1.14 per Kilovar credit will be applied to the amount which the average lagging Kilovar demand during the billing period is below that for an average Power Factor of .875. This credit shall not in any case be used to reduce the prescribed Minimum Charge.

(b) If the average Power Factor during the billing period is less than .875, a per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of .875 in accordance with the following table:

Power Factor	***Penalty***
0.700 to 0.874	*$1.14 per Kilovar*
Below 0.700	*$1.14 per Kilovar first 2 months*

Adjustment for Power Factor shall not be applied when the On-Peak Billing Demand is based on 60% of the highest On-Peak Billing Demand created during the preceding bill months of June through September or on a Minimum On-Peak Billing Demand.

(c) A Power Factor less than 0.700 is not permitted and necessary corrective equipment must be installed by the customer. A $5.25 per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of 0.875, after two consecutive months below 0.700 Power Factor and will continue as long as the Power Factor remains below 0.700. Once the customer's Power Factor exceeds 0.700, it is necessary to complete two consecutive months below 0.700 before the $5.25 per Kilovar penalty applies again.

See Connolly Testimony, Page 11, Lines 22-23; Exhibit A-120 (BAG-1), Item No. 16

LARGE ECONOMIC DEVELOPMENT RATE LED

(Continued From Sheet No. D-78.30)

Monthly Rate (Contd)

Interruptible Service Provision

The monthly credit available to the customer under this Interruptible Service Provision shall not exceed the Production Capacity Charge specified in the Large Economic Development Rate.

A customer participating in this provision is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season.

The Company reserves the right to limit the amount of load contracted as Interruptible Service Capacity under this rate schedule or require testing to demonstrate the customer's ability to meet the contracted Interruptible Service Capacity.

Customers contracting for interruptible service under this rate schedule shall be required to monitor and provide real-time, Internet-enabled power monitoring. The Company will provide the metering or monitoring devices necessary, which shall be owned by the Company and provided to the customer at the Company's expense. The customer may be required to provide suitable space for such monitoring equipment and either a static or non-static, as applicable, Internet Protocol (IP) address and Local Area Network (LAN) access that allows for Internet-based communication of the customer's site electricity consumption and interruption event performance.

The interruptible load is subject to the MISO Load Modifying Resource requirements. Within 30 minutes of receiving an interruption notice from the Company, the customer shall reduce its total load level down to the Firm Contracted Capacity level or as required by the MISO partial curtailment request.

Any load designated as interruptible is subject to MISO requirements for Load Modifying Resources and the Company shall inform the customer of such MISO requirements. Interruption under this Interruptible Service Provision may occur if MISO declares a Maximum Generation Emergency Event that requires deployment of Load Modifying Resources in accordance with the currently effective MISO Emergency Electrical Procedure or North American Electric Reliability Corporation Emergency Event Alert 2 notice indicating that MISO is experiencing or expects to experience a shortage of economic resources and the Company has declared emergency status. Participation in the Interruptible Service Provision does not limit the Company's ability to implement emergency electrical procedures as described in the Company's Electric Rate Book including interruption of service as required to maintain system integrity.

~~**Interruptible Service Provision: (Contd)**~~

Annual Power Test Requirement

Under this provision, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this provision must be supported by an updated energy reduction plan on an annual basis.

Conditions of Interruption

Under this Interruptible Service Provision, the customer shall be interrupted at any time MISO deems it necessary to maintain system integrity. The Company shall endeavor to provide notice to the customer in advance of probable interruption by MISO. The Company shall provide the customer at least thirty minutes advance notice of a required interruption, and if possible, a second notice. Notices will be communicated by telephone to the contact numbers provided by the customer. The customer shall confirm the receipt of such notice through the automated response process. Failure to acknowledge receipt of such notice shall not relieve the customer of the obligation for interruption. The customer shall be informed, when possible, of the estimated duration of the interruption at the time of interruption.

The Company shall not be liable for any loss or damage caused by or resulting from any interruption of service under this Interruptible Service Provision.

Interruptions beyond the Company's control, described in Rules C1.1, Character of Service, and C3, Emergency Electrical Procedures, of the Company's Electric Rate Book, shall not be considered as interruptions for purposes of this Interruptible Service Provision.

Should the Company be ordered by Governmental authority during a national emergency to supply firm instead of interruptible service, billing shall reflect firm service capacity as provided under this rate schedule.

Cost of Non-Compliance with Interruption

Failure by customer to comply with an interruption order under this Interruptible Service Provision shall be considered as unauthorized use and billed at (i) the higher of the customer's pro rata share of any actual MISO penalties incurred by the Company or (ii) the rate of $25.00 per kW for the highest 15-minute kW of Interruptible Peak Billing Demand created during the interruption period in excess of the Firm Contracted Capacity or the partial curtailment requested amount, in addition to the prescribed monthly rate.

(Continued on Sheet No. D-78.50)

LARGE ECONOMIC DEVELOPMENT RATE LED

(Continued From Sheet No. D-78.40)

Monthly Rate: (Contd)

Maximum Demand:

The Maximum Demand shall be the highest 15-minute demand created during the current month or previous 11 months. The contract for service under this rate shall specify the customer's projected Maximum Demand.

On-Peak Billing Demand:

The On-Peak Billing Demand shall be based on the highest on-peak demand created during the calendar month, but never less than 60% of the highest on-peak billing demand of the four preceding summer billing months (June through September), nor less than 35,000 kW. Upon mutual agreement between the customer and the Company, up to 60 months from the initial service date for billing purposes may be granted for the customer to meet the 35,000 kW On-Peak Billing Demand required to be eligible for this rate.

The On-Peak Billing Demand shall be the Kilowatts (kW) supplied during the 15-minute period of maximum use during on-peak hours, as described in Rule C14., Provisions Governing the Application of On-Peak and Off-Peak Rates.

The Company reserves the right to make special determination of the On-Peak Billing Demand, and/or the Minimum Charge, should the equipment which creates momentary high demands be included in the customer's installation.

Renewable Energy Credit (REC) Programs:

These programs provide customers with the opportunity to subscribe to the environmental attribute of renewable energy by offering customers the ability to utilize renewable energy credits to match up to 100% of their total annual energy.

A customer that participates in one of the Renewable Energy Credit (REC) Programs is subject to the provisions contained in Rule C10.8., Renewable Energy Credit (REC) Programs.

General Terms:

The rate is subject to all general terms and conditions shown on Sheet No. D-1.00.

Monthly Minimum Charge:

The Monthly Minimum Charge shall be the sum of monthly Capacity Charges and any applicable non-consumption based Surcharges.

