Subject: It's time for Michigan utilities to expand and improve solar programs
Date: Wednesday, July 09, 2014 11:08:05 AM

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

Subject: Solar is a much better economic and climate investment than Fermi 3
Date: Wednesday, July 09, 2014 11:20:53 AM

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment. And it will eliminate the need to build future coal and nuclear plants.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease. And solar is a much cheaper, faster, and less risky way to invest for climate mitigation than old nuclear technology.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014, and (3) commit to solar, wind, and conservation as cheaper and less risky ways to reduce GHG emissions than to consider new nuclear plants.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Subject: It's time for Michigan utilities to expand and improve solar programs
Date: Wednesday, July 09, 2014 11:55:10 AM

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

Subject: It's time for Michigan utilities to expand and improve solar programs
Date: Wednesday, July 09, 2014 4:14:01 PM

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.

Michigan residents like myself need the Commission and our utilities to act now so that Michigan doesn't fall even farther behind other states in solar energy development. Please act on the recommendations of the solar working group to expand Consumers' and DTE's customer-owned solar programs to build a stronger and more resilient electricity grid, a more diverse energy supply, a stronger Michigan economy, and a healthier environment for us all to live in.

As a Michigan consumer, I strongly urge you to: (1) invest immediately, using funds already collected, in a significant expansion of your solar programs, and (2) create a long-term plan to more fully realize the solar benefits and recommendations in the MPSC report issued in early July 2014.

As a Michigan utility customer, I am urging DTE, Consumers Energy, and the Michigan Public Service Commission to expand and improve customer-owned solar programs. Better and more solar programs will diversify our electricity grid, improve our economy, and protect public health and the environment.

Not only will these programs create jobs and stabilize our grid, but they'll reduce the amount of fossil fuels that we have to burn for our energy usage. Relying too much on coal for our energy contributes to many public health problems and is making Michiganders sick. Increasing solar and reducing coal will help to prevent asthma, cardiovascular disease, allergies, and cerebral vascular disease.

In addition, an overwhelming number of Michigan home and business owners want more solar energy, but they're being stifled by the small size and inefficient design of existing solar programs. Fortunately, the MPSC's solar working group has determined that there are clear and specific improvements that can be made to expand solar at no additional cost to Michigan consumers.

The reluctance of DTE and Consumers Energy is the only thing holding Michigan back from more solar, a better economy, and healthier communities. DTE and Consumers continue to perpetuate the false claim that solar is too expensive. These claims ignore many of the legal, economic, and environmental benefits outlined by the Governor's office, the MPSC, local businesses, and clean energy experts. It also ignores the fact that utilities have already collected millions of dollars that could and should be advancing solar energy in our state.