Due Date and Late Payment Charge:

The due date of the customer bill shall be 21 days from the date of mailing. A late payment charge of 2% of the unpaid balance, net of taxes, shall be assessed to any bill which is not paid on or before the due date shown thereon.

Form of Contract and Authority to Require a Minimum On-Peak Billing Demand by Date Certain:

Service under this rate shall require a written agreement between the customer and the Company. The Company may require the customer to meet a minimum On-Peak Billing Demand (in addition to the 35,000 kW required to be eligible for this rate) by a date certain, which shall not exceed the customer's projected Maximum Demand specified in the contract. If the customer fails to meet the minimum On-Peak Billing Demand requirement required by its contract for service under this rate, the customer's Production Charge will be reset at the CONE as of the date certain and annually thereafter for the term of the contract, until the customer meets the required minimum On-Peak Billing Demand, after which the Production Charge will be fixed for the remaining term of the contract.

GENERAL SERVICE SELF GENERATION RATE GSG-2

(Continued From Sheet No. D-81.00)

Nature of Service (Contd)

Where service is supplied at a nominal voltage equal to or greater than 2,400 volts and the Company elects to measure the service at a nominal voltage above 25,000 volts and where the meter is located on the Company side of the substation transformer, 1% shall be deducted for billing purposes, from the demand and energy measurements thus made.

Where service is supplied at a nominal voltage equal to or greater than 2,400 volts and the Company elects to measure the service at a nominal voltage of less than 2,400 volts, 3% shall be added for billing purposes, to the demand and energy measurements thus made.

Where service is supplied at a nominal voltage less than 2,400 volts and the Company elects to measure the service at a nominal voltage equal to or greater than 2,400 volts, 3% shall be deducted for billing purposes from the energy measurements thus made.

There shall be no double billing of demand under the base rate and Rate GSG-2.

Monthly Rate

Standby Charges:

Power Supply Standby Charges:

For all standby energy supplied by the Company, the customer shall be responsible for the MISO Real-Time Locational Market Price (LMP) for the Company's load node (designated as "CONS.CETR" as of the date of this Rate Schedule), multiplied by the customer's consumption (kWh), plus the Market Settlement Fee of $0.002/kWh. In addition capacity charges will be assessed monthly, calculated using the highest 15 minute kW demand associated with Standby Service occurring during the Company's On-Peak billing hours will be multiplied by the highest contracted capacity purchased by the Company in that month, plus allocated transmission and ancillaries. The capacity charges will be prorated based on the number of On-Peak days that Standby Service was used during the billing month.

A customer with a generator(s) nameplate rating more than 550 kW must provide written notice to the Company by December 1 if they desire standby service in the succeeding calendar months of June through September. Written notice shall be submitted on Company Form 500.

Real Power Losses:

Real Power Losses shall be measured based on the transmission loss factor of ~~2.12~~ *2.20*% plus the associated meter point as listed below:

	Meter Point	
	High Side	Low Side
Customer Voltage Level 1	0.000%	~~0.986~~ *0.917*%
Customer Voltage Level 2	~~1.359~~ *1.320*%	~~2.247~~ *2.220*%
Customer Voltage Level 3	~~3.268~~ *3.237*%	~~6.502~~ *7.963*%

Delivery Standby Charges:

System Access Charge: $100.00 per generator installation per month

Charges for Customer Voltage Level 3 (CVL 3)

Capacity Charge: $~~6.68~~ *8.12* per kW of Maximum Demand

Charges for Customer Voltage Level 2 (CVL 2)

Capacity Charge: $~~3.61~~ *4.45* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL 1)

Capacity Charge: $~~2.37~~ *3.28* per kW of Maximum Demand

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

(Continued on Sheet No. D-83.00)

GENERAL SERVICE SELF GENERATION RATE GSG-2

(Continued From Sheet No. D-82.00)

Monthly Rate (Contd)

Standby Charges: (Contd)

Adjustment for Power Factor

This rate requires a determination of the average Power Factor maintained by the customer during the billing period. Such average Power Factor shall be determined through metering of lagging Kilovar-hours and Kilowatt-hours during the billing period. The calculated ratio of lagging Kilovar-hours to Kilowatt-hours shall then be converted to the average Power Factor for the billing period by using the appropriate conversion factor. Whenever the average Power Factor during the billing period is above or below .875, the customer bill shall be adjusted as follows:

(a) If the average Power Factor during the billing period is higher than .875, a $1.14 per Kilovar credit will be applied to the amount which the average lagging Kilovar demand during the billing period is below that for an average Power Factor of .875. This credit shall not in any case be used to reduce the prescribed Minimum Charge.

(b) If the average Power Factor during the billing period is less than .875, a per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of .875 in accordance with the following table:

Power Factor	**Penalty**
0.700 to 0.874	$1.14 per Kilovar
Below 0.700	$1.14 per Kilovar first 2 months

(c) A Power Factor less than 0.700 is not permitted and necessary corrective equipment must be installed by the customer. A $5.25 per Kilovar penalty will be applied to the amount by which the average lagging Kilovar demand during the billing period is in excess of that for an average Power Factor of 0.875, after two consecutive months below 0.700 Power Factor and will continue as long as the Power Factor remains below 0.700. Once the customer's Power Factor exceeds 0.700, it is necessary to complete two consecutive months below 0.700 before the $5.25 per Kilovar penalty applies again.

Substation Ownership Credit

Where service is supplied at a nominal voltage of more than 25,000 volts, energy is measured through an Interval Data Meter, and the customer provides all of the necessary transforming, controlling and protective equipment for all of the service there shall be deducted from the bill a monthly credit. For those customers, part of whose load is served through customer-owned equipment, the credit shall be based on the billed Standby Demand.

The monthly credit for the substation ownership shall be applied as follows:

Delivery Charges:

Charges for Customer Voltage Level 2 (CVL 2)
Substation Ownership Credit: $~~(1.93)~~ *(2.16)* per kW of Maximum Demand

Charges for Customer Voltage Level 1 (CVL 1)
Substation Ownership Credit: $~~(1.82)~~ *(2.51)* per kW of Maximum Demand

For those customers served by more than one substation where one or more of the substations is owned by the customer, the credit will be applied to the customer's coincident Maximum Demand for those substations owned by the customer. This credit shall not operate to reduce the customer's billing below the prescribed minimum charges included in the rate. The credit shall be based on the kW after the 1% deduction or 3% addition has been applied to the metered kW.

(Continued on Sheet No. D-83.10)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-83.10**

GENERAL SERVICE SELF GENERATION RATE GSG-2

(Continued From Sheet No. D-83.00)

Monthly Rate (Contd)

Standby Charges: (Contd)

Transmission Interconnect Credit

Where standby service is provided to a non-utility electric generator located within the Company's service territory and taking power through its transmission interconnect, where the Company has no owned infrastructure other than metering, including billing grade current transformers and potential transformers, telemetry facilities and associated wiring, the following monthly credit shall be applied to the bill:

Delivery Charges:

Transmission Interconnect Credit: $~~(2.37)~~ *(3.28)* per kW of Maximum Demand

This credit shall be based on the kW after the 1% deduction has been applied to the metered kW. The credit supersedes any applicable substation ownership credit.

Sales of Energy to the Company

Administrative Cost Charge

Generation installation with a capacity of over 550 kW but less than or equal to 2,000 kW
As negotiated or $0.0010 per kWh purchased, at the option of the customer

Generation installation with a capacity of over 2,000 kW
As negotiated

Energy Purchase

An energy purchase by the Company shall be bought at the Midcontinent Independent System Operator's Inc. (MISO) real-time Locational Marginal Price (LMP) for the Company's load node (designated as "CONS.CETR" as of the date of this Rate Schedule).

Demand Response Program

Customers participating in the voluntary Demand Response Program help reduce peak demand when energy use is the highest. A customer specific agreement stating the customer's Contracted Capacity kW shall be completed prior to participation in the Demand Response Program. Customer eligibility to participate in this program is determined solely by the Company. The Company reserves the right to specify the term or duration of the program. A customer participating in this program is not eligible to participate in Demand Response programs with an Aggregator of Retail Customers during any MISO season.

Under this program, the customer shall provide a documented energy reduction plan. The energy reduction plan shall serve as the representation of the customer's annual simulated power test in compliance with the Commission Order issued October 29, 2020 in Case No. U-20628. Any changes to the customer's contracted capacity under this program must be supported by an updated energy reduction plan on an annual basis.

Demand Response Program customers shall receive an annual Program Payment on the customer bill or a check for the capacity amount delivered during events specified in the customer specific agreement within three billing cycles after the program season ends. Eligible customers may also receive Emergency Event Performance Payments on the customer bill under specific circumstances as outlined in the customer specific agreement. If a customer fails to deliver their total Contracted Capacity during an Emergency Event ordered by Consumers Energy, an Underperformance Penalty may be applicable. Any applicable penalties or program incentives shall be applied to the customer bill. As a condition of enrollment, Customers will be required to provide energy reduction plans that detail their load reduction procedure as specified in the agreement. Customers will be required to provide event notification contacts that support the program. The program agreement will specify the terms of the program that include program duration, number and length of events, performance calculations and program rules.

GENERAL SERVICE METERED LIGHTING RATE GML

Availability

Subject to any restrictions, this rate is available to any political subdivision or agency of the State of Michigan having jurisdiction over public streets or roadways, for Primary or Secondary Voltage energy-only metered lighting service where the Company has existing distribution lines available for supplying energy for such service. Luminaires which are served under the Company's unmetered lighting rates shall not be intermixed with luminaires served under this metered lighting rate. Luminaire types in addition to those served on Rate Schedule GUL, such as light-emitting diode (LED) streetlights, may receive service under this Rate Schedule.

This rate is not available for resale purposes or for Retail Open Access Service.

Nature of Service

Secondary Voltage:

Service under this rate shall be alternating current, 60-hertz, single-phase or three-phase (at the Company's option), 120/240 nominal Volt service for a minimum of ten luminaires located within a clearly defined area. Control equipment shall be furnished, owned and maintained by the Company. The customer shall furnish, install, own and maintain the rest of the equipment comprising the metered lighting system including, but not limited to, the overhead wires or underground cables between the luminaires, protective equipment, and the supply circuits extending to the point of attachment with the Company's distribution system. The Company shall connect the customer's equipment to the Company's lines and supply the energy for its operation. All of the customer's equipment shall be subject to the Company's approval. The customer shall not change the capacity requirements of the equipment owned by it without first notifying the Company in writing of such changes and the date that they shall be made.

Dusk to Midnight Service:

Dusk to midnight service shall be the same as Secondary service except:

The customer shall pay the difference between the cost of the control equipment necessary for dusk to midnight service and control equipment normally installed for Secondary service. Circuits shall be arranged approximating minimum loads of 3 kW.

Primary Voltage:

Service under this rate shall be alternating current, 60-hertz, single-phase or three-phase (at the Company's option), Primary Voltage service for actual kW demands of not less than 100 kW for each point of delivery and where the customer guarantees a minimum of 4,000 annual hours' use of the actual demand. The Company will determine the particular nature of the voltage in each case. The customer shall furnish, install, own and maintain all equipment comprising the metered lighting system including, but not limited to, controls, protective equipment, transformers and overhead or underground metered lighting circuits extending to the point of attachment with the Company's distribution system. The Company shall furnish, install, own and maintain the metering equipment and connect the customer's metered lighting circuit to its distribution system and supply the energy for operation of the customer's metered lighting system.

Monthly Rate

Secondary Power Supply Charge:

Energy Charge:

Non-Capacity	Capacity	Total	
$0.055240		*$0.055240*	per kWh for all kWh
~~$0.045272~~	$0.000000	~~$0.045272~~	

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Monthly Rate (Contd)

Secondary Delivery Charge:

System Access Charge:	$10.00	per customer per month
Distribution Charge:	~~$0.118564~~ *0.135414*	per kWh for all kWh

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Primary Power Supply Charge:

Energy Charge:

Non-Capacity	Capacity	Total	
$0.027109		*$0.027109*	per kWh for all kWh
~~$0.022217~~	$0.000000	~~$0.022217~~	

This rate is subject to the Power Supply Cost Recovery (PSCR) Factor shown on Sheet No. D-6.00.

Primary Delivery Charge

System Access Charge:	$20.00	per customer per month
Distribution Charge:	~~$0.090355~~ *0.103197*	per kWh for all kWh

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00 and the Securitization Charges shown on Sheet Nos. D-7.00 and D-7.10.

Net Metering Program

The Net Metering Program is available to any eligible customer as described in Rule C11.2., Net Metering Program, who desires to generate a portion or all of their own retail electricity requirements using a Renewable Energy Resource as defined in Rule C11.2.B., Net Metering Program.

A customer who participates in the Net Metering Program is subject to the provisions contained in Rule C11.2., Net Metering Program.

Green Generation Program

Customer contracts for participation in the Green Generation Program shall be available to any eligible customer as described in Rule C10.2, Green Generation Program.

A customer who participates in the Green Generation Program is subject to the provisions contained in Rule C10.2, Green Generation Program.

Renewable Energy Credit (REC) Programs

These programs provide customers with the opportunity to subscribe to the environmental attribute of renewable energy by offering customers the ability to utilize renewable energy credits to match up to 100% of their total annual energy.

A customer that participates in one of the Renewable Energy Credit (REC) Programs is subject to the provisions contained in Rule C10.8., Renewable Energy Credits (REC) Programs.

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-88.00**

GENERAL SERVICE UNMETERED LIGHTING RATE GUL

This Rate is Not Open to New Business

Availability:

As of XX/XX/2027, this Rate Schedule is closed to new unmetered lighting installations. All new unmetered lighting installations shall take service under the General Unmetered Light Emitting Diode Lighting Rate (GU-LED). Any conversion, replacement, or upgrade of existing luminaires will be to LED, and service will be transitioned to the GU-LED rate. Upon transition, all terms, conditions, and charges of the GU-LED rate schedule shall apply.

Subject to any restrictions, this rate is available to any political subdivision or agency of the State of Michigan having jurisdiction over public streets or roadways for (i) unmetered lighting service where the Company has existing distribution lines available for supplying energy for such service or (ii) for any Company-owned system consisting of one or more luminaires. This rate is also available to existing farm or Non-Residential customers previously served under General Service Outdoor Lighting Rate L-4, but closed to new business.

~~New installations under this rate require approval by the Company of the proposed design and type of any customer equipment. In the event that the Company does not approve the design, the Company may require the customer to be served under a general service metered rate provision.~~

This rate is not available for resale purposes or for Retail Open Access Service. Only streetlighting types referenced within this rate schedule may receive unmetered service. Other types of streetlighting are excluded from service under this Rate Schedule. *Existing non-LED luminaires installed prior to XX/XX/2027 may remain in service until conversion to LED, or until service is otherwise terminated by either party upon three months' written notice or by mutual agreement.*

Changes in the federal or state law have limited or eliminated the manufacture or importing of supplies needed to maintain some types of existing lighting offered under this Rate Schedule. ~~To the extent that the Company has the necessary materials, the Company will continue to maintain existing mercury vapor lamp installations in accordance with this Electric Rate Schedule~~.

Nature of Service:

Customer-Owned

In systems where the Company has existing distribution lines available for supplying energy for unmetered lighting service, control equipment shall be furnished and owned by the Company. The customer shall furnish, install and own the rest of the equipment comprising the unmetered lighting system including, but not limited to, the overhead wires or underground cables between the luminaires and the supply circuits extending to the point of attachment with the Company's lines. All of the customer's equipment shall be subject to the Company's approval. The Company shall connect the customer's equipment to the Company's lines~~,~~ *and* supply the energy~~.~~ *.* ~~control the burning hours of the lamps, provide normal replacement of luminaire glassware and lamps, and paint metal parts as needed; all other~~ *All* maintenance and replacement of the customer's equipment shall be paid for by the customer.

Company-Owned

In Company-owned systems consisting of one or more luminaires, the Company shall ~~furnish, install and~~ own all equipment comprising the unmetered lighting system. The Company shall supply the energy~~, and renew~~ and maintain the entire equipment *for eligible existing installation, which may remain in service until such time as conversion to LED is performed or the customer elects to terminate service*. In areas where the Company has installed an underground electric distribution system pursuant to the Company's residential underground electric distribution policy as set forth in its Electric Rate Book, the unmetered lighting system shall be served from said underground electric distribution system. In all other areas, the unmetered lighting system shall normally be served from overhead lines or from underground cables installed at customer's request pursuant to special unmetered lighting provisions contained in Monthly Rate clause and Facilities Policy.

Outdoor Lighting

For existing outdoor lighting, luminaires and control equipment shall be ~~furnished,~~ owned~~, installed~~ and maintained by the Company. Luminaires shall be installed on Company-owned or Company-leased poles and must be accessible to the Company's construction and maintenance equipment.

Facilities Policy:

Customer-Owned

At the customer's request, the Company shall install, at its own cost, its distribution facilities under this rate to the extent that the cost of such installation does not exceed the allowance granted under the Company's general service line extension policy. Costs of facilities in excess of the free allowance shall require an advance, nonrefundable, contribution in the amount by which the estimated costs exceed the free allowance.

(Continued on Sheet No. D-89.00)

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-89.00**

GENERAL SERVICE UNMETERED LIGHTING RATE GUL

(Continued From Sheet No. D-88.00)

Facilities Policy: (Contd)

Company-Owned

At the customer's request, the Company shall ~~install new luminaires and associated~~ *maintain* facilities *served* under this rate ~~or replace existing luminaires and associated facilities served under this rate with other luminaires and associated facilities for which it has rates available in accordance with the following guidelines:~~ *for any existing non-LED luminaires installed prior to XX/XX/2027, subject to the following provisions:*

~~A.~~ ~~The installation of all new, standard unmetered lights shall require a customer contribution of $230 per luminaire. This policy includes the extension of up to 350 feet of distribution facilities to serve any individual light. Any extension beyond 350 feet shall require a contribution based on the Company's general service line extension policy.~~

~~B.~~ *Customer-Requested Conversion*

At the customer's request, the Company shall convert its existing incandescent/fluorescent luminaires to the nearest *equivalent* ~~standard size high-pressure sodium~~ *LED* luminaire at no cost to the customer. If ~~requirements for installations make it necessary for~~ *conversion is required* ~~the Company to convert luminaires or if the customer requests a conversion of luminaires that the Company can no longer maintain~~ due to federal or state requirements *or the unavailability of required materials*, the Company shall cover the cost of the ~~bulb~~ *LED luminaire* and the customer shall be responsible for all other expenses as a contribution.

For customers with existing high-pressure sodium (HPS) luminaires, the Company shall, upon customer request, convert such luminaires to the nearest equivalent LED luminaire. The customer shall pay the estimated cost of conversion. Where the upgrading results in additional revenues to the Company the customer shall receive a credit calculated in accordance with the Company's general service line extension policy to be applied against the estimated cost of conversion.

Company-Initiated Conversion

For conversions completed with normal Company maintenance such as replacement of bulbs *or luminaires* ~~on a routine schedule~~ or due to failure*, the Company shall, as part of normal maintenance or service, replace the luminaire with a Company-standard LED luminaire at no cost to the customer* ~~then the average cost of that work type shall be deducted from the total work order cost to determine the required customer contribution~~. If other light*ing facilities are* ~~upgrading is~~ also involved, the Company expenditure shall be calculated in accordance with the Company's general service line extension policy. Any costs in excess of this amount shall be borne by the customer.

~~Additional annual revenue is the greater of (1) the difference between the annual revenue from the nearest size high-pressure sodium luminaire and the annual delivery revenue from the upgraded light which would be installed or (2) the difference between the annual delivery revenue from the existing light and the annual delivery revenue from the light which would be installed.~~

~~C.~~ ~~Where upgrading of high-pressure sodium unmetered lights are requested, the customer shall pay the estimated cost of conversion. Where the upgrading results in additional revenues to the Company the customer shall receive a credit calculated in accordance with the Company's general service line extension policy to be applied against the estimated cost of conversion. If the cost of conversion is overestimated, the Company shall, upon completion of construction, refund that portion of the contribution resulting from the overestimate.~~

~~D.~~ ~~Where Company-approved nonstandard poles are requested, the customer contribution shall be the difference in installed cost between standard wood poles and the requested pole. Where Company-approved nonstandard fixtures are requested, a customer contribution shall be required to cover costs in excess of the equivalent Company standard fixture.~~

~~E.~~ ~~For unmetered lighting systems installed underground (exclusive of subdivisions where the developer's contribution provided for underground unmetered lighting), the customer shall be required to contribute the estimated difference in cost between the equivalent standard overhead construction and required underground construction. No contribution shall be required for that footage of unmetered lighting cable which can be satisfactorily installed in underground conduit furnished by the customer for the Company's use and in accordance with the Company's specification.~~

~~F.~~ For system-wide conversions from one light source to another, the customer may be limited to an annual quota as determined by the Company.

~~G.~~ ~~If underground unmetered lighting cable is requested, except that requested in conjunction with the Company's residential underground electric distribution policy, the customer shall contribute to the Company the difference between the Company's estimated installed costs of the underground unmetered lighting cable and the Company's estimated installed costs of standard overhead unmetered lighting conductors.~~

M.P.S.C. No. 14 - Electric
Consumers Energy Company **Sheet No. D-94.00**

GENERAL UNMETERED LIGHT EMITTING DIODE LIGHTING RATE GU-LED

(Continued From Sheet No. D-93.00)

Facilities Policy (Contd)

Company-Owned Option (Contd)

D. The Company will determine LED lighting fixtures to be offered under this rate. The list of approved fixtures is subject to modification at the sole discretion of the Company to accommodate new product development and advances in technology. Upon customer request, the Company shall provide a list of LED lighting available under this rate.

E. For customer requested material requiring special order, an additional per luminaire per month charge may apply for procurement and material handling. The Company and the Customer shall mutually agree to the monthly charge prior to procurement and installation of the special order material.

F. The Company shall determine all associated equipment necessary to provide service under the Company-Owned Unmetered LED Lighting option.

G. Any charges, deposits or contributions may be required in advance of commencement of construction.

H. At the Company's discretion, any fixture may be converted to LED at no cost to the customer. The replaced fixture will be moved to General Unmetered Light Emitting Diode Lighting Rate GU-LED upon completion of the installation and reconciliation of the community's streetlighting inventory for billing accuracy.

Customer-Owned Option

If it is necessary for the Company to install distribution facilities to serve a customer-owned system, contributions and/or deposits for such additional facilities shall be calculated in accordance with the Company's general service line extension policy. Any charges, deposits or contributions may be required in advance of commencement of construction.

Monthly Rate

Company-Owned Conversion Credit

A conversion credit may be available to Customers who converted to LED municipal streetlighting.

Customers who converted to LED streetlighting before April 1, 2018 are eligible for the following Conversion Credit per billing month beginning with the January 2021 billing month through the December 2028 billing month:

Fixture Credit per Luminaire: $~~(7.72)~~ *(7.57)* per month

GENERAL SERVICE UNMETERED RATE GU

Availability

Subject to any restrictions, this rate is available to the US Government, any political subdivision or agency of the State of Michigan, and any public or private school district for filament and/or gaseous discharge lamp installations maintained for traffic regulation or guidance, as distinguished from street illumination and police signal systems. Lighting for traffic regulation may use experimental lighting technology including light-emitting diode (LED). This rate is also available to Community Antenna Television Service Companies (CATV), Wireless Access Companies or Security Camera Companies for unmetered Power Supply Units. Where the Company's total investment to serve an individual location exceeds three times the annual revenue to be derived from such location, a contribution to the Company shall be required for the excess.

This rate is not available for resale purposes, new roadway lighting or for Retail Open Access Service.

Nature of Service

Customer furnishes and installs all fixtures, lamps, ballasts, controls, amplifiers and other equipment, including wiring to point of connection with Company's overhead or underground system, as directed by the Company. Company furnishes and installs, where required for center suspended overhead traffic light signals, messenger cable and supporting wood poles and also makes final connections to its lines. If, in the Company's opinion, the installation of wood poles for traffic lights is not practical, the customer shall furnish, install and maintain suitable supports other than wood poles. The customer shall maintain the equipment, including lamp renewals, and the Company shall supply the energy for the operation of the equipment. Conversion and/or relocation costs of existing facilities shall be paid for by the customer except when initiated by the Company.

The capacity requirements of the lamp(s), associated ballast(s) and control equipment for each luminaire shall be determined by the Company from the specifications furnished by the manufacturers of such equipment, provided that the Company shall have the right to test such capacity requirements from time to time. In the event that said tests shall show capacity requirements different from those indicated by the manufacturers' specifications, the capacity requirements shown by said tests shall control. The customer shall not change the capacity requirements of the equipment owned by it without first notifying the Company in writing of such changes and the date that they shall be made.

Monthly Rate

Power Supply Charges:

Energy Charge:

(Continued From Sheet No. E-21.00)

RETAILER:

Monthly Rate - Retailer

Transmission Service

Subject to Rule E1.5, Transmission Service must be obtained from the appropriate transmission service providers and the charges for such service shall be as specified in the Applicable FERC Open Access Tariff.

Real Power Losses

The Retailer is responsible for replacing Real Power Losses of ~~6.502~~ *7.963*% on the Company's Distribution System associated with the movement of Power and for compensation for losses.

General Terms and Conditions

This rate is subject to all general terms and conditions shown on Sheet No. D-1.00.

Term and Form of Contract - Retailer

All service under this rate shall require a written ROA Service Contract between the Company and a Retailer.

ROA CUSTOMER:

Monthly Rate - ROA Customer

ROA System Access Charge, Distribution Charge, General Terms, Minimum Charge and Due Date and Late Payment Charge

The System Access Charge, Distribution Charge, General Terms, Minimum Charge and the Due Date and Late Payment Charge shall be as provided for under the ROA Customer's otherwise applicable Company Full Service rate.

This rate is subject to the Surcharges shown on Sheet Nos. D-2.00 through D-5.00, the Power Plant Securitization Charges shown on Sheet No. D-7.00 and the Karn 1 and 2 Securitization Charges Shown on Sheet No. D-7.10.

Customers taking ROA service on December 6, 2013 are excluded from the Power Plant Securitization Charges. This exclusion does not apply to customers first taking ROA service after December 6, 2013 or to customers taking service on December 6, 2013 who discontinue taking ROA service any time after December 6, 2013. Customers who discontinue taking ROA service any time after December 6, 2013 and who return to ROA service shall pay the Power Plant Securitization Charges applicable to the customer's otherwise applicable Company Full Service Rate Schedule.

Customers taking ROA service on December 17, 2020 are excluded from the Karn 1 and 2 Securitization Charges. This exclusion does not apply to customers first taking ROA service after December 17, 2020 or to customers taking service on December 17, 2020 who discontinue taking ROA service any time after December 17, 2020. Customers who discontinue taking ROA service any time after December 17, 2020 and who return to ROA service shall pay the Karn 1 and 2 Securitization Charges applicable to the customer's otherwise applicable Company Full Service Rate Schedule.

State Reliability Mechanism for ROA

Beginning June 1, 2018 all ROA customers may be subject to a State Reliability Mechanism Capacity Charge. This charge shall not apply to ROA customers for any planning year in which their Alternative Electric Supplier can demonstrate to the Commission that it can meet its capacity obligations by the seventh business day of February each year starting in 2018.

If a capacity charge is required to be paid in the planning year beginning June 1, 2018, or any of the three subsequent planning years, due to the Alternative Electric Supplier not meeting its capacity obligations, then the capacity charge is applicable for each of those planning years. Any capacity charged required to be paid any time after the first initial four-year period shall be applicable for a single year. The planning year is defined as being June 1 through the following May 31 of each year. The capacity charge paid by ROA customers will be the same amount as a Full Service Customer on the otherwise applicable Rate Schedule. Non-capacity charges shall not apply.

ROA Customer Switching Service Charge

A $5.00 switching fee shall be charged the ROA Customer each time a ROA Customer switches (i) from one Retailer to another or (ii) from ROA to a Company Full Service rate. The ROA Customer may switch Retailers at the end of any billing month by having their new Retailer give the Company at least 30 days' written notice. The Company will notify the ROA Customer's previous Retailer and new Retailer electronically of the effective date of the switch. The ROA Customer may choose to return to Company Full Service at the end of any billing month in compliance with Rule E2.5 D., Return to Company Full Service - Residential ROA Customers. The ROA Customer Switching Service Charge shall not be applied (i) for the initial switch to ROA Service or (ii) at the time the ROA Customer returns to Company Full Service or another Retailer because the ROA Customer was Slammed by the Retailer.

Term and Form of Contract - ROA Customer

Service under this rate shall not require a ROA Service Contract between the Company and a ROA Customer.

RETAIL OPEN ACCESS SECONDARY RATE ROA-S

(Continued From Sheet No. E-23.00)

Metering Requirements

The ROA Customer with a Maximum Demand of less than 20 kW shall be separately metered by a Wireless Under Glass Meter or an Energy Registering Meter, with or without maximum demand registers, of billing quality. Such metering equipment shall be furnished, installed, maintained and owned by the Company.

The ROA Customer with a Maximum Demand of less than 20 kW may elect to install an Interval Data Meter. Such metering equipment shall be furnished, installed, maintained and owned by the Company. The requesting ROA Customer shall be required to pay the System Access Charge, as provided for under the ROA Customer's otherwise applicable Company Full Service rate, for all such metering equipment.

The ROA Customer with a Maximum Demand of 20 kW or more shall be separately metered by a Wireless Under Glass Meter or an Interval Data Meter of billing quality. Such metering equipment shall be furnished, installed, maintained and owned by the Company. The ROA Customer shall be required to pay the System Access Charge, as provided for under the ROA Customer's otherwise applicable Company Full Service rate, for all such metering equipment.

The ROA Customer with an Interval Data Meter shall be responsible for (i) the communication links that allow access to the meter data by the Company and are compatible with the Company's metering and billing systems, and (ii) all associated costs relating to the communication links including other accompanying equipment and monthly fees.

RETAILER:

All service under this rate shall require a written ROA Service Contract between the Company and a Retailer.

(Continued on Sheet No. E-25.00)

RETAIL OPEN ACCESS PRIMARY RATE ROA-P

Availability

Subject to any restrictions, this rate is available to any customer receiving service at a Primary Voltage for the delivery of Power from the Point of Receipt to the Point of Delivery and for resale service in accordance with Rule C4.4, Resale.

This rate is not available to a ROA-P Customer where the Company elects to provide one transformation from the available Primary Voltage to another available Primary Voltage desired by the customer. This ROA Customer must take service under Retail Open Access Secondary Rate ROA-S.

This rate is not available for unmetered general service or for any unmetered or metered lighting service.

Service under this rate shall be separately metered. The Retailer shall deliver a flat, fixed amount of power every hour of every day.

Any ROA Customer whose monthly minimum Maximum Demand is less than 1,000 kW must utilize an Aggregator.

Nature of Service

Service under this rate shall be alternating current, 60-Hertz, single-phase or three-phase (at the Company's option) Primary Voltage service. The Company will determine the particular nature of the voltage in each case.

The Company shall not be required to, but may expand its existing facilities to make deliveries under this tariff. The ROA Customer and/or Retailer shall be liable for any and all costs incurred as a result of an expansion of facilities made to make deliveries under this tariff.

Metering Requirements

The load under this tariff shall be separately metered by a Wireless Under Glass Meter or an Interval Data Meter of billing quality. Such metering equipment shall be furnished, installed, maintained and owned by the Company. The ROA customer shall be required to pay the System Access Charge, as provided for under the ROA customer's otherwise applicable Company Full Service rate, for all such metering equipment.

The ROA Customer with an Interval Data Meter shall be responsible for (i) the communication links that allow access to the meter data by the Company and are compatible with the Company's metering and billing systems, and (ii) all associated costs relating to the communication links including other accompanying equipment and monthly fees.

RETAILER:
Monthly Rate - Retailer

Transmission Service

Subject to Rule E1.5, Transmission Service must be obtained from the appropriate transmission service providers and the charges for such service shall be as specified in the Applicable FERC Open Access Tariff.

Real Power Losses

The Retailer is responsible for replacing Real Power Losses as shown below on the Company's Distribution System associated with the movement of Power and for compensation for losses.

	Meter Point	
	High Side	Low Side
Customer Voltage Level 1	0.000%	~~0.986~~ *0.917*%
Customer Voltage Level 2	~~1.359~~ *1.320*%	~~2.247~~ *2.220*%
Customer Voltage Level 3	~~3.268~~ *3.237*%	~~6.502~~ *7.963*%

Rate Case Customer Communications

Communicating potential bill impacts in rate cases filed on or after March 1, 2026
Mich Admin Code, R 460.149 (Rule 49)

Key Requirements

Customer Notification

Within 60 days of filing a general rate case, utilities must provide customers with:

- Notice that a rate change has been requested
- Application available for inspection at utility offices and website
- Explanation of proposed rate changes available upon request

Delivery Method

- Bill insert or same method used for billing
- Utility's website

Commission Findings

- Notices must include both dollar and percentage impacts on average residential and commercial bills
- Information must appear physically (bill insert or on the bill) and digitally (website homepage and app home screen)
- Initial information based on the application; revised after the final order; may be removed 60 days after the rate case concludes
- Utilities must include previews of physical and digital notifications in future filings
- A dedicated landing page should provide detailed rate case information, with all notices linking to it

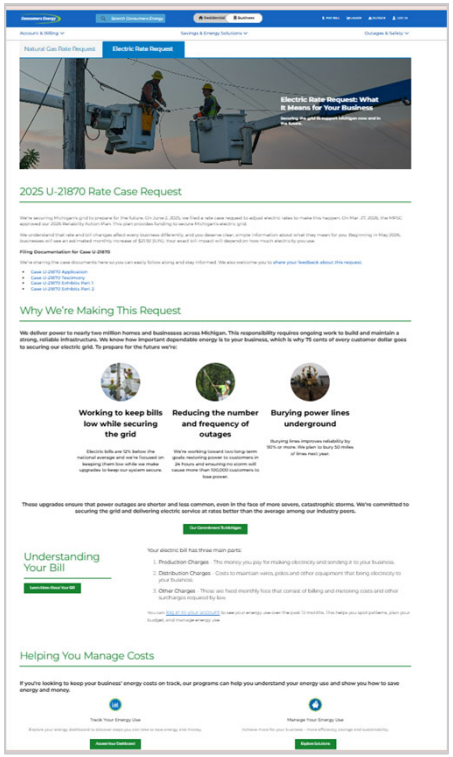
Residential

2026 U-22070 Rate Case Request



We're securing Michigan's electric grid to prepare for the future. On Jun. 2, 2026, we filed a rate case request with the MPSC to adjust electric rates to make this happen.

We understand that rate and bill changes affect everyone differently, and you deserve clear, simple information about what they mean for you. If the MPSC approves our rate request, the average home with a monthly electric bill of about $132 would see an estimated monthly increase of $13 (9%) starting in May 2027. But your exact bill impact will depend on how much electric you use.

No Immediate Impact
It's important to note there are no immediate changes to customer bills. The MPSC is reviewing this filing and has until Apr. 2027 to approve all or some of the request. When the process is complete, we'll let customers know about any changes to their bill and when they will take effect.

Electric Rate Case Application Information

Bill changes affect everyone differently, and you deserve clear, honest information when changes happen. With aging infrastructure and changing weather patterns, work is needed to secure Michigan's grid – and that work requires costs. On June 2, 2026, we asked the Michigan Public Service Commission to approve new electric rates. If approved, the average home will see an estimated monthly increase of $13 (9%) and businesses will see an estimated monthly increase of $39 (8.6%) starting May 2027.

Employee Incentive Compensation Plan - Metric Explanation and Measurement or Calculation Method

Line		Metric	Explanation	Measurement or Calculation Method
1	Employee Safety	**Recordable Incident Rate**	Recordable Incident Rate is benchmarked through EEI (Edison Electric Institute) and is the number of recordable injuries multiplied by 200,000 (industry standard) divided by the total hours worked	# of recordable injuries * 200,000 / total hours worked
2		**High Risk Injuries (2025)**	Number of injuries (Recordable and Non-Recordable) that are classified against the EEI Safety Classification Learning Model as High Risk which includes: High-Energy Serious Injury or Fatality (HSIF) & Potential Serious Injury or Fatality (PSIF)	# of injuries classified as HSIF & PSIF
3		**Serious Injury Incidence Rate (2026)**	Serious Incident Injury Rate is benchmarked through EEI and is the number of injuries or illnesses classified as HSIF or Low Energy Serious Injury or Fatality (LSIF) multiplied by 200,000 (industry standard) divided by the total number of hours worked	# of HSIF and/or LSIF injuries * 200,000 / total hours worked
4	Culture Index	**Employee Engagement Index**	The Employee Engagement index is an average favorability score derived from the taking the total favorable responses received for the 4 questions within the Employee Engagement Category from each of the Company's employee engagement surveys administered by Korn Ferry and they use Qualtrics as the survey platform (https://www.qualtrics.com/) and dividing by the total number of responses received. The Company's Engagement, Empowerment and Diversity, Equity and Inclusion indexes are how we measure our culture values in action. The indexes focus on things like ensuring we have simple processes, fix problems, keep our workforce engaged by measuring the combination of emotional commitment (are you proud to work here?) and rational commitment (do you plan to stay?) and embed diversity, equity and inclusion into everything we do.	This index is an average of the scores of 4 questions: 1. I would recommend my Company as a good place to work. 2. I understand how my job contributes to the Company's strategic priorities and goals. 3. I feel proud to work for the Company. 4. I feel motivated to do more than is required of me.
5		**Employee Empowerment Index**	The Employee Empowerment index is an average favorability score derived from the taking the total favorable responses received for the 4 questions within the Employee Empowerment Category from each of the Company's employee engagement surveys administered by Korn Ferry and they use Qualtrics as the survey platform (https://www.qualtrics.com/) and dividing by the total number of responses received. The Company's Engagement, Empowerment and Diversity, Equity and Inclusion indexes are how we measure our culture values in action. The indexes focus on things like ensuring we have simple processes, fix problems, keep our workforce engaged by measuring the combination of emotional commitment (are you proud to work here?) and rational commitment (do you plan to stay?) and embed diversity, equity and inclusion into everything we do.	This index is an average of the scores of 4 questions: 1. My job makes good use of my skills and abilities. 2. I feel encouraged to come up with new and better ways of doing things. 3. I have enough autonomy to do my job well. 4. There are no significant barriers at work to doing my job well.
6		**Diversity, Equity & Inclusion Index**	The Diversity, Equity and Inclusion index is an average favorability score derived from the taking the total favorable responses received for the 4 questions within the Diversity, Equity and Inclusion Category from each of the Company's employee engagement surveys administered by Korn Ferry and they use Qualtrics as the survey platform (https://www.qualtrics.com/) and dividing by the total number of responses received. The Company's Engagement, Empowerment and Diversity, Equity and Inclusion indexes are how we measure our culture values in action. The indexes focus on things like ensuring we have simple processes, fix problems, keep our workforce engaged by measuring the combination of emotional commitment (are you proud to work here?) and rational commitment (do you plan to stay?) and embed diversity, equity and inclusion into everything we do.	This index is an average of the scores of 4 questions. 1. My Company values and promotes employee diversity. 2. I am treated with respect as an individual. 3. In my work environment, everyone is treated fairly regardless of personal background or characteristics. 4. I feel like I belong at my Company.
7		**Customer Experience Index**	Customer Experience Index is a survey benchmarked by Forrester (https://go.forrester.com/analytics/) and is a measure of customer service based on 3 questions – Did we meet your needs? Was it easy to do business with us? Was the experience enjoyable.	The metric is calculated by asking those 3 questions of customers on a scale of 1 to 5 with 4s and 5s being positive responses, 1s and 2s being negative responses, and 3s being a neutral response. To calculate the score, the number of negative responses is subtracted by the number of positive responses, which is then divided by the total number of customers responding. The results of the three questions are averaged together to calculate the Customer Experience Index score.
8		**Electric Reliability**	Electric Reliability/SAIDI (System Average Interruption Duration Index) is a utility-industry benchmark; SAIDI indicates the total duration of interruption for the average customer during a predefined period of time, typically one calendar year.	Use of IEEE (Institute of Electrical and Electronics Engineers) standard to exclude outlier events/MEDs (Major Event Days); total customer-minutes of interruption divided by total customers served (i.e. customers on the system).
9		**Methane Emissions Reduction**	Reduce fugitive methane emissions associated with natural gas system. Reductions are obtained as a result of replacing and/or retiring older, aging infrastructure from natural gas distribution.	Summation of reduction in methane emissions associated with Vintage Service Replacements (VSR), Enhanced Infrastructure Replacement Program (EIRP), Other Non-Vintage Replacements (Mains & Services), Well Plug & Abandonment (P&A) and capital replacements from the Leak Backlog. See sub-categories below for more details. Note: Compression Venting was included in previous years; however, is no longer included beginning in 2025. **Vintage Service Replacements** - The methane emission reductions are calculated using emission factors (EFs) for the type of service replaced (copper and Bare steel). The EFs and formulas used are consistent with those defined in EPA's Greenhouse Gas Reporting Rule. **EIRP** - The methane emission reductions are calculated using EFs for the type of main or service replaced. EFs for mains are based on miles replaced while services, as with VSRs above, are based on the number of services. The EFs and formulas used are consistent with those defined in EPA's Greenhouse Gas Reporting Rule. **Other Mains & Services** - same calculations as VSR and EIRP. **Well Plug & Abandon** - The methane emission reductions are calculated using emission factors (EFs) for the type of component retired. The EFs and formulas used are consistent with those defined in EPA's Greenhouse Gas Reporting Rule. **Gas Leak Backlog** - same calculation as VSR.

[1] The information related to the 2020 Settlement Accounting Utility Amortization was provided directly by CMS and was not calculated or reviewed by Aon. The amortization was set up as a regulatory asset for the utility portion of the 2020 settlement loss of $35.5 million at August 31, 2020. As provided by CMS, the amortizations starts in September 2020 over service life of 8.55 years. Additionally, the settlement attributable to the utility portion on December 31, 2020 is $9.8 million, which is also amortized over service of 8.55 years beginning in January 2021. Nonutility portions of the settlement loss are $0.9 million and $0.3 million for August 31, 2020 and December 31, 2020 respectively.

[2] The information related to the 2021 Settlement Accounting Utility Amortization was provided directly by CMS and was not calculated or reviewed by Aon. The amortization was set up as a regulatory asset for the utility portion of the 2021 settlement loss of $17.6 million at October 31, 2021. As provided by CMS, the amortizations starts in November 2021 over service life of 8.19 years. Additionally, the settlement attributable to the utility portion on December 31, 2021 is $3.3 million, which is also amortized over service of 8.19 years beginning in January 2022. Nonutility portions of the settlement loss are $0.5 million and $0.1 million for October 31, 2021 and December 31, 2021 respectively.

[3] The information related to the 2022 Settlement Accounting Utility Amortization was provided directly by CMS and was not calculated or reviewed by Aon. The amortizations were set up as regulatory assets for the utility portions of the 2022 settlement losses. The settlements attributable to the utility portions are $3.9 million, $3.7 million, $11.5 million, and $2.5 million as of March 31, 2022, June 30, 2022, September 30, 2022, and December 31, 2022 respectively. As provided by CMS, the amortizations are amortized over service life of 8.11 years beginning in April 2022, July 2022, October 2022, and January 2023 respectively. Nonutility portions of the settlement loss are $0.1 million, $0.1 million, $0.3 million, and $0.1 million for March 31, 2022, June 30, 2022, September 30, 2022, and December 31, 2022 respectively.

Expected Return on Assets	7.30%	7.30%	7.30%	7.30%
Salary Increases	3.80%	3.75%	3.75%	3.75%

2026-2033 projections reflect the following:

- January 1, 2025 census data.
- PBO discount rate of 5.58% (Plan A) and 5.28% (Plan B) in fiscal 2026+, based on December 31, 2025 yield curve anlaysis.
- Service Cost effective interest rate of 5.67% (Plan A) and 5.80% (Plan B) in fiscal 2026+, based on December 31, 2025 yield curve analysis.
- Interest Cost effective interest rate of 4.98% (Plan A) and 4.75% (Plan B) in fiscal 2026+, based on December 31, 2025 yield curve analysis.
- Expense is allocated to Utility/Non Utility based on PBO using the preliminary allocation percentages for 2026 expense.
- Contributions are allocated to Utility/Non Utility based on the most recent allocation percentages provided by CMS for the December 2020 contributions.
- December 31, 2025 market assets provided by CMS, with expected returns thereafter.
- Expected and actual asset returns of 7.90% (Plan A) and 7.30% (Plan B) in fiscal 2026+.
- The plans will waive Funding Balance when necessary, in order to maintain a Funded Percentage of at least 80%.
- Other provisions, assumptions and methods are the same as those used for the December 31, 2025 ASC 715 disclosures.

Notes
(1) Capacity and energy production costs adjusted to capture elements occurring outside the Cost-of-Service Study.
(2) Includes Non-SRM capacity related costs.
(3) Excludes IRM costs recovered through the IRM surcharge.
(4) Credit adjustments approved in Case No. U-21389
